## How to take out the Old Pages and put in the New

1st—With your key you loosen the nut at the top and bottom of the Volume and lift the front cover.

2nd—Take your metal transfer frame and insert the prongs into the post of the Volume; slide the pages from the Volume on to the transfer frame; remove the old pages and substitute the new.

3rd—After the new pages have been inserted, the old pages can be thrown away and the Volume locked. To lock the Volume fit the pins of the upper cover into the posts as shown in first illustration, close the Volume, press it down tight with your left hand and tighten the nut at the top and bottom. THAT'S ALL.

The person charging this material is responsible for its return to the library from which it was withdrawn on or before the **Latest Date** stamped below.

**Theft, mutilation, and underlining of books are reasons for disciplinary action and may result in dismissal from the University.**

## LIST OF CONTRACTIONS USED IN THIS WORK.

- ac.**, acres.  
**agric.**, agricultural.  
**Ala.**, Alabama.  
**alt.**, altitude.  
**Alta.**, Alberta.  
**Amer.**, America or American.  
**anc.**, ancient.  
**ann.**, annual.  
**Ar.**, Arabic.  
**Arama.**, Aramaic.  
**Ariz.**, Arizona.  
**Ark.**, Arkansas.  
**arr.**, arrondissement.  
**A. S.**, Anglo-Saxon.  
**A. V.**, Authorized Version.  
**aver.**, average.  
**b. p.**, boiling point.  
**bor.**, borough.  
**Brit.**, Britain or British.  
**B. C.**, British Columbia.  
**bur.**, burgh.  
**c.** (circa), about.  
**C.**, centigrade.  
**Cal.**, California.  
**cap.**, capital.  
**cf.**, compare.  
**co.**, county.  
**Colo.**, Colorado.  
**Com.**, Commission.  
**comm.**, commune.  
**Conn.**, Connecticut.  
**cub. ft.**, cubic feet.  
**Dan.**, Danish.  
**D. C.**, District of Columbia.  
**Del.**, Delaware.  
**dep.**, department.  
**dist.**, district.  
**div.**, division.  
**Du.**, Dutch.  
**E.**, east.  
**eccles.**, ecclesiastical.  
**ed.**, edition; edited.  
**e. g.**, for example.  
**Eng.**, England or English.  
**episc.**, episcopal.  
**et. seq.**, and the following.  
**F.**, Fahrenheit.  
**Fla.**, Florida.  
**fort. tn.**, fortified town.  
**Fr.**, French.  
**ft.**, feet.  
**Ga.**, Georgia.  
**Ger.**, German.  
**gov.**, government.  
**Gr.**, Greek.  
**Heb.**, Hebrew.  
**I.**, isl., island.  
**Ia.**, Iowa.  
**ibid.**, the same.  
**i. e.**, that is  
**Ill.**, Illinois  
**in.**, inches.  
**Ind. T.**, Indian Territory.  
**Ind.**, Indiana.  
**Ire.**, Ireland or Irish.  
**Ital.**, Italian.  
**Kan.**, Kansas.  
**Ky.**, Kentucky.  
**l.**, lake.  
**La.**, Louisiana.  
**Lat.**, Latin.  
**lat.**, latitude.  
**l. bk.**, left bank.  
**lit.**, literally.  
**long.**, longitude.  
**m.**, miles.  
**Man.**, Manitoba.  
**Mass.**, Massachusetts.  
**Md.**, Maryland.  
**Me.**, Maine.  
**M. E.**, Methodist Episcopal.  
**Meth.**, Methodist.  
**Mich.**, Michigan.  
**Minn.**, Minnesota.  
**Miss.**, Mississippi.  
**Mo.**, Missouri.  
**Mont.**, Montana.  
**m. p.**, melting point.  
**mrkt. tn.**, market-town.  
**Mt.**, **mts.**, mount, mountain, -s.  
**munic.**, municipal.  
**N.**, north.  
**Neb.**, Nebraska.  
**N. B.**, New Brunswick.  
**N. C.**, North Carolina.  
**N. Dak.**, North Dakota.  
**Nev.**, Nevada.  
**N. H.**, New Hampshire.  
**N. J.**, New Jersey.  
**N. Mex.**, New Mexico.  
**N. S.**, Nova Scotia.  
**N. T.**, New Testament.  
**N. W. T.**, Northwest Territories.  
**N. Y.**, New York.  
**O.**, Ohio.  
**Okla.**, Oklahoma.  
**Ont.**, Ontario.  
**Ore.**, Oregon.  
**O. T.**, Old Testament.  
**par.**, parish.  
**parl.**, parliamentary.  
**Pa.**, Pennsylvania.  
**P. E.**, Protestant Episcopal.  
**P. E. I.**, Prince Edward Island.  
**Per.**, Persian.  
**P. I.**, Philippine Islands.  
**pop.**, population.  
**Port.**, Portuguese.  
**P. R.**, Puerto Rico.  
**Presb.**, Presbyterian.  
**prom.**, promontory.  
**prov.**, province.  
**pueb.**, pueblo.  
**Que.**, Quebec.  
**q. v.**, which see.  
**R.**, **riv.**, river.  
**r. bk.**, right bank.  
**R. C.**, Roman Catholic.  
**R. R.**, or **ry.**, railroad or railway.  
**R. I.**, Rhode Island.  
**R. V.**, Revised Version.  
**R. R. jn.**, railroad junction.  
**S.**, south.  
**Sans.**, Sanskrit.  
**Sask.**, Saskatchewan.  
**S. C.**, South Carolina.  
**Scot.**, Scotland or Scottish.  
**S. Dak.**, South Dakota.  
**seapt.**, seaport.  
**Sp.**, Spanish.  
**sp. gr.**, specific gravity.  
**sq. m.**, square miles.  
**stn.**, station.  
**s. v.**, under the word.  
**Syr.**, Syriac.  
**temp.**, temperature.  
**Tenn.**, Tennessee.  
**terr.**, territory.  
**Tex.**, Texas.  
**tn.**, town.  
**trans.**, translated.  
**trib.**, tributary.  
**U. S.**, United States of America.  
**Va.**, Virginia.  
**vil.**, village.  
**vol.**, volume.  
**Vt.**, Vermont.  
**W.**, west.  
**Wash.**, Washington.  
**wat.-pl.**, watering-place.  
**W. Va.**, West Virginia.  
**Wis.**, Wisconsin.  
**Wyo.**, Wyoming.  
**yds.**, yards.

and often in conspicuous clusters. The stems are four-angled, generally climbing or trailing. Yellow

bunches of yellow pendent catkins, each catkin including ten or more flowers; the female flowers

prickly husks that ultimately ripen and burst open in four valves, liberating the two triangular nuts

Cut-leaved Beech (*Fagus laciniata*), a variety of cultivated Beech. (Photo. by G. Chase, Newport, R.I.)

or lady's bedstraw (*G. verhum*) was formerly used for curdling milk; and a yellow dye was obtained from the flowers by boiling them in an alum solution. A red color is also got from the roots. Cleavers, or goose-grass (*G. aparine*), is the rough trailing herb, climbing in bushes by means of minute hooked hairs. Its spherical fruits, roasted and ground, are said (doubtedly) to be an excellent substitute for coffee.

**Beech.** The American beech (*Fagus Americana*) is one of the stateliest of our forest trees. It is large, attaining to a height of more than 100 ft., and a diameter of 4 ft., and when grown in the open forms a very symmetrical head, a wide-spreading pyramid or dome. The light-gray, smooth bark is conspicuous in winter; as are also the fine sprays, and the long, sharp pointed buds. In summer the dull, acuminate leaves give deep shade. In autumn the leaves take on glowing yellow, orange, gold and purple tints. The male and female flowers occur on the same tree. The former consist of little

are enclosed within a mass of scales, which develops into the

within. The beech is easily propagated by sowing the nuts in March at a depth of one inch in carefully prepared soil.

The European beech (*F. sylvatica*) is also famous. It was honored by the Romans, and is the Danish national tree. The old herbalist, Gerard, referred to beechnuts as fattening food for swine and deer, as 'pleasant' to thrushes and pigeons, and as 'greatly delighting mice and squirrels.' They have also been dried and made into flour, and have been used as a source of oil. There are many varieties of this beech in cultivation. Of these the copper beech and purple beech are best known. Both these are very beautiful when the leaves are expanding in the spring, but become dull and monotonous as the color deepens with advancing summer. The weeping beech (*F. s. pendula*) and the fern-leaved beech (*F. s. asperifolia*) have their admirers.

Beech.

1, Male flower; 2, female flower; 3, fruit.

**Beecher, CATHERINE ESTHER** (1800-78), American educator, eldest child of Lyman Beecher,

was born at East Hampton, L. I., N. Y., and was educated at the seminary at Litchfield, Conn. The loss of Prof. Fisher of Yale at sea, to whom she was betrothed, led her to devote her life to teaching. She established a school for young women at Hartford, Conn., which became very successful and was continued for ten years after her father's acceptance of the presidency of Lane Theological Seminary (1832). She accompanied him to the West, and there developed an extensive plan for introducing women teachers into that part of the country, which was successful, except as it was neutralized by their early marriage. She published several books on domestic and educational subjects, of which the most important was written in collaboration with her sister, Harriet Beecher Stowe, *The American Woman's Home* (1869).

**Beecher, CHARLES** (1815-1900), American clergyman, fourth son of Lyman Beecher, was born at Litchfield, Conn., and graduated (1834) at Bowdoin. He studied divinity at Lane Theological Seminary. He was ordained pastor of the Second Presbyterian Church of Fort Wayne, Ind., 1844, and held pastorates over Congregational churches in N. J., Mass., and Penn. He was state superintendent of public instruction for Florida for two years during his residence in that state (1870-7). Mr. Beecher made the musical selections for the *Plymouth Collection of Hymns and Tunes*. He edited the *Autobiography and Correspondence of Lyman Beecher* (1864), and wrote *Pen Pictures of the Bible* (1855), *Spiritual Manifestations* (1879), and *Eden Tableau* (1880).

**Beecher, CHARLES EMERSON** (1856-1904), American geologist, was born at Dunkirk, N. Y., and graduated (1878) at the University of Michigan. He was for ten years an assistant in the New York State Museum and upon the State Geological Survey. In 1888 he was appointed to the Yale teaching staff, and in 1897 became professor of historical geology at that university. Two years later he was in addition appointed curator of the geological collection. Professor Beecher contributed more than fifty papers to scientific periodical literature. They dealt principally with brachiopoda and trilobita.

**Beecher, EDWARD** (1803-95), American clergyman and educator, second son of Lyman Beecher, was born at East Hampton, L. I., N. Y., and graduated (1822) at Yale. He studied for the ministry at Andover and at Yale, where he was a tutor until 1826, when he assumed charge

of the Park Street Congregational Church, Boston, Mass. From 1830 to 1844 he was president of Illinois College, at Jacksonville, Ill., and was helpful in the pioneer development of the West. Dr. Beecher was pastor of churches in Boston and in Galesburg, Ill., from 1844 to his retirement in 1872. He was an editor of the *Congregationalist*, and wrote for other periodicals. His principal works, *The Conflict of Ages* (1853) and *The Concord of Ages* (1860),

Theological Seminary, near Cincinnati, O., of which his father was president, and his first pastorate was that over the Presbyterian Church at Lawrenceburg, Ind., 1837, when he married Eunice White Bullard. From 1839 to 1847 he preached at Indianapolis, in the latter year accepting a call to the pastorate of Plymouth Congregational Church, Brooklyn, N. Y. Here he gathered around him the largest congregation in the U. S. From the

American Beech (*Fagus Americana*) in Winter.

promulgate the theory that man's life upon earth is the outgrowth of a former life as well as the prelude to a future one.

**Beecher, HENRY WARD** (1813-87), American clergyman, third son of Lyman Beecher and brother of Harriet Beecher Stowe, was born at Litchfield, Conn., and graduated (1834) at Amherst. He studied divinity at the Lane

first Mr. Beecher took a great interest in public questions, identifying himself with the anti-slavery party, and making bold attacks on intemperance and political abuses. His sermons were marked by great freshness, originality, eloquence, and imagination. They were printed weekly, beginning with 1859, in a publication entitled *Plymouth*

**Pulpit.** He gained a great reputation as a speaker on public occasions and lecturer, his lecture engagements becoming so numerous that he was compelled temporarily to abandon the field. His efforts in favor of the abolition of slavery were untiring; he took an active part in the Republican campaign of 1856, and in 1863 he delivered in England a course of remarkable addresses which had a considerable influence in changing public opinion in that country in favor of the Union cause. They were published in London as *Speeches on the American Rebellion* (1864). Mr. Beecher was editor of the *Independent*, 1861-3, and contributed to it for twenty years. Some of his contributions, signed with an asterisk, were published as *Star Papers* (1855-8). He was editor of the *Christian Union* (now the *Outlook*) in 1870-1881. In 1874 Mr. Beecher's reputation was temporarily beclouded by a suit brought by Theodore Tilton for alienating his wife's affections. Leading counsel were employed on both sides, and the trial, which lasted six months, ended in a disagreement of the jury, nine of whom voted for Mr. Beecher's innocence. The largest Congregational council ever convened, after a thorough examination of the charges, proclaimed his innocence. At a celebration of Mr. Beecher's seventieth birthday, by the citizens of Brooklyn, the same opinion was expressed in a formal resolution. Justice Neilson, who presided at the trial, also presided at this celebration, and the chief counsel for Mr. Tilton, several years after the trial, publicly expressed his belief in Mr. Beecher's innocence. In 1882 he withdrew from the local association of Congregational churches, owing to criticism of his theological views. He again visited England in 1886, and died the following year. See Lyman Abbott's *Henry Ward Beecher*, with a full bibliography (1903); and *Henry Ward Beecher: a Biography*, by W. C. Beecher, Rev. S. Scoville, and Mrs. Beecher (1888).

**Beecher, LYMAN (1775-1863)**, American clergyman, was born in New Haven, Conn., and graduated (1797) at Yale. He pursued his theological studies at New Haven, was licensed to preach, 1798, and was ordained pastor of the Presbyterian church at East Hampton, L. I. 1799. He was called to the Congregational church at Litchfield, Conn., 1810. The defection among Congregational churches caused by Dr. Channing's propaganda led Dr. Beecher to accept a call to the Hanover Street church

in Boston, 1826, where he upheld the Trinitarian side of the controversy until his acceptance, 1832, of the presidency of Lane Theological Seminary, near Cincinnati, O., a position which he held for twenty years. The last ten years of his life were passed, his health failing, at the home of his most distinguished son, Henry Ward Beecher, in Brooklyn, N. Y. He published an edition of his *Works* (3 vols., 1852). His highly entertaining *Autobiography and Correspondence* was edited by Charles Beecher (1863).

**Beecher, THOMAS KENNICUTT (1824-1900)**, American clergyman, sixth son of Lyman Beecher, was born at Litchfield, Conn., and graduated (1843) at Illinois College. After several years of teaching he became pastor (1852) of the N. E. Congregational church at Williamsburg, N. Y. In 1854 he removed to Elmira, N. Y., and was pastor of the Independent church (later Park church) until his death. Mr. Beecher introduced many institutional features into his church organization, such as a bowling alley, stage, gymnasium, and parlors, and gave personal attention to their development, as well as spending the greater part of his salary in charities personally distributed. He was nominated against his will for many political offices, but always by a minority party. Among the poorer classes he was known as 'Father Tom.' Author of *Our Seven Churches* (1870).

**Beecher, FREDERICK WILLIAM (1796-1856)**, English rear-admiral and geographer, son of Sir William Beechey, served under Franklin in the Arctic expedition of 1818, and under Parry in 1819. He co-operated, by Bering Strait, with polar expeditions from the east (1825), and at various periods was employed in survey work on the north coast of Africa, the coast of S. America, and the Irish seaboard. Author of various geographical works, including a *Voyage of Discovery towards the N. Pole* (1843), and an account of his Bering Strait explorations (1831).

**Beechey, SIR WILLIAM (1753-1839)**, English painter, entered as student at the Royal Academy (1772). Elected A.R.A. in 1783, his portrait of Queen Charlotte, painted the same year, procured him the post of portrait painter to her majesty. In 1798 he was knighted and elected R.A. His reputation depends on his portraits, which are marked by good coloring, but by stiff and ill-arranged draperies. Two examples of his portraits are in the Metropolitan Museum of Art, New York.

**Beechey Island**, islet, Arctic Archipelago, N. of Barrow Str.,

Canada, 74° 43' N., 91° 39' W.; so called from Admiral Beechey. Here Franklin's second expedition wintered for two years, and here memorials have been erected to the members of this and of a later British expedition, also to Lieutenant Bellot, who perished in 1853.

**Bee-eater**, a bird of the picarian family *Meropidæ*, allied to the kingfishers. All the bee-eaters are brilliantly colored, green predominating, with long bills and great power of flight; the majority

*Bee-eater.*

are Ethiopian forms. The common migratory bee-eater of Europe (*M. apiasler*) has an extensive range over Asia, Europe, and Africa, and earns its name by its habits, but all the members of the family subsist on insects caught during flight. They breed in deep holes excavated in river banks and lay unspotted eggs.

**Beefeater.** (1.) A term popularly applied to some of the retinue of the English royal household, notably to the yeomen of the guard, whose original duties were those of service at the king's table. The word has been derived from the corrupted French *beaujetier*, or *buffetier*, one who waits at the buffet or sideboard. Skeat, however, maintains that its natural English meaning is the right one. See YEOMEN OF THE GUARD. (2.) An African bird (*Buphaga africana*) similar to the starling, called also ox-pecker and buffalo-bird. It is seen in small flocks, alighting on the backs of cattle and other animals, where it searches for and picks from their hide the larvae of botflies, on which it feeds.

**Beefsteak Club**, a social club founded (1735) by Rich and Lambert, actors, at Covent Garden Theatre, in the reign of Queen Anne, and known as the Sublime Society of Steaks. The Prince of Wales was a member, as also were Garrick, Beard the singer, Hogarth, and Wilkes, and Charles Morris was club laureate. It was dissolved in 1867. See Arnold's *Life... of the Sublime Society of Steaks* (1871). Another club of this name, of which Peg Woffington was first president, was connected with the Theatre-Royal, Dublin, and was founded by Sheridan in 1749. There is also a modern Beefsteak Club in Lon-

don, founded in 1876, and long associated with Toole's Theatre.

**Beef Tea**, a light article of diet, commonly used for the sick and convalescent. It is best prepared as follows: Take a pound of lean beef, free from tendon, fat, etc.; chop fine, and let it lie in a pint of cold water for two hours. Simmer for three hours at a temperature never over 160° F. Make up the water lost with cold water, so that a pint of the tea represents a pound of beef. Strain, and carefully express all fluid from the beef. The composition of well made beef tea is—water, 96.31; albuminoids, 0.82; extractives 2.09; salts, 0.78 per cent. Even the best beef tea is practically no more than a stimulating drink, containing a minimum of nourishment. It is, however, useful for that very reason, when invalids are more in need of rest for the stomach than of food, as is often the case. It must never be used to replace nutriment where that is needed. Numerous beef extracts, from which beef tea may be expeditiously prepared, are on the market.

**Beefwood**, a name applied to the wood of two different kinds of tree—the bully-tree (*Suarizia*) of the order Leguminosæ, in Guiana, and the various species of *Casuarina*, found in Australia. See CASUARINA.

**Beelzebub**, bē-el'zi-bub, or, as in 2 Kings i. 2 ff. BAALZEBUB, 'Baal of flies,' i. e. a god who controls insect plagues (*cf.* Zeus Apomuios of the Greeks—Pausanias, viii. 26, 7), a deity whose shrine was at Ekron, a Philistine town. As the later Jews considered heathen gods to be demons, the New Testament transference of the name (which, according to the best mss., should be Beelzebub) to Satan is easily understood. The word is now believed to be a derivative corruption of Baalzebub, 'lord of the high house'—i. e., the deity worshipped in a temple—and Matt. x. 25 seems to hint at the original meaning, the 'high house' being now 'the pit.' See BAAL.

**Bee Martin**. See KING BIRD.

**Bee Moth**. See HONEY MOTH.

**Beer**. See BREWING.

**Beerbohm**, MAX (1872), British author and caricaturist, a half-brother of Sir Beerbohm Tree (q. v.), was born in London. He was educated at Oxford, and early attracted attention by his skilful caricatures of contemporary figures. He published *The Works of Max Beerbohm*; *More*; *Yet Again*; *A Christmas Garland*; *The Happy Hypocrite*; *Zuleika Dobson*, his only novel, a burlesque of student life at Oxford; *Caricatures of*

*Twenty-Five Gentlemen*; *The Poets' Corner*; *A Book of Caricatures*; *The Second Childhood of John Bull*; *Fifty Caricatures*. A number of exhibitions of his drawings have been held.

**Beernaert**, bār'nart, AUGUSTE MARIE FRANÇOIS (1829–1912), Belgian statesman, was born in Ostend. He was educated at the University of Louvain and commenced the practice of law in Brussels in 1853. From 1873 to 1878 he was minister of public works; in 1884 he was appointed minister of agriculture, industry, and public works, and soon after he became president of the council and minister of finance. He was made minister of state in 1894. M. Beernaert was an ardent advocate of international arbitration and served many times on arbitral tribunals.

**Beeröth**, bē'röth, a city of Benjamin (Josh. xviii. 25, etc.), between Jerusalem and Bethel; now the village Bireh, on the main north road. It contains the ruins of two ancient reservoirs and of a Christian church erected by the Templars in 1146. Pop. 1,000.

**Beers**, HENRY AUGUSTIN (1847), American educator, was born in Buffalo, N. Y., of a Connecticut family. He was graduated (1869) from Yale, studied law and practised for a year in New York, after which he joined the Yale teaching staff (1871). He was appointed assistant professor of English in 1875, and full professor in 1880. He contributed extensively to periodicals, and was a member of the staffs of several dictionaries and encyclopædias. His own books include: *Odds and Ends*, verse (1878); *A Century of American Literature* (1878); *Life of Nathaniel Parker Willis* (1885); *The Thankless Muse*, verse (1885); *From Chaucer to Tennyson* (1890); *Initial Studies in American Letters* (1891); *Selections from the Prose Writings of S. T. Coleridge* (1893); *The Ways of Yale*, sketches (1895); *History of Romanticism in the Eighteenth and Nineteenth Centuries* (1899–1901); *Points at Issue* (1904); *Milton's Ter-Centenary* (1910); *The Two Twilights*, verse (1917); *Four Americans: Roosevelt, Hawthorne, Emerson, Whitman* (1919).

**Beersheba**, bē'er-shē'ba, town, Palestine, the southernmost one belonging to the Israelites (whence came the saying 'from Dan to Beersheba,' meaning all Israel), lies 40 miles southwest of Jerusalem. It seems to have derived its name, signifying 'well of swearing' or 'well of seven,' from the covenant entered into here by Abraham and the Philistine Abimelech, which Abraham ratified by an oath and

a gift of seven ewe lambs (Gen. xxi. 28, 32). It is closely associated with the history of the patriarchs, and frequent references are made to it throughout the Old Testament narrative. In the days of Eusebius (264–340) Beersheba was a flourishing market-village with a Roman garrison, and also an episcopal see. Extensive ruins now mark its site. A little to the southwest is the modern town, Bir-el-Seba, with a serai, a mosque, and a few small shops.

During the course of the Great War of Europe (q. v.) British and Australian troops under General Allenby occupied Beersheba Oct. 31, 1917.

**Bees**, a family of insects belonging to the order Hymenoptera (q. v.), and to the same sub-order as the wasps and ants (q. v.) from which they differ by the possession of more profuse branched and feathery hairs on the head and thorax and by the modification of the mouth parts into a proboscis-like structure, fitted in many varieties for gathering nectar from deep tubular blossoms.

Bees are variously classified on the basis of structural differences and on the basis of habit. Structurally there are two great groups—those in which the tongue is a short, flattened, spoon-like organ, and those in which it is long, slender, and flexible. Grouped on the basis of habit, they also fall into two classes, solitary and social.

Solitary bees include the so-called Mining Bees of the short-tongued genera Colletes and Prosopis, which burrow in the ground or in stems of brambles and other plants; the large and small Carpenter Bees, which tunnel their way into twigs and canes and even into fallen trees, fence posts, and boards (see CARPENTER BEE); the Mason Bees, which build their nests of clay or sand; the Potter Bees; the Leaf-cutting Bees; and other varieties. Many solitary bees, especially the Nomadidæ, or Cuckoo Bees, and the Stelidæ, are parasitic in character, the female depositing eggs in the nest burrow of another bee, upon whose food supplies the newly hatched larvæ may feed.

The social bees include two great families—the Honey Bees (*Apis*) and the Bumble Bees (*Bombus*). These bees live in communities, and, as in the case of ants, various sets of members have come to discharge special functions. The result of this division of labor has been difference of form, or polymorphism. In fact, restricted function has led to the establishment of castes. Thus the ordinary hive contains (1) a single queen bee—

the fertile female and mother of the next brood, (2) the males or drones, and (3) the vast majority of workers or imperfectly developed females, which only exceptionally become fertile. Because of its great economic importance, the Common Honey Bee or Hive Bee will be considered in detail.

**Form and Structure.**—Like that of other insects, the body of the bee is readily divisible into three portions—head, thorax, and abdomen. The head is well defined from the body, and bears the organs of sight, touch, mastication, and honey-collecting. There are two compound eyes, borne on the sides of the head. Below the eyes are two jointed feelers or antennæ, most essential organs of sensation. Next come the horny, toothed mandibles, freely articulated to the head, and well adapted for cutting the resinous cement or propolis into shapes, and for the finer work of handling the pollen, and the like. The first pair of maxillæ are much elongated flattened blades, embracing the second pair, and forming the outer sheath of the proboscis, as the entire collecting

and bumble bee belong, this is a much elongated slender hairy organ of varying firmness throughout its course. When at rest, the internal portion of the tongue is somewhat curled up and retracted into the lower end of the mentum. It is capable of very rapid protrusion and of free motion in almost every direction. The tongue of the workers is twice as long as that of the queens or the drones, who do not collect honey.

The somewhat oval thorax bears the two pairs of wings and three pairs of legs, and consists of the usual three segments, of which the most anterior (the prothorax) is greatly reduced. The wings, which are borne on the last two segments, are membranous and transparent. When at rest, they are folded together over the back; when in action the two pairs are clasped together by means of small hooks on the fore margin of the hind pair. The many-jointed mobile legs do not differ from those of other insects, except in the high development of pollen-collecting hairs.

The abdomen, or posterior

end of the canal thus formed is in connection with the female generative aperture, so that the eggs can pass neatly down from the body of the bee into the cell prepared as a cradle. But the base is also connected with a poison-bag containing formic acid and other irritants, which are squeezed into the wound made by the sharp sting, and are the obvious causes of the familiar inflammation. In the queen bees this specialization of abdominal appendages forms a long, stout, curved organ, which is occasionally used as a weapon in duels with rivals, but much more frequently for its main business as an egg-laying organ.

The circulatory, respiratory, excretory, and reproductive systems do not differ markedly from those of other insects.

**Life History.**—As in the case of the majority of insects, the life-history is divisible into four chapters—the developing egg, the larva or grub, the pupa, and the perfect insect. (1) The eggs have a long oval shape, and a whitish color. They are laid by the queen bee. After normal fertilization she becomes, in fact,

Photograph from Underwood and Underwood, N. Y.

### The Honey Bee

From left to right, worker, queen, drone

organ is called. The fused basal portion of the second pair of maxillæ, the mentum, as it is called, is in movable membranous and elastic connection with the cardines or bases of the first pair.

This mentum bears internally the structure known as the ligula or tongue. In the long-tongued bees, to which both the honey bee

portion of the body, is joined to the thorax by a comparatively narrow bridge. The females bear at the end of the body an ovipositor or sting, which consists of a median piece deeply grooved on its lower surface and of two adjacent sharply pointed structures, which being apposed to the median piece make the groove into a canal. The inter-

little more than an egg-producing machine, turning them out sometimes at the rate of 100 per hour, and is often fed while at her work, so that the expenditure of living matter is to a certain extent recouped. If a young queen be not impregnated in the first three weeks of her life, she continues laying drone-eggs only, as above described. (2) The

*grub* appears after three or four days, and grows like any other insect larva, and as it touches the sides of its cell, coils up in a crescent, and floats in the food which has been left in the cell. During this stage the reproductive organs either atrophy, as in the case of the worker grubs, or fully develop, as in the queen type. (3) In several days, varying slightly with the season, the grub passes into another stage of its life history. It has grown greatly and accumulated some reserve material to serve it throughout a period of fasting. The cell is sealed up by the nurses, and the grub becomes a *pupa*. The queen is  $5\frac{1}{2}$  days a larva and  $8\frac{1}{2}$  days a pupa, the worker 6 and 11, the drone 6 and 15 days respectively. The imprisoned grub does not at once fall into inactivity, but proceeds first to spin its chrysalis-robes. Alternately contracting and elongating its body, it at the same time allows filmy threads to exude from the orifices of spinning-glands situated on its lower lip. There are two such organs, and the resulting thread which the grub weaves round itself is therefore double. In a day and a half the worker-grub has spun a complete cocoon, and becomes a true resting pupa or beey-nymph. The male-grubs also spin complete cocoons, but those of the queen-grubs only enclose head, thorax, and the first ring of the abdomen.

Within the curtain of the cocoon important changes occur. The mummy-like pupa is gradually modified into the young bee. The skin, the segments, the appendages, and the internal organs undergo most marked changes, and on the twentieth or twenty-first day after egg-laying the young insect finally bursts its swaddling clothes, and emerges as a winged perfect insect or *imago*. The young queens are not allowed to escape when their metamorphoses are over. In the door of their cell a small hole is made, through which the royal prisoners are fed till the tone of their piping probably intimates their complete sexual maturity.

**Functions and Habits.**—It has been already noted that the social life of bees has resulted in some division of labor. At the beginning of spring the hive contains a single queen and a much-reduced contingent of workers. Their first care is to restore the normal population. Towards this end the queen lays numerous eggs which develop into *workers*. After the stock has been thus replenished, eggs are laid which turn out males or *drones*. After they begin to appear, eggs are laid which

develop into more workers, and also into a few *queens*. The rapid increase of population culminates in the emigration known as *swarming*, when the old queen accompanied by a large contingent of subjects leaves the hive. The date of swarming is markedly affected by the temperature and the food-supply.

A populous stock will often send off three swarms in rapid succession. When the season and necessity for swarming are past, the young queens that remain imprisoned in the royal cells are liberated at once and allowed to fight for the sovereignty. The survivor then takes her nuptial flight.

Mating occurs in the air, followed by the death of the male. The newly impregnated queen thereupon returns to the hive to begin her egg-laying. It is a generally accepted conclusion that the queen mates but once, a single impregnation being sufficient for her lifetime of from two to four years. When swarming time is over, and the supply of honey decreases, the bees commence to rid the hives of the drones, henceforth mere useless consumers.

The queen bees are reared from special eggs, which begin to be laid after the drones appear on the scene. According to some, the queen herself deposits in the special royal cells the eggs which develop into future queens; according to others, the workers shift the eggs into these specially large cradles. They develop very rapidly in consequence of rich nutrition, attaining their maturity in about sixteen days.

Just as the drones and queens maintain the numbers of the hive so far as reproduction is concerned, so the supplies of food are collected by the myriads of workers. Among these there is some slight division of labor. Members of the community, varying in age and constitution, are told off to special tasks. Thus we can distinguish the external workers who collect nectar and pollen from those who attend to more internal domestic duties. Some of the internal workers, usually the young bees, act as nurses, effecting the mastication and semi-digestion of the food for the young larvæ, and caring for all the needs of the brood; while some wait upon the queen. Others again devote their energies, for a time at least, to the architecture of the cells, for which some of the heavy eaters secrete the wax. Others attend to the ventilation of the hive, which is apt to become hot enough not only to be disagreeable, but to soften the wax. These ventilators fan industriously with their wings, and

produce air-currents through the hive strong enough to blow out a lighted match.

In the normal colony there may be as many as 20,000 workers to one queen and a few dozen or possibly a few hundred drones.

**Feeding.**—Bees feed principally on the nectar and pollen of flowers. In spring they frequent the early-flowering willow, hazel, plane, apple, pear, alder, gooseberry, currant, etc. The borage, the mignonette, the thyme, the heathers, the tealz, are also valuable sources of food.

When the bee proceeds to rob a flower of its nectar, the tongue, folded up when at rest, is protruded beyond its ensheathing parts, and is pushed as a probe into the flower-tube. By the action of the hairs on the outside of the tongue, or by the general action of the suctorial proboscis, helped by muscular contractions of the body, or by an ascent up the fine capillary tube of the tongue, the nectar is conveyed to the mouth, and later into the honey-bag, whence it is expelled, after undergoing certain changes, into the cell. (See HONEY.)

Besides the nectar, the *pollen* of flowers is essential to the normal life of bees; it is the ambrosia of the hive, and is largely used as food for the young. As the nectar is non-nitrogenous, the necessity for some other kind of food is obvious. Drones and queens, however, never eat raw pollen, and must therefore get their nitrogen indirectly. The special food supplied to the young is formed from pollen partly digested along with honey. The pollen is collected by the hairs of the body, from which it is cleaned off by the feet and jaws, damped with dew or other moisture, mixed with a little honey ejected from the mouth, kneaded into pellets, taken up by the brushes on the hind-legs, and deposited in the baskets in which it is carried home. The cargo thus brought to the hive may be immediately seized by the nursing bees, or may be stored up for future use. In the first case it is worked up by the nurses into a suitable state and given to the larvæ. In the other case the worker frees itself from its burden, pulling it off with the forelegs over a cell in the comb, and starts off again for more, while another bee packs the pollen into the cell, with the addition of a little honey, and covers it over with a varnish.

Bees also collect a resinous strongly adhesive, reddish-brown substance, known as *propolis*. This is obtained chiefly from the resinous exudations of such trees as fir, poplar, alder, birch, willow, horse-chestnut, etc., and is much

used by the bees as a cement. With it they varnish the combs, stop up holes, and 'strengthen the outworks of their city.'

**Formation of the Comb.**—The wax used in the construction of the comb is manufactured by the bees themselves. The secretion is exuded from eight wax-pockets situated on the ventral surface of the abdomen. The wax projects in small flakes between the rings, is removed by the legs, shifted forward to the mouth, masticated by the jaws, and laid in heaps for the use of the comb-builders.

Each comb consists of rows of cells disposed at right angles to the comb. Each cell of this two-sided comb is a hexagonal prism, with its internal apex lying in the depression between three adjacent cells on the opposite side.

In some of the cells honey is placed for winter use; in some pollen is stored after being salivated and compressed by indoor workers, while others constitute the brood-cells, the cradles of the future young bees. These vary slightly in size. Those for workers are smaller and lower; those for the drones are broader and longer. In spring-time, after the drones have begun to appear, the royal cradles are formed for the young queens.

**Beekeeping or Apiculture.**—Bee culture for the production of honey and wax for human use has been carried on for centuries. Apart from the frequent Scriptural mention of bees and honey, and the allusion to bees in the hieroglyphics of ancient Egypt four thousand years ago, Aristotle the philosopher, in the fourth century B.C., and, two hundred years later, Virgil the poet and Pliny the naturalist, all wrote about bees—Virgil's fourth Georgic being in itself a valuable book on bees and beekeeping. In mediæval times, too, it is recorded that the Saxon lord of the manor sometimes took part payment for rent of holdings in honey.

The seventeenth century was prolific in bee literature, but little additional knowledge was gained, and it was not until Huber, the blind naturalist of Geneva, began his investigations, and in 1792 published his *Nowelles Observations sur les Abeilles*, that marked progress was made. In 1841 Prokopovitch, a Russian beekeeper, who owned an apiary of 2,800 colonies of bees, made the first known attempt at constructing a hive with an upper chamber for surplus honey, and frames of combs that were capable of being removed. The introduction of the methods of modern beekeeping may, however, be said to date from the

invention (1851) of the movable frame by the Rev. L. L. Langstroth, an American clergyman, who made perfect the frame devised by the Russian apiarist. The next important advance was made by the introduction of what is known as comb foundation—i.e., thin sheets of beeswax, which, on being passed between embossed metal rollers, have impressed on their surface the outline of the cell base of natural comb. These sheets, when fitted in frames, ensure perfectly straight combs, and are readily adopted by bees as their own handiwork, thus effecting an enormous saving to them in labor and material. Other inventions tending to increase the production of honey and render the management of bees more easy have followed upon these, and to-day bee culture constitutes a profitable minor industry in the United States and elsewhere.

The first consideration in constructing the apiary is a locality rich in nectar-producing plants (see above). The hives should preferably face away from the prevailing winds and be protected from high winds, and should be shaded, especially during the heat of the day. Various arrangements of the hives have been adopted. An excellent one is placed in pairs three feet or more apart. As a general rule it is considered best to limit the number of colonies in a single apiary to 100 and to have apiaries at least 2 miles apart.

The hive, while light, so as to be easily moved about, should have walls of sufficient thickness to protect the bees alike from the extreme cold of winter and the excessive heat of summer, and of such material as will effectually shield them from rain or damp. Each hive is generally placed on a separate stand to raise it slightly above the ground.

The type of hive most commonly used in the United States is the Langstroth, consisting of a plain wooden box, holding a number of movable frames, hung from the top of the box,  $\frac{1}{2}$  to  $\frac{3}{8}$  of an inch apart and at a like distance from the top, sides, and bottom of the hive. The frames are made of four bars of wood joined at the corners, usually  $14\frac{1}{2}$  inches long by  $8\frac{1}{2}$  inches deep, and about an inch from side to side. The number depends on the size of the swarm to be accommodated, and on the honey-yielding capabilities of the district. Ten frames have generally been considered sufficient, although many beekeepers use hives containing as many as fifteen or even eighteen frames. The box thus constructed is the brood-chamber and storehouse

of the bees, and is never despoiled of its sweets.

To provide accommodation for the storage of surplus honey, a bottomless box of corresponding dimensions, and fitted with frames—known as a 'super box'—is placed above the hive and covered with a suitable roof. It may be separated from the brood chamber by a zinc sheet perforated with slits of sufficient size to allow the passage of the workers, but at the same time small enough to prevent the queen's leaving the brood chamber.

To obtain the honey the super-box is removed when full and replaced by an empty one. The capping of the cells is then cut off, and the bars are put into a machine known as the 'extractor.' This is a large cylinder containing wirework cages, that may be set in rapid rotatory motion. The centrifugal force throws out the honey, and the empty combs are replaced in the hive, to be again filled by the bees. By this method of working, the bees are saved the labor of comb-building, and large harvests of honey may be secured. For the production of comb honey special forms of 'supers' for holding small wooden sections are usually employed.

In securing the honey and in any other necessary manipulations, the bees should be handled so that they will be disturbed as little as possible in their work, and with proper precautions against stinging. The use of a good 'smoker' in the form of a miniature bellows in which a piece of cotton is kept smouldering is advisable. A few puffs of smoke directed into the entrance of the hive just before opening will cause the bees to gorge themselves with honey, as they do preparatory to swarming, and they may be handled without danger, though undue crowding or rough manipulation must be avoided.

The question as to the race and strain of bees to be kept is an important one. The most popular race in the United States is the Italian, introduced from Northern Italy. Other varieties are the Black or German Bees, the Caucasians, Carniolans, Cyprians, and Syrians.

The control of swarming is a very important feature of bee raising. When a swarm issues from the hive it commonly settles on the limb of a nearby tree or bush. This may be sawed off and the bees may be carried on it to the hive or they may be shaken off into a box or basket and hived. To avoid the necessity of watching for swarms and the chance of eventually losing them, methods of *artificial*

## BEE KEEPING

1. The Bees made Harmless by Smoke, Clinging to the Frame after its Removal from the Hive. Note the character of the comb.

2. Smoking the Bees before Robbing the Hive of its Honey. The Hives are of the Langstroth Type.

*swarming* are now practised by all advanced beekeepers. An empty hive is placed on the site of the hive to be swarmed, which is itself moved aside. The frames of bees are lifted out and examined one by one until the queen is discovered, when the comb on which she is found is placed in the empty hive. One or two brood-combs are also removed and placed along with it. The hive is filled up with empty bars and covered up as before. Empty bars take the place of those removed from the old hive, which is taken to a new situation in the garden, when the work is complete. All the bees on wing during the operation, as well as the old bees in the swarmed hive, will make their way to the new hive on the old site.

**Feeding.**—A hive should have at least 20 pounds of honey stored for winter use. After the season is over it may be found that the supply is deficient, and as bees should never be fed during the winter months, the quantity should be made up before cold weather sets in. If fed in autumn, a strong colony will easily store away a quart of sirup in 24 hours, and the whole winter supply may be thus given in a few days. A good feeding sirup may be made by dissolving 4 pounds of cane-sugar in 2 pints (40 ounces) of water over a gentle fire. A tablespoonful of vinegar should be added to prevent the sirup from recrystallizing in the combs. One-fourth of a pint of this given daily will be found to be sufficient.

**Parasites and Diseases.**—On the adult bee lice are common pests, while the larvæ of the ichneumon do great damage to the grubs. Honey-bees, however, are apparently exempt from the attacks of the latter, which appear to be unable to gain access to their dwellings. The adult honey-bee is greatly troubled by the bee-louse (*Braula cæca*) and by the bee-fly (*Phora incrasata*). The larvæ are often devoured by a species of beetle (*Trichodes*).

The most common diseases to be guarded against are Bee Paralysis and Dysentery, which attack the adult bees, and American and European Foul Brood, which destroy the larvæ. American Foul Brood attacks the hive just as pupation has begun, and the larvæ die, turn dark brown in color, and form a mass of decayed tissue of a peculiar ropy character. The onset of European Foul Brood is at a somewhat later stage, and the dead larvæ show a characteristic yellow or grayish color. Treatment of both infections consists in the complete removal from the hive by vari-

ous methods of all infected material.

Department of Agriculture); *Langstroth on the Hive and Honey Bee*; Maeterlinck's *Life of the Bee* (translated by Sutro); Root's *ABC and XYZ of Bee Culture*; E. F. Phillips' *Bee-keeping* (1915); F. C. Pellet's *Productive Bee Keeping* (1916); J. G. Digges' *Practical Bee Guide* (4th ed., 1918).

**Beeston**, town, Nottinghamshire, England, on the river Trent; 3½ miles southwest of Nottingham. It is a manufacturing community, producing lace, machinery, bicycles, and automobiles. Pop. (1911) 11,336.

**Beeswax**, a yellow solid secreted by bees and used in the formation of the honeycomb. It breaks with a granular fracture, and has an agreeable honey-like odor. It is prepared for use by draining away the honey and heating the wax in water, on which it floats, and solidifies on cooling. It melts at about 64° C., is soluble in ether, chloroform, or benzine, but only partly soluble in alcohol. It may be bleached by chlorine or nitric acid, but a much better product is obtained by exposure in thin layers to sunshine, it being at the same time kept moist. Beeswax is used for making candles, waxing polished floors, in medicine as an ingredient in plasters and ointments, and for many other purposes. It is often adulterated with paraffin wax, vegetable waxes, and fats.

**Beet (Beta)**, a garden vegetable grown for its fleshy, edible root, belonging to the order Chenopodiaceæ. There are four or five species of the genus *Beta*, but *B. vulgaris*, from which all the garden varieties are derived, is the only one of economic importance. The original home of the plant was Southern Europe, along the Mediterranean coast, and as far east as the Caspian Sea and Persia. Its cultivation dates from two or three centuries B.C. The plants are mostly biennial and are grown exclusively from seeds. They have dark green, smooth, wavy-margined leaves, which when young are used for 'greens,' and tall flowering stems. The roots are carrot-like in some varieties and turnip-shaped in others. They are of a purple or crimson color of varying depth.

Beets thrive at a low temperature and are therefore suited to the cooler countries. They may be cultivated in the open or under glass and are an important crop in truck gardening. They require a loose, well-drained, light, clean, rich soil which has been carefully tilled.

Fully rotted barn manure with a good potash fertilizer and a light application of nitrate of soda are beneficial. In ordinary gardening the seed should be sown early in the spring, an inch deep, in rows two to three feet apart to admit of horse cultivation. After thinning, which may be done when the plants are sufficiently grown to be used as 'greens,' they may be left about four inches apart. For market gardening the rows may be placed nearer together and the plants thinned to six inches apart. As a fall crop, beets are planted in June, and the roots are pulled after the first frost, and stored in cellars. The average yield of mature beets is 300 bushels per acre.

Some of the popular varieties of garden beet are Bassano, a white and red mixed; Early Blood Turnip, a deep rich red, turnip-shaped; Eclipse, bright red, fine-grained, and sweet; Egyptian, a rich deep red, with small tops; Edmand, round, smooth, and of good flavor.

**Chard**, or *Swiss Chard* is a variety of beet grown for its large succulent leaves, which are cooked and eaten like asparagus; the tender young leaves are used as a pot-herb and for salads. **Foliage Beets**, the ribs of whose leaves are beautifully colored, are grown for ornamental purposes and make excellent borders.

The *Sugar Beet* is of the same species as the common garden variety but of a higher sugar content. See SUGAR BEET.

The *Mangel-wurzel* or *Fodder Beet* is a coarse large form of the common beet grown for animal food. It is largely grown in Europe and in Canada, but is also adapted to the Northern United States. The soil requirements are about the same as for sugar beets, but the cultural methods differ in that the fodder beet may be spaced a little farther apart in the row.

**Insect Pests and Diseases.**—Several species of insects feed on beets, but the flea beetle is the only one of importance. Leaf-spot and potato scab are the most troublesome diseases; the former being more common to sugar beets than to the garden variety. Bordeaux mixture is beneficial in all these cases.

See SUGAR; SUGAR BEET. Consult *Farmers' Bulletin* 52 (U. S. Department of Agriculture).

**Beet Fly (*Anthomyia betæ*)**, an insect the maggots of which feed on the pulp of beet leaves, and thus reduce them to dry skin. The eggs are laid beneath the leaves, and as soon as the maggots are hatched they start feeding, feed for a month,

and then turn to chestnut-brown pupæ. The flies come out in about a fortnight—ashy gray, with black, bristly hairs. There are two broods—one in summer and one in autumn. Spraying with some poisonous solution is recommended.

**Beethoven, LUDWIG VAN** (b. Bonn, Dec. 16, 1770; d. Vienna, Mar. 26, 1827), one of the greatest of musical composers. As a child he displayed unusual talent for music, and from the age of four was taught the violin and clavier by his father, a tenor singer in the band of the elector of Cologne at Bonn. When nine years old he was placed with Pfeiffer, and received lessons on the organ from Van der Eeden, and then from Neefe. Before Beethoven was twelve he could play the greater part of Bach's *Wohltemperiertes Clavier*, and had acted as deputy organist during Neefe's temporary absence in Münster. About this time he was appointed *celebrist*—practically conductor—of the opera band at the theatre. During 1785 he studied the violin with Franz Ries, and in 1787 paid a visit of some months to Vienna, where he had a few lessons from Mozart. His career at this period was greatly influenced by his friendship with the Breuning family and with Count Waldstein—to whom, in 1803, Beethoven dedicated his famous piano sonata (Op. 53). Beethoven had already earned much distinction as a pianist and improviser, but he further enhanced his reputation as a composer by writing a set of brilliant variations for the piano, which he dedicated to his friend the Countess of Hatzfeldt. In July, 1792, while on a visit to Bonn, Haydn 'greatly praised' a composition of Beethoven's which had been submitted to him; and in the autumn of that year Beethoven placed himself under Haydn in Vienna, where he spent the rest of his life. Not wholly satisfied with his progress under Haydn, he also became a pupil of Schenk; and after Haydn left for England, he studied counterpoint with Albrechtsberger, the violin with Schuppanzigh, the writing of quartets with Aloys Förster, and Italian vocal composition with Salleri. Of the many friends Beethoven made among the aristocracy of Vienna may be mentioned Prince and Princess Lichnowsky, whose admiration for him took the practical form of presenting him with a quartet of valuable instruments and a pension of \$300 a year, in addition to giving him a home with them; but the regular hours and formalities soon proved irksome to him. When twenty-eight years of age he began to suffer from partial deafness, which increased to such

an extent that from 1822 onwards all communication with him had to be made in writing. Notwithstanding this, many of his greatest works were composed during this period. In 1808 Jerome Bonaparte, king of Westphalia, offered Beethoven the post of *maitre de chapelle* at Cassel, with an annual salary of \$1,500; but as several noblemen subscribed to a fund which guaranteed him a yearly pension of about \$1,050, he was induced to remain in Vienna. Unfortunately, after the death of Prince Lobkowitz (1816) this pension was reduced to about \$550.

At the age of ten Beethoven began the work of composition, and even for some time after the years of his pupilage wrote in accordance with the principles observed by Haydn, Mozart, and others; but at a later period he gradually introduced changes of treatment in individual sections, and also developed considerably some of the musical forms of his predecessors. His greater choice of keys in modulations, his development of the minuet into the scherzo, his unique use and treatment of variations, his revival of *programme* music, which had been almost entirely neglected since its introduction by Bach, also his innovations in the construction of the introduction, coda, finale, and connective phrases of symphonies, may be instanced as indicating the nature of his principal divergences from pre-existing compositions. His symphonies, concertos, chamber music, string quartets, sonatas for violin and for violin and piano, would each have been sufficient to earn for their composer undying fame. His vocal compositions include an oratorio, *The Mount of Olives*, two *Masses*, the *Choral Symphony*, and many other great works, besides a large number of songs, etc. By executive musicians Beethoven's compositions are acknowledged to be the supreme tests, intellectual gifts of the highest order being as essential as technical skill. See *Beethoven*, by Moscheles (1841); *Etude Analytique des Symphonies de Beethoven*, by Berboz (1844); *Beethoven*, by Richard Wagner (Eng. trans. by Parsons, New York, 1883); *Beethoven and his Nine Symphonies*, by Sir G. Grove (1893); *Wagner's A Pilgrimage to Beethoven* (trans. by Weyer, Chicago, 1897); and the most exhaustive work yet written, his *Life*, by A. W. Thayer, an American (1876-78; 2nd ed. 1901).

**Beetles** (Coleoptera), a well-defined order of insects in which the cuticle is hard, and the first pair of wings are converted into scalelike wing covers (elytra), which cover and protect the posterior part of the body. The sec-

ond pair of wings may function as organs of flight, or may be absent; but, as a rule, beetles are not adapted for an aerial life, and live mostly in concealed situations. The order is rich in species, some 150,000 being said to be known. In classifying beetles, reliance is chiefly placed upon the shape of the antennæ and the number of joints in the tarsus. Thus, the lamellicornes—beetles with the terminal joints of the antennæ leaflike—constitute a very familiar series, including the stag-beetles and the very numerous dung-beetles. The diet of beetles is very varied, but all are voracious; the weevils (*Rhynchophora*) may be mentioned as a group whose destructive habits render them of economic importance.

**Beets, NIKOLAAS** (1814-1903), Dutch writer, born at Haarlem; was pastor of Heemstede (1840) and Utrecht (1854), and professor of theology (1875-84) at Utrecht University, but is chiefly noteworthy as the author of stories and sketches of Dutch life in graceful and humorous prose—*Camera Obscura* (1839; 18th ed. 1888), a Dutch classic, published under the pseudonym of Hildebrand, and with a continuation, *Na Vijftig Jaar* (1887). Besides this he wrote critical essays on literature, theological works, and poems (*Dichtwerken*, 5 vols. 1886-91).

**Beeville, tn., Tex.**, co. seat of Bee co., 90 m. S.E. of San Antonio, on the Southern Pac. and the San Ant. and Aransas Pass R. Rs. It has a good trade in cotton, live stock, oranges, bananas and market garden products. Pop. (1910) 3,269.

**Befana** (corruption of 'Epiphany'), legendary old woman who, sweeping the house when the three wise men passed by with gifts to the infant Christ, put off seeing them till their return, and is still awaiting them. At her festival (Jan. 5) in Italy her effigy is in places carried about, followed by an admiring crowd. Counterpart to the Wandering Jew and Santa Claus, and fused in Germany with the heathen Berchta, Befana served as a scare to naughty children. On Twelfth Night, in Italy, Befana brings to good children toys and sweets, but to bad children ashes.

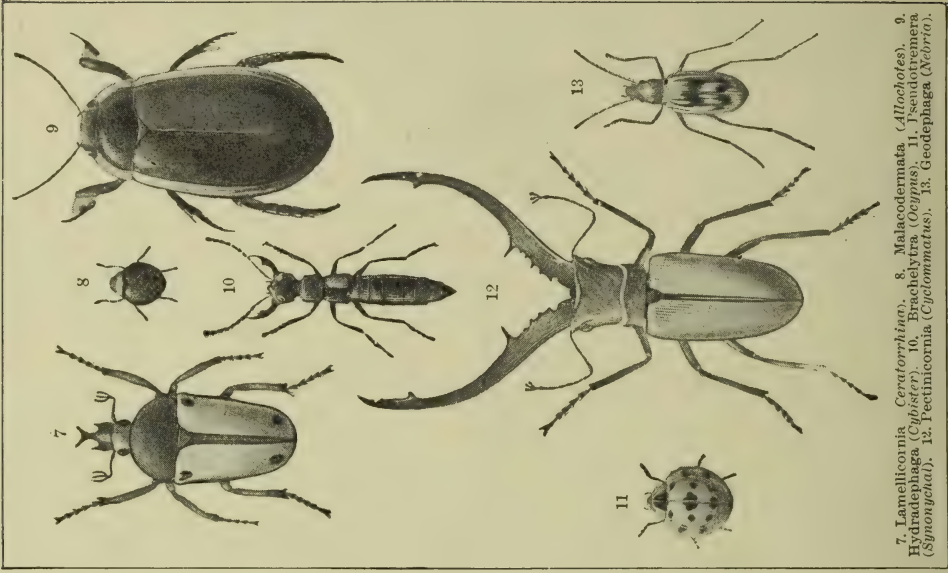

**Beg**, more commonly BEY ('lord'), Mohammedan title of the governor of a district or town, but now also applied to officers, and used by almost every Turk of gentle birth.

**Begas, REINHOLD** (1831), German sculptor, a pupil of Rauch. He first attracted notice by the *Borussia* (1861), on the façade of the Berlin Exchange, and confirmed his reputation by his statue

Diec 1916

of Schiller (1871), in the same city. Other works are monuments to the Emperor William (1893-97), Bismarck (1901), the bronze Neptune fountain in Berlin (1891), and busts of the Emperor, Frederick III. and his Empress, William II., Moltke, Menzel, and others.

*Dies Oct 8 1929*  
**Begbie, HAROLD** (1871- ), English author, was born in Fornham St. Martin, Suffolk, and was educated privately. His publications include: *The Political Struwwelpeter* (1899); *The Struwwelpeter Alphabet* (1899); *Great Men* (1899); *The Handy Man* (1900); *The Fall of the Curtain* (1901); *The Adventures of Sir John Sparrow* (1902); *Bundy in the Greenwood* (1902); *The Priest* (1906); *The Cage* (1909); *Broken Earthenware*, published in the United States as *Twice-Born Men* (1910); *The Challenge* (1911); *The Lady Next Door* (1912); *The District Lamp* (1912); *The Day that Changed the World* (1913); *The Proof of God* (1914); *On Our Side of the Angels* (1915); *Mrs. O'H'* (1916); *The Vindication of Great Britain* (1916); *An English Family* (1919); *Mr. Sterling Sticks It Out* (1919); *Life of William Booth* (1919); *The Ways of Laughter* (1920).

**Begbie, SIR MATTHEW BAILLIE** (1819-94), Canadian jurist, was born in Edinburgh, Scotland, and was educated in St. Peter's College, Cambridge. He was called to the bar in 1844 and practised law in England until 1858, when he was sent to British Columbia as judge of the colony. In 1870 he became Chief Justice of British Columbia, an office which he filled with great wisdom and firmness until his death. He was knighted in 1871.

**Begg, JAMES** (1808-83), Scottish Free Church minister, one of the leaders of the evangelical party in the movement that culminated in the disruption of the Church of Scotland (1843). In the new Free Church, Dr. Begg was the leader of the constitutional (or conservative) party, and the resolute opponent of voluntarism, of relaxation of the terms of subscription, and especially of the projected union with the United Presbyterian Church in the 'sixties. Consult *Memoirs*, by Professor T. Smith.

**Beggar.** See VAGRANTS.

**Beg'gar-my-neigh'bor**, a game at cards similar to that of 'catch honors.' The cards are dealt face downwards among the players, usually two in number. The players then lay down card after card in turn, face uppermost, until a court card is turned up. If this be an ace the player's adversary pays him four cards; if a king, three cards; if a queen, two cards; and if a knave, one

card; while he takes up also all of the cards previously laid down, and puts them underneath those in his hand. If in the course of payment an honor is turned, then the creditor becomes the debtor to the value of the honor. Play continues until one player obtains all the cards in the pack.

**Beggar's Lice** (*Echinosperrum virginicum*), or STICKSEED, a common weed found in woods and thickets and along waysides, from Canada southward. It grows from 2 to 4 feet high, with widely spreading branches, bearing oblong leaves, small whitish flowers, and globular nutlets covered with barbed prickles.

**Beggar Tick**, the name applied to several varieties of the Bur Marigold (*Bidens*), annual or perennial herbs in which the achenes are flattened parallel with the bracts of the involucre, or slender and four-sided, crowned with barbed awns or short teeth.

**Beghards**, beg'ardz, an association of men corresponding to the female Beguinages (see BEGUINES). The earliest record shows them established at Louvain about 1220. They spread through the Netherlands, Germany, France, and even into Italy. As they took no vows and were under lax discipline, heretics and disreputable characters became associated with them, and the authorities and ultimately the populace regarded them with disfavor. Toward the end of the 14th century severe measures were enforced against them and they were dispersed or became absorbed in the older and better regulated orders.

**Begharmi.** See BAGHIRMI.

**B e g i n**, LOUIS NAZAIRE (1840- ), Canadian cardinal, was born in Levis, Que. He was educated at Laval University, from which he was graduated in 1863, and studied theology in Rome, where he was ordained priest in 1865. He was professor of dogmatic theology and ecclesiastical history in Laval University from 1868 to 1884; was principal of the Laval Normal School from 1885 to 1888; became bishop of Chicoutimi in 1888, and coadjutor to Cardinal Taschereau, with the title of archbishop of Cyrene, in 1891. He was made archbishop of Quebec in 1898, and was elected a cardinal in 1914. His writings include *La primauté et l'infaillibilité des souverains pontifes* (1873); *La Sainte Ecriture et la règle de la foi* (1874); *Aide-mémoire, ou chronologie de l'histoire du Canada* (1886); *Cathéchisme de controverse* (1902).

**Bègles**, beg'l', town, France, department of Gironde, 2½ miles southeast of Bordeaux, near the left bank of the Garonne. Pop. (1911) 14,055.

**Begonia**, bi-gō'ni-a, a genus of tropical plants belonging to the order Begonaceæ, including nearly 500 species and many hybrids and variations, grown either for their beautiful foliage or for their showy blooms. Begonias are indigenous to Mexico, Central and South America, Asia, and South Africa; the first plants were introduced into England about 1780. They are succulent herbs or ow-growing shrubs with diverse root systems, varying from a thick rhizome to a distinct tuber. The leaves are alternate, more or less irregular in shape, and vary greatly in size and texture; the flowers are monocious, pink, white, rose, scarlet, and yellow in color, with many stamens; the fruit is usually a colored capsule containing numerous tiny seeds.

The cultivated varieties of begonia may be considered under four headings — the fibrous-rooted, or winter-flowering; the ornamental-leaved, or rex; the tuberous, or summer-flowering; the semi-tuberous, winter-flowering. Members of the first class, such as *B. nitida*, *B. semperflorens*, and *B. haageana*, require a temperature which never falls below 50° at night. Cuttings taken in March from vigorous stems will make good plants for later winter or early spring flowering. Suitable soil is composed of two parts loam, one part rotted manure, one part leaf mould, and one part sand. These fibrous-rooted begonias make excellent house plants and are easily grown.

The rex begonias, which include a number of varieties derived from *B. rex* crossed with two or three other species, are grown for their large, beautifully shaped, and often brilliantly colored leaves, their flowers being usually small and insignificant. They do not need so high a temperature as that required for the winter-flowering begonias, but do best in the intermediate house or a warm greenhouse. They should be shaded from strong sunlight during the summer months, and flourish best in a moist atmosphere. Soil similar to that suggested for the fibrous-rooted class is suitable for the rex varieties. Propagation is best effected by means of leaf cuttings.

The tuberous-rooted begonia is the most popular and commercially the most important variety. Its profuse flowering habit, the great range and brilliance of its colors—from yellow to bronze, red to orange, white to pink—and the ease with which it may be cultivated, have all contributed to its success. It is half hardy, and the tubers must, therefore, be lifted before frost

has touched them; but as they are dormant during the winter, they may be stored anywhere that the temperature about them does not fall to freezing point. They may be grown in pots or conservatories as well as in the open air. Propagation is effected by means of seeds or cuttings. The semi-tuberous begonias include such plants as *B. socotrana*, a familiar variety of which is *Gloire de Lorraine*. They require a temperature of at least 60° at night, and great care is needed in their cultivation.

houses for poor spinsters. There are at present some twenty beguinages in Belgium and Holland, notably the two at Ghent, one at Amsterdam, and one at Breda. There is also one in France at Castelnaudary. See also BEGHARDS.

**Begum**, bē'gum, a Hindustani name denoting a woman of high rank, used principally of Mohammedan queens-regnant. The term is also applied to the sultanas of seraglios.

**Behaim**, bā'him, BOEHEIM, or BEHEM, MARTIN (c. 1495-1506),

lossal animal, real or imaginary, described with leviathan in Job xl. 15-24, and referred to in the Book of Enoch, lx. 7-9, and 4 Esdras vi. 49-52. It is generally identified with the hippopotamus, but the representation shows traces of a mythical element.

**Behera**, be-hā'rā, province of Lower Egypt, with an area of 1,726 square miles. The capital is Damanhur. Cotton is cultivated. Pop. (1917) 892,246.

**Behistun**, bā-his-tōon', BISUTUN, or BAGHISTAN, mountain in the province of Kermanshah, Persia, about 22 miles east of Kermanshah. It rises to a perpendicular height of 1,700 feet and about 300 feet above ground bears sculptures and cuneiform inscriptions (in three languages—Persian, Babylonian, and Median) recording the deeds of Darius Hydaspes (500 B.C.). Darius is represented as standing with his foot upon a prostrate man with upstretched hands; back of him are two warriors; before him nine captives with hands tied behind their backs and chains about their necks. The inscriptions, which were deciphered and translated by Major-Gen. Sir Henry Rawlinson, in 1835-7, set forth the king's genealogy and victorious deeds.

**Behm**, bām, ERNST (1830-84), German geographer, was born in Gotha. His chief work was the compilation (with Hermann Wagner) of *Bevölkerung der Erde* (7 vols., 1872-82). He was also editor of *Geographisches Jahrbuch* (1866-86), and of *Petermann's Mitteilungen* (1878-84).

**Behmen**, JACOB. See BOEHME.

**Behn**, bān, APHRA (1640-89), English dramatist and novelist, 'the George Sand of the restoration,' was driven after the death of her husband, a wealthy Dutch merchant, to support herself by her pen, and thus became the first professional Englishwoman of letters. Her dramas (of which the most successful, *The Rovers*, held the stage long after her death) are marked by much coarseness, but also by ability and a genuine lyrical faculty. The best known of her tales is probably *Oroonoko*, or *the Royal Slave* (1698), upon which Thomas Southerne based his popular tragedy of that name. A late edition of her *Works* appeared in 6 volumes in 1871.

**Behring**. See BERING.

**Behring**, bē'ring, EMIL ADOLF (1854-1917), German physician, was born in Hansdorf, Prussia, and was educated in the Army Medical College, Berlin, from which he was graduated in 1878. In 1899 he was made assistant in the Institute of Hygiene, Berlin, and three years later was transferred to Koch's Institute

*Begonia, Single Tuberous Variety*

**Beg-Shehr**. See BEISHEHR GÖI.

**Beguines**, beg'inz (Beguinae, Beguttæ), a semi-monastic association of women formed during the twelfth century, probably by Lambert le Bègue, a priest of Liège. They lived in villages or communities known as 'beguinages' (from *beginagium*, 'a vineyard') and devoted themselves to nursing the sick, the care of the poor, and other charitable and pious works. They took no vows, retained any property they might possess, and were free to marry or to leave the association at any time. These associations soon spread throughout Belgium, the Netherlands, France, and Germany. In the latter half of the thirteenth century, in company with the Franciscans, the order suffered persecution as an heretical sect, and the beguinages gradually disappeared or survived only as alm-

German cosmographer, was born in Nüremberg, studied under Regiomontanus, and in 1484 accompanied the Portuguese Diogo Cão (Cam) on a voyage of discovery in which they reached the mouth of the Congo River. In 1486 he settled at Horta, the capital of Fayal, in the Azores. He is remembered especially for the globe which he constructed at Nüremberg in 1492 (twenty-one inches in diameter), the oldest globe extant. He also devised a portable sun-dial to be used in finding the latitude at sea, and is credited with having introduced small astrolabes of brass into the Portuguese navy in place of unwieldy instruments previously in use. Consult Ravenstein's *Martin Behaim: His Life and His Globe*.

**Behar**. See BIHAR.

**Behading**. See CAPITAL PUNISHMENT.

**Behemoth**, bē-hē'moth, a co-

for Infectious Diseases, where he began the research work on diphtheria which resulted in his discovery of diphtheria antitoxin. For this work he received the Nobel prize in Medicine, 1901. In 1894 he was appointed to the chair of Hygiene in the University of Halle, and the following year became director of the Institute of Hygiene in Marburg. He is notable also for his research work on tuberculosis, particularly bovine tuberculosis.

**Bejerland**, bi'yer-länt, island, Holland, between the Old Moss and the Hollandsche Diep. Its fertile soil yields much flax.

**Beilan**, bā-lān', town and pass in the northern corner of Syria, on the trade route from the interior to Alexandretta (Iskanderun). The pass (1,800 ft. high) lies between the Alma-Dagh Mountains and Jebel-el-Ahmer, and is believed to be the ancient Syrian Gates. The town was the scene of a battle between the Turks and the Egyptians in 1832. Pop. 5,000.

**Beilstein**, bil'shtin, FRIEDRICH KONRAD (1838-1905), Russian chemist, was born in St. Petersburg, and studied under Bunsen, Liebig, Wöhler, and Würtz. He was graduated in 1858 from Göttingen, became assistant in the university laboratory in 1860, and extraordinary professor of chemistry in 1865. He was professor of chemistry in the Technological Institute in St. Petersburg from 1866 to 1896, during part of which time he held also the professorship in the Imperial Academy of Science, and other posts. Beilstein is world famous for his *Handbuch der organischen Chemie* (3rd ed. 4 vols. 1892-9; with continuations from 1900 onwards, ed. Jacobson). He also wrote *Anleitung zur qualitativen Analyse* (8th ed., by E. Schulze and Winterstein, 1898).

**Beira**, bā'ē-rā, province, Portugal, extending from the Atlantic to the Spanish frontier, and having the Douro for its northern boundary, and the Tagus for part of its southern boundary. The Serra da Estrella, a bare, heath-clad, granite range (6,540 feet high), seamed by numerous picturesque dells and valleys, traverses the interior. Coal, iron, and salt are mined, marble is quarried, and there are mineral springs. Grain, oil, and wine are produced, and fishing is extensively carried on. Area, 9,208 square miles. Pop. (1911) 1,626,484. The capital and chief town is Coimbra.

**Beira**, seaport, Portuguese East Africa, capital of district of Beira, at the mouth of the Pungwe River and the terminus of the Mashonaland Railway; 35 miles north of Sofala. The harbor is good, and a break-

water guards the town from the encroachments of the sea. Beira has a hospital, three schools, and public gardens. It exports sugar, rubber, beeswax, ivory and hides, and imports cotton goods, foodstuffs, and alcoholic liquors. Pop. (1919) 9,227 (1,301 whites).

**Beiram**. See BAIKAM.

**Beirut**, bā'rūot, or BEYROUT, Mediterranean seaport, Syria, capital of a vilayet of same name, is situated on St. George's Bay in a plain backed by the mountain of Lebanon; 90 miles northwest of Damascus, whose port it is. It is the most healthful place on the coast, having temperate summers, a plentiful rainfall in winter, and a good water supply. It is the seat of a Greek and a Maronite bishop, and of the United Greek Patriarch of the Orient, and is the centre of several foreign missions. It has a university, an astronomical observatory, a society of Oriental languages, and many mosques, Christian churches, and schools. The American College (Presb.) is probably the most influential educational institution in Syria. Silk stuffs, gold and silver thread, and porous earthenware are manufactured, and through the port pass the imports and exports of all Syria. Exports consist chiefly of silk, wool, oils, soap, lemons, and oranges; imports of iron, cotton goods, coffee, rice, sugar, and fancy goods. In pre-war years the foreign trade reached more than \$10,600,000 annually, of which \$3,600,000 represented exports and \$7,000,000 imports. The population is about 180,000, over one-fourth of which is Mohammedan.

Beirut is the ancient Berytus, and was a port of the Phœnicians. It later came under the power of Egypt, from whom it was taken by Antiochus the Great, and so became part of Syria. Conquered for the Romans by Agrippa, it was made by Augustus a military colony, under the name of Colonia Julia Augustus Felix Berytus. During the crusades it belonged alternately to the Christians and to the Saracens. It fell under the power of the Turks in 1763; was conquered by Ibrahim Pasha, son of Mehemet Ali of Egypt, in 1831; and on Sept. 10, 1840, was bombarded by the allied English, Austrian, and Turkish fleets, until evacuated by the Egyptians. Its modern growth dates from 1843, when steam navigation was introduced. In the Great War Beirut was occupied by British and French troops, Oct. 7, 1919. It was placed under French administration in December 1919. See illustration, page 13.

**Belsa**. See ORYX.

**Beishehr Göl**, bā-she'h'r göl, lake, Asia Minor, 40 miles west of Konieh. It is 38 miles long by 5 to 10 miles broad, and drains into the Soghla Göl (lake), to the southeast. The town of Beishehr is situated on its eastern shore, and Kirili near its north-eastern shore, whence the lake is called also Kirili Göl.

**Beissel**, bi'sel, JOHANN CONRAD (1690-1768), German-American religious propagandist, was born in Eberbach, in the Palatinate. He studied theology, was banished for irregular religious views, and settled in Germantown, Pennsylvania, about 1720, where he later allied himself with the Dunkards. His advocacy of the seventh day of the week as the only true Sabbath caused a division in this sect, a group known as the Seventh Day Dunkards withdrawing under his leadership. In 1732 he founded, at the present village of Ephrata, a communist society organized upon a basis of voluntary celibacy, within which the members assumed monastic names, his being Friedsam Gottrecht. After Beissel's death the community declined and the few remaining members were incorporated as Seventh Day Baptists. He composed words and music for several volumes of hymns in German and Latin (1766-73), and published several other volumes.

**Beit-el-Fakih**, bāt'el-fā'kēh, trading centre in Yemen, Arabia, near the Red Sea, 37 miles southeast of Hodeida. Pop. 8,000.

**Beja**, bā'zhā (anc. *Pax Julia*), town and episcopal see, Portugal, in the district of Beja; 95 miles southeast of Lisbon. Interesting buildings are a medieval castle, the cathedral, and the convent of Nossa Senhora da Conceição, dating from the 15th century. There are manufactures of leather and pottery, and olive oil refineries. Pop. (1911) 10,113.

**Beja**, administrative district of the province of Alemtejo, Portugal, with an area of 3,958 square miles. Pop. (1911) 192,499.

**Bejan**, bē'jan, or BAJAN (*cf.* Fr. *bec jaune*, Med. Lat. *bejanus*, 'yellow beak'), the common name for freshmen in universities in the Middle Ages. The idea, which appears also in the German *Gelbschnabel*, is that of a young bird whose beak has not lost its first yellow tint.

**Bejapur**. See BIJAPUR.

**Bekaa**, bē'kā, EL, or EL BIKA, a valley in Syria, lying at an altitude of 2,600 to 3,000 feet, between the ranges of the Lebanon, stretching from the sources of the Jordan to the upper course of the Nahr-el-Asi (anc. *Orontes*),

and traversed by the Nahr-el-Litany (anc. *Leontes*). This valley is the ancient Cele-Syria (in the Old Testament *Hamath*). Its principal town, Baalbek, situated near the source of the Nahr-el-Litany, is mentioned in the hieroglyphic and cuneiform inscriptions as Babiki, from the Semitic Baal-Beka.

**Beke**, bék, CHARLES TILSTONE (1800-74), English explorer, was born in Stepney, Middlesex, studied law, and in 1834 published the results of his researches in primeval history, under the title *Origines Biblicæ*. In 1840 he visited Abyssinia, and made important discoveries as to the true structure of the mountain ranges in East Africa. In 1848 he organized an expedition to explore the sources of the Nile, starting from Zanzibar; but the expedition was only partially carried out. He visited Theodore of Abyssinia in 1864, to urge the release of Captain Cameron and the other imprisoned British subjects, and afterward furnished maps and information to Napier's military expedition (1868). Much of his time was devoted to the identification of Biblical localities, especially of Mount Sinai (1874). His chief works are *The Sources of the Nile* (1860), a plea for the opening up of Africa, and *Discoveries of Sinai in Arabia, and of Midian*, published posthumously (1878).

**Bekes**, bā'kăsh, town, Hungary, in the county of Bekes, near the junction of the Black and White Körös, 105 miles southeast of Budapest. Cattle raising, wine making, and bee keeping are the chief industries. Linen and hemp fabrics are manufactured. Pop. (1920) 46,679, mostly Protestants.

**Bekker**, bek'er, ELISABETH (1738-1804), Dutch novelist and poetess, wrote, in conjunction with Agatha Deken, what are practically the first modern Dutch novels—*Historie van Mejuffrouw Sara Burgerhart* (1782; 7th ed. 1886), *Historie van den Heer Willem Leevend* (1784-5), *Brieven van Abraham Blankaart* (1787-89), *Cornelia Wildschut* (1793-6) — long-winded moral works in the style of Richardson, but written in easy, natural language. She also wrote semi-satirical sketches of contemporary life—e.g. *De Menuet en de Dominiees-Pruik* — besides some dull philosophic poems.

**Bekker**, IMMANUEL (1785-1871), German philologist, was born in Berlin, where he became professor of philology in 1810. He is best known by his editions of the classics, including *Homer* (1858), *Plato* (1816-23), *Attic Orators* (1822-24), *Thucydides* (1821-32), *Aristophanes* (1829), and *Aristotle* (1831), the text of

which he rectified from manuscripts in the chief libraries of Europe.

**Bel**, title of the principal Babylonian deity, signifying, like Baal, 'owner' or 'lord.' See BABYLONIA.

**Bela**, bā'lo, the name of several Hungarian kings of the Arpad dynasty. BELA I. deposed his brother Andrew I. in 1060. A strong ruler, he introduced many reforms, and suppressed the last pagan rising. BELA III. (d. 1196) succeeded his brother, Stephen III., in 1174. He was a brother-in-law of Philip Augustus of France. His reign of twenty-two years was signalized by wars with the Poles and Austrians, and the recovery of Dalmatia from the Venetians. BELA IV. ascended the throne in 1235, and six years later was driven from it by the Mongols under Batu Khan. He sought refuge in Austria, but regained his throne in 1244 and reigned until 1270. He was one of the greatest kings of Hungary.

**Bel and the Dragon**, a book of the Apocrypha, consisting of two legends setting forth the wisdom of the prophet Daniel. In the Septuagint and other translations of the Bible they are attached (like the Song of the Three Holy Children and Susanna) to the canonical book of Daniel. In the first legend Daniel outwits the priests of Bel (q. v.), the chief Babylonian deity; in the second he procures the death of a huge sacred dragon, for which presumptuous deed the populace compel the king of Babylon to cast him into the den of lions, where, however, he is miraculously preserved, and fed with provisions brought by the prophet Habakkuk from Judæa. It is probable that the original language of the book was Aramaic, but it is not known when it was appended to the Greek version of Daniel. See APOCRYPHA.

**Belasco**, DAVID (1853- ), American dramatist, was born in San Francisco, Calif. He was graduated from Lincoln College, California, in 1875, was stage manager at several San Francisco theatres (1879-81), and at the Madison Square Theatre, New York (1881), and in 1886 became manager of the Lyceum Theatre. Nine years later he established Belasco's Theatre in the same city, and was manager of E. H. Sothern, Mrs. Leslie Carter, David Warfield, and Blanche Bates. Belasco's first success as a playwright was with *May Blossom* (1884). This was followed by *Lord Chumley*, *Men and Women*, *The Charity Ball*, *The Wife* (all with H. C. de Mille); *The Girl I Left Behind Me* (1893, with Franklin Fyles); *The Heart of Maryland* (1895);

*Zaza* (adaptation 1896); *Naughty Anthony* (1899); *Madame Butterfly* (1900; founded on the story of the same name by John Luther Long); *Kitty Bellairs* (1903); *Adrea* (1904; with John Luther Long); *The Girl of the Golden West* (1905); *The Return of Peter Grimm* (1911); *Van der Decken* (1915); *The Son-Daughter* (1919, with George Scarborough); *Kiki* (1921, an adaptation). Because of his ability in training artists, and his genius in stage and lighting effects, Belasco has become better known in later years as a producer of plays.

**Belbeis**, bel-bās' (anc. *Bubastis Aghia*), town in Lower Egypt, 28 miles northeast of Cairo and 13 miles southeast of Zagazig, on the trade route from Syria. It was occupied by Napoleon in 1798. Pop. (1917) 15,624.

**Belch'er**, SIR EDWARD (1799-1877), British admiral and explorer, was present at the bombardment of Algiers in 1816. In 1825 he went with Captain F. M. Beechey, in the *Blossom*, to Bering Strait, and in 1829 was promoted to be commander. In 1836 he was appointed to the command of the *Sulphur*, and for three years was employed in surveying the west coast of the United States. Returning by the western route, he served in the naval operations against the Chinese in 1841. He was appointed in 1852 to command an Arctic expedition sent in search of Sir John Franklin (q. v.). He became an admiral in 1872. Among his works are *Narrative of a Voyage round the World in H.M.S. 'Sulphur' in 1834-42* (1843), and a treatise on nautical surveying.

**Belcher**, JONATHAN (1681-1757), American colonial governor, was born in Cambridge, Mass., son of a member of the provincial council. He was graduated (1699) from Harvard, and thereafter passed several years in Europe, making the acquaintance of the future George I. Returning to Boston, he became a merchant, and in 1730 was appointed governor of Massachusetts and New Hampshire, holding the position until a dispute concerning his salary brought about his dismissal in 1741. He was able to vindicate himself, and in 1747 was appointed governor of New Jersey, where he contributed to the stability of the colony's affairs, and was a notable benefactor of the College of New Jersey (Princeton).

**Bel'ding**, city, Michigan, Ionia county, on the Flat River, and on the Pere Marquette Railroad; 35 miles northeast of Grand Rapids. Manufactures include silk, baskets, refrigerators, and foundry products. Pop. (1910) 4,119; (1920) 3,911.

BEIRUT, SYRIA

View of the Harbor, from the American College

**Belem**, city, Brazil. See PARA.

**Belem**, a suburb of Lisbon, Portugal. See LISBON.

**Belemnites**, bel'em-nits (Gr. *belemnōn*, 'a dart' or 'arrow'), an interesting genus of fossil cephalopodous Mollusca, the type of a family called Belemnitidae or Belemnites, and closely allied to the cuttle family. No recent species is known. Fossil species, which are numerous, are found in all the Jurassic and Cretaceous strata. The remains are generally those of the shell alone, which was entirely internal and double, consisting of a conical chambered portion (the *phragmacone*), inserted into a longer, solid, pointed sheath, termed the *rostrum* or *guard*. The body was furnished with lateral fins, and had eight arms and two longer tentacles. The suckers were provided with horny hooks which probably were used to secure prey. Horny mandibles and remains of an ink-bag have been found, but these are rarely preserved, the part most commonly met being the solid *guard*. From their form belemnites have received such popular names as arrowheads, petrified fingers, picks, and thunder-bolts. They vary from one to fifteen inches in length.

*Belemnite*

A. Restoration of a belemnite shell (after Zittel). B. Vertical section of a belemnite. C. Belemnite shell.

**Belfast**, bel-fást', seaport, Ireland, capital of Ulster, and a parliamentary and municipal borough in counties Antrim and Down, situated on the river Lagan at the head of Belfast Lough; 113 miles north of Dublin. The river is crossed here by four bridges, of which Queens, opened in 1841, is perhaps the most notable. The finest street of the city is Royal Avenue, on which are many of the better shops and hotels. The principal public parks are Ormeau Park and the Botanic Gardens. Note—

worthy edifices are the City Hall, erected in 1906 on the site of the old Linen Hall, the Post Office, Library, Belfast Museum, St. Anne's Cathedral (P. E.), St. Peter's Church (R. C.), Carlisle Memorial Church, Ulster Bank, and Custom House. Educational institutions include Queen's College, Methodist College, Presbyterian Theological College, Municipal Technical Institute, and Campbell College (for boys).

Belfast is an important manufacturing and commercial town. In its shipyards, some of the largest ships afloat, as the *Cedric*, *Baltic*, *Olympic* and *Titanic*, have been constructed. The chief manufactured products are linen, chemicals, machinery, sails, ropes, damasks, flax, aerated waters, and boots and shoes.

The harbor, which is safe and commodious, is provided with extensive docks and quays. The Alexandra dock, 850 feet long and 100 feet wide, and the graving dock constructed in 1903-10 are among the largest in the world. Inland trade is facilitated by a canal connecting the Lagan with Lough Heagh. Exports include linen, whiskey, iron, sheep, pigs, and potatoes; imports are grain, timber, coal, linen and flax yarn, sugar, and petroleum. Pop. (1911) 386,947.

In 1177 a castle was erected on the site of Belfast. In 1315 Edward Bruce landed here and, aided by Irish chiefs, destroyed the town and castle. In 1604 the castle was granted to Sir Arthur Chichester, who was really the founder of Belfast. It was incorporated as a municipality in 1613, as a city in 1888.

**Belfast**, seaport city, Maine, county seat of Waldo county, on Penobscot Bay, and the Maine Central Railroad, of which it is a terminus; 85 miles northeast of Portland. The chief public buildings are the Free Library, the Odd Fellows' Hall, and the Masonic Temple. A deep, spacious harbor adds to the city's importance as a seaport, and it has a good shipbuilding trade. Iron, boots and shoes, sashes, and doors are manufactured. Pop. (1910) 4,618; (1920) 5,083.

**Belfast Lough**, deep and picturesque arm of the sea (14 miles long by 6 miles broad), between counties Antrim and Down, province of Ulster, Ireland. It is generally free from rocks, the only dangerous reef being the Briggs or the Clachan (north side). Near Belfast is Queen's Island (shipbuilding yards), connected with the mainland.

**Belfort**, bel-fôr', town France, capital of the Territory of Belfort and a fortress of the first class; 171 miles southeast of Troyes. It is of strategical importance, as it commands the

passage between the Jura and the Vosges, known as the Trouée de Belfort. The citadel, on the summit of a rock 220 feet high, before which stands the colossal 'Lion of Belfort' commemorating the defence of 1870-71, is the chief point of interest. Important buildings are the Palais de Justice, the Church of St. Christopher, the Hôtel de Ville, the Library and Museum. Textiles, clocks, hats, iron wire, and wine are manufactured, and there is trade in grain and liquors. Pop. (1921) 39,301.

Belfort was founded about the 11th century. It was taken by the Swedes in 1632 and in 1634, and was ceded in 1648 to France. In 1814-15 it successfully withstood the Allies. In the Franco-German War it was besieged by the Germans. A fierce engagement took place outside its walls on Jan. 15-17, 1871; and on Feb. 18 the garrison capitulated, and were permitted to march out with full honors of war.

**Belfort**, TERRITORY OF, small district (235 square miles) on the eastern frontier of France, forming the remnant of the former department of Haut-Rhin, ceded to Germany in 1871. It drains to the Saône. The land under irrigation yields good crops, and the meadow lands are rich. Iron and cotton and woolen goods are manufactured. Pop. (1921) 94,338.

**Bel'fry**, in its modern sense, a bell-tower, and, in a more restricted sense, the chamber of a tower in which the bells are hung. Originally it was applied to the wooden tower on wheels which was used by besiegers in attacking a castle, and occasionally to a stationary pent-house, under cover of which the attacking force shot their missiles, and from the upper story stormed the ramparts. See BELL; CAMPANILE.

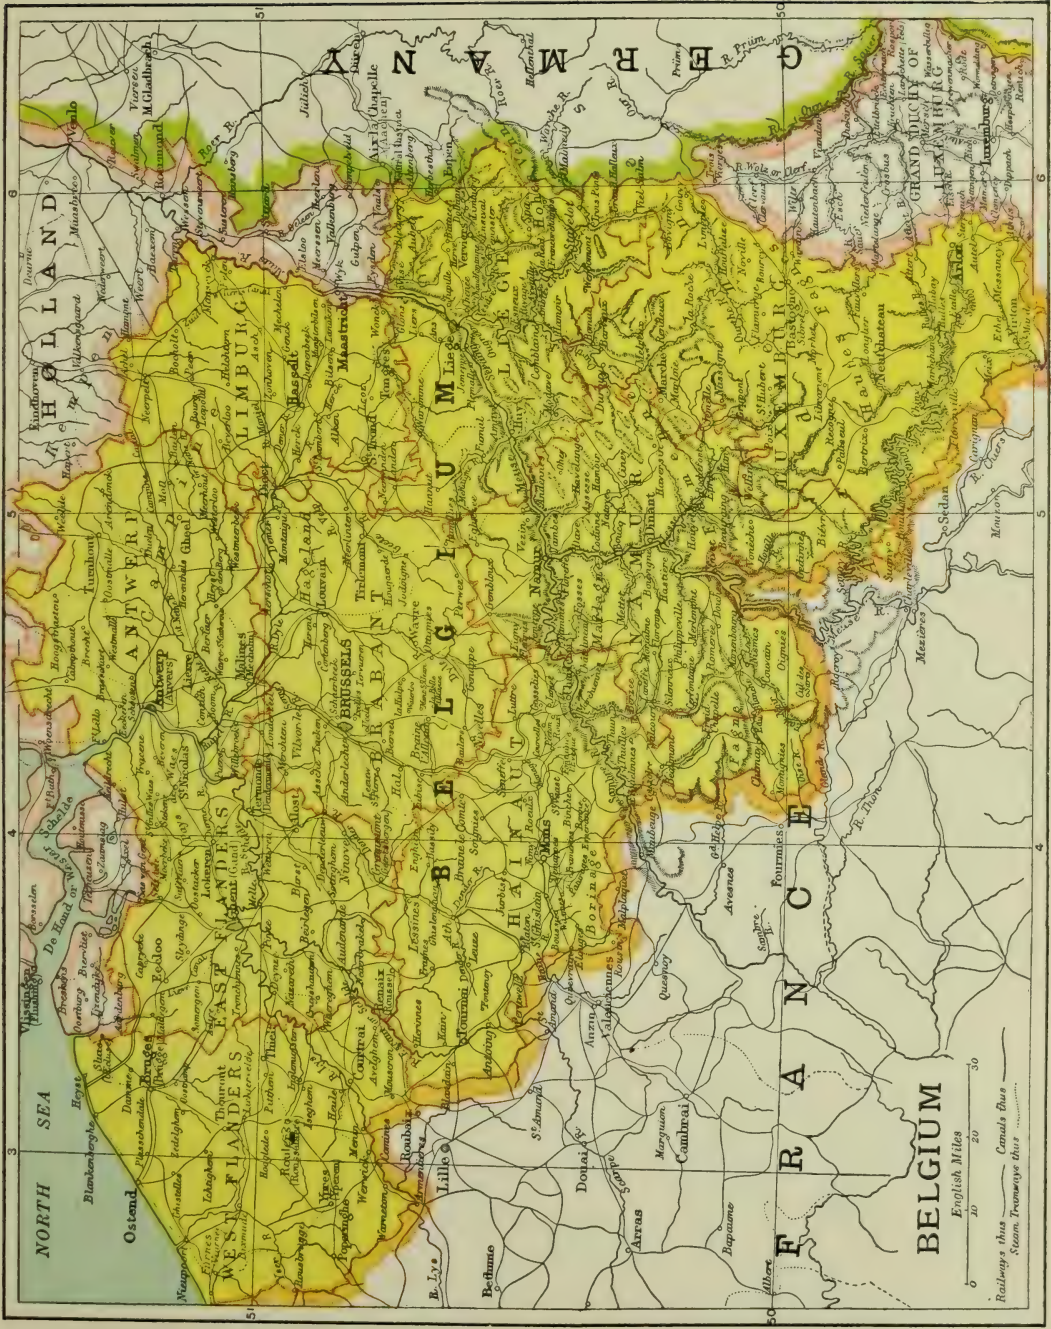

**Belgæ**, bel'jē, a nation of Germanic origin, who dwelt in the northeast of Gaul, between the Rhine, the English Channel, and the Seine. Cæsar subdued them after prolonged resistance.

**Belgaum**, bel-gä'oom, chief town in the district of the same name, Bombay Presidency, India. It consists of a town, fort, and military cantonment situated in a plain about 2,500 feet above the sea. There are a fort church, containing memorials to the heroes of the Kolhapur insurrection, a mosque, two Jain temples, and several schools. Pop. 36,000.

**Belgian Congo**. See CONGO, BELGIAN.

**Belgiojoso**, bel-jō-yō'sō, CRISTINA, PRINCESS OF (1808-71), Italian writer and patriot, was born in Milan, where she also died. She married in 1824

to Prince Belgiojoso—an unhappy union. Full of enthusiasm for the liberty of Italy, in 1848 she equipped at her own cost a regiment of volunteers. Upon the failure of the rising she retired to the Orient, where she remained until 1855, when her confiscated estates were restored her. After a short stay in Italy she again went, in 1858, to Paris, where she worked energetically for the plans of Cavour. In 1861 she returned to Italy to found the periodicals *Italia* and *Perseveranza*. A little later she became the friend of the house of Savoy. She wrote *Essai sur la Formation du Dogme Catholique* (4 vols. 1842-3), *Souvenirs d'Exil* (1859), *Emina: Récits Turco-Asiatiques* (2 vols. 1856), *Scenes de la Vie Turque* (1858), *Historie de la Maison de Savoie* (1860), etc.

**Belgium**, bel'ji-um, a small country of Western Europe, formerly a part of the Low Countries or the Netherlands (q. v.), bounded on the north by the North Sea and Holland, on the east by Holland, Prussia, and Luxemburg, on the west and south by France. The total area is about 11,373 square miles; the greatest length from northwest to southwest, 173 miles; the greatest breadth from north to south, 105 miles; the coast line 42 miles.

**Topography.**—The surface of Belgium slopes from the southeast to the North Sea, and is drained by the Scheldt and the Meuse (Maas) and their numerous tributaries, of which the most important is the Sambre. The Sambre-Meuse line divides the country into two main physiographic regions. To the south is a roughly triangular area consisting of a series of plateaus, trenched by ravines and narrow valleys, belonging mostly to the system of the Ardennes (q. v.), and including marsh and moor land and heavily wooded slopes. North of the line the surface is nearly a level plain, made exceptionally fertile by the unremitting labors of generations. It includes the Campine, formerly a barren tract of sand, stretching across the provinces of Antwerp, Limburg, and Brabant, which has been largely reclaimed, since the middle of the nineteenth century, by spade labor and heavy manuring; and the low coast lands of West Flanders, protected by artificial embankments from the inundations of the sea.

**Climate.**—The climate is generally temperate. In the plains near the sea it is cool, humid, and somewhat unhealthy; in the higher districts in the southeast, hot summers alternate

with very cold winters. The rainfall ranges from 27.5 inches in the west to 40 inches in the district east of the Meuse.

**Geology.**—The geological formations of Belgium are closely associated with those of France and England. The greater portion of the country is covered with *Tertiary deposits* in which the different geological periods are fully represented, though only the second, containing the Pliocene deposits, is rich in fossils. *Secondary deposits* occupy an extensive tract in Central Belgium, between the Scheldt and the Demer. The most important district, economically, is the southwest, consisting of *Paleozoic rocks*—Silurian, Devonian, and Carboniferous.

**Mineral Products** are abundant and constitute an important source of the country's prosperity—coal, iron, copper, zinc, lead, alum, manganese, marble, slate, and limestone being found within its borders. Coal deposits are said to underlie about a twentieth of the total area; the annual output of coal under normal conditions is about 24,000,000 tons; and the mines give employment to more than 150,000 people. The produce of the iron mines is valued at \$13,000,000 annually, and the principal seats of the industry are Charleroi and Liège. The production, however, even before the Great War, was less than in former years, iron being imported in considerable quantities from France. Lead and zinc are worked in Liège, copper in Hainault and Liège, manganese in Liège and Namur, black marble at Dinant, slate at Herbeumont, and calamine (zinc) at Liège.

**Manufactures.**—Manufacturing ranks with mining as one of Belgium's most important industries, cheap and abundant fuel being a great incentive. The principal manufactured products are textiles (linens, woollens, cotton, and silk), lace, leather, and metals.

The great seats of the linen industry, the oldest in Belgium, are in Flanders. Lace manufacture is also largely Flemish, and though it has declined in recent years still gives employment to thousands of workers. Woollen centres are Ypres, Ghent, Tournay, and especially Verviers. Brussels and Louvain have large carpet manufactures, and Hainault supplies a considerable amount of hosiery. The principal seat of the cotton trade is Ghent, where the industry was first established in 1798. Belgian leather has a good reputation, and the manufacture of gloves has made great progress in

recent years. Metallurgy also has rapidly increased in productiveness since 1816, when Cockerill introduced into Belgium the English method of smelting iron with coke. The principal seats of metal manufactures are Liège, Ghent, Charleroi, Mons, and their neighborhoods. Machinery is manufactured at Brussels and Seraing. There are large ordnance foundries at Liège and Antwerp, and celebrated makers of firearms in Liège; nail-making at Charleroi; manufactures of copper at Malines, and of tinware at Liège; wire and brass factories at Namur, Liège and Brussels; zinc manufactures at Liège; and lead and shot factories at Ghent. Gold and silver goods are manufactured at Brussels, Liège, and Antwerp; glass and porcelain at Tournai, Brussels, Courcelles, Charleroi, Namur, and Liège. Other industries include the manufacture of sugar, paper, and furniture, brewing, and distilling.

Belgium's manufacturing interests suffered heavily during the Great War (1914-19), the German government from the beginning systematically stripping the factories of machinery and tools with the purpose not only of crippling industry as a war measure, but as an economic means of preventing future competition. While the armistice terms require the return of all industrial equipment, the lack of raw materials and the general disorganization of industry constitute serious handicaps to a return to pre-war conditions.

**Agriculture and Stockraising.**—Compared with mining and manufacturing, agriculture is of somewhat minor importance, and a constantly diminishing number of people are engaging in it. The large majority of the farmers are small holders, owning only about 2½ acres of land, but under the intensive system of cultivation these small farms yield a maximum of produce. An agricultural commission in each province looks after the interests of the farmer, gives counsel, and encourages improvements. The Ardennes districts yield a large supply of wood, and their forests abound in game; while the level provinces raise all kinds of grain—wheat, rye, oats, and barley—leguminous plants, hemp, flax, colza, tobacco, hops, dyeplants, and chicory. Beets are extensively cultivated both for sugar and for fodder.

The acreage and production of the principal crops in 1913, the year preceding the outbreak of the Great War and the vast devastation wrought by the German invaders, was as

follows: Oats, 679,235 acres, 1,559,251,680 pounds; rye, 648,727 acres, 1,278,132,576 pounds; wheat, 398,735 acres, 900,369,120 pounds; potatoes, 379,677 acres, 3,200,932 tons; sugar beets, 131,047 acres, 1,391,917 tons; barley, 85,082 acres, 205,650,592 pounds.

Industries akin to agriculture are stockraising, dairying, and viniculture. Cattle, hogs, sheep, and horses are bred, and animals and animal products form an important item of export. Cheese is produced for both domestic and foreign consumption. Grapes are grown in the valley of the Meuse.

**Commerce.**—In 1913, prior to the German invasion, the foreign trade of Belgium amounted to \$1,753,134,600; the imports for home consumption being valued at \$1,009,971,800 and the exports at \$743,162,800. There was also a large transit trade amounting to \$591,985,000. The chief articles of export were wool, valued at \$70,099,000; iron and steel, \$50,263,000; flax, \$26,564,600; flax yarns, \$22,880,400; raw hides, \$22,476,800; and rubber, \$21,849,800. Imports include cereals, cotton, wool, hides, seeds, and rubber.

The great bulk of the trade was formerly with Germany, the latest pre-war statistics (1912) showing the following distribution of exports and imports: Germany, \$201,493,800 exports, \$140,624,000 imports; France, \$150,462,800 exports, \$181,609,600 imports; Great Britain and Ireland, \$118,925,000 exports, \$101,129,200 imports; Netherlands, \$73,519,800 exports, \$71,314,600 imports; United States, \$29,025,600 exports, \$82,765,800 imports.

**Communications.**—In 1913 there were in Belgium 2,926 miles of railroads, of which 2,709 miles were operated by the state; 1,360 miles of navigable waterways; 6,000 miles of roads; and an extensive system of canals. The roads were generally excellent, and there were electric and steam tramways in the principal cities. There were also nearly 5,000 miles of public telegraph lines and over 260 urban telephone systems, all under state management. In 1919 transportation facilities were demoralized. The Germans in their retreat had destroyed 690 miles of railway and rendered useless 260 miles, beside commandeering large numbers of locomotives, passenger coaches and freight cars, wrecking bridges, and destroying telephone and telegraph systems.

**Population.**—The population in 1913 was estimated at 7,571,-

387, or 665 persons per square mile, making Belgium one of the most densely populated countries in Europe.

The people consist of two races, the Flemings and Walloons, with small numbers of Germans, French, and Dutch. The Flemings (q. v.), generally blond, ponderous, and phlegmatic, obviously of Teutonic origin, make up some five-eighths of the population, living chiefly in Flanders, Antwerp, Limburg, and Brabant. The Walloons (q. v.), dark, active, and vivacious, are of Celtic origin. They dwell chiefly in the Ardennes region. The Flemings and Walloons have each their peculiar dialect but the French language has gained the ascendancy in educated society and in the offices of the government.

The principal cities are: Brussels the capital, with a population (1913) of 663,647; Antwerp, 312,884; Liège, 170,634; Ghent, 167,477; Mechlin, (Malines) 59,735.

**Religion.**—The Roman Catholic is the dominant religion, although full liberty of worship is guaranteed to all, and grants are made by the state to ministers of all denominations. Protestants number only 15,000, Jews 3,000.

**Education.**—Primary education is largely under communal control and is supported by communal taxation, supplemented by state and provincial subsidies. Each commune has at least one primary school—frequently a private institution taken over by local authorities and adapted to the requirements of the parish. Middle Schools are of two kinds—Upper and Lower. Upper Middle Schools usually receive boys only, but Lower Middle Schools, including industrial and commercial schools, are maintained for both boys and girls. There are also many private schools, chiefly under ecclesiastical direction. Higher education is provided for by universities at Louvain, Brussels, Ghent, and Liège—the two latter maintained by the state.

**Army.**—The Belgian army, the organization of which was established by a law of 1873, was intended solely for defence and to preserve the neutrality of the country. It is recruited by voluntary enlistment and by conscription, decided by lot, and the purchase of substitutes is allowed. The period of service is eight years, five of which are generally passed on furlough or in the reserve. The peace strength is 51,000 men; the regular war strength 150,000. Besides the regular army there

is a *Garde Civique* of 40,000 men which may be raised to 130,000.

During the Great War voluntary enlistment greatly increased and compulsory service was extended, bringing the mobilized strength to 267,000 at the signing of the Armistice. Casualties sustained during the war were placed at 90,000, including 20,000 dead, 60,000 wounded, and 10,000 prisoners and missing. The country has no navy.

**Government.**—The government of Belgium is a limited constitutional and hereditary monarchy, established in its present form in 1830. The legislative power is vested in the King, the Senate, and the Chamber of Deputies. The Senate, or Upper House, is composed of 120 members, part of whom are chosen by direct vote, part by the provincial councils. Members of the Lower House are elected directly by the people on the basis of population. The executive power is vested in the king and a responsible ministry.

Universal male suffrage obtains and failure to vote is a misdemeanor. Plural voting up to three votes, according to property or educational qualifications, was formerly in force but was discontinued by the Electoral Reform Bill enacted early in 1919, which also extended the franchise to widows who have not remarried and to mothers of soldiers killed in battle or of civilians shot by Germans.

For administrative purposes the kingdom is divided into nine provinces, which are subdivided into cantons and communes. Each province has a governor appointed by the king and a provincial council elected by popular vote, with jurisdiction in all provincial matters not provided for in the general administration.

**Finance.**—In 1913 the total state revenue amounted to \$161,557,600; the total expenditures to \$185,703,800. On Jan. 1, 1914, the debt stood at \$748,605,487. The greater part of this debt was incurred for public works and the interest is normally more than covered by the revenue from railways. Under the German *régime* the estimated revenue for 1916 was \$49,729,987 and the expenditures \$54,896,908—a deficit of \$5,166,100. The monetary unit is the franc.

**History.**—The history of Belgium as an independent kingdom commences in 1830, when it separated from Holland (see NETHERLANDS). The union of what had been the Spanish or Austrian Netherlands to Holland in 1815 was from the first an arbitrary one, as the people of

the northern and southern parts of the united kingdom differed essentially in religion, language, interests, and historic feeling.

Under William I., the Belgians had become more and more dissatisfied, and finally, on August 25, 1830, the anniversary of the king's accession, inflamed by the Paris revolution of July (1830), they rose in revolt. After weeks of rioting and fighting, a provisional government was formed; Prince Frederick, the son of the Dutch king, who had attempted to quell the revolt, was compelled to retreat from Brussels to Antwerp, having suffered considerable loss; and on Oct. 4 Belgian independence was declared. The crown was offered to Leopold of Saxe-Coburg, husband of Princess Charlotte of England, and he ascended the throne as Leopold I. on June 21, 1831.

Immediately upon the accession of Leopold, the Dutch invaded Belgium and in the ensuing struggle disaster was prevented only by the arrival of aid from France. This intervention alarmed the other powers, especially England, and as a result, the treaty of London (1831), guaranteeing the neutrality of the new kingdom, was signed by the five great powers, King William of Holland reluctantly assenting to the treaty in 1839.

Up to 1840 the Catholic and Liberal parties, which had joined forces in the struggle for independence, remained united. By degrees, however, the more conservative element obtained control and in 1842 succeeded in enacting a law declaring religious instruction compulsory in primary schools and entrusting it to the clergy under state supervision. From this dates the chief political struggle in Belgian history. In the first instance it occasioned the formation of a Liberal alliance (organized by a prominent Freemason named Defacqz), which agitated for extension of the franchise by educational as well as property qualifications, and which gained sufficient hold on the electorate to necessitate the formation of a purely Liberal ministry (with Charles Rogier as premier) in 1847. Under this ministry, many public works of great value were undertaken—railways were extended, and other means of communication were opened up; the question of secondary education was settled; and private industry was encouraged. In 1855 the Catholics returned to power, but in 1857 they were again replaced by the Liberals, who retained control of the government until 1870.

The ultimate cause of the defeat of the Liberal party was the Flemish movement. There had been a literary revival of the Flemish language about 1840, and attempts had been made to put it on a par with French in official use. The Liberals, whose strength lay chiefly in the French-speaking districts, opposed the movement, and at the elections of 1870 Antwerp and Ghent abandoned them, and Clerical ministries succeeded (1870-8). They were successful in raising Flemish to the dignity of an official language, but the demonstrativeness of the Clerical party, at a time when there was a strong anti-Clerical reaction in other Continental countries, led to a considerable Liberal success at the elections of 1878. The resultant Liberal ministry (under Frère-Orban) carried a primary education law which placed the elementary schools under strict state supervision. The bishops protested and organized a rival system of voluntary church schools; diplomatic relations were broken off with the Vatican; the ministry was severely defeated in 1884; and the Catholics again acquired the ascendancy, which they have since maintained.

By 1884 Socialism was becoming more and more a force to be reckoned with in Belgian politics, and in 1886 a socialist rising at Liège spread rapidly to other industrial centres. The ministry acted promptly and the outbreak was suppressed by military force but it led to an inquiry into the causes of dissatisfaction, and to a parliamentary consideration of franchise reform. No change was effected, however, until 1893, when a general strike of 50,000 workmen, led to the immediate acceptance of universal manhood suffrage tempered by the plural vote. A second vote was given to fathers of families possessed of a specified amount of property, and a second and third vote to persons with certain educational and professional qualifications. Proportional representation in all parliamentary elections was secured in 1900, and in 1919 plural voting was superseded by pure manhood suffrage.

Other measures of reform passed under Catholic ascendancy provided for industrial and labor councils, composed of employers and employees; erection of workmen's dwellings; supervision of the labor of women and children; regulation of workshops; granting of corporate rights to trade unions; guaranteeing security and health of working men during the hours of labor; equality of employee and employer in regard to con-

tracts; free control of their savings by married women; and old age pensions.

In 1885 the Congo Free State was acknowledged by the European powers as an independent state under the presidency of the Belgian king, and in 1908, following serious charges of extortion and cruelty by resident officials, it was annexed to Belgium as the Belgian Congo (q. v.).

King Leopold II., who had followed Leopold I. in 1865, died in 1909, and was succeeded by his nephew, Albert I. (q. v.).

*The Great War.*—Prior to the outbreak of the Great War the neutrality of Belgium, as guaranteed in 1831 and 1839, was considered an inviolable principle of European law. It had been strictly observed during the Franco-German War by both France and Prussia, and was reaffirmed by France immediately following the outbreak of hostilities in Europe in July, 1914. Germany, however, placing military expediency above all consideration of international honor, demanded of the Belgian government a free passage to France, and upon Belgium's refusal, invaded the country on Aug. 4, forcing the retreat of the gallant Belgian army, whose numbers were too weak for effective resistance, looting and burning houses and villages, and committing unprecedented outrages against the lives and property of the civil population. Liège, the key to the French railway system, fell before the invaders on Aug. 7; Brussels was taken on Aug. 20 three days after the government and the greater part of the army had fled to Antwerp; Namur fell on Aug. 23. From Antwerp the government moved to Ostend and thence to Havre, France, where it was granted extra-territoriality. Antwerp was taken after a stubborn resistance on Oct. 10, and Ostend on Oct. 15. Before the close of 1914 practically all of Belgium was occupied by the enemy. General von Bissing was appointed German military governor and upon his death in April, 1917, was succeeded by Gen von Falkenhausen.

The history of the German *régime* in Belgium is one of systematic spoliation and oppression. Heavy indemnities were imposed on the Belgian cities; thousands of estates were destroyed; vast quantities of machines and machine tools, horses, motors, locomotives, food-stuffs, and raw materials were seized by the German authorities in a systematic attempt to destroy Belgian enterprise; and thousands of Belgian workmen

(100,000 to 300,000) were deported to serve practically as slaves in German industries. Under these conditions famine and destitution were inevitable in spite of the splendid efforts of relief organizations—notably the Commission for Relief in Belgium—under whose auspices the charity of the world was made available for the stricken land (see BELGIUM, COMMISSION FOR RELIEF IN).

Organized efforts were made also, to create a lasting division between the Flemings and the Walloons, by reviving and exploiting for German ends the old Flemish movement. Two distinct administrative districts were created (March, 1917), separatist demonstrations were organized by German agents, and a declaration of Flemish independence was actually issued. This movement, however, not only failed to gain any popular adherence, but served rather to affirm the unshakable will of the people to continue unflinching their struggle for the integral restoration of Belgium as an independent nation.

By 1916 the Belgian army, reorganized and re-equipped, had taken its place on the Western front. In the great fall offensive of 1918 it co-operated with other Allied units in retaking Ostend, Zeebrugge, and Bruges, in driving the enemy from Flanders, and in bringing Germany to terms which included the evacuation of all the occupied portion of Belgium and France (see ARMISTICE). On Nov. 13, 1918, King Albert re-entered Ghent; on Nov. 19, Antwerp; and on Nov. 22, Brussels.

By the terms of the Peace Treaty Germany was required to consent to the abrogation of the treaty of 1839, by which Belgium was established as a neutral state, and to agree in advance to any convention by which the Allied and associated powers might determine to replace them. She was to recognize also Belgian sovereignty over the contested territory of Moresnet (q. v.) and over part of Prussian Moresnet, and to renounce in favor of Belgium all rights over the circles of Eupen and Malmédy on the Belgian-Prussian frontier, the inhabitants of which were entitled within six months to protest against this change of sovereignty; to give options to Belgium over ten years for delivery of 8,000,000 tons of coal; to repay all sums borrowed by Belgium from her Allies as a result of Germany's violation of the treaty of 1839, up to Nov. 11, 1918; and to restore certain art treasures. By a decision of the Peace Conference announced June 24, 1919, Belgium was

granted priority payment of \$500,000,000 from the German indemnities.

**Bibliography.**—Consult C. Smythe's *The Story of Belgium*; Boulger's *A History of Belgium* (2 vols.), and *Belgian Life in Town and Country*; Scudmore's *Belgium and the Belgians*; Rowntree's *Land and Labor: Lessons from Belgium* (1910); Ingpens's *The Glory of Belgium* (1914); Essen's *Short History of Belgium* (1915); Vose's *The Spell of Flanders* (1915); McDonnell's *Belgium, Her Kings, Kingdom and People* (1914); R. C. K. Ensor's *Belgium* (1915); Brand Whitlock's *Belgium* (2 vols., 1919).

**Belgium, Commission for Relief in**, an international organization formed late in 1914 by the American and Spanish ambassadors in London, the American and Spanish ministers at Brussels, the American ambassador at Berlin, and the American minister at The Hague, to care for civilians in the war-devastated districts of Belgium and Northern France. Headquarters were established in London with branches in New York, Rotterdam, Paris, and Brussels, and Herbert C. Hoover (q. v.) was appointed chairman and director of affairs in Belgium. The original idea of the commission was to depend upon a generous response to appeals for funds but it soon became apparent that such a large undertaking could not be maintained on a basis of benevolence, and it was financed by government loans from Great Britain and France. Up to June 1917, the Commission had received from the British Government \$89,500,000 and from the French \$66,000,000 for relief in Belgium, with an additional \$108,000,000 from France for relief in her own invaded territory; charitable contributions amounted to over \$30,000,000—about \$16,000,000 from Great Britain and \$11,500,000 from the United States, with \$3,000,000 from the rest of the world; so that there was available over \$299,000,000 in cash and kind. In June, 1917, the American Government took over the financing of the Commission for the following six months by granting loans of \$75,000,000 to the governments of Belgium and France. The work included the provisioning of the entire population of the occupied areas, and for it some 7,000 committees were created under the control of two central organizations—the Commission for Relief in Belgium and the Comité National de Secours et d'Alimentation. The first shipment of food was made October 30, 1914, and more than 2,750,000

tons were subsequently shipped and distributed.

**Belgium: Language and Literature.** There is no Belgian language *per se*, the Flemings and Walloons each speaking their own tongue—that of the Flemings belonging to the Low German branch of the Teutonic class of Aryan languages; that of the Walloons being a French dialect.

Before the birth of Belgium as a nation in 1830 there had been no lack of writers among both Flemings and Walloons, but their productions were representative chiefly of their own districts or cities. Under the Napoleonic rule, as in France, literature was almost *nil*, and during the early years of the new nation interest centred in politics and business, rather than in literary accomplishment. Modern Belgian literature may therefore be said to begin with the Flemish movement, the object of which was the literary cultivation of the Flemish tongue and its establishment on a footing of complete equality with French. The originators and principal promoters of this movement were for the most part publicists, like Willems (1793-1846), called the 'father' of the movement, Blommaert (1809-71), Rens (1805-74), Snelaert (1809-72), Van Duyse (1804-59), and Vleeschhouwer; but its most influential champion, from the literary point of view, was the novelist Hendrik Conscience (1812-83), who not only wrote good historical novels like *De Leeuw van Vlaenderen* (1838), but is especially famous for his excellent little stories of Flemish life, such as *Hoe men Schilderwordt* (1843), *Siska van Roosemael* (1844), *Rikketikke-tak* (1851), *De Arme Edelman* (1851), and *Het Geluk van rijk te zijn* (1855). The most important supporters of Conscience were the poet Ledeganck (1805-47), whose poetic trilogy, *Les Trois Villes Sœurs* (Ghent, Bruges, and Antwerp), was an impassioned defence of Flemish tradition; Rijswijk (1811-69), in political verse like *Refrains Politiques* (1844) and *Chansons Populaires* (1846); and DeCourt (1834-78), in various volumes of *Liederen*.

Flemish tendencies were also predominant in the poetical productions of Hiel (1834-99), who wrote songs for children; Van Beers (1824-88), in the poem of humble joys and sorrows, *Begga*; De Laeb (1815-91), in the romance *Het Huis van Wesenbeke* (1842), the village tale *Het Lot* (1846), and *Poems* (1848); Gezelle (1830-1900), who recorded his deep love for nature in *Rijmsnoer* (1897); Pol de Mont (b. 1857), who put characteristic

work into *Claribella* (1893) and *Iris* (1894); De Geyter (b. 1830), in the radical war-cry 'Hymne de Gueux' in *Charles Quint* (1888), and in *Trois hommes* (1861); Van Droogenbroeck (1835), in *Rayons de soleil* (1866); the humorist Vuylsteke (1836), in *L'Amour silencieux* (1860) and *La vie d'étudiant* (1868); Antheunis (1840), in poems of domestic life, *Du fond du cœur* (1875) and *Vivre, aimer, et chanter* (1879); and, last but not least, Hélène Lapidoth-Swarth (1859), in several volumes of limpid and harmonious verse, such as *Beelden en stemmen* (1887) and *Riouwviolet* (1889). Virginie Loveling (1835) in poems, but more especially in numerous novels, distinguished for that rare combination of real power with a simple style—e.g., *Au pays flamand* (1877), *Le clef de la maison* (1883), *Sophie* (1886), *Een Dure Eed* (1892), and *Het Land der Verbeelding* (1896)—well sustained the tradition of Conscience, while Sleeckx and others have ploughed the same furrows. The study of Flemish folklore was much developed by Vervliet, Cornelissen, Harou, Penken, and other writers in the Brabant journal *Ons Volksleven*.

The part played by the Walloons in Belgian letters has been slight compared with that taken by the Flemings. Among the names associated with the Walloon movement are Charles Nicholas Simonon (1774-1847), whose *Collected Poems* appeared in 1845; J. F. E. Bailleux, founder of the Société Liégeoise, and Henri J. Forir (1784-1862) its first president; Nicholas Defrecheux (1825-74), the greatest of the Walloon poets; Edouard Remouchamps (1836), the dramatist; Henri Simon (1856), Julien Delaite, and Zephir Henin (1866).

In addition to works in Flemish and Dutch, there is a large body of Belgian literature written in French but nevertheless possessing a distinctly national character. Among the earlier works of this class are De Coster's sixteenth century romance *Uylenspiegel* (1867), and the *Feuilles, pensées, et maximes* (1862), *Jours de solitude* (1869), and *Lettres à José* (1884) of Octave Pirmez (1832-83). The later French writers fall into two main groups—(1) the Parnassians, represented chiefly by Graud and Arenberg, and by the Walloons Gilkin, Gille, and Severin, and other supporters of the organ *Le jeune Belgique*, which aimed at preserving the ease, polish, and precision of the French classical style; (2) the mystical Franco-Flemish school embracing the

most distinguished names in Belgian literature. The first strong note of the latter movement was struck by Lemmonier in his novel *Un mâle* (1881), and it was energetically carried on by Edmond Picard. The four greatest names associated with it are Eeckhoud, Verhaeren, Rodenbach, and Maeterlinck. Georges Eeckhoud, born in 1854, was Flemish to the core, describing with brutal realism the peasant life of Flanders and glorifying Flemish brutality and courage in such works as *Kees Doorik* (1883), *Kermesses* (1883), *Nouvelles kermesses* (1887), *La cycle patibulaire* (1892), *Mes communions* (1895), and *La faneuze d'armour* (1900). He wrote also a story of modern Antwerp—*Nouvelle Carthage*—satirizing the merchant and the respectable bourgeoisie, and translated plays by Beaumont and Fletcher, Webster, and Marlowe.

Verhaeren (1855-1916) is the poet of Flanders—the most virile, varied, and spontaneous of the symbolists—a direct, poetic De Maupassant of Flemish race. Among his works may be mentioned *Les flamades*, *Les moines*, *Les campagnes hallucinées*, and *Les villes tentaculaires*. Rodenbach (1855-98) was as Flemish a poet as Verhaeren, but he was saturated with mediævalism and has been called the 'poet of silence.' His works are morbid and melancholy in the extreme, yet tinged with a delicacy of tone that is inimitable. His best known work is *Bruges la morte*.

Maurice Maeterlinck, the most famous of Belgian writers and one of the first to attain a world reputation, is the acknowledged example of complete synthesis of the Germanizing and Latinizing forces which meet in the Belgian people. He combines the visual quality so characteristic of his race and their extreme mysticism. (See MAETERLINCK.)

Other names in modern Belgian literature include the poets Elskamp and Demolder; the novelist and playwright Cyriel Buysse; the historians Baron de Lettenhove, Louis Gachard, Rahlenbeck, Pirenne, Kurth, De Potter, D'Alviella, and de Marez; the economist de Laveleye; Rooses, Reclus, Nys, Hamelins, Gevaert, and Fétis. Consult Hamelins' *Histoire politique et littéraire du mouvement flamand*.

**Belgorod.** See BIELGOROD.

**Belgrade**, bel-grād, city, capital of the Serb-Croat-Slovene State, is situated at the junction of the rivers Danube and Save, opposite Semlin, 251 miles southeast of Budapest. The famous citadel, now in a somewhat dilapidated condition, stands on a hill 133 feet high,

overlooking the two rivers. In its upper part are prisons and an army museum; in the lower part barracks, magazines, the *Heboysa* (torture tower), and the Emperor Charles Gate. Kalemegdan Park, a favorite resort and one of the city's chief attractions, lies just south of the fortress. Beyond this is the town proper—prior to the Great War a thoroughly modern city with wide streets, fine buildings, and excellent lighting and transit facilities. The great mosque, national theatre, (1871), museum, cathedral (1845), university, royal palace, and national library (150,000 vols.) are the principal features of interest. Industries are comparatively insignificant, but commercially the city was of considerable importance, being the centre of the Serbian export trade, and the entrepôt of trade between Turkey and Austria. Pop. (1872) 26,674; (1911) 90,890; (1921) 111,740.

The strategical importance of Belgrade was recognized from the earliest times. During the eleventh and twelfth centuries the fortress was held by the Greek emperors till it fell into the hands of the Magyars, who for long successfully disputed its possession with the Serbians and Turks. It was heroically defended in 1456 by Hunyadi (q.v.), and remained one of the greatest obstacles to the advance of the Crescent till captured by Sultan Solyman in 1521. It was taken by the Austrians in 1688, but was recaptured in 1690 by the grand vizier Mustafa Köprili and continued in the possession of the Ottomans till Prince Eugene retook it in 1717. From 1738 till 1862 it was again under Turkish rule. In the latter year it was transferred to Serbia and was made the capital of that principality.

In the Great War (1914-19) Belgrade was bombarded by the Austrians on July 29, 1914. It was evacuated by the Serbians Dec. 1, 1914, having been practically reduced to ruins by bombardment, was occupied by the enemy Dec. 2, and was retaken by the Serbians Dec. 5. It fell again on Oct. 9, 1915, and remained under Austrian control until Nov. 3, 1918, when it was re-occupied by the Serbians. Following the war Belgrade became the capital of the new Serb-Croat-Slovene state.

**Belgravia**, bel-grā'vi-a, a fashionable district in the southern part of the West End of London, built between 1826 and 1852. It borders on Hyde Park, the Green Park, and Buckingham Palace Gardens.

**Belial**, bē'li-al, a Hebrew word meaning worthlessness or wickedness in an ethical sense, usually found in connection with a person, as 'man of Belial.' Although not originally a proper name, it came to be so regarded. It occurs once in the New Testament (2 Cor. vi. 15), where Paul uses it as the equivalent of Satan.

**Belief**, in general, that of which one is persuaded. The word is used, however, in several senses. (1.) It may signify an element in all serious judgment (as distinguished from mere imagination and from wilful falsehood)—*viz.*, that the judgment is taken to be true of reality. It is to be observed however, (a) that this truth may be asserted with various degrees of assurance, from full certainty to the vaguest probability; (b) that the reality may be that of a fictitious world, as, for example, when it is said that 'Ivanhoe did not really marry Rebecca as Thackeray *falsely* makes him do.' (2.) Belief may be used in a narrower sense to signify the conviction that attaches to a probability, as distinguished from that which belongs to certain knowledge. (3.) Belief is also used as equivalent to faith in the religious sense—faith as contrasted with sight. In this sense, it is opposed, not as probability to certainty, but as one kind of certainty to another. That is to say, the certainties of faith, resting upon moral and spiritual experience, are contrasted with those resting solely upon sense experience, or observation. (See, also, FAITH.)

**Belinsky**, be-lin'ski, VISARION GRIGORIEVITCH (1810-48), Russian literary critic, was born at Chembar in the government of Penza, son of an army surgeon. He studied at Moscow, and early entered upon a journalistic career, his first important work, an admirable *Survey of Russian Literature since the Eighteenth Century*, appearing in 1834. Writing at first in the spirit of Hegel and Schelling, he later abandoned his early ideas for the theory that the essence of literature is to give an idealized picture of actual life. As a writer, he was a master of style and his work is characterized by vigor and passion. As a critic, he was a true reformer, and fought despotism, insincerity, and slavery with all his energy. He was keenly alive to the merits of his Russian contemporaries, and it was he who first showed the real value of the works of Pushkin, Lermontov, and Gogol to the national literature. His short

life was a constant struggle with poverty and ill health, and his death occurred from tuberculosis in 1848. His complete works appeared in 1859-62 in twelve volumes.

**Belisarius**, bel-i-sā'ri-us, (c. 500-565) (Slav. Beli-tzar, 'white prince'), the greatest general of the Byzantine empire, is said to have been a native of Thrace. After Justinian's accession to the throne in A.D. 527, Belisarius, who had been one of his private guards, was appointed to the command of the eastern army of the Empire. Between 529 and 532 he was occupied in repelling the inroads of the Persians; but Africa and Italy were the scenes of his greatest exploits. In 533 he was sent by Justinian into Africa to recover the provinces there held by the Vandal King, Gelimer (q.v.). After achieving two victories, Belisarius made the king a prisoner, seized his treasure, and conquering Sardinia, Corsica, and the Balearic Isles, brought him to Constantinople, where he appeared in a triumphal procession of the conqueror—the first that a subject had enjoyed since the days of Tiberius.

The first of the Italian campaigns, by which Justinian sought to wrest Italy from the Ostrogoths, began in 535. In that year Belisarius conquered Sicily. In 536 he occupied Lower Italy and entered Rome, which he defended for a year against Vitiges, the Gothic king. In 539 he seized Ravenna and took Vitiges captive but was recalled by the jealousy of Justinian. He was then engaged (541-2) against the Persians under Chosroes, but was again recalled through the intrigues of the Empress Theodora and his own wife Antonina. His second great struggle with the Ostrogoths now began. The barbarians under Totila having invaded and reconquered Italy, Belisarius was sent against them. After a five years' struggle, however, he was superseded by his rival, Narses, who completed his work by finally overthrowing the Ostrogothic kingdom. Belisarius gained his last victory against the invading Bulgarians in 559. In 563 he was accused of conspiring against Justinian, and was imprisoned for seven months, his property being confiscated. He was, however, restored to full honors by the emperor, the legend that he was deprived of his eyes and reduced to beg his bread being absolutely without foundation. He died in March 565.

The chief authorities on the

life of Belisarius are the *Histories* of Procopius (his private secretary), Agathias, and Theophanes. Consult also Gibbon's *Decline and Fall*; Mahon's *Life of Belisarius*; Bury's *Later Roman Empire*; *The Cambridge Medieval History*.

**Belize**, be-lēz' (so named from the Spanish pronunciation of Wallace, a Scottish buccaneer), the capital of British Honduras, is situated on the Caribbean Sea at the mouth of the Belize River, which divides the town into two parts. It is the largest and most important town on the Caribbean coast of Central America, but the harbor is shallow and vessels are obliged to anchor a mile outside. The town is generally clean, with an English atmosphere. Flowers and fruit abound, and the climate is healthful. There is a considerable trade in logwood, mahogany, and chicle gum. Pop., (1921) 12,661.

**Beljame**, bel-zham', ALEXANDRE (1842-1906), French writer and professor of English literature at the Sorbonne, Paris, was born at Villers-le-Bel, Seine-et-Oise. His works include *Le public et les hommes de lettres en Angleterre au XVIII<sup>e</sup> siècle* (1881) and numerous French translations of English classics, as *Macbeth*, *Othello*, and *Enoch Arden*. In 1905-6 he lectured at Cambridge University on English literature.

**Bel'kine**, IVAN, pseudonym of the Russian author, Pushkin (q.v.).

**Bel'knap**, bel'nap, GEORGE EUGENE (1832-1903), American naval officer, was born in Newport, N. H. He entered the navy in 1847, was in command of a launch at the capture of the Barrier forts, Canton River, China, (1856), and during the Civil War took a leading part in several naval engagements, including the capture of Fort Fisher, N. C. In 1873 he was assigned the duty of taking deep-sea soundings between the United States and Japan, with the object of ascertaining whether a cable route was feasible. He invented apparatus for determining the character of the sea floor, and published a work, *Deep Sea Soundings*. He was superintendent of the U. S. Naval Observatory in 1885. He became rear-admiral in 1889, and commanded the U. S. fleet on the Asiatic station from 1889 to 1892. He retired in 1894.

**Belknap**, WILLIAM WORTH (1829-90), American politician and soldier, was born at Newburg, N. Y., and was educated at Princeton. With the rank of major, he joined the Union army (1861), took part in the Shiloh,

Vicksburg, and Atlanta campaigns; was made a brigadier-general of volunteers (1864) and major-general of volunteers in 1865. He was Secretary of War from 1869 to 1876, when he was impeached on charges of corruption, which, however, were not formally investigated because of his resignation.

**Bell**, a hollow metal instrument, usually cup-shaped, which, when struck, gives forth a ringing sound. Early specimens of bells have been found in Egyptian tombs, and small bronze articles, supposed to be bells, have been dug up in the ruins of Nineveh. The festival of the Egyptian Isis was celebrated with the sound of bells, and in the Old Testament bells of gold are mentioned as being suspended from the robes of the high priest. They were also used in Old Testament times in the trappings of horses and as ornaments. The Persians employed them for ornamentation, and in India and China they were probably known long before they were in use in Europe.

It is uncertain when bells were first employed in the Christian Church, although their introduction has been generally attributed to Paulinus, bishop of Nola (400 A.D.). Bede mentions bells as being in use in England about the end of the 7th century, and in the 10th century St. Dunstan appears to have introduced them very generally. They play an especially important rôle in the services of the Roman Catholic Church. The *Ave bell* is rung at the time the Ave Maria is to be said; the *vesper bell* as a call to vespers; and the *sacred bell* at the elevation of the Host in the celebration of the Mass. This last bell was formerly hung in a small turret outside the church, so that all within hearing of it might prostrate themselves. The *passing bell* was tolled when a soul was passing out of life, and this custom still survives, though the bell is now tolled *after* the death. In excommunication by *bell*, *book*, and *candle*, the bell was rung to summon the congregation to the ceremony. The consecration or baptism of bells is still practised in the Roman Catholic Church.

The most familiar secular use of the bell is the tolling or ringing of the hours. This practice is referred to by Lucian (b. *circa* 125 A.D.), who describes an instrument which marked the hours on a bell by means of water power. The curfew bell (Fr. *couvre feu*) is a later development. It was introduced into England from Normandy by William the Conqueror, and was rung at eight o'clock in the evening, to warn all persons to ex-

tinguish fire and light—a necessary precaution, when houses were built of wood. This practice, however, was enforced only during the reigns of William I. and William II., and was abolished by Henry I. The *locsin*, or alarm bell, was hung in castles and fortresses, where it was sounded to announce the approach of an enemy.

Bells have been made in a great

portion of copper to tin is from three to four parts of the former to one of the latter. The thinner a bell is made in proportion to its size, the lower in pitch is its tone, and *vice versa*. The thickest portion of a bell is the part—called the *sound-bow*—against which the clapper strikes. The proportions of bells are not determined by fixed rules, but, generally speaking, in large bells the

Various Types of Bells.

variety of forms and of a still greater variety of substances, but since the middle ages, for bells which are required to possess a high degree of richness and volume of tone, a modification of the hemispherical form and an alloy of copper and tin—called *bell-metal*—have been universally regarded as superior to all others. For large bells the best results are said to be obtained when the pro-

diameter at the lip is usually about 15 times, and the height about 12 times, the thickness of the sound-bow. Bells are said to be *true* only when the consonant upper-partials—the third, fifth and octave—are dead in tune with the fundamental or keynote of the bell. Bells may be lowered in pitch by thinning the inside of the sound-bow, but the only means of raising the

pitch is to lessen the height and diameter by cutting a portion from the rim all round, and this, besides altering, frequently impairs the quality of tone.

With the exception of modifications in methods of manipulation, the art of bell-founding has remained almost unchanged since its invention in mediæval times. Now, as then, bells are cast by forming a bell-shaped model, covering this with a larger mould and, through an opening in the top of the latter, pouring in molten metal until the space between the two is completely filled.

Bells are sounded either by being *swung* or by being *chimed*. A *peal* of bells is a suite of bells tuned in certain relations to each other. Peals of 'swung' bells never contain a greater number than twelve, but peals of 'chimed' bells—termed *carillon-peals*—may comprise forty or more. In Great Britain, bells 'rung in peal' in their primary or natural order of sequence are usually tuned to produce a succession of diatonic intervals, but 'carillon-peals' may be tuned to be capable of producing a complete chromatic scale. *Change-ringing* is the art of constantly varying, in accordance with certain prescribed rules, the order in which peals of 'swung' bells are rung; 'hunting,' 'dodging,' 'place-making,' 'singles,' 'doubles' and 'triples' are among the terms which are used to designate methods of manipulation. The number of bells contained in the 'peal' determines the number of changes which can be made—*e.g.*, on 3 bells 6 changes may be rung; on 6 bells, 720; on 12 bells, 479,001,600. The earliest known work on the subject of change-ringing is Fabian Stedman's *Tintinnologia* (pub. 1668). Large peals of swung bells are most numerous in England; in that of St. Paul's, London, which contains 12 bells, the tenor bell weighs over three tons.

Bells may be 'chimed' in various ways, but the term is generally understood to imply that, instead of being swung, the bells are struck—usually on the outside—by a hammer or wooden mallet. On the Continent, in peals of chimed bells which are constructed to play automatically, the hammers are called into action by a spiked revolving barrel regulated by clock-work (see MUSICAL BOX), but for large carillon-peals which are played by hand a species of keyboard mechanism is employed. The art of carillon playing is now much neglected, but during the 18th century some carilloneurs in the Netherlands were able to perform intricate fugal works in two and, with the aid of pedals, even in three parts. Among

celebrated carillon-peals on the Continent, some of which are capable of being played either mechanically or by hand, are those of Antwerp, Bruges, Ghent, Louvain, Malines and Tournai; while of noteworthy English carillons may be mentioned those at Boston, Bradford, Manchester, Rochdale, Shoreditch and Worcester. In New York City, in the tower of the Metropolitan Life Insurance Building, is a chime of four bells, weighing about 7 tons, and said to ring at twice the height of any other peal in the world. These chimes are played by motive power derived from mechanism operated by the great clock in the tower. Another notable chime in the United States is that in the Chapel at West Point, consisting of twelve bells and said to be one of the finest in the world.

Tubular chimed bells are a recent invention and, being comparatively cheap, are likely to become popular; but so far, though made in sizes to cover a wide extent of compass, they are perhaps best known arranged in sets to form portable carillons.

Bells were at first comparatively small in size but about the thirteenth century bells of large size were beginning to be cast and by the fifteenth century some attained huge dimensions. The largest bell in the world, the great bell of Moscow, was cast in 1733, and weighs 198 tons. It was cracked either in the founding or later, and is unhung, but stands on a pedestal within the Kremlin. Another Moscow bell, said to be the largest in use, was given to the cathedral by the Czar Boris Godunoff; it weighs 128 tons; another, belonging to St. Ivan's Church, weighs 57 tons; one cast in 1819 weighs 80 tons. Other large bells are: the bell at Mingoan, Burma, 80 tons; great bell of Peking, 53½ tons; at Novgorod, 31 tons; at Cologne, 26¾ tons; at Nanking, 22 tons; the famous Mahajanda bell at Rangoon, 22 tons; at Olmutz, 18 tons; at Vienna, 17¾ tons; Great Paul (St. Paul's, London), 17½ tons; Big Ben (Westminster), over 13½ tons; bell at Erfurt, 13¾ tons; at Montreal, 13½ tons; at Paris (1680), 17 tons; Great Peter (York Minster), 10¾ tons. The finest collection of bells in any country is said to be that at the Mission Inn, Riverside, California. See also ELECTRIC BELL; and for pneumatic bell, PNEUMATIC APPLIANCES.

*Bells and Bell Ringers*; Myers' *Bells and Bell Lore*.

**BELL**, ACTON, CURRER, and ELLIS, a pseudonym of the Brontës. See BRONTE.

**BELL**, ALEXANDER GRAHAM (1847-1922), American scientist and inventor of the telephone, the son of Alexander Melville Bell, the inventor of 'Visible Speech' (q. v.), was born in Edinburgh, and moved with his family to Canada in 1870. He introduced his father's system for the education of deaf-mutes in a Boston school newly opened, and was appointed professor of vocal physiology in Boston University (1872). In 1876 he exhibited at the Philadelphia Exhibition the telephone, which he had been working on for some four years, and a company was organized for its development. He also invented the photophone (1880) and the graphophone (1887). He founded the Volta Bureau, which has published many of his important researches regarding the instruction of deaf-mutes. He was elected a member of the National Academy of Sciences in 1883; received the Volta Prize from the French government in 1881; and in 1882 a diploma and the decoration of the National Legion of Honor of France. He was greatly interested in the education of the deaf and served as president of the American Association to Promote Teaching of Speech to the Deaf, as president of the National Geographic Society, and as a regent of the Smithsonian Institution. His last few years were spent in efforts to make wider applications of his greatest invention, the telephone, and in the development of aviation, in which he took great interest. He died at Baddeck, Nova Scotia, Aug. 1, 1922. He was the author of many educational and scientific monographs. See TELEPHONY.

**BELL**, ALEXANDER MELVILLE (1819-1905), Scottish-American educator, father of Alexander Graham Bell, was born in Edinburgh, Scotland, and received his education from his father, Alexander Bell, inventor of a method for removing impediments of speech. He was lecturer at Edinburgh and London, removed to Canada in 1870 and to Washington in 1881. His great work was the formulation of a method of instruction in phonology, known as Visible Speech (q. v.), which has been successfully used in teaching deaf-mutes to speak.

**BELL**, ANDREW (1753-1832), founder of the Madras system of education, was born and educated in St. Andrews, Scotland. He was a tutor in Virginia from 1774 to 1781, when he returned to Great Britain, and took orders in the Church of England. In

1789 he became superintendent of the Madras Male Orphan Asylum, where he developed the monitorial system of education, explained in his work, *An Experiment in Education* (1797). In 1816 he assisted at the formation of the National Society for Promoting the Education of the Poor, a church organization which founded over 12,000 schools on his method. In 1831 he transferred \$600,000 to trustees for various educational purposes, principally in Scotland; half of this went to found the Madras College, St. Andrews. The chairs of education in Edinburgh and St. Andrews have grown out of the Bell Lecture on Education, established 1831. See Southey's *Life of Bell* (1844); Meiklejohn's *An Old Educational Reformer* (1881).

**Bell, SIR CHARLES** (1774-1842), discoverer of the distinct functions of the nerves; became fellow of the Royal College of Surgeons of Edinburgh (1799), and in 1804 contributed the account of the nervous system to his brother John Bell's *Anatomy of the Human Body*. The same year he removed to London, where his *Anatomy of Expression in Painting* was published (1806). Bell's great achievement was the discovery of the existence of distinct motor and sensory nerves, and the further discovery that the spinal cord gives off filaments of both kinds, the anterior roots being motor and the posterior sensory. The first hints of this discovery occur in a letter to his brother George (Nov. 26, 1807), but its final authoritative exposition was made in 1830, in a volume entitled *The Nervous System of the Human Body*. In 1812 he was appointed surgeon to the Middlesex Hospital, and in 1824 professor of anatomy and surgery at the Royal College of Surgeons, London. Knighted on the accession of William IV., Bell accepted the chair of surgery at Edinburgh University in 1836. Besides the volumes mentioned above, he was author of *A System of Operative Surgery* (1807), *Institutes of Surgery* (1838), and several other books, chiefly surgical. See *Letters of Sir Charles Bell* (1870).

**Bell, GEORGE JOSEPH** (1770-1843), advocate, brother of Sir Charles Bell, was admitted to the Scottish bar (1791). His *Treatise on the Laws of Bankruptcy in Scotland* (1804), republished in 1810 under the title *Commentaries on the Laws of Scotland* (7th ed. 1870), at once took rank as the authority in the domain of mercantile jurisprudence. Bell was elected to the chair of Scots law in 1822, and served on the commissions which resulted in the Scottish Judicature Act of 1825 and the Scottish Bankruptcy

Act of 1839. He also wrote *Principles of the Law of Scotland* (1829; 6th ed. 1872). See *Edin. Rev.*, Apr., 1872.

**Bell, HENRY** (1767-1830), one of the earliest introducers of practical steam navigation into the United Kingdom, was born at Torphichen Mill, near Linlithgow, Scotland. In Jan., 1812, his boat, the *Comet*, a thirty-ton vessel driven by an engine of three horse power, began plying between Glasgow and Greenock on the Clyde. It has been said that Robert Fulton, who built the first passenger steamboat, derived his ideas of steam navigation from Bell. See STEAM ENGINE.

**Bell, HENRY THOMAS MACKENZIE** (1856), English poet and critic. He went to London in 1884, publishing in the same year *Charles Whitehead*, a monograph on the poet (new ed. 1894). Among his works are *Spring's Immortality, and other Poems* (1893; 3rd ed. 1896); *Christina Rossetti: a Biographical and Critical Study* (1898); and *Pictures of Travel, and other Poems* (1898). A selection of verse appeared in 1901.

**Bell, JAMES FRANKLIN** (1856), American soldier, was born in Shelbyville, Ky., was graduated at the U. S. Military Academy in 1878, served in several Indian campaigns, and in the Philippines during the Spanish-American war till 1903. He was commandant at several army schools till 1906, when he became chief of the general staff of the army; promoted major-general in 1907.

**Bell, JAMES MONTGOMERY** (1837), American soldier, was born at Williamsburg, Pa., and graduated (1862) at Wittenberg College, Springfield, O. He entered the U. S. army as lieutenant, 1862, and was promoted for gallantry in the Battle of the Wilderness, and at Ream's Station, Va., during the Civil War. He saw much Indian fighting in the sixties and seventies, and served with distinction in the Cuban War and in the Philippines, where he became military governor of the third district of Southern Luzon, 1900, retiring in 1901 with the rank of brigadier-general.

**Bell, JOHN** (1763-1820), surgeon, elder brother of Sir Charles Bell, became fellow of the Royal College of Surgeons, Edinburgh (1786), and in 1790 established himself in that city as an independent lecturer on anatomy and surgery. For twenty years Bell remained the leading operating surgeon in Edinburgh, and showed himself a bold innovator in surgical practice. Chief works: *Anatomy and Physiology of the Human Body* (1793-98); *Discourses on the Nature and Cure of Wounds* (1793-5); *Principles of Surgery* (1801-8; new ed. 1826).

**Bell, JOHN** (1797-1869), American political leader, born near Nashville, Tenn. He graduated at the University of Nashville in 1814, was admitted to the bar in 1816, and became a prominent lawyer and political leader, being a Democrat until 1835, and thereafter a Whig. He was a member of the state Senate for one term, being elected in 1817; was a representative in Congress (1827-41) and speaker of the House of Representatives in 1834-5; was Secretary of War (Mar.-Sept., 1841), resigning, with the other members of the cabinet when, after the death of Pres. Harrison, Pres. Tyler broke with the Whig Party; and was a member of the U. S. Senate (1847-59). Throughout his Congressional career he took an influential part in debate, and was conspicuous among the Southern members for conservatism and for independence, opposing, for instance, the Kansas-Nebraska Bill and the Lecompton Constitution. On the approach of the Civil War, though his sympathies were with the South rather than with the North, he opposed disunionism, and in 1860 was the candidate, for the presidency, of the Constitutional-Union Party (q. v.) or 'Bell and Everett Party,' Edward Everett being the candidate for the vice-presidency. He received a popular vote of 588,879, most of which was cast in the Southern states; but received only 39 electoral votes, those of Ky., Tenn., and Va. When Tenn. seceded he gave his allegiance to his state rather than to the Union, but had no share in the Civil War.

**Bell, JOHN** (1811-95), an English sculptor, born in Norfolk. His first exhibited work was a religious group (Royal Academy, 1832). His *Eagle-slayer* (1837) was exhibited in 1844; the well-known *Dorothea* belongs to 1841. For the Houses of Parliament he executed the statue of Lord Falkland (1847), and among his public works are the *Guards' Memorial* in Waterloo Place (1858), the *Crimean Artillery Memorial* (Woolwich), the *Wellington* monument at the Guildhall (1855-6), and the *United States* group in the Prince Consort Memorial, Hyde Park (1873). A copy of the latter is in Washington, D. C.

**Bell, ROBERT** (1800-67), Irish journalist and miscellaneous writer, edited the London *Atlas* for many years, contributed the 'History of Russia' and 'Lives of English Poets' to *Lardner's Cyclopædia*, became editor (1840) of the *Monthly Chronicle*, and published three comedies—*Marriage* (1842), *Mothers and Daughters* (1843), and *Temper* (1847)—together with two novels. His great work is his unfinished annotated edition of the

English poets in 24 vols. (1854-7; new ed. 1866-7).

**Bell, ROBERT** (1841), acting director of the Geological Survey of Canada (1901-6), born at Toronto. Joining the Canadian Geological Survey in 1857, he was geologist and medical officer on the expedition of the *Neptune* in 1884, and of the *Alert* in 1885, to Hudson Strait and Bay. The western branch of the Nodaway which he surveyed in 1895, is named Bell River after him. He was in 1863-7 professor of chemistry and natural science at Queen's University.

**Bell, THOMAS** (1792-1880), dental surgeon and zoologist, was appointed dental surgeon to Guy's Hospital (1817), professor of zoology at King's College, London (1836), secretary of the Royal Society (1848-53), president of the Linnæan Society (1853-61). Chief works: *Hist. of British Quadrupeds* (1837; revised 1874); *British Reptiles* (1839); *British Stalk-eyed Crustacea* (1853); and an edition of White's *Selborne* (1877).

**Belladonna**, a name for the deadly nightshade or common dwale (*Atropa belladonna*), a perennial poisonous plant of the order Solanaceæ, indigenous to S. Europe and Asia, and cultivated in the United States. It has a much-branched rhizome, which yearly sends up rank stems to the height of three feet; its leaves are alternate, broad, pointed, and from three to eight inches long. The flowers are one inch long, arise singly in the axils of the leaves, and are of a greenish purple color; the berries, about the size of cherries, are deep violet black, and have a sweet taste; sometimes eaten with fatal consequences. The whole plant has a heavy, unpleasant smell, especially when crushed. Belladonna is useful in medicine chiefly by virtue of its active principle atropine, procured from the root by distillation, first with alcohol, and at a later stage with chloroform, after which it forms colorless crystals. There are two extracts of belladonna, a tincture, a plaster, ointment, and liniment; atropine is also used hypodermically, in an ointment, and in lamellæ or discs, for ophthalmic purposes. For external application, belladonna is prepared with alcohol, chloroform, or some other volatile substance, that it may penetrate the unbroken skin. An inflamed surface or a mucous membrane will admit it more readily. So applied it affects the sensory nerve terminations, depressing them, and thus acting as a local anæsthetic and anodyne. Hence its use in superficial inflammation, and in muscular rheumatism, gout, and neuralgia. It also affects the special nerves to sweat-

glands and milk-glands, and is therefore useful in hyperidrosis, and as an antilactagogue. Applied to the eye, it dilates the pupil by paralyzing accommodation, and is therefore used by the ophthalmic surgeon when examining the fundus of the eye, and to prevent adhesions of the iris in inflammation. Internally given, its action proceeds on the same lines. It lowers all secretions except those of the kidneys, and it lessens sensitivity. It is used for lessening sweat production in pthisis. The brain is not affected by medicinal doses, but poisoning has been caused by the free application of belladonna to inflamed or broken skin. The com-

*Belladonna and Fruit.*

monest form of poisoning is found among children who have eaten the berries, all parts of the plant being poisonous. In such cases dryness of the mouth and throat is followed by dilated pupils, a flushed face, uncertainty of gait, and possibly delirium and stupor, followed by death. Treatment is first by the stomach-pump or emetics, and next by such a stimulant as hot coffee, with warmth, and, if need be, artificial respiration. Pilocarpine and morphine are said to be antidotes, but can only be administered by a medical man, while the other remedies could and should be used at once. Another effective and simple antidote is vinegar. Belladonna is also prescribed for nausea, vomiting, spasmodic coughs such as whooping-cough, hay-fever, and asthma.

**Belladonna Lily** (*Amaryllis belladonna*), a native of the Cape of Good Hope, which is hardy only in the Southern United States. It has large bulbs; its leaves develop

in early summer, and die down before the flowering stems appear. The flowers are in umbels, pale rose in color, and about the size of white lilies.

**Bellagio**, tn. and summer resort, prov. Como, Italy, on the s. shore of the Lake of Como, at the apex of the peninsula which divides the two s. arms of the lake. It is in a most charming situation. It has numerous handsome villas and gardens—the Villa Melzi, built in 1810-15, being the most noteworthy. There is regular steamboat communication with Como and Lecco. Pop. (1901) 3,635.

**Bellahouston**, s.w. suburb of Glasgow, in par. of Govan, Lanarkshire, Scotland; has a very valuable cannel-coal pit. Pop. (1901) 10,906.

**Bellaire**, city, Belmont co., O., 3 m. s. of Wheeling, W. Va., on the Ohio R. and on the B. & O., the Pa. and other R. Rs. Iron, steel, farm implements, glass and enamel are the most important manufactures. Iron, coal and limestone occur abundantly in the region. Pop. (1910) 12,946.

**Bellamy, EDWARD** (1850-98), American author, was born at Chicopee Falls, Mass., and studied at Union College. He read law, and was admitted to practice, 1871, but early entered journalism, was assistant editor of the Springfield (Mass.) *Union*, 1872-6, and established with his brother the Springfield *Daily News*. He had published three works of fiction, *Six to One*, a *Nantucket Idyl* (1877), *Dr. Heidenhoff's Process* (1879), and *Miss Ludington's Sister* (1884), when his socialistic romance, *Looking Backward*, 2000-1887 (1888), appeared, and hitting the spirit of the time, was enormously successful, causing the formation of 'Nationalist' clubs throughout the United States, and being translated into many foreign languages. His sequel, *Equality* (1897), is a rather perfunctory performance.

**Bellamy, GEORGE ANNE**, 'GEORGIANA' (? 1731-88), an Irish-English actress, was daughter of Lord Tyrrawley, ambassador at Lisbon. Her first success was as Monimia in *The Orphan*, produced by Rich, Nov. 22, 1744. She afterward acted at Dublin and at Covent Garden, and played Juliet with Garrick (1750). See her own *Apology* (6 vols. 1785); Genes's *Account of the English Stage* and Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (1886).

**Bellamy, JACOBUS** (1757-86), a distinguished Dutch poet, was born at Flushing. He was first apprenticed to a baker, but sent (1782) by a clergyman to Utrecht University. He published *Gezan-*

gen mijner Jeugd (1782), *Roosje*, his most celebrated poem (1784), *Vaderlandsche Gezangen* (1783), and *Gezangen* (1785).

**Bell Animalcules.** See VOR-  
TICELLA.

**Bellarmino**, bel'är-min or mën, or BELLARMINO, ROBERT FRANCIS ROMULUS (1542-1621), Roman Catholic theologian, was born at Montepulciano in Tuscany. He became a Jesuit (1560), lectured at Louvain, held an appointment in the Collegium Romanum (1576-89), and in 1590 accompanied the legation sent into France by Pope Sixtus v. He was made cardinal in 1599, and archbishop of Capua in 1601, but resigned this post in 1605. He was a rigorous ascetic, and one of the greatest theologians that the Roman Catholic Church has produced. His works include: *Disputatio de Controversiis Christiana Fidei* (3 vols., 1581), *Christiana Doctrina Applicatio, Potestate Summi Pontificis* (1610), *Institutiones Hebraicae Linguae, De Scripioribus Ecclesiasticis, De Ascensione Mentis in Deum*.

**Bellary**, bel-lä'-ri, district and town, Madras, India. The district, lying between the Nizam's territories and Mysore, has an area of 5,714 square miles.

The town, which is one of the principal military stations in Madras, is strongly defended by two lines of fortifications, the upper fort crowning a rock 450 feet high. Pop. (dist.) 950,000; (town) 58,000.

**Bellatrix**, bel'a-triks (γ Orionis), a white star of 1.6 photometric magnitude, situated in the right shoulder of Orion. Bellatrix is a typical helium star. No parallax has been determined for it.

**Bellay**, be-lä', JOACHIM DU (1524-60), French poet, surnamed 'The French Ovid,' and 'Prince of the Sonnet,' was born in Lyré, near Angers. He was closely associated with Ronsard, whom he met in 1548, and with the famous group of poets known as the *Pléiade*, who sought to create a French school of Renaissance poetry. His well known *Défense et illustration de la langue francoyse* (1549) in prose was followed by *Recueil de poésie, L'Olive, Les antiquitez de Rome* (1558), *Regrets* (1559), and *Les Jeux rustiques*. A few of his poems—among them his best known piece, *Vanneur*—have been translated by A. Lang in *Ballads and Lyrics of Old France* (1872).

**Bell Bird**, a name given to various birds on account of their bell-like note. It is applied especially to *Chasmorhynchus niveus*, the campanero of the Spanish settlers in Guiana, one of the chatters; and to *Anthornis melanura* in New Zealand, a

member of the family Meliphagidae. The former is remarkable for a jet-black caruncle, about three inches long, which depends from the beak, and becomes elongated when the bird utters its bell-like note.

**Bell Buoy.** See BUOY.

**Belle Alliance**, bel-läl-i-äns', a farm in the centre of the French position at the battle of Waterloo, 13 miles south of Brussels, in Belgium. Belle Alliance is the name the Prussians give to the battle.

**Belleau Wood** (Fr. *Bois de Belleau*), be-lö', a wooded height, in the region northwest of Châteaueu Thierry, France, occupied by the Germans during the Great War and strongly defended by German infantry and machine gunners. It was attacked by the Second Division of the American Army (including two regiments of Marines) on June 10, 1918, and the following day, after violent fighting, was reported cleared of the enemy. A counter attack was opened by the Germans on June 13 and fighting of the most desperate character was continued until June 26, when the Allied possession of the wood was assured. In honor of the brilliant exploits of the U. S. Marines the wood was renamed by special order of General Dégoutte, *Bois de la Brigade de Marine*.

**Belleek'**, town, county Fermanagh, Ulster, Ireland, at the west end of Lough Erne; 3 miles east of Ballyshannon. It is famous for its production of *Belleek China*, a fine grade of porcelain highly glazed.

**Bellefontaine**, bel-fon'-tän, city, Ohio, county seat of Logan county, on the Cleveland, Cincinnati, Chicago and St. Louis, and the Toledo and Ohio Central Railroad; 30 miles north of Springfield. It has extensive railroad yards and car shops, flour mills, and manufactures of carriages, automobile bodies, iron and steel bridges, harness, automobile parts, cigars, brass faucets, and cement. Pop. (1910) 8,238; (1920) 9,336.

**Bellefonte**, bel-font', borough, Pennsylvania, county seat of Centre county, on the Pennsylvania and the Bellefonte Central Railroads; 34 miles southeast of Clearfield. It is beautifully situated at the foot of Bald Eagle Mountain, and is a popular summer resort, well known for a spring which has, with its abundant outflow, supplied the borough since 1807. It has flour and planing mills, iron and brass works, large lime and limestone operations, and a match factory. Pop. (1910) 4,145; (1920) 3,996.

**Belle Fourche River**, bel föörsh', the northern fork of the Cheyenne River (q. v.).

**Belle-Ile-en-Mer**, bel-le'-län-mär', island, Atlantic Ocean, forming a part of the department of Morbihan, France, lies 7 miles south of Quiberon Point, France. It is 11 miles long and from 2 to 7 miles wide, with an area of 34 square miles. There are pilchard and sardine fisheries, horses are bred, and agriculture is practiced. Off its coast the British fleet under Hawke defeated the French under Conflans in 1759. It was taken by the British in 1761, but was restored to France by the Treaty of Paris in 1763. Pop. 10,000.

**Belle Isle**, bel il', a rocky island, 9 miles long and 3 broad, at the Atlantic entrance to *Strait of Belle Isle*, Newfoundland; has two lighthouses, one of them 250 feet high. It is noted as the place of origin of the Newfoundland dog.

**Belle Isle**, island, Conception Bay, Newfoundland, about 6 miles long and 3 miles broad. It is fertile and picturesque, having lofty cliffs.

**Belle Isle**, CHARLES LOUIS AUGUSTE FOUQUET, DUC DE (1684-1761), French marshal, grandson of the famous intendant Fouquet, was born at Villefranche in Aveyron. He served with distinction in the War of the Spanish Succession, and was made governor of Metz and a marshal of France. In the war of the Austrian Succession he shared with Broglie the command of the forces, stormed Prague in 1741, and the following year conducted the masterly retreat to Eger. He became minister of war in 1758, and created the military Order of Merit in 1759.

**Bellenden**, bel'en-den (BALLENTYNE), JOHN (fl. 1508-50), Scottish poet and translator employed by James v, to translate Hector Boece's Latin *History of Scotland*, which was reprinted at Edinburgh in 1821, edited by Thomas Maitland, Lord Dundrennan. This was followed, also at the king's request, by a translation of Livy, which was first published at Edinburgh in 1822, also edited by Lord Dundrennan.

**Bellenden**, WILLIAM (c. 1555-1633), Scottish classical scholar of the family of Ballantyne or Bellinden, is said to have been professor at the University of Paris. He published *Ciceronis Princeps* (1608), a collection of Cicero's remarks on regal government; *Ciceronis Consul* (1612), a similar work concerned with consular authority; *De Statu Prisci Orbis* (1615); *De Tribus Luminibus Romanorum* (1634)—unfinished—an elaborate history of Roman institutions drawn from Cicero.

**Belle Plaine**, city, Iowa, Benton county, on the Iowa River

and the Chicago and North Western Railroad; 34 miles southeast of Marshalltown. It is the centre of an agricultural and dairying district and has foundries, machine shops, a brick and tile factory, cannery, and creamery. Pop. (1910) 3,121; (1920) 3,887.

**Bellerophon**, be-ler'ō-fon, a genus of univalve molluscs abundant in the earlier geological formations. The shells are globular, coiled in a flat spiral in one plane; the mouth is large and circular, with a deep notch in the outer lip, which, as the animal continues to grow, is gradually filled in with calcareous matter, forming a band or keel along the centre of the convex aspect of the shell.

**Bellerophon** (originally called **HIPPONOUS**), in Greek legend, son of Glaucus, king of Corinth, and of Eurymede, daughter of Sisyphus. Having accidentally killed the Corinthian Bellerus, he fled to his relative Prætus, king of Argos, whose wife, Antea, fell in love with the young hero. He rejected her offers, whereupon in revenge she poisoned her husband's mind against his guest. Prætus sent him to his father-in-law, Iobates, who imposed upon Bellerophon the task of slaying the Chimæra. Mounted on the winged steed Pegasus, he succeeded in killing the monster with his arrows. He was next sent against the Amazons, whom he also defeated. On his way home he destroyed an ambuscade of Lycians, sent by Iobates for his destruction. Subsequently the wrath of the gods fell on him, and he wandered, 'devouring his soul,' in loneliness through the Alean fields.

**Belleville**, bel'-vil, city, Illinois, county seat of St. Clair county, on the Southern, the Illinois Central, and the Louisville and Nashville Railroads; 18 miles southeast of St. Louis. It is the see of a Roman Catholic bishop and the seat of St. Elizabeth Hospital and other philanthropic institutions. Its principal industries are foundries and machine shops, flour mills, and manufactures of stoves, nails and tacks, shoes, and bricks. According to the Federal Census for 1919, industrial establishments number 114, with products valued at \$14,017,292. Pop. (1900) 18,756; (1910) 21,122; (1920) 24,823.

**Belleville**, city, Kansas, county seat of Republic county, on the Union Pacific and the Chicago, Rock Island and Pacific Railroads, and on the Pike's Peak Ocean-to-Ocean, and the Winniepeg-Gulf Highways; 201 miles northwest of Kansas City. The city has a hospital and a well-equipped tourist camp. It is the centre of a productive agricultural district, and has grain ele-

vators, flour mills, lumber yards, a creamery, bottle works, and an ice factory. Pop. (1910) 2,224; (1920) 2,254.

**Belleville**, town, New Jersey, Essex county, on the Passaic River and the Erie Railroad; adjacent to Newark, of which it is a residential suburb. It has a public library and Elks' Home. Industries include brass foundries and manufactures of chemicals, rubber goods, brushes, dynamos, baking machinery, and metal goods. Pop. (1910) 9,891; (1920) 15,660.

**Belleville**, town, Ontario, Canada, county seat of Hastings county, on the Bay of Quinte, Lake Ontario, and on the Canadian Pacific and the Canadian National Railways; 48 miles west of Kingston, and 113 miles east of Toronto. It is the seat of Albert College and of the Provincial School for the Deaf, and has a business college. There are mills, foundries and manufactures of cement, industrial alcohol, optical goods, and lock apparatus. According to the Canadian Census for 1919, industrial establishments number 101, with products valued at \$3,922,488. Belleville is a thriving trade centre for dairy products, live-stock, fruit, grain, fish, and lumber. Pop. (1911) 9,876; (1921) 12,206.

**Bellevue**, bel-vū', city, Kentucky, in Campbell county, on the Ohio River, opposite Cincinnati, of which it is a residential suburb, and on the Chesapeake and Ohio Railroad. The chief industry is the quarrying of sand and gravel. Overalls and license plates are manufactured. Pop. (1910) 6,683; (1920) 7,379.

**Bellevue**, city, Ohio, Huron and Sandusky counties, on the Pennsylvania, the New York Central, the New York, Chicago and St. Louis, and the Wheeling and Lake Erie Railroads; 13 miles southwest of Sandusky. Bellevue has a unique sewage system which consists of a series of holes (100 feet deep) drilled to connect with a natural underground stream emptying into Lake Erie. Industries include limestone quarries, railroad shops, and the manufacture of stoves, cultivators, and automobile accessories. Pop. (1910) 5,209; (1920) 5,776.

**Bellevue**, borough, Pennsylvania, Allegheny county, on the Ohio River, adjoining Pittsburgh, of which it is a residential suburb. It has the Suburban General Hospital and the Balph Memorial Park. Pop. (1910) 6,323; (1920) 8,198.

**Bellew**, bel'ū; *often* be-lōō', HAROLD KYRLE (1857-1911), English actor and playwright. After varied experiences in the British Navy, the Australian

goldfields, and in journalism, he achieved a rapid success on the English stage. He was leading man at Wallack's Theatre, New York (1885-6), and toured with Mrs. Brown Potter with a repertoire of plays. He also wrote several plays, including *Yvonne*, *Iolande*, *Hero and Leander*, and *Charlotte Corday*.

**Bellely**, bel-ā', town, department of Ain, France, near the Rhone; 39 miles by rail southeast of Bourg. It has an interesting cathedral (9th century) and bishop's palace (1609), and produces lithographic stones. Pop. (1921) 6,200.

**Bellflower**. See CAMPANULA.

**Belli**, bel'lē, GIUSEPPE GIOACHINO (1791-1863), Italian dialect poet, was born in Rome. In his youth he held a government post, and was secretary to a prince, but afterward he devoted himself to poetry, writing in the Roman dialect more than 2,000 sonnets (1831-46).

**Belligerent** is the term applied to a nation in a state of war. Its use marks an important distinction in international law between a *de facto* government at war and a subject state or race in rebellion, though in some instances, even when a nation is divided by internecine strife, recognition of the combatants as belligerents may become inevitable. Such was the case when, during the Civil War, Great Britain and France recognized the Southern States as a belligerent power.

A belligerent has the right to use every means which he considers necessary to bring his enemy to terms. This broad and general right, however, is modified by the humane usage of nations, and by international compact. These modifications, in their widest application, are summarized in the project of an international declaration concerning the laws and customs of war drawn up by the Brussels Conference of 1874, but not ratified. These prohibit the use of poisons or poisoned weapons, the murder of enemies or antagonists who lay down their arms, the employment of arms, projectiles, or substances which cause unnecessary suffering, such as explosive bullets (prohibited by the declaration of St. Petersburg in 1868, and signed by most European states), the abuse of a flag of truce, the national flag, the Geneva Cross, or the insignia or uniform of the enemy, attack or bombardment of open, or undefended towns or villages, and in case of bombardment of a fortified place direct that hospitals, religious, artistic, scientific, and charitable buildings, not used at the same time for military purposes, be spared. No town

taken by storm shall be given up to plunder. Lawful and disarmed enemies are prisoners of war, to be maintained and treated with humanity, and not to be deprived of their personal property. They may be interned in any locality, but may not be placed in confinement unless such is absolutely necessary. They may be employed on public works, but not in the operations of war. Prisoners attempting to escape may after summons be shot, and if retaken may be punished, but an escaped prisoner retaken is not liable to punishment for his previous escape. Exchange of prisoners and release on parole are lawful. If parole is broken and the prisoner is recaptured, he is deprived of the rights accorded to prisoners of war. War correspondents and other non-combatants with an army may be treated as prisoners of war, but spies and marauders have no such rights. For duties of belligerents with regard to the sick and wounded, see GENEVA CONVENTION. The population of an occupied territory cannot be compelled to fight against their own country, nor be made to swear allegiance to the enemy's power. The honor and rights of the family, the life and property of individuals, and their religious convictions and exercises should be respected. Private property cannot be confiscated, and pillage is expressly forbidden. Regulations are also made as to the duties of belligerents with regard to flags of truce, capitulations, armistices, belligerents interned and wounded treated in neutral territory.

See also WAR, LAWS OF; CONTRACTABAND OF WAR; PARIS, DECLARATION OF; HAGUE CONFERENCES; INTERNATIONAL LAW.

**Bellingham.** See PERCEVAL.

**Bellingham,** city, Washington, county seat of Whatcom county, on Puget Sound, and Bellingham Bay, and on the Chicago, Milwaukee and St. Paul, the Great Northern, and the Northern Pacific Railroads; 100 miles north of Seattle and 57 miles south of Vancouver, B. C. Electric railways and motor stage lines connect with surrounding towns, and there is ferry service to Vancouver Island. It is the nearest American city to Alaska and has steamship connection with Pacific and Atlantic ports. The city occupies an ideal site on the Pacific Highway with Mount Baker as the chief scenic attraction, and enjoys the advantage of one of the finest land-locked harbors in the world. The County Court House, the High School and State Normal School are among the most notable buildings.

Bellingham is the centre of a profitable agricultural region with poultry, grains, hay, and sheep as the leading products. The city is notable for being the tulip centre of the country, the experimental farm conducted by the U. S. government being located here. A great amount of shipping is carried on, principally in lumber. The industrial establishments include shingle mills, sawmills, and salmon canneries, one of the latter being among the largest in the world. The manufacture of cement, and dairy and food products is also of importance. The city was formed by the Union of Whatcom and Fairhaven, Dec. 28, 1903. Pop. (1910) 24,298; (1920) 25,585.

**Bellingham, RICHARD** (1592-1672), American colonial governor, was born in England, and went to America in 1634, being one of the original patentees of the Massachusetts colony. He was made deputy-governor in 1635, and governor for the first time in 1641, a position which he held continuously from 1665 until his death. He declined to return to England at the behest of Charles II.'s commissioners in 1664, to give an account of his conduct, and was able to smooth matters over by the present of a shipload of masts to the king. Bellingham was an honest but opinionated official, being especially severe in his treatment of the Quakers.

**Bellingshausen,** bel'ingks-hou'zen, FABRIAN GOTTLIEB VON (1778-1852), Russian explorer and naval commander, was born on the island of Osel. He headed an expedition which sailed in 1819 for the Antarctic regions and discovered Traversay Island, Peter Island, and Alexander Land, bestowing on them their respective names. Returning to Russia in 1821, he subsequently received the command of the Russian fleet in the Baltic, and finally became military governor of Cronstadt. A report of his work of exploration appeared in 1831.

**Bellini, bel-lē'nē,** GENTILE, (? 1429-1507), Italian painter, eldest son of Jacopo Bellini (q. v.), was probably born in Padua. He studied and worked in his father's studio and is believed to have settled in Venice about 1460. In 1464 he was commissioned to decorate the doors of the organ of St. Mark's, and the following year he painted the portrait of the Patriarch Lorenzo Guistiniani, now in the Academy of Venice. By 1474 his reputation was firmly established and he was appointed to restore the decorations of the Sala del Gran Consiglio in the Ducal Palace and in 1479 was

sent at the expense of the state to Constantinople, to paint the portrait of Sultan Mehmet II., who created him Bey. On his return to Venice Bellini resumed his work in the Council Hall and painted several large canvases depicting events in Venetian history, most of which were destroyed by fire in 1577. Among his finest works are *The Miracle of the Cross*, in the Academy at Venice, and the *Preaching of St. Mark*, in the Brera, Milan. Gentile's fame has been somewhat over-shadowed by that of his younger brother Giovanni, but during his lifetime he was probably considered the chief artist in Venice. His coloring is harmonious and his draughtsmanship excellent.

**Bellini, GIOVANNI** (c. 1431-1516), famous Italian artist, younger son of Jacopo Bellini (q. v.), was born in Padua or in Venice. He worked and studied with his father and brother in the former's studio and was greatly influenced by his brother-in-law, Andrea Mantegna (q. v.), especially in his earlier works. Upon his brother Gentile's departure to Constantinople, Giovanni was appointed to his position in the redecoration of the Ducal Palace and spent the remainder of his life on this undertaking and in executing private commissions, his chief work being the painting of altar pieces. During the last years of his life he was surrounded by pupils and imitators, the most famous of whom are Giorgione, Titian, and Tintoretto. Bellini is probably the greatest Italian artist of the 15th century. His work combines beauty of coloring, correctness of drawing, and vigor of treatment with the purest religious feeling. Among his most famous works, several of which are in the National Gallery, London, are the *Transfiguration*; *Madonna and Saints*; *Madonna between Saint Paul and Saint George*; several *Pietas*; *Doge Loredano*; *Madonna and Adoration of the Magi*; *Christ's Agony in the Garden*; and the *Coronation of the Virgin*. The Metropolitan Museum, New York City, has one of his *Madonnas*. Consult Berenson's *Venetian Painters of the Renaissance*; Tytler's *The Old Masters and Their Pictures*; Meynell's *Giovanni Bellini*.

**Bellini, JACOPO** (c. 1400-70), Italian painter, founder of the Venetian school of the 15th century, was born in Venice, the son of a tinsmith. He was a pupil of Pisanello and Fabriano, and accompanied the latter to Florence, where he became involved in trouble with a Florentine artist and was obliged to leave the city. He returned to Venice about 1429, and some years later

joined the School of St. John the Evangelist, for which he executed many important works, including a series representing the life of the Virgin and Christ, all of which have perished. About 1450 he established a studio, probably in Padua, where he and his sons worked. Very little of his work has survived, the only authentic examples being a damaged *Madonna and Child* in the Venice Academy, a similar composition in the Tadini Collection at Lovere, and a *Crucifixion* in the Gallery at Verona. One of his sketch books is in the British Museum and another in the Louvre, Paris. He was a fine draughtsman but lacked precise knowledge of anatomy.

**Bellini, LORENZO** (1643-1704), Italian physician and anatomist, was professor of anatomy at Pisa and senior consulting physician to Pope Clement XI. He discovered the action of the nerves on the muscles and the uriniferous tubes, known as Bellini's tubes. His research work in this connection is described in his *De Structura et Usu Renum* (1662). He had also some literary talent and left one unique volume of poetry, the *Bucchereide* (1729).

**Bellini, VINCENZO** (1802-35), Italian operatic composer, was born in Catania, Sicily, and studied at the Conservatorio, Naples. After composing an aria, a symphony, several masses and a cantata, he produced his first opera in 1825, *Adelson e Salvini*, which met with immediate success. This was followed by *Bianca e Fernando*, *Il Pirata*, and *La Straniera*. His *Zaira* (1829) was a failure, but in 1831 he produced his most popular operas, *La Sonnambula* and *Norma*. His last work, *I Puritani*, was also extremely successful. Though Bellini had little dramatic power, he possessed a gift of charming melody, full of grace, pathos, and tenderness. Consult *Life* by W. A. Lloyd.

**Bellinzona, bel'in-tso'na**, town, Switzerland, capital of the canton of Ticino, on the left bank of the Ticino River; 20 miles north of Lugano. It has a fine Abbey Church dating from the sixteenth century, and on the hills surrounding the town are the picturesque ruins of Castello San Michele, Castello Montebello, and Castello Corbaro. Bellinzona was formerly regarded as the key to the St. Gotthard and San Bernardino passes, but the modern fortifications at St. Gotthard have rendered it of less importance. Pop. (1920) 10,232.

**Bellite**, an explosive prepared from nitrate of ammonia and mono or di-nitro-benzene. It can be stored and transported with safety, not being exploded by a blow or by friction. It was dis-

covered in 1886, and is said to be three times more powerful than ordinary gunpowder.

**Bellman, bel'man**, KARL MIKAEEL (1740-95), Swedish poet, was born in Stockholm and received an excellent education. From about the age of twenty-five he was a frequenter of inns and taverns, and in this environment his peculiar talent for verse and melody flourished. Having attracted the notice of Gustavus III., he was given a small secretaryship and a yearly income, half of which he paid an assistant to do the work, while he continued his troubadour life on the remaining half. His poems, to which he usually composed zither accompaniments, are full of a kind of pathetic joyousness and unique charm, in spite of occasional coarse passages. The most important of Bellman's verses were issued as *Fredman's Epistlar* (1790) and *Fredman's Sanger* (1791). The best edition of his works is by Carlén (1881). Consult Erdmann's *Carl Michael Bellman*.

**Bell Metal**, an alloy used in the manufacture of bells. The usual composition is 75 parts of copper to 25 of tin, or 78 of copper and 22 of tin, although sometimes the alloy consists of copper, tin, zinc, and lead. A large percentage of copper gives a deep tone, but iron, zinc, and tin give a sharper ring.

**Bello, bel'lo**, FRANCESCO, Italian epic poet (c. 1450-1505), known from his blindness as Ciego da Ferrara, lived at Mantua and Ferrara in great poverty. His poem in 45 cantos, *Mambriano* (first ed. 1509), is a chivalrous romance depicting the adventures of an Oriental prince, and is one of the books which directly inspired the *Orlando Furioso* of Ariosto.

**Belloc, be-lok'**, HILAIRE (1870- ), English author, was born in France and was educated at Balliol College, Oxford, where he gained a scholarship in history. He served for a time in the French army and then entered the literary field, where he has achieved success as a magazine writer, historian, essayist, and novelist. He served two terms in Parliament (1906-10). His books include *The Bad Child's Book of Beasts* (1896); *The Modern Traveller* (1898); *Danton* (1899); *Lambkin's Remains* (1900); *Robespierre* (1901); *Path to Rome* (1902); *Emmanuel Burden* (1904); *The Old Road* (1905); *The Historic Thames* (1909); *First and Last* (1911); *Paris* (1912); *The Path to Rome* (1912); *The Book of the Bayeux Tapestry* (1913); *High Lights of the French Revolution* (1915); *Hills and the Sea* (1915); *The Elements of the Great War* (1915); *The Free Press*

(1918); *Europe and the Faith* (1920); *The Jews* (1922); *Sonnets and Verses* (1923).

**Bello Horizonte, bel'o õ-rõ-sõn'tã**, capital of Minas Geraes, Brazil, on the slopes of the Serra de Espinhaco, northwest of the former capital, Ouro Preto; 376 miles northwest of Rio de Janeiro. It is a beautifully laid-out, up-to-date city with handsome public buildings, fine broad streets, gardens and modern improvements. There are cotton mills, and gold, iron and manganese occur in the vicinity. Pop. 60,000.

**Bellona, bel-o'na**, the Roman goddess of war, sister, wife or daughter of Mars. Her worship is possibly of Sabine origin, but her first temple at Rome was not founded until 296 B.C., in the Campus Martius. In it the Senate assembled to give audience to foreign ambassadors, and to victorious generals. Consult Keightley's *Mythology of Ancient Greece and Italy*.

**Bellot, bel-o'**, JOSEPH RENÉ (1826-53), French naval officer and Arctic explorer, was born in Paris. He distinguished himself for bravery in the French expedition against Tamatave in 1845, and in 1851 joined the British Arctic expedition in search of Sir John Franklin, in the course of which he reached the strait called by his name. Two years later he accompanied an Arctic expedition whose chief object was to convey despatches to Sir Edward Belcher in the Polar Seas, and while attempting to cross some thin ice was blown into a deep crevice by a violent gust of wind and perished. Consult his *Journal* edited by Lemer (1854).

**Bellot Strait**, a narrow strait in the Arctic region between North Somerset Island and Boothia, connecting the Gulf of Boothia and Franklin Channel. It is about midway between the Arctic Ocean and Baffin Bay. It is some twenty miles long and one mile wide, and was discovered by Kennedy on the British expedition in search of Sir John Franklin, 1851, and named by him in honor of Lieutenant Bellot (q. v.).

**Bellotto, BERNARDO**. See CANALETTO.

**Bellows**, a mechanical device for producing a current of air. The usual form of bellows is a chamber formed of two pieces of wood, generally heart-shaped, fastened together with a flexible band of leather and having a nozzle at one end and a valve in the lower board for the admission of air. The air is admitted by the drawing apart of the boards and is forced out through the nozzle by the closing of the boards. There are various modifications of this common form.

MADONNA AND CHILD, BY GIOVANNI BELLINI

**Bellows, GEORGE WESLEY** (1882- ), American artist, was born in Columbus, O., was educated at Ohio State University and studied under Robert Henri. He has exhibited in Venice, Rome, Berlin, London, and the principal cities of the United States, and is a member of the National Academy. Bellows has been called the painter of democracy. One critic says of him that he suggests the American journalistic reporter armed with palette and brush rather than pen. His work is notable for its power rather than its beauty, and is vibrant with life and action. Among his best known paintings are *On the Beach*, *The Cliff Dwellers*, *Men of the Docks*, *Forty-five Kids*, *Lillian, Anne*, *Portrait of Dr. W. O. Thompson*, *The Circus*, *The River Front*, *The Polo Crowd*.

**Bellows, HENRY WHITNEY** (1814-82), American clergyman, was born in Boston, Mass. He was graduated from Harvard (1832) and from the Cambridge divinity school (1837), and in 1839 was ordained pastor of the First Congregational church in New York, the name of which was twice changed, to the Church of the Divine Unity and to All-Souls Church. Here he served as pastor for forty-three years, gaining a considerable reputation for his eloquent preaching. He was founder and principal editor (1846-50) of the *Christian Inquirer*, a Unitarian weekly, and was on the staff of other religious papers. He delivered a course of Lowell lectures in Boston on *The Treatment of Social Diseases* (1857), and defended the moral influence of the stage in a lecture before the Dramatic Fund Society, the same year. He also published volumes of sermons and travels. From 1861 until 1878 Dr. Bellows was president of the U. S. Sanitary Commission (q. v.).

**Bellows Falls**, village, Vermont, Windham county, on the Connecticut River, and on the Rutland, and the Boston and Maine Railroads; 80 miles south of Montpelier. It is picturesquely situated amid mountainous scenery. The falls in the river have a descent of 50 feet. Paper, farm implements, and paper machinery are manufactured. Pop. (1910) 4,883; (1920) 4,860.

**Belloy, bel-wá'**, **PIERRE LAURENT BUIRETTE DE** (1727-75), French dramatist, a native of Auvergne, entered the dramatic profession, and attained success as an actor in Russia. In Paris, in 1760, he produced his tragedy *Zelmire*, a marked success, followed by *Le Siège de Calais* (1765), also well received, and *Gaston et Bayard* (1771), which procured his admission to the Academy. Among his other plays are *Ca-*

*bielle de Vergy* (1770) and *Pierre le Cruel* (1772). His collected works were published by Gaillard in 1779 and 1787, and a selection by Anger in 1811.

**Bell Pepper**, the fruit of the *Capsicum grossum*, or Guinea pepper, used as a vegetable, and for pickling. See PEPPER.

**Bell Ringing**. See BELL.

**Bell Rock**, or INCHCAPE ROCK, a rocky reef, in the North Sea, off the coast of Forfarshire, Scotland, 12 miles southeast of Arbroath, surmounted by a lighthouse 120 feet high. The tradition that the bell placed there by the abbot of Aberbrothock was removed by a pirate whose vessel was at length wrecked on the reef is celebrated in Southey's ballad, *The Inchcape Rock*.

**Bells**, a nautical method of expressing the time of day. The twenty-four hours are divided into periods of four hours, each half-hour of these being represented by one bell. Thus, beginning at twelve o'clock, half-past twelve is 'one bell,' one o'clock 'two bells,' half-past one 'three bells,' two o'clock 'four bells,' continuing up to four o'clock, or 'eight bells,' when the round begins again.

**Bell-Smith, FREDERICK MARLETT** (1846- ), Canadian painter, was born and educated in London. After studying painting in Paris he went to Canada, living first in London, Ontario, and later in Toronto. He is known both for his successful work in figure and portrait painting and for his landscapes. His pictures of the Northwest and Rocky Mountain scenes are of particular merit. His best known works include *Landing of the Blenheim*, with *Sir John Thompson's Remains*; *Queen Victoria's Tribute to Canada*; *Lights of a City Life*.

**Bell's Palsy**, or PARALYSIS. See PARALYSIS.

**Bell-the-Cat**. See DOUGLAS.

**Bell Tower**. See CAMPANILE.

**Belluno**, bel-lōō'nō, province, Italy, in the northern part, lying between Tyrol and Venetia, with an area of 1,276 square miles. It is almost entirely mountainous and is watered by the Piave. Pop. (1921) 228,714.

**Belluno**, (Rom. *Belunum*), city and episcopal see, Italy, capital of the province of Belluno, is situated on a lofty height overlooking the Piave; 72 miles north of Venice. The chief points of interest are the Cathedral, dating from 1517, the Palazzo der Rettori, now the prefecture, the Municipio, and the Museum, with a good collection of paintings, bronzes, and natural history specimens. There are manufactures of silk and leather. Belluno was the birthplace of Pope Gregory XVI. Pop. (1921) 26,770.

**Belluno, DUKE OF**. See VICTOR, CLAUDE PERRIN.

**Bellwood**, borough, Pennsylvania, Blair county, on the Pennsylvania Railroad; 8 miles northeast of Altoona. Pop. (1910) 2,277; (1920) 2,629.

**Bellwort**, small perennial herbs (*Uvularia*) of the order Liliaceae, found in Eastern North America. They have short creeping, fleshy rootstocks; slender stems; alternate leaves, oval, ovate, or lanceolate, with smooth margins; and drooping, bell-shaped flowers, with elongated perianth segments. The most striking, found in rich woods, is the Large-flowered or Smooth Bellwort (*U. grandiflora*), with a deep-yellow blossom. The Mealy Bellwort (*U. perfoliata*), is similar but with smaller flowers, of a paler color. The Sessile-leaved Bellwort (*Oakesia*) is similar to *Uvularia* but with a slender creeping root stock and rough-margined leaves. *O. sessilifolia*, or Wild Oats, is common in moist, low woods and grassy lands from Maine to Florida.

**Belmez, bel-māth'**, town, Spain, province of Cordova, 45 miles by rail northwest of Cordova. It is the centre of important coal fields. Pop. about 12,000.

**Belmont**, town, Massachusetts, Middlesex county, on the Central Massachusetts and the Fitchburg divisions of the Boston and Maine Railroad; 6 miles northwest of Boston. It is an attractive residential town, and the seat of the McLean Insane Asylum. Market gardening is carried on. Pop. (1900) 3,929; (1910) 5,542; (1920) 10,749.

**Belmont**, village, Missouri, Mississippi county, on the Mississippi River, about 20 miles below the confluence of the Ohio, and on the Missouri Pacific Railroad. It was the scene of a sharp battle, Nov. 7, 1861, in which General Grant, after taking the Confederates' camp, was forced to retire before their overwhelming reinforcements. Pop. about 200.

**Belmont**, town, Cape of Good Hope, 50 miles southwest of Kimberley. Here, on Nov. 22 and 23, 1899, Lord Methuen drove the Boers from a strong position on the railway, and on the following day stormed Gras Pan.

**Belmont, AUGUST** (1816-90), American financier, was born in Alzey, Germany. He was in the employment of the Rothschilds in Frankfurt and Naples until 1837, when he became their agent in New York. He was consul-general at New York for the Austrian government in 1844-50, was U. S. minister to Holland, 1854-8, and negotiated an important consular convention with The Hague government. Mr.

Belmont was active in both social and political life in New York, was president of the American Jockey Club for twenty years, and chairman of the National Democratic Committee from 1860 to 1872. He was a vigorous war Democrat, and used his influence with foreign leaders of finance in favor of the Union. As a banker, he was prominent in many large railroad transactions and acquired a large fortune.

**Bel'mont**, AUGUST (1853-1919), American banker, son of August Belmont (1816-90), was born in New York City and was graduated from Harvard University in 1874. On the death of his father, he became the head of the firm of August Belmont and Company, was a director in many corporations, and chairman of the board of directors of the Interborough Rapid Transit, the Interborough Consolidated Corporation, and the Rapid Transit Subway Construction Company.

**Belmont**, PERRY (1851- ), American lawyer and politician, was born in New York, and was graduated (1872) from Harvard. He studied law at Columbia, and practised in New York until his election to Congress. He was a member from New York, 1881-7, was chairman of the committee on foreign affairs, 1885-7, and was an active promoter of Democratic measures. Mr. Belmont was U. S. Minister to Spain, 1888-9, after which he resided in New York.

**Beloit**, bē-loit', city, Kansas, county seat of Mitchell county, on the Solomon River, and on the Missouri Pacific, and the Union Pacific Railroads; 195 miles northwest of Kansas City. It is the seat of the State Industrial School for Girls and has a public library, court-house, and Federal building. The chief industries are flour milling and trade in building stone, agricultural produce, and live-stock. Pop. (1910) 3,082; (1920) 3,315.

**Beloit**, city, Wisconsin, Rock county, on Rock River, at the southern boundary of the State, and on the Chicago and North Western, and the Chicago, Milwaukee and St. Paul Railroads; 85 miles northwest of Chicago. It is built on high ground, and has wide streets. It is the seat of Beloit College (q. v.) and has a public library. Industries include mills, foundries, and the manufacturing of agricultural implements, gasoline engines, windmills, paper, shoes, and scales. According to the Federal Census for 1919 industrial establishments number 59 with \$16,-939,092 capital, and products valued at \$21,105,232. Pop. (1900) 10,436; (1910) 15,125; (1920) 21,284.

**Beloit College**, a non-sectarian educational institution founded in 1846, in Beloit, Wisconsin. Until 1874 it offered only classical courses; a science course was established in 1892. Women were first admitted to the college classes in 1895. At present courses are given leading to the degrees of B.A. and B.S. The college has a system of accredited schools, whose students graduating with a required rank are admitted without examination. The library contains about 71,000 volumes. The Logan Museum of American Archaeology and the Art Hall contain valuable collections. For recent statistics see Table of American Colleges and Universities, under the heading COLLEGE.

**Belomancy**, bel'ō-man-si, divination by means of arrows. Nebuchadnezzar had recourse to this form of divination (Ezek. xxi. 21-22), and there is an indication of it in the story of Elisha and Joash, king of Israel (2 Kings xiii. 14-19). It was in extensive use among the Arabians.

**Belon**, b'lōn, PIERRE' (1517-64), French naturalist, was born in Soullière, near Mans. Under the patronage of the Cardinal de Tournon, he travelled for scientific purposes in Greece, Asia Minor, Palestine, and Egypt (1546-9). He published his *Observations* during these journeys (1551-8) and wrote also on marine fish (1551) and birds (1555).

**Belovar**, bel'ō-vār, former county of Hungary, now included in Yugoslavia, lies between the Drave and the Save. The surface is mountainous, but the soil is fruitful. Area, 1,442 square miles. Pop. (1910) 331,385.

**Bel'per**, market town, England, in Derbyshire, on the Derwent River; 7 miles north of Derby. There are manufactures of cotton yarn, hosiery, linens, and nails. Coal and iron are found in the vicinity. Pop. (1921) 12,125.

**Belphæbe**, bel-fē'bi, a character in Spenser's *Fabrie Queene*, twin sister of Amoret, typifying Queen Elizabeth as the embodiment of womanly virtue and chastity.

**Bel'sham**, THOMAS (1750-1829), English Unitarian divine, was appointed minister of the Independent chapel, Angel Street, Worcester, in 1778, and was head of Davenport Academy from 1781 to 1789. After becoming a Unitarian, he was successively professor of divinity in the Hackney College (1789), minister of the Gravel Pit Unitarian chapel (1794), in succession to Priestley, and of Essex Street Chapel (1805-29). His published works include: *Memoirs of Theophilus Lindsey* (1812); *Ele-*

*ments of the Philosophy of the Human Mind* (1801); *Letters to the Bishop of London in Vindication of Unitarianism* (1815).

**Belsham**, WILLIAM (1752-1827), English political writer and historian, brother of Thomas Belsham, devoted his life to the promotion of Whig doctrines. He wrote *Essays, Philosophical, Historical, and Literary* (1789-91), and *Remarks on the Nature and Necessity of Political Reform* (1793). His historical works were reissued in 1806 in 12 vols., under the title *History of Great Britain to the Conclusion of the Peace of Amiens*.

**Belshazzar**, bel-shaz'ar, a Babylonian prince. The book of Daniel (v.) makes him the son of Nebuchadnezzar, and the last Chaldean king of Babylon, and relates the story of the feast at which he was warned of the impending fate of his kingdom by a mysterious writing on the wall. This is not, however, in agreement with other ancient records, according to which Nabonidos was the last king of Babylon. Cuneiform inscriptions discovered in 1854 would indicate that Belshazzar (or Bel-sharra-uzur) was the eldest son of Nabonidos, that he was in command of the Babylonian army, and though not himself king, was the last great defender of the Babylonian monarchy. Consult *Commentaries* on the Book of Daniel.

**Belt**, GREAT, a strait between Zealand and Fünen, Denmark, the middle channel connecting the Baltic and the Kattegat. It is about 40 miles long, and from 10 to 20 miles broad, the depth varying from 30 to 150 feet. Navigation is rendered difficult by shoals, and in winter by ice.

**Belt**, LITTLE, strait between Jutland and Fünen, the west channel connecting the Baltic and the Kattegat. It is about 30 miles long, and from less than a mile to 12 miles broad, the depth varying from 30 to 180 feet. The hindrances to shipping are similar to those of the Great Belt. During the first four months of the year it is generally frozen.

**Belt and Rope Transmission.** Power developed by a prime mover can rarely be used directly; it must be transmitted, in many cases, to a considerable distance from its source. Belting, running upon pulleys, is a means for such transmission universally in use. It cannot be used, however, where an exact proportional movement between the driving and the driven shafts is to be preserved, because of the unavoidable slip in belts. Such movements are therefore transmitted by trains of cogged gear or chains. The length of the drive and its location determine the mechanism most suitable.

When the distance is comparatively great and the level of the driven shaft is at a considerable angle above the horizon of the driving shaft the rope drive is generally preferred.

Belts are of two general classes: leather and fabric. The fabric belts are mostly of a cotton base, treated with various substances—*asphalt, rubber, balata, etc.* In a class by itself is the camel's-hair belt. Steel belts have had so far a limited use. The rope used in power transmission is of cotton or manila.

**Leather Belts.**—First-quality belts are made exclusively of oak-tanned hides of steers; only the central part of the hide, lying 15 inches on either side of the backbone, from the shoulder to the tail, is considered good enough for the best belts. These strips are about 48 inches long when cut, and are stretched lengthwise to 54 inches. Their ends are skivered for laps of from 3½ inches for narrow belts to 6 inches for wide belts, and the joints are cemented with a glue made expressly for this purpose. After the cement has hardened the belting is again stretched at a strain of 2,500 lbs. per square inch of section. Chrome-tanned belting is especially useful where the belts must work in a temperature above 150 °F. and in conditions of extreme moisture. They are thinner than oak-tanned leather and are extremely pliable; and are preferred for high-speed work on small pulleys.

Leather belts are of one, two, or three ply; and some three-ply belts have the middle layer of rawhide, which is about three times stronger than leather and much more pliable. Belts entirely of rawhide are also in use, but are less satisfactory in the long run than tanned material.

The joining of leather belts is commonly by lacing; the ends being scrupulously squared and the edges being drawn close together with rawhide lacings run through holes punched not less than half an inch back for narrow belts and further for wide belts. Five holes on each side of the joint are enough for a 4-inch belt; 9 to 15 holes for a 6-inch belt. The stitch used in lacing is shown in Fig. 1

Fig. 1

Fig. 2

as it appears on the outer side of the belt; on the inner side the lacing strands lie parallel to the length of the belt. An endless belt, cemented at the factory, is

preferable, transmitting 15 per cent. more power than a laced belt. Patent metal clasps, shown in Fig. 2, are also in use.

**Fabric Belts.**—There are three types of fabric belts having cotton as a basis: solid-woven, canvas, and rubber or balata. Solid-woven belts are woven directly to the required thickness. Canvas belts are made by stitching together several layers of canvas, as many as 12 in some cases. Rubber and balata belts are made up of layers of canvas with rubber or balata gum in between. In cotton belts the fabric is almost always impregnated with asphalt or a similar substance, which at once enables them to withstand moisture and machine oil, and also lubricates them to a state of greater pliability, and through the reduction of internal friction gives them a longer life. Without this treatment they deteriorate rapidly. Stitched fabric belts are cheaper in first cost, but are less pliable than the solid-woven type.

Rubber belts are built up of several plies of canvas, one upon another, cemented together with a composition largely of rubber. A coating of rubber is then spread upon both sides and the entire belt is vulcanized. The thickness of the outer coatings is determined by the work the belt is to perform. Rubber belts are made from 4 to 12 plies in thickness. They are preferred when the belt is exposed to the weather or to steam. The balata belt is built up in the same way, using balata gum instead of rubber. Balata cannot be vulcanized, however, and will not endure exposure to heat or oils. Balata belts have a superior grip on pulleys, require no dressing, and do not deteriorate with age.

Camel's-hair belts are woven solid. They have a high coefficient of friction, endure heat and moisture, and stand up well under severe operating conditions; but are expensive.

**Steel Belts.**—Steel band belts are made from a specially prepared charcoal steel, rough-rolled when hot, and brought to the required thickness and width by cold working. For these belts it is necessary to cement a cork-

surfaced canvas face on the pulleys used. A steel belt needs to be only one-third the width of a leather belt for the same power. Steel belts are replacing rope

drives in some of the British cotton mills and saving considerable power and time formerly spent in repair.

**Rating of Belts.**—Belts are rated by the manufacturer as

Fig. 3

capable of transmitting a certain horsepower. These ratings are calculated on driving and driven pulleys of the same diameter, and an arc of belt contact of 180°. In such case the power transmitting capacity of a belt is directly proportional to its width. When the pulleys are of different diameter, the arc of contact on the smaller pulley is less than the rating arc and a wider belt is needed to transmit a given power.

The general formula for determining the power rating of a belt is  $H = \frac{S \cdot W \cdot V}{33000}$  where H is the horsepower, S the effective belt pull in pounds per inch of width, V the belt velocity, and W the width of the belt in inches. The variable factor is the difference between the tensions on the tight and slack sides; and this is affected by belt velocity, arc of pulley contact, and belt thickness (as related to pulley diameter).

**Belt Tension.**—The tension of a belt should be just sufficient to prevent loss of power through slip. To strain a belt tighter than this is to shorten its life, cause hot bearings, and increase wear of the bearings. The tension when the belt is at rest should be close to 100 pounds per inch of width. The tension varies inversely as the sag. While recent practice is to run belts at a higher tension than formerly, it is best to use such dressing on the belt as will permit it to run 'easy,' yet without slip. Tighteners bring strain on the journals and should not be used; an idler set close to the smaller pulley will take up slack and increase power by increasing the arc of

contact. Rubber belts may be run with higher tension than

leather belt pulls 55 lbs. per inch of width; a heavy double, 88 lbs.; a heavy triple, 110 lbs. The efficient horsepower equals this pull times the speed in feet per minute times the belt width, divided by 33,000. Light belts would give 80 per cent. of this horsepower, and medium belts, 90 per cent. These figures are based upon pulleys of equal arcs (180°) of contact; the effect of other arcs may be gauged by reference to the three types of drive shown in Fig. 4, where A, B, and C are the driven pulleys. At 600 feet per minute a rubber belt will transmit one horsepower for each inch of width. A four-ply rubber belt is equivalent to a single leather belt; a six-ply thickness to a double leather belt. A rubber belt must be watched to see that

**Rope Drives.**—Cotton ropes are used almost altogether in rope drives, manila fibres being too stiff and brittle for long wear and requiring frequent stoppages to take up slack. The ropes are

Fig. 4

leather belts, but only with greater wear of the bearings.

**Pulleys.**—The life and efficiency of belts depend largely on the size of the pulleys, which should be as large as space permits without raising the belt velocity to more than 4,500 feet per minute. The face of the pulley should be wider than the belt by an inch for each 4 inches of belt width, and be slightly crowned—about 1/8 inch for each 12 inches width of face.

Wood pulleys afford a better grip than either cast-iron or steel pulleys; but the latter may be improved by boring holes through the face, or by setting cork inserts in staggered pits in the face, or by covering the face with rubber or leather cemented on. Solid cast-iron pulleys are usually limited to a face speed of 3,000 feet per minute, and split pulleys to 1,800 feet. Split steel pulleys are run up to 6,000 feet per minute.

**Speed of Belts.**—Critical speed is reached for most belts at 5,000 feet per minute; above that the slip is so great that the power transmitted is lessened. The best belt velocity is expressed by the formula,  $v = 5.27\sqrt{s}$ , where  $v$  is the speed in feet per minute and  $s$  the tensile strength of the belt in pounds per square inch of section. For rubber belts the speed should be held down to below 4,000 feet per minute. Fig. 3 shows graphically the effect of speed upon horsepower delivered.

**Power Transmission.**—The flesh side of a leather belt should not be run next the pulley face. When a belt is new, the flesh side gives the best traction for a few days, but later transmits only 60 per cent. as much as the hair side. A thin belt transmits less power than a thick one. A heavy single

Fig. 5

run on pulleys with grooved faces; the size of the rope determines the size of the groove, but the angle is always at 40°. The rope grips by pinching in the groove, as shown in Fig. 5. The sides of the grooves must be free from the slightest roughness

Fig. 6

it does not slip excessively. Slip not only wastes power but shortens the life of the belt. A leather belt will save its cost above a rubber belt in three years.

and be kept clean at the bottom. The ends of the ropes are spliced together with a lap of 82 times their diameter, and the splices kept rigidly to the original size,

smooth and free from lumps. The diameter of the smallest pulley should be at least 30 times the diameter of the rope for ordinary speeds. For low speeds this figure may be reduced: a half-inch rope will run well on a 4-inch pulley at 1,000 feet per minute, and an inch-rope on an 18-inch pulley at 2,000 feet per minute.

A rope drive will not work at all unless accurately installed. A small number of large ropes is better than a greater number of small ones. Every rope added decreases the proportional power transmitted. The following table shows the horsepower that is transmitted by cotton driving ropes at different speeds:

Velocity of Rope in Feet per Min.	Horsepower transmitted.					
	1 in.	1½ in.	1¾ in.	1½ in.	1¾ in.	2 in.
1,000	4.5	7.1	10.2	14.0	18.2	
2,000	9.1	14.2	20.5	28.0	36.5	
3,000	12.6	19.8	28.4	38.7	50.4	
4,000	14.8	23.2	33.4	45.5	59.4	
5,000	15.4	24.1	34.6	47.1	61.5	

Two systems are employed: the multiple, and the continuous. In the former each rope on a pulley forms an independent belt; in the latter only one rope is used, and it is carried continuously around all the pulleys, with but one splice. The slack, which is very considerable in a continuous rope, is taken up by a movable idler pulley placed in a bight of the rope, and so weighted as to keep a proper strain on the entire rope. Fig. 6 shows in plan and elevation the disposition of a 30-rope drive.

**Bibliography.**—Consult C. G. Barth's *Transmission of Power by Leather Belting*, in *American Society of Mechanical Engineers Journal*, Vol. xxxi. pp. 43-78; H. E. Collins' *Shafting, Pulleys, Belting and Rope Transmission*; R. T. Kent's *Power Transmission by Leather Belting* (1916); W. G. Dunkley's *Belts for Power Transmission* (1920).

**Beltane**, bel'tān, BELTAINÉ, or BELTINE, a word found in Scotland, Ireland, Cumberland, and Cornwall, applied in a secondary sense to the first of May (or, in some districts, to St. John's Eve and St. Peter's Day), but originally used to denote the great fire festivals which marked the beginning of summer. Traces of human sacrifices at them were particularly clear. Beltane cakes were baked for the occasion, and used in casting lots to determine which of the company was to be sacrificed as the Beltane witch, the death penalty being mitigated into a mild form of social outlawry. Songs and dances, known as Beltane games, were

also an accompaniment of the ceremony. The antiquity of these observances is further indicated by the fact that the bonfire was kindled by the primitive method of 'forced' or 'need' fire (Gael. *vein-eigin*)—i.e. from combustion produced by the violent friction of two pieces of wood. The Beltane rites continued to linger on into the 19th century in certain parts of the British Isles.

**Belton**, city, Texas, county seat of Bell county, on the Leon River and the Missouri, Kansas and Texas of Texas, and the Gulf, Colorado and Santa Fe

ground, or a room built above the roof of a house for the purpose of viewing the surrounding country. In France the term is also used for a summer-house in a garden. Two important structures are known by this name—the Court of the Belvedere in the Vatican, which forms part of the sculpture gallery, and a palace near Vienna, built in 1725 for Prince Eugene of Savoy.

**Belvidere**, city, Illinois, county seat of Boone county, on the Kishwaukee River, and the Chicago and North Western Railroad; 75 miles northwest of

*Beluga, or White Whale*

Railroads; 40 miles southwest of Waco. It is the seat of Baylor Female College (Baptist), and has a county court-house and Carnegie library. The chief industries are connected with the export of cotton and marble, also flour, lumber, and brick. Pop. (1910) 4,164; (1920) 5,098.

**Beltrami**, bel-trā'mē, EUGENIO (1835-1900), Italian mathematician, was born in Cremona and taught mathematical physics in the University of Rome and other Italian universities. He is remembered for the important departures which he made in the study of geometry. His was the theory that non-Euclidian geometry deals with surfaces of constant negative curvature. He published *Saggio di interpretazione della geometria non-euclidia* (in *Giornale Matematica* VI.), and other valuable papers on mathematics, physics, electricity, magnetism, and elasticity.

**Beluchistan**. See BALUCHISTAN.

**Beluga**, be-lōō'ga, or WHITE WHALE (*Delphinapterus leucas*), a cetacean allied to the dolphins, and especially to the narwhal (q. v.). The beluga is from eight to ten feet in length, is white in color, and is found in the Arctic seas, but occasionally strays southward. In spring it chases the herring and other fish, upon which it preys, into bays and shallow waters, where it is easily killed by the Eskimos.

**Belur-tagh**, or BOLOR-TAGH. See PAMIRS.

**Belus**, in Greek mythology, son of Poseidon and Libya, and father of Ægyptus and Danaus. He was supposed to have founded Babylon.

**Belvedere**, bel-vi-dēr', a summer-house or kiosk on rising

Chicago. It has a public library, court-house and city park. Belvidere is a manufacturing centre, producing sewing machines, automobiles, boilers, bicycles, razors, screen doors, flour, and dairy products. Pop. (1910) 7,253; (1920) 7,804.

**Belvisia** (*Napoleona imperialis*), an African plant closely allied to the mangrove (q. v.), with flowers of a brilliant red, blue, or white color, and an edible fruit resembling the pomegranate.

**Belvoir Castle**, bē'vær, Leicestershire, England, the seat of the Duke of Rutland. The original building was a fortress, erected soon after the Conquest by Robert de Todeni. The present pile is a modern castellated, hollow quadrangle. It contains a noble apartment called the Regent's Gallery, 127 feet long. The castle commands a view of thirty miles over the picturesque Vale of Belvoir.

**Belzoni**, bel-tso'nē, GIOVANNI BATTISTA (1778-1823), Italian Egyptologist, was born in Padua. In 1803 he went to England, and for some time supported himself and his English wife by street acrobatic performances; but with an engagement at Astley's Amphitheatre his circumstances improved, and he devoted much time to studying mechanics. In 1812 he began to travel, visiting Portugal, Spain, and Egypt, where he designed a hydraulic machine for raising the waters of the Nile. He then visited Thebes, and removed the Young Memnon statue, which he sent to London. He investigated the temple of Edfu, visited Elephantina and Philæ, discovered the temple of Abusimbel, worked at Karnak, and found a magnifi-

cent tomb in the Bibân-el-Moluk. He was the first to enter the second pyramid at Gizeh, and to visit the oases west of Lake Moeris. In 1821 he published his *Narrative of Recent Discoveries in Egypt and Nubia*. He then attempted to reach Timbuktu, but died on his way inland from Benin.

**Bem**, JOSEPH (1795-1850), Polish general, was born in Tarnow, Galicia. He took part in the Polish rebellion of 1830-31, distinguished himself at Ostrolenka, and after the fall of Warsaw (1831) took refuge in Paris. In 1848, at the head of 10,000 Hungarian insurgents, he overran Transylvania, but was defeated by the allied Austrians and Russians at Schässburg on July 31, 1849, and again at Temesvar on Aug. 9, 1849. Thereafter he fled to Turkey, adopted Islamism, and entered the Turkish army, receiving the title of Amurat Pasha. He was sent to Aleppo, in 1850, to suppress an Arab attack upon the Christian population, and there died of fever.

**Bemba**, lake. See BANGWEOLO.

**Bembatoka, Bay of**. See BOMBETOKE.

**Bemberg**, bän'bür', HENRI (1861- ), French composer, was born in Paris, of Argentine parents. He was educated at the Paris Conservatoire under Dubois and Massenet, whose influence is apparent in his work. Among his compositions are *La Mort de Jeanne d'Arc* (1886), a cantata for chorus and orchestra; *Le Baiser de Suzon* (1889), a comic opera; and *Elaine* (1892), an opera. He wrote numerous songs, and *La Ballade du Désespéré*, a recitative poem with musical accompaniment.

**Bem'bex**, a genus of hymenopterous insects specially notable for their burrowing propensities, generally known as 'sand wasps.' They are found chiefly in warm climates, where they infest sandy banks, on which the females deposit their eggs, provide food for the larvæ, and then close up the holes with earth.

**Bem'bo**, PIETRO (1470-1547), Italian humanist, was born in Venice. He learned Greek under Laskaris, and became a leading member of the academy of Aldus Manutius at Venice. From 1513 to 1521 he was secretary to Pope Leo x., and in 1539 was made a cardinal, receiving in 1541 the see of Gubbio, and later that of Bergamo. His works greatly contributed to the creation of a good style, both in Latin and in Italian. Among them are: *Epistolæ* (1535); *Rerum Veneticarum Libri XII*. (1551), a history of Venice from 1487 to 1513; *Carmina* (1533), clever imitations of Petrarch; *Gli Asolani* (1505), philosophical talks about love; and *Rime* (1530).

**Bem'bridge Beds**, a division of the Oligocene or Upper Eocene strata, principally developed in the Isle of Wight and in Hampshire, England.

**Bemidji**, bē-mij'i, city, Minnesota, county seat of Beltrami county, on Bemidji Lake, and on the Great Northern, the Minneapolis, Red Lake and Manitoba, the Minneapolis, St. Paul and Sault Ste. Marie, and the Minnesota International Railroads; 200 miles northwest of Minneapolis. It is a summer resort and the seat of a State normal school. Lumbering is the chief industry. Pop. (1910) 5,099; (1920) 7,086.

**Bem'is**, EDWARD WEBSTER (1860- ), American economist and appraisal engineer, was born in Springfield, Mass., and was educated at Amherst College (A.B. 1880; A.M. 1884) and Johns Hopkins University (PH.D. 1885). He served as professor of history and political economy in Vanderbilt University (1889-92); associate professor of political economy in the University of Chicago (1892-5); and professor of economics and history in Kansas State Agricultural College (1897-9). From 1901 to 1909 he was superintendent of the water department of Cleveland, Ohio, and in 1910 became a special investigator, appraising a number of public utilities for city and State commissions. His publications include *Municipal Monopolies* (1899) and papers on municipal government and economic subjects.

**Bemis Heights, Battle of**. See SARATOGA, BATTLES OF.

**Ben** (Hebrew and Arabic 'son'), often used in connection with the father's name to form personal names and patronymics—thus, Ali Ben Hassan, 'Ali, son of Hassan'; Benoni, 'son of my pain'; Benjamin, 'son of the right hand.' The Arabs, Persians, and Turks often make the prefix into *Ibn* (*Ebn*), the Jews, under Arabic influences, use *Aben*, *Aven*, as in *Aben Esra*.

**Ben**, or BEINN, the Gaelic form (Welsh *Pen*) of a Celtic word signifying 'mountain' or 'mountain head.' It occurs in the names of a great many mountains and places in the British Isles, as *Ben Nevis*, *Pennigant*, *Penzance*; it appears, also, in European Continental names, as the *Pennine Alps*.

**Ben**, OIL OF. See MORINGA.

**Benacus Lacus**. See GARDA.

**Benadir**, ben-à-dēr', administrative division of Italian Somaliland, East Africa, extending from the Juba north to Meghed. It is officially known as Southern Italian Somaliland.

**Benalla**, town, Victoria, Australia, in Deltatite county; 110 miles northeast of Melbourne.

It is the centre of an agricultural and fruit-growing district. Pop. 3,100.

**Benares**, ben-à'rez or -rēz, native state, United Provinces, India, formed in 1911 from the parganas of Bhadohi and Kera Mangraur and the tract comprising the Fort of Ramnagar and its appurtenances. Area, 870 square miles. Pop. (1921) 362,860.

**Benares** (*Banāras*), the most sacred city of the Hindus, and one of the principal towns of the United Provinces, India, is situated on the left bank of the Ganges; 429 miles northwest of Calcutta, with which it is connected by rail. It skirts the Ganges for 3 miles, and the high bank is lined with broad flights of stairs or *ghats*, leading to innumerable temples and large substantial houses, which present toward the river an imposing array of towers and pinnacles and richly carved façades. The river, which takes a great crescent-like sweep at this point, is crossed by the Dufferin Railroad Bridge of sixteen spans, with a total length of 3,518 feet.

Notable buildings are the Nepalese temple, Aurungzeb's mosque, with two minarets 147 feet high; Raja Jai Singh's observatory; the Gopal Mandir, wealthiest of all the temples; the Bisheswar or Golden Temple of Siva, the holiest of all; and the famous Durga Temple, popularly called the Monkey Temple. Other points of special interest are the well of Mani Karniki, formed of Vishnu's sweat, to bathe in which is to be cleansed of all sin for time and eternity; the Juana-vapi, or 'pool of Knowledge'; and the Lat Bhaïro, a portion, it is believed, of one of Asoka's pillars. At the Burning Ghat the bodies of Hindus are reduced to ashes.

*Sikrol*, the European quarter of Benares, lies to the northwest of the native city. Here, among other public buildings, are a college established by the British government in 1791 for the study of Sanskrit, the King Edward VII. hospital, and a town hall. The Central Hindu College, founded in 1898 by Mrs. Annie Besant (q.v.), has been merged in the new Benares Hindu University, the cornerstone of which was laid in 1916.

Benares draws immense revenues from the thousands of pilgrims who visit it from all parts of India. It has a considerable trade, not only in country produce, but in English goods, jewelry and precious stones, sugar, saltpetre, and indigo. Its brassware, kinob or cloth of gold, lacquered toys, silks, shawls, and embroideries are famous.

A city of great antiquity, Benares (Sanskrit *Varanasi*) was

for 800 years the centre of the Buddhist faith. In the fourth century B.C. it reverted to the ancient faith of the Hindus, of which it has ever since been the metropolis. Pop. (1901) 209,-331; (1911) 203,804; (1921) 198,-447. Consult Rajani Rangan Sen's *The Holy City* (1912).

**Benbecula**, an island of the Outer Hebrides. See **HEBRIDES**.

**Benbow**, ben'bō, JOHN (1653-1702), British admiral, was born in Shrewsbury, England, and first distinguished himself as captain of a merchantman in a bloody action with Sallee pirates (1686). He commanded the fleet in the battle off Beachy Head in 1690, and at Barfleur and La Hogue in 1692. In 1693-4 he was in charge of a squadron which burned Dieppe, bombarded Havre and Calais, and otherwise harried the French coast. In 1696 he became rear-admiral, and in 1698 took command of a force in the Channel. In 1699 he commanded in the West Indies. On his return to England, the following year, he was appointed vice-admiral. In 1702 he was again sent to the West Indies, where the French, under Ducasse, were active against the English. He attacked the enemy on Aug. 19, and although deserted by some of his captains, carried on a running fight for five days. The battle lost, he sailed for Jamaica, where he died, shortly afterward, from his injuries.

**Bench**, a collective term for the judiciary, as in the phrase 'bench and bar,' to denote the judges and practising lawyers of a given jurisdiction. Specifically, the term is also in use to designate a judge, or, more commonly, a court composed of several judges acting together, as in the phrases the 'supreme bench,' the 'circuit bench,' the 'full bench.' In English judicial history the two greatest courts of common law were for centuries known respectively as the 'King's (or Queen's) Bench' and the 'Common Bench,' the latter being better known under its ancient title, the Court of Common Pleas. See **BANC**, **SITTINGS IN**.

**Bencher**, a member of the governing body of any of the Inns of Court (q.v.).

**Bench Warrant**, an order issued to enforce compliance with some decree of a court, or to arrest an individual for contempt of court.

**Benckendorff**, COUNT ALEXANDRE (1849-1917), Russian diplomat, was educated in Paris and entered the diplomatic service as an attaché in Italy. He subsequently served as secretary of legation in Vienna, minister to Denmark (1897-1903), and ambassador to Great Britain (1903-17). He handled with

skill the Dogger Bank incident, and had a large share in realizing the Triple Entente.

**Bencoolen**, or **BENKULEN** (Dutch *Benkoelen*), seaport town, Dutch East Indies, on the west coast of Sumatra, in 3° 47' s. lat. The site is low and swampy, and most of the houses are built on bamboo piles. Vessels anchor 3 miles from the town. Fort Marlborough, the residence of the governor, was erected in 1714. Pop. 7,700.

The *Residency of Bencoolen* stretches along the Sumatran coast from 2° 30' to 5° 58' s. lat., and embraces an area of 9,995 square miles, with a population of over 200,000. It produces tobacco, coffee, rattan, rubber, edible birds' nests, and gold and silver.

**Bend**, in heraldry one of the honorable ordinaries, is a figure with parallel edges, extending diagonally right across the shield from the dexter chief to the sinister base. Its size (i.e., width) is, if charged, one-third of the field; if uncharged, one-fifth. It is supposed to represent the scarf or shoulder belt of a knight. The bend has three diminutives—the *bendlet*, which is (in width) half the bend; the *cost* or *cotice*, half the bendlet; and the *ribbon*, of the same width with the cost, but couped at the ends.

The *bend sinister* is the bend dexter reversed—i.e., sloping from the sinister chief to the dexter base. It has two diminutives—the *scarp* (half the bend) and the *baton* (half the scarp, and couped at the ends).

*Bendy*, one of the varied fields, is formed by dividing the field into an equal number of bends of two alternating tinctures. *In bend*, or *per bend*, is said of charges or partition lines when placed in the direction of a bend. See **HERALDRY**.

**Benda**, GEORG (1721-95), member of a notable musical family, was born in Jungbunzlau, Bohemia, and was distinguished as a pianist, violinist, and composer. He produced several operas and cantatas, including *Ariadne auf Naxos* and *Medea*, and is said to be the originator of that illustrative form of music which accompanies spoken words.

**Bendemann**, ben'de-män, EDUARD (1811-89), German painter, was born in Berlin. In 1832 he produced *The Jews in Babylon* (Cologne Museum), which excited wide attention; and in 1835, *Jeremiah on the Ruins of Jerusalem*. In 1838 he was appointed professor of the academy at Dresden, and was entrusted with the painting of a series of frescoes at the royal palace. This work, upon which he was engaged till 1855, depicts *The Progress of the Human Race*. Later pictures include: *The Carrying Away of the*

*Jews into the Babylonian Captivity* (Berlin) and *Penelope* (Antwerp).

**Ben'der**, or **BENDERI**, town, Roumania, in Bessarabia, on the River Dniester, and on the railway from Tiraspol to Jasi (Jassy); 62 miles northwest of Odessa. The principal industries are the manufacture of bricks, stoneware, paper, and leather, agriculture, fishing, and mining. Pop. 35,000.

**Bender Abbas**, ben'der äb'bäs, or **BANDAR ABBAS** (formerly *Gombrun* or *Gombroon*), seaport, Persia, in the province of Kerman, on the north side of Ormuz Strait; 12 miles northwest of Ormuz. It has trade with Europe and India, chiefly in British vessels. Exports include dates, almonds, raisins and other fruits, drugs, raw cotton, dyeing materials, and wool. Pop. 8,000.

**Bender Gez**, seaport, Persia, in the province of Astrabad, is situated at the southeast corner of the Caspian Sea; 20 miles west of Astrabad. Its exports are valued at \$1,500,000 annually, two-thirds of this amount representing raw cotton.

**Bendigo**, ben'di-gō (formerly *Sandhurst*), Victoria, Australia, capital of Bendigo county, and chief town of a large district devoted to gold mining and farming; 101 miles by rail northwest of Melbourne. Pop. (1921) 25,682.

**Bendire**, ben-dě'rě, CHARLES EMIL (1836-97), American ornithologist, was born near Darmstadt, Germany. He went to America in 1852, enlisted in the U. S. Army in 1854, served through the Civil War, and retired as a captain in 1886. Much of his time was passed in the West, where he devoted himself to ornithology, and made a large collection of nests and eggs, now in the U. S. National Museum. His chief work, *The Life Histories of North American Birds* (1892-6), was left unfinished.

**Bends**. See **CAISSON DISEASE**.

**Bendzin**, ben'jën, town, Poland, in the government of Piotrkow; 100 miles southwest of Lodz. It has zinc works and coal mines. Pop. 46,000.

**Benedek**, bā'ne-del, LUDWIG VON (1804-81), Austrian general, was born in Odenburg, Hungary. He entered the army in 1822, and distinguished himself at Mortara and Novara (1849) in Italy, and at Raab, Komorn, and Uj-Szegedin (1849), in Hungary. He won further credit in the Italian campaign in 1859, and at Solferino drove back the Piedmontese with great slaughter. He was appointed governor of Hungary in 1860, and subsequently commander-in-chief at Venice. In 1866 he commanded the northern Austrian army against Prussia;

but shortly after the disastrous defeat of Sadowa he was superseded, and court martialled.

**Benedetti**, *bā-nā-det'tē*, VINCENT, COUNT (1817-1900), French diplomat, was born in Bastia, Corsica. He was ambassador at Turin in 1861, and at Berlin in 1864. He drew up the draught of a secret treaty between France and Prussia in 1870; and it was he who at Ems demanded of King William a guarantee that no Hohenzollern prince should be allowed to accept the Spanish crown, thus playing an important rôle in the precipitation of the Franco-German War (q. v.). In *Ma Mission en Prussia* (1871) and *Studies in Diplomacy* (Eng. trans.) he defends his own policy.

**Benedicite**, or the Song of the Three Children, a canticle from the Apocrypha forming part of the prayer of Abednego in the fiery furnace. It was sung in the Christian Church as early as the time of St. Chrysostom, and is used in the Anglican Church at the morning service when the Te Deum is not sung.

**Benedict**, the name of fifteen popes and one anti-pope. The most important are:

**BENEDICT VIII.** (1012-24) was driven from Rome by the anti-pope Gregory, but in 1014 was restored to the papal chair by the Emperor Henry II. He distinguished himself as a reformer of the clergy, and interdicted, at the synod of Pavia, both clerical marriage and concubinage.

**BENEDICT IX.**, a nephew of Benedict VIII., obtained the papal throne by simony in 1033, at the age of eighteen; but in 1038 the Romans rose in indignation, and banished him. He was several times reinstalled, and as often deposed.

**BENEDICT XIII.** is a title assumed by two popes, *Peter de Luna*, a Spaniard, chosen by the French cardinals in 1394, and recognized only by Spain and Scotland up to his death in 1424; and *Vincenzo Marco Orsini* (1724-30), a learned and well-disposed man.

**BENEDICT XIV.** (1740-58) (Prospero Lambertini), a most worthy pontiff, founded chairs of physics, chemistry, and mathematics in Rome; revived the academy of Bologna, and instituted others; dug out the obelisk in the Campus Martius, constructed fountains, and rebuilt churches; caused the best English and French books to be translated into Italian; and encouraged literature and science.

**BENEDICT XV.** (1914-22) (Giacomo Della Chiesa) was born in Pogli, near Genoa, in 1854, was educated in Rome, and was ordained in 1878. From 1883 to 1887 he was at Madrid as secretary of the Nunciature and assistant to Cardinal Rampolla,

after which he returned to Rome and held various positions in the secretariate of state. In 1900 he was made a prelate; in 1901 became consultor of the Holy Office; in 1907 was created archbishop of Bologna; and in May, 1914, cardinal. On the death of Pope Pius X., Cardinal Della Chiesa was elected to succeed him (Sept. 3, 1914), taking the title of Benedict XV.

Benedict's pontificate, beginning very shortly after the opening of the Great War, covered one of the most critical periods in the history of the world. His position was one of extreme difficulty, having to deal with Catholics on both sides of the

sentation in the British Empire. His influence upon Italian politics was constructive, and in January, 1919, he freed Italian Catholics from all inhibition against participating in the political movements of the country.

**Benedict**, surnamed BISCOP (c. 628-690), an Anglo-Saxon monk who journeyed several times to Rome, whence he brought books, pictures, and relics for the monastery which he afterward founded (674) at Wearmouth. He erected (682) another religious house at Jarrow, 6 miles distant. Leland ascribes to him *Concordantia Regularum*, a commendation of the rules of St. Benedict.

**Benedict**, St. (480-543), foun-

Copyright, 1914, by Brown Bros.

Pope Benedict XV.

great conflict, and maintain, as far as possible, a practical neutrality. He made repeated efforts to end the war, issuing his first peace encyclical one week after his coronation. He appointed Feb. 7, 1915, throughout the Catholic world as a day of prayer for the restoration of peace and good will. Other efforts to bring about peace were made in July, 1915, February, 1916, and August, 1917. He sent Monsignor Cerratti as an observer at the Peace Conference and after the Treaty of Versailles declared that as the head of the Church he would do all in his power to support the decisions of the delegates. During his pontificate, relations with France and Portugal were restored, and steps were taken for a more intimate repre-

der of Western monasticism, was born of a wealthy family at Nursia, near Spoleto, Italy. At the age of fourteen he retired to a deserted country lying on a lake, hence called *Sublaqueum* (now Subiaco), where, in a cavern (which afterward received the name of the Holy Grotto), he dwelt for three years, until his fame spread over the country. He was appointed abbot of a neighboring monastery, but left it for a stricter mode of life. In the course of a few years numbers flocked after him, including the sons of wealthy Romans and uncivilized Goths, and he was able to found twelve monasteries. After some time he sought (about 529) another retreat, and, accompanied by a few followers, founded the monastery of Monte

Cassino, near Naples, which became one of the richest and most famous in Italy. Here he had an interview with Totila, king of the Goths, whom he sternly reproved. In 515 he wrote his *Regula Monachorum*, in which he aimed, among other things, at repressing the irregular and licentious life of the wandering monks by introducing sterner discipline and order, and which eventually became the standard rule of the Western monastic orders.

**Benedict, SIR JULIUS** (1804-85), musician and composer, was born in Stuttgart, Germany, where his father was a Jewish banker. He was a favorite pupil of both Hummel and Weber, and held appointments as conductor at Vienna (1824) and Naples (1826). After becoming known as the composer of several operas, Benedict, acting on the advice of Malibran, went to London (1835), and was conductor at Covent Garden, Drury Lane, the Monday popular concerts, and various musical festivals. During this period he composed *The Gypsy's Warning* (1838), *The Brides of Venice* (1844), and *The Crusaders* (1846). In 1850-51 he acted as concert director during a successful tour of the United States by Jenny Lind. In 1860 he produced a cantata, *Undine*; but his *Lily of Killarney*, first given in 1862 at Covent Garden, was his greatest operatic success. Other productions include a cantata, *Richard Cœur de Lion* (1863); an opera di camera, *The Bride of Song* (1864); the cantatas *St. Cecilia* (1866) and *Graziella* (1882); and the fine oratorio, *St. Peter*, written for the Birmingham Musical Festival (1870), which was perhaps his masterpiece. He was knighted in 1871.

**Benedictine.** See LIQUEURS.

**Benedictines**, an order of monks and nuns who follow the rule of St. Benedict (q. v.). In Benedict's lifetime his disciple, St. Placid, spread the order in Sicily, and St. Maurus in France. St. Gregory the Great was the first (590-604) of the fifty Benedictines who have occupied the papal throne, a list which includes such names as Leo IV., Gregory VII., Pius VII., and Gregory XVI. St. Augustine, the disciple of Gregory the Great, brought the Benedictine rule to England, and became the first of a long list of Benedictine archbishops of Canterbury. The English Benedictine, St. Boniface, preached the faith in Germany, and founded there the great abbey of Fulda. Ansgar, the apostle of Denmark; Willibrord, of the Frisians and Dutch; Adalbert, of the Bohemians; and Casimir, of the Poles, were all Benedictines; while Bede and Anselm in Eng-

land; Isidor, Leander, and Ildemarus in Spain; Peter Damiani in Italy, and Bernard in France, are other names which illustrate the strength of this order.

As early as 1354 the order numbered 24 popes, 200 cardinals, 7,000 archbishops, 15,000 bishops, 1,560 canonized saints, and 5,000 holy persons worthy of canonization—a number since increased to 40,000. It then possessed 37,000 monasteries, 20 emperors, 10 empresses, 47 kings, 50 queens, and an immense number of royal and noble persons. In the fifteenth century there were 15,107 Benedictine monasteries. The Reformation left not more than 5,000; and at the present day the list would not exceed 800. During the past century the order has spread widely in the United States, where there are eight large abbeys and a number of smaller establishments. The congregation of St. Maur in France is pre-eminent for literary fame (see MAURISTS). Other famous monasteries are St. Denis and Fontanelle in France; Bobbio in Italy; Fulda, Corvei, St. Gall, and Reichenau in Germany; Wearmouth and Jarrow in England.

The *Rule of St. Benedict* is a modification of that of the Eastern ascetics, St. Basil, Cassian, etc. It was the first to introduce *Stability*, or the binding of the monk to a permanent abode in a monastery, and in the practice of monastic life till death. This is the first of the Benedictine's three vows; the second is *Conversion of Manners*—i. e., the striving after perfection of life; and the third, *Obedience according to the Rule*, by the tenor of which the monk is bound to chastity, to the renunciation of private property, to retirement from the world, to the daily and public solemnization of the divine office, and to a life of frugality and labor under filial obedience to the abbot.

The Benedictine habit consists of a tunic and scapular, over which is worn a long full gown called a *cowl*, with a hood to cover the head. The color is not specified in the rule, and it is conjectured that the early Benedictines wore white as being the natural color of undyed wool. For many centuries, however, black has been the prevailing color, whence the term 'black monk' has come to mean a Benedictine in general, though colors may differ in different congregations—e. g., the Camaldolese, the Cistercians, and Olivetans wear white, and the Silvestrines blue. Consult Cardinal Newman's *Mission of St. Benedict*; Montalembert's *Monks of the West* (Eng. trans. by Gasquet).

**Benediction**, a solemn invo-

cation of the divine blessing upon men or things. In the Protestant churches the Benediction is the prayer for blessing pronounced by the minister at the close of divine service, usually either in the words of 2 Cor. xiii. 14, or in the form given at the end of the communion service of the Church of England. Num. vi. 24-26 and Heb. xiii. 20-21 are also employed.

In the Roman Catholic Church a priestly benediction has been defined as a formula of imperative prayer, which transmits a certain grace or virtue to the object over which it is pronounced. Priests having special faculties for the purpose may bless crosses and rosaries, which only, when so blessed, impart the papal indulgence to those who use them. The *Benediction of the Blessed Sacrament*, a comparatively modern rite, is a solemn function in which, after certain canticles and antiphons have been sung in presence of the Sacred Host, exposed above the altar, the priest, mantled with the veil, in silence makes the sign of the cross with the monstrance held over the people.

**Benedictus** (Latin 'blessed'), the hymn of Zacharias (Luke i. 68-79), used from ancient times in the services of the Church. The term is also applied to a part of the service of the mass, beginning '*Benedictus qui venit*' (Blessed is he who comes).

**Benedix**, (JULIUS) RODERICH (1811-73), German playwright, was born in Leipzig. From 1842 to 1861 he was mainly at Cologne, as director of the Stadttheater, teacher of dramatic art, and man of letters; from 1861 to his death he lived at Leipzig. His earliest success was *Das bemooste Haupt* (1841); other plays are *Doctor Wespe*, *Eigensinn*, *Das Gefängnis*, *Die Zärtlichen Verwandten*, and *Mahlilde*. He was a master of the comedy of situation, and pictured German middle-class life.

**Benefice**, the term applied to an ecclesiastical living in the Church of England, and, in a more general sense, to any form of ecclesiastical preferment in that Church. A clergyman obtains a benefice by presentation by the patron of the advowson, or, if the patron is a bishop, by collation, followed in each case by admission by the bishop, institution, and induction. A benefice may be lost by simony, the possession of more livings than is lawful, or continued disobedience to authority.

In feudal law the term was employed in a wider sense to include any gift of lands made by a lord to his vassal, to be held by the latter on condition of military or other service. In this use the term

was superseded by the word feud or fief, which survives in 'fee.'

**Beneficiary.** ben'-e-fish'-i-a-ri, strictly, the holder of a benefice (q. v.); in the law of trusts, the *cestui que trust*, or person for whose benefit the trust fund is created. It is in an analogous sense that the term is employed to describe the person entitled to the benefits of a policy of life insurance. See TRUST.

**Benefit of Clergy,** a privilege claimed by the mediæval church, whereby the clergy, when charged with crime, were permitted to stand trial in ecclesiastical rather than secular courts. In England this privilege was extended in 1330, to include all persons who could read, i.e. to all 'clerks.' In 1531, persons below the rank of subdeacons were excluded from it in the case of the more serious felonies; at the beginning of the sixteenth century it was enacted that certain offenses should be 'without benefit of clergy'; and in 1827 the privilege was abolished. In the early days of the American colonies there were a few cases of its use, but in 1790 it was forbidden by Act of Congress.

**Benefit Societies.** See FRATERNAL SOCIETIES.

**Beneke,** bā'ne-ke, FRIEDRICH EDUARD (1798-1854), German philosopher, was born in Berlin, and succeeded Hegel as professor of philosophy there. His *Erkenntnislehre*, or 'Theory of Knowledge' (1820), in which he opposes the philosophy of Hegel and Kant, shows a strong sympathy with the Scottish metaphysicians. In his view the basis of all philosophy consists in empirical psychology, and mental phenomena are to be treated by the methods of natural history. Consult his *Lehrbuch der Psychologie als Naturwissenschaft* (1833; 4th ed. 1877); also *Memoirs*, in German, by J. Friedrich and by Gramzow; Brandt's *Beneke, the Man and His Philosophy*.

**Benes,** ben-esh', EDUARD (1884-<sup>5, 1948</sup>) Czechoslovakian statesman, was born in Kozlany, worked his way through the University of Prague, and studied also in France. From 1908 to 1913 he was instructor in sociology at the University of Prague, and after the outbreak of the Great War organized the so-called Czech mafia, an underground society working in the interest of the Allies. In 1915 he fled to Switzerland to escape arrest by the Austrian police, and joining Professor Masaryk (q. v.) in Paris, organized with him the Czechoslovak National Council. When the Czechoslovak Republic was proclaimed (1918), Benes was made foreign minister. He was a member of the Peace Conference, and was premier in 1921-

1922. The famous protocol providing for compulsory arbitration, adopted by the Assembly of the League of Nations in September 1924, was prepared by him. He is the author, also, of *Bohemian Case for Independence* (1917), *De-truisez l'Autriche-Hongrie* (1916), and *The Spirit of the Czechoslovak Revolution* (1923).

**Benevento,** province, Italy, in the south central part, with an area of 819 square miles. The surface is rugged, and the people are chiefly engaged in agriculture. Pop. (1921) 266,980.

**Benevento,** city and archiepiscopal see, Italy, capital of the province of Benevento, is situated on a hill between the rivers Sabato and Calore; 60 miles by rail northeast of Naples. The town still retains its ancient walls, and to the north is the Porta Aurea, a famous triumphal arch erected in A.D. 114, in honor of the Emperor Trajan. Other notable features are the Lombardo-Saracenic cathedral dating from the 11th century; the 8th-century church of St. Sophia; the 14th-century castle, and the town hall. There are manufactures of leather and silver-plate, and trade in grain. Pop. (1921) 27,510.

Beneventum, originally known as Maleventum ('ill wind'), was founded by Diomedes. In 275 B.C., Pyrrhus, king of Epirus, was defeated here by the Romans, and the name was changed to Beneventum ('fair wind'). In A.D. 545 it was destroyed by the Gothic king Totila. It was the chief city of an independent Lombard duchy from the 6th to the 11th century, and was a papal possession from 1053 to 1806, when Napoleon created it a principality. In 1815 it was restored to the Pope, and in 1860 became a part of the kingdom of Italy. The town has frequently suffered damage from earthquakes.

**Benevolence,** forced loans demanded from the English people by Edward IV. and succeeding sovereigns. Though under the guise of a willing offering, these contributions were absolutely compulsory, and became one of the chief grievances of the nation. They were nominally abolished by Parliament in 1484, but persisted until the time of James I.

**Benevolent Societies.** See FRATERNAL SOCIETIES.

**Benevy,** ben'fi, THEODOR (1809-81), German orientalist, of Jewish extraction, a distinguished student of comparative philology and folklore, was born in Nörten, near Göttingen. He was appointed extra professor of Sanskrit and comparative philology at Göttingen in 1848, and professor in 1862. The chief re-

sult of his early studies was his *Griechisches Wurzellexikon* (1839-42). His works on Sanskrit include an edition of the *Sāma Veda* (1848), *Handbuch der Sanskritsprache* (1852-4), *kurze Grammatik der Sanskritsprache* (1858), subsequently translated into English, an edition of the *Panchatantra* (2 vols., 1859), and a *Sanskrit-English Dictionary* (1866).

**Bengal,** ben-gōl', a province of British India, constituting, since 1912, the Presidency of Bengal. It stretches from the Himalayas to the sea, with an area of 76,843 square miles. Except for spurs of the Himalayas in the northern and eastern parts, the surface is a 'fertile, alluvial plain watered by the Ganges and the Brahmaputra. Indeed, the greater part of Bengal is a delta in various stages of formation, due to the changes which have from time to time taken place in the course of the Ganges. The southernmost portion of this delta, some 6,500 square miles, is known as the Sundarbans, a jungle of forest and swamp, which, however, is gradually being reclaimed and converted into productive rice fields. The climate is generally tropical, except in the Himalayan region where alpine cold and temperate conditions prevail. There are three well defined seasons, cold, hot, and rainy. Rainfall is abundant, and humidity excessive.

Bengal is rich in minerals, producing coal, copper, iron, manganese, gold, mica, slate, and saltpetre. Diamonds have been found in the bed of the Mahanadi River. Agriculture is the most important industry, three-fourths of the population being dependent upon it for a livelihood. Rice is the chief crop; others of value are maize, wheat, barley, jute, indigo, cinchona, tea, tobacco, and oilseeds. A large laboring class is employed in jute mills, tea gardens, iron and steel works, silk and cotton mills, and tobacco factories. Stone and ivory carving employ numbers of skilled workmen. Manufacturing is of constantly increasing importance.

The rivers are the chief means of communication, supplemented by canals. There are good roads in many parts of the province, and more than 2,000 miles of railway. The population, chiefly Mohammedan and Hindu, numbers 46,695,536 (1921).

The Bengal Presidency is administered by a Governor in Council, assisted by a legislative council of at least 125 members. Not under direct British rule are two Native States, Cooch Behar and Hill Tippera, with a combined area of 5,434 square miles and a population which numbered 896,936.

**History**—The earliest inhabitants of Bengal are said to have been Dravidians. In the 6th century B.C. arose the kingdom of Magadha (Bihar) under the Mauryas. This was overthrown in the first century B.C., and in the 4th century A.D. the country became part of a united empire under the Gupta dynasty. In the 12th century Mohammedan invaders conquered the land and for about 400 years Bengal was governed by Moslem rulers. It was under the dominion of Afghan chiefs from about 1540 until 1576, when it was annexed to the Mogul empire. Following Lord Clive's victory at Plassey in 1765 (see CLIVE, ROBERT), it passed to the control of the British East India Company, which had made its first settlement there in the 17th century. Since that time Bengal has been under British administration, and its history has been that of British India. Various changes in boundaries and administrative areas have been made at different times in order to meet changing conditions of population. The province was constituted a presidency, with its present boundaries, in 1912. Consult O'Malley's *Bengal, Behar and Orissa, Sikkim* (1917).

**Bengal**, BAY OF, an extension of the Indian Ocean, between India on the west, and Burma and the Malay Peninsula on the east, measuring more than 1,200 miles from north to south and about 1,300 miles from east to west. It receives the waters of the Salwin, Irawadi, Brahmaputra, Ganges, Mahanadi, Godavari, and Kistna. On the west there are no good harbors, but on the east are the ports of Akyab, Rangoon, Moulmein, and Tavoy. In the eastern part of the bay are the Andaman, Nicobar, and Mergui Islands; at its southwest corner is Ceylon.

**Bengal Gram**, the seed of an annual leguminous plant (*Cicer arietinum*), often called chick pea (q. v.).

**Bengali Language and Literature**, beng-gā'li, The Bengali language, one of the chief dialects of India, spoken by more than forty million people, is derived from Sanskrit. The alphabet is simplified from the Devanagari alphabet, which in its turn was a development of the Indo-Pali character used by Asoka in the third century B.C.

Bengali literature, properly speaking, began in the fourteenth century with imitations of the song of Jayadeva, who flourished in the twelfth century. His great work *Gita Govinda* is a collection of beautiful songs concerning the love of Krishna and Radhika. Chandi Das is the earliest vernacular poet of Bengal. He lived in the fourteenth

century and has immortalized the washerwoman Rami in his songs of love. In the fifteenth century the Sanskrit epics were translated into Bengali, and in the sixteenth came the religious reform inaugurated by Chaitanya, which gave a great impetus to theological and poetic literature. The sixteenth century also produced Raghunandan, who wrote an exhaustive treatise on rites and observances for the Bengal people, and the logician Raghunath. The seventeenth century is distinguished for the work of the poet Mukunda Ram. Ram Prasad Sen and Bharat Chandra Rai are the two great poets of the eighteenth century.

The nineteenth century witnessed a notable revolution in Bengali thought and ideas. Outstanding names of this period are Ram Mohan Rai, often called the father of prose literature in Bengal; Iswar Chandra Gupta, poet and satirist; Akhay Kumar Datta, whose prose is a model of dignity and earnestness; Iswar Chandra Vidyasagar, whose work in behalf of Hindu widows and other native women is of equal importance with his literary achievements; Ram Narayan Tarkaratna and Dina Bandhu Mitra, both dramatists; Madhu Sudan Datta, the author of *Tilotama*, a noble epic poem, and the drama *Sarmishtha*; and Bankim Chandra Chatterjea, whose social and historical tales won remarkable popularity. The most important writer of the twentieth century is Sir Rabindranath Tagore (q. v.), who was awarded the Nobel prize in literature in 1913. Other notable contemporary writers are Ghose, Banerjea, Kali Lahiri, Mukerji and Dinesh Chandra Sen.

Bengali grammars and dictionaries have been published by Nicholl, Beames, Ghosal and Shahidullah. Consult Sen's *History of Bengali Language and Literature* (1911); De's *History of Bengali Literature in the Nineteenth Century* (1919); Anderson's *Manual of the Bengali Language* (1920); Mazumdar's *History of the Bengali Language* (1920).

**Bengali Lights**, colored fires—red, white, green, blue, or yellow—used as signals and in pyrotechny. Potassium chlorate, antimony sulphide, and sulphur are the chief ingredients.

**Bengazi**, beng-gā'zē, or BENGHAZI (anc. *Berenice*), seaport town, North Africa, capital of the district of Cyrenaica, Italian Libya. It is the terminus of a caravan route from Wadai and has a good harbor, but silt-filled. The chief exports are barley, ivory, ostrich feathers, and sponges. Pop. 30,000.

**Bengel**, JOHANN ALBRECHT (1687-1752), German biblical

critic, was born in Winnenden, in Württemberg. He studied at Tübingen, acted as repetent or (theological) lecturer there for five years, and in 1713 became head of the preparatory theological institute at Denckendorf, where he remained for twenty-eight years. In 1741 he was made prelate of Herbrechtingen, and eight years later prelate at Alpirspach. Bengel's chief work was upon the New Testament, his *Apparatus criticus* (1734) being the starting point for modern text-criticism. Other works are *Gnomon Novi Testamenti* (1742), which is still in use as a suggestive commentary, and has had considerable influence on exegesis in Germany and England; *Erklarung Offenbarung Johannis* (1740); *Ordo Temporum* (1741).

**Benguella**, beng-gā'la, town, Angola, Portuguese West Africa, capital of the district of Benguella, is situated on the Atlantic coast, about 300 miles south of Loanda. The chief exports are rubber, wax, cattle, hides, and sugar. The town was formerly an important slave-trading centre. Pop. 4,000.

**Benguet**, beng-gat', province, Luzon, Philippine Islands, in the north central part, with an area of 900 square miles. The surface is mountainous, covered with beautiful forests; there are deposits of copper, gold, iron, coal, and limestone; and wheat, rice, coffee, tea, beans, and potatoes are grown. Baguio, the capital, 175 miles north of Manila, is a favorite resort. Pop. (1918) 43,768.

**Benhadad**, ben-hā'dad, the name given in the Old Testament to three (or two) kings of Damascus—i.e. Syria. Benhadad I. allied himself with Asa of Judah against Baasha of Israel (1 Kings xv. 18-22). His son, Benhadad II., the Dad-idri (i.e. Hadadezer) of the inscriptions, was defeated by Shalmaneser II. of Assyria at Karkar in 853 B.C. He warred against Ahab and besieged Jerusalem and Samaria (1 Kings xx.; 2 Kings vi.-vii.). He was slain by Hazael (2 Kings viii. 7-15). Benhadad III. (Mari), son of Hazael, was thrice vanquished by Joash, king of Israel (2 Kings xiii. 25). Some—e.g. Cheyne—identify Benhadad I. and II.

**Benham**, ben'am, ANDREW ELLICOTT KENNEDY (1832-1905), American naval officer, was born in New York. He was appointed a midshipman in 1847, and was commissioned lieutenant in 1855. In the Civil War he saw service with the blockading squadrons in the South, and took part in various engagements. In 1894 he obliged the insurgent squadron at Rio de Janeiro, Brazil, to raise their blockade and cease firing upon American merchant

craft. He was made rear admiral, 1890, retiring in 1894.

**Benham**, ben'am, WILLIAM (1831-1910), English theological writer, was born in Hampshire and was educated in King's College. He was tutor in St. Mark's College, Chelsea (1857-64); professor of modern history, King's College, London (1864-73); honorary canon of Canterbury (1885); and Boyle lecturer in 1897. He was rector of St. Edmond's from 1882 and rural dean of East City from 1903 until his death. His works include *A New Translation of Thomas à Kempis' 'Imitatio Christi'* (1874); *Cowper's Letters* (1883); *A Short History of the Episcopal Church in America* (1884); *The Dictionary of Religion* (1887); *Life of Archbishop Tail* (in collaboration with the Bishop of Winchester, 1891). He was the editor of the *Ancient and Modern Library of Theological Literature*.

**Beni**, bā-nē', or PARO, river, Bolivia. See AMAZON.

**Beni**, a department of Bolivia, in the northeastern part, bordering upon Brazil; area 101,814 square miles, heavily forested but with some prairie land. The collection of rubber is the chief industry. Trinidad is the capital. Pop. about 35,800.

**Benicia**, be-nish'i-a, seaport city, California, Solano County, on the Strait of Carquinez, and on the Southern Pacific Railroad; 24 miles northeast of San Francisco, to which it has boat service. It has a good harbor, a U. S. arsenal and barracks, shipyards, packing houses, and manufactures of iron implements, leather goods, wagons, and dairy products. Pop. (1910) 2,360; (1920) 2,693.

**Beni-Hassan**, bā-nē-hās'sān, village, Egypt, on the right bank of the Nile; 15 miles southeast of Minieh. In its neighborhood, and overlooking the river, are catacombs believed to have been the tombs of the people of the ancient Hermopolis. Pop. 1,300.

**Benin**, ben-ēn', province, town, and river in the Southern Province of the British Protectorate of Nigeria. The province has a fertile soil which produces rice, yams, cotton, sugar, tobacco and fruits. Palm-oil is the chief export. It was discovered by the Portuguese in 1486, and was the centre of the slave trade until its suppression by the British. The inhabitants, formerly savage barbarians, have become law abiding and industrious. The city of Benin is 75 miles inland and has a population of about 15,000.

**Benin**, BIGHT OF, a division of the Gulf of Guinea, extending along the southern coast of Nigeria, from Cape Formosa on the east to Cape St. Paul on the west.

**Beni-Saf**, bā'nē-sāf', seaport, Algiers, in the department of Oran; 30 miles north of Tlemsen. It has a good harbor but owes its importance entirely to its rich iron mines. Pop. about 4,500.

**Beni-Suaf**, bā'nē-swef', town, Upper Egypt, capital of the province of the same name (pop. 452,893), on the right bank of the Nile; 77 miles southwest of Cairo. It is a trade centre for the Fayum district, and has sugar and cotton manufactures. Pop. (1917) 31,986.

**Benjamin** ('son of the right hand' or 'of the south'), the youngest son of the patriarch Jacob, and the only full brother of Joseph. He was born near Ephrath—Rachel, his mother, dying at his birth (Gen. xxxv. 18). She named him Ben-Oni, 'son of my pain,' but his father changed it to Benjamin, a word portending comfort or consolation.

Recent Old Testament scholarship regards Benjamin not so much as a historical character as the 'eponymous' ancestor of the tribe of that name. Its territory lay immediately to the north of Judah, and consisted of a rugged region, better fitted to produce warriors than farmers (see Gen. xlix. 27). The tribe did serviceable work in repelling the Philistines, and gave Israel its first king, Saul. At the rending of the kingdom it remained faithful to the Davidic dynasty, and after the exile joined Judah in the claim of being the only true inheritors of the promises. The prophet Jeremiah and the apostle Paul were of the tribe of Benjamin.

**Benjamin**, JUDAH PHILIP (1811-84), American Confederate leader, was born of English-Jewish parentage on the island of St. Croix, W. I. He was educated at Yale (1825-8), and settled in New Orleans. He was a member of the Louisiana Constitutional Convention of 1845, and in 1853 became a Whig member of the U. S. Senate, in which he was prominent as a debater on the Southern side, in all matter concerning the question of slavery restrictions. He resigned in February, 1861, and during the Civil War was the ablest and most influential member of President Davis' cabinet, becoming known as 'the brains of the Confederacy.' He was in turn Attorney-General (February-August 1861), Secretary of War (November 1861-February 1862), and Secretary of State (1862-5). Upon Lee's surrender he escaped to England, where he soon became one of the most successful lawyers in Great Britain, and in 1872 was made a Queens Counsel. His work, generally known as *Benjamin on Sales* (1868), is a classic.

**Benjamin**, MARCUS (1857- ), American scientist and editor, was born in San Francisco, Cal. He was graduated from the School of Mines, Columbia University, in 1878, and in 1882 became editor of *The American Pharmacist*. He engaged in cyclopædia and dictionary work in New York, at the same time acting as sanitary engineer for the New York Board of Health. He is a member and officer in many learned societies, and has contributed largely to scientific and other periodicals. In 1896 he became editor at the U. S. National Museum, Washington, D. C.

**Benjamin** of TUDELA (d. 1173), a learned Israelite and rabbi, was born in Tudela, Spain. He visited Constantinople, Egypt, Assyria, Persia, and Chinese Tartary (1159-73). An account of his travels, based upon his notes, was first published in Constantinople in 1543, under the title *Mazahoth* ('Excursions').

**Benjamin**, PARK (1809-64), American journalist, was born in Demerara, British Guiana, and was graduated (1829) from Trinity College, Hartford. He edited the *New England Magazine*, 1835-7, which he transferred to New York as the *American Monthly Magazine* in 1837; assisted Horace Greeley on the *New Yorker*; established the *New World* in 1840; and was associated with other journalistic ventures.

**Benjamin**, SAMUEL GREENE WHEELER (1837-1914), American author and diplomat, son of a missionary, was born in Argos, Greece. He was educated at the English College in Smyrna and at Williams College, from which he was graduated in 1859. He was for some years assistant Librarian at the Albany State Library, studied art, and travelled widely in Europe and the East. He was U. S. minister to Persia (1883-5). Among his many published books are *Constantinople, Isle of Pearls, and Other Poems* (1861); *The Choice of Paris, a Romance of the Troad* (1870); *What is Art?* (1877); *Persia and the Persians* (1886); *The Story of Persia* (1887).

**Benjamin-Constant**. See CONSTANT.

**Benjamin Tree**, the tree from which benzoïn is obtained. See BENZOÏN.

**Benkulen**. See BENCOLEN.  
**Ben Lomond**, mountain (3,192 feet), in Stirlingshire, Scotland, on the east side of Loch Lomond.

**Ben Macdhuil**, mak-dō'ī, mountain (4,296 feet) in Aberdeenshire, Scotland, at the junction of the shires of Banff, Aberdeen, and Inverness.

**Ben More**, mōr, mountain (3,843 feet), Southwest Perth-

shire, Scotland, 9 miles from the head of Loch Lomond.

**Benmore Head.** See FAIR HEAD.

**Benne Oil,** ben'í, an oil obtained from the seeds of *Sesamum indicum*, an Indian plant belonging to a tropical order related to Scrophulariaceae. It is called also gingili or gingelly, sesamum, til, and teel oil. Its uses are similar to those of olive oil.

**Bennet, Henry.** See ARLINGTON, EARL OF.

**Bennett, (ENOCH) ARNOLD** (1867- ), English novelist, was born in Hanley, in North Staffordshire, and was educated at Newcastle-under-Lyme. He entered a lawyer's office in London, but after a few years he abandoned law for editorial work on a woman's paper, of which he became editor. In 1900 he resigned this position and devoted himself to writing. His best works are his series of novels portraying life in the Five Towns, *Anna of the Five Towns* (1902), *The Old Wives Tale* (1906), *Clayhanger* (1910), *Hilda Lessways* (1911), and *The Matador of the Five Towns* (1912). Among his many other works are the novels *A Man from the North* (1898), *A Great Man* (1904), *The Old Adam* (1913), *These Twain* (1916), *The Card* (1916), *The Roll Call* (1918), *The Pretty Lady* (1918), and *Mr. Prohack* (1922); the plays *Polite Farces* (1899), *What the Public Wants* (1910), *The Great Adventure* (1913), *Body and Soul* (1921); also *Your United States* (1913), *Over There* (1915), *Books and Persons* (1917), *How to Make the Best of Life* (1923), *Riceyman Steps* (1923), *Elsie and the Child* (1925), *Lord Raingo* (1926), *The Vanguard* (1927).

**Bennett, JAMES GORDON** (1795-1872), American journalist, was born in Newmills, Banffshire, Scotland, and emigrated to America in 1819. He settled at Halifax, but being unsuccessful as a teacher of bookkeeping there, removed to Boston and New York (1822), where he began to write for the press. He was variously occupied in Washington and other Eastern cities as reporter, correspondent and editor for different papers, and as a newspaper man was more or less concerned with politics. Becoming dissatisfied, however, he originated the idea of the *New York Herald* as an independent newspaper, and published the first number May 6, 1835. Bennett introduced many novel features of gathering news, and through his original methods gained for his paper a large circulation.

**Bennett, JAMES GORDON** (1841-1918), American journalist and proprietor of the *New York Herald*, was born in New York and was educated abroad,

under private tutors. He succeeded to the ownership of the *Herald* on the death of his father in 1871, and directed its policies and conduct by cable from Paris. He issued a Paris edition, which was continued after his death, and for a time he published also a London edition. In conjunction with the London *Daily Telegraph*, he fitted out Stanley's expedition to Africa (1874-8); he also equipped the *Jeanette* Polar Expedition (1879) and with John W. Mackay established the Mackay-Bennett Commercial Cable Co. (1883). He introduced the publication in England of storm warnings sent from the United States. At one time Mr. Bennett took an active interest in yachting, and sailed two races across the Atlantic. Later he became interested in automobilizing and aeronautics.

**Bennett, JOHN HUGHES** (1812-75), English physician and physiologist, was born in London. He studied at the University of Edinburgh, and in 1848 was elected to the chair of the institutes of medicine there. He was distinguished for his studies in histology and therapeutics.

**Bennett, RICHARD BEDFORD** (1870- ), Canadian statesman, was born in Hopewell, New Brunswick, and educated at Dalhousie University, Halifax, N. S. He commenced the practice of law in New Brunswick, but in 1897 moved to Calgary, Alberta, where from 1898 to 1905 he was a member of the Legislature of the Northwest Territories. Later on he was a member of the Alberta Provincial Legislature from 1909 to 1911, when he resigned and was elected to the Dominion House of Commons as a Conservative. In 1917, during the war period, he was appointed Director-General of National Service. In 1921 he became Minister of Justice in the administration of Mr. Arthur Meighen, but resigned shortly afterwards. When the first King Ministry resigned in 1926, Mr. Bennett became Minister of Finance in the short-lived second Meighen administration. In November 1927 he was chosen as Meighen's successor. He is the first leader of either of the great historic parties to come from so far west as Alberta, and his choice may be considered to symbolize the growth of the political importance of Western Canada in the Confederation.

**Bennett, SIR WILLIAM STERNDALE** (1816-75), British composer and pianist, was born in Sheffield. He studied at the Royal Academy of Music, London, and at Leipzig, and for some years (from 1856) was professor of music at Cambridge. He

became principal of the Royal Academy in 1868, and was knighted in 1871. Among his more noteworthy works are the overtures *Tempest* (1832), *Merry Wives of Windsor* (1833), and *Paradise and the Peri* (1867); *The May Queen* (1858), a cantata; *The Woman of Samaria* (1867), an oratorio; *Genevieve* (1873), a romance; *The Maid of Orleans* (1873), a sonata; the anthems, *Cast thy Bread upon the Waters* (1874), *Remember now thy Creator* (1879).

**Bennett, Lake,** in Northwest-ern Canada, near Chilkoot Pass.

**Bennettsville,** town, South Carolina, county seat of Marlboro County, on the Atlantic Coast Line, and the Bennettsville and Cheraw, and the Rockingham Railroads; 130 miles north of Charleston. The town has a Sanitarium and Public Library. It is the centre of a cotton and agricultural district and has manufactures of cotton goods. Pop. (1910) 2,646; (1920) 3,197.

**Ben Nevis,** ne'vis, mountain (4,046 ft.), the loftiest mountain in Great Britain, in Invernesshire, Scotland, overlooking Glen Nevis, toward Fort William.

**Bennigsen,** ben'ig-sen, LEVIN AUGUST THEOPHIL, COUNT (1745-1826), Russian general, a native of Brunswick who entered the Russian army in 1773. He was made a major general, and commanded at Eylau (1807), led the Russian centre at Borodino (1812), defeated Murat at Tarutino (1812), and (1813) shared in the famous victory of Leipzig.

**Bennington,** village, Vermont, county seat of Bennington County, in the southwest corner of the State, on the Chatham and the Bennington branches of the Rutland Railroad. It is the seat of the State Soldiers' Home. On Old Bennington Hill, on the site of the Catamount Tavern of revolutionary days, stands the famous Cat in Bronze. A monument 300 feet in height commemorates General Stark's victory on Aug. 16, 1777. Woollen goods, cashmere, hosiery, shirts, and collars are manufactured. Pop. (1910) 6,211; (1920) 7,230.

**Bennington, BATTLE OF,** a battle of the American Revolution fought at Bennington, Vt., Aug. 16, 1777, between a force of about 1,300 German and British soldiers under Colonel Baum and about 2,000 Americans under General Stark. The British forces were defeated.

**Ben-nut Tree** (*Moringa pterygosperma*), a tree belonging to a small order of plants found in Arabia and East Indies. Its bark yields gum; and its seeds are the source of ben oil.

**Benolt,** be-nawá', DE SAINTE-MOIRE, or MAURE, FRENCH troubadour of the 12th century; at the request of Henry II. of England

composed his great poem of 45,000 octosyllabic verses, *Chronique des ducs de Normandie* (about 1180). It was edited by Francisque Michel, in three volumes, in 1836-44. His *Roman de Troie*, running to over 30,000 verses, enjoyed great popularity in the Middle Ages. It was edited by M. A. Joly, in two volumes, in 1870-71. To him are also attributed *Enéas*, a poem of 10,000 verses, and *Le Roman de Thebes*, a poem of 15,000 verses.

**Benoit**, PETER LÉONARD LÉOPOLD (1834-1901), Belgian musical composer and critic, was born in Harlebeke, Belgium. His ambition was to form a distinctively Flemish movement in music, based upon the theories of Wagner and Liszt, but in this he had slight success. He was director of the conservatory of Antwerp (1867) and author of several operas (e.g. *Isa*, 1867), oratorios (e.g. *Lucifer*, 1866; *Oorlog*, 1873), cantatas, and ecclesiastical pieces.

**Bensberg**, bens'berch, village, Prussia, 11 miles by rail east of Cologne. A chateau built by the Elector Palatine John William, in 1705, is now used as a military school. Lead, zinc, and iron are mined in the vicinity. Pop. (1919) 12,080.

**Ben'son**, ARTHUR CHRISTOPHER (1862-1925), English author, was the second son of Archbishop Benson (see BENSON, E. W.). He was educated at Eton, and at King's College, Cambridge; was a master at Eton (1885-1903), and a fellow (1904-15) and master (1915-25) of Magdalene College, Cambridge. His publications include: *Memoirs of Arthur Hamilton*, published under the pseudonym 'Christopher Can' (1886); *Archbishop Laud* (1887); *Men of Might* (with H. F. Tatham, 1890); *Poems* (1893); *Lyrics* (1895); *Essays* (1896); *Lord Vyel, and other Poems* (1897); *Fasti Etonenses* (1899); *Life of Archbishop Benson* (1899); *The Professor, and other Poems* (1900); *The Schoolmaster* (1902); *Tennyson* (1902); *Coronation Ode* (1902); *The Hill of Trouble* (1903); *The House of Quiet* (anonymously, 1904; new ed., 1906); *Peace, and other Poems* (1905); *From a College Window* and *The Upton Letters* (1906); *Beside Still Waters* (1907); *At Large* (1908); *Ruskin: a Study in Personality* (1911); *Hugh: Memoirs of a Brother* (1915); *Life and Letters of Maggie Benson* (1917); *The Reed of Pan* (1923).

**Benson**, EDWARD FREDERIC (1867- ), English novelist, third son of Archbishop Benson, was born in Wellington College. He was educated at Cambridge, and was connected with the British Archæological School in

Athens (1892-5), and with the Hellenic Society in Egypt (1895). His works include *Dodo* (1893); *Rubicon* (1894); *The Babe, B. A.* (1897); *Mammon and Co.* (1900); *Book of Months* (1903); *The Angel of Pain* (1906); *The House of Defence* (1907); *The Osbornes* (1910); *Dodo the Second* (1914); *Dinner for Eight* (comedy, 1915); *Crescent and Iron Cross* (1918); *Our Family Affairs* (1920); *Dodo Wonders* (1921); *Colin* (1923); *Mother* (1925); *Colin II.* (1926).

**Benson**, EDWARD WHITE (1829-96), Archbishop of Canterbury, was born near Birmingham, England. He was a master at Rugby, became a priest in 1856, and served as the first headmaster of Wellington College, from 1858 to 1872. In 1872 he became chancellor of Lincoln, where he instituted a theological college. He was made bishop of Truro in 1877, and founded the cathedral there, which was consecrated in 1887. He was appointed Archbishop of Canterbury in 1882. His *Life of Cyprian* (1897) and *The Apocalypse* (1900) were published posthumously.

**Benson**, FRANK WESTON (1862- ), American painter, was born in Salem, Mass. He studied drawing and painting in the Museum of Fine Arts, Boston (1880-3), and in the Julien Academy, Paris (1883-5), and in 1889 became instructor of painting and drawing in the Museum of Fine Arts, Boston. He is a member of the National Institute of Arts and Letters, and one of the 'Ten American Painters.' He is known chiefly as a painter of women and children, and of out-of-door studies. His works include decorations in the Congressional Library, Washington, representing the *Seasons* and the *Three Graces* (1896); *My Little Girl* (1897); *In a Spruce Woods* (1905); *Eleanor* (1908); and *Portrait of Professor Clark* (1908).

**Benson**, ROBERT HUGH (1871-1914), English author, son of Archbishop Benson, was born in Wellington College, was educated at Eton and at Trinity College, Cambridge, and took orders in the Anglican church. He was received into the Roman Catholic Church in 1903, and the following year was ordained a priest. In 1911 he was appointed private chamberlain to Pope Pius x. His works include: *The Light Invisible*; *The Queen's Tragedy*; *The Dawn of All* (1911); *The Friendship of Christ* (1912); *Come Rack! Come Ropel!* (1912); *An Average Man* (1913); *Initiation* (1914).

**Bent**, JAMES THEODORE (1852-97), English author and traveller, was born near Leeds. He was graduated from Wadham College, Oxford (1875), and subse-

quently travelled widely. In 1891 he visited South Africa, and explored the ruins of Zim-babwe, discovered by the German traveller Mauch in 1871, which he pronounced to be of Arab origin. In 1893-4, with his wife, daughter of R. W. Hall-Dare, he went to South Arabia, which he again visited in 1896-7. On this latter journey he contracted malarial fever, of which he died shortly after his return to London. The results of Bent's explorations appear in *The Ruined Cities of Mashonaland* (1892; 3rd ed. 1895), *The Sacred City of the Ethiopians* (1893; 2nd ed. 1896), and *Southern Arabia*, this last being published by his wife after his death (1900).

**Bent**, SILAS (1820-89), American naval officer, particularly distinguished as a meteorologist and hydrographer, was born in St. Louis, Mo. He became a midshipman in the U. S. Navy in 1836, and a lieutenant in 1849. He served as a captain in Perry's famous expedition to Japan (1853-4), and is remembered chiefly as the first scientific writer to describe fully (1855) the Japanese Current or Kuro Shiwo. He is known, also, for his researches into the meteorology and climatology of parts of the Great Basin in the Western United States.

**Bent Grass**, a genus of grasses (*Agrostis*) including nearly a hundred species widely distributed over the globe. All flower in a loose, spreading panicle, and the small spikelets bear but one flower apiece. The more important varieties are the Common Bent Grass or Red Top, a variety of *A. alba* extensively cultivated as a fodder plant in Europe and America; the Marsh Bent Grass (*A. alba*), also useful for pastureage; Cloud Grass (*A. nebulosa*), a Spanish variety of beautiful light feathery habit; Creeping Bent Grass (*A. stolonifera*), which gives a velvety turf for lawns; Rhode Island or Brown Bent Grass (*A. canina*), a perennial grass which makes a dense sod.

**Ben'tham**, GEORGE (1800-84), English botanist, nephew of Jeremy Bentham (q. v.), was born near Plymouth. He studied for the law, and in 1827 produced *Outlines of a New System of Logic*, containing the first clear statement of the doctrine of the quantification of the predicate—a discovery commonly attributed to Sir W. Hamilton. From 1832 he devoted himself exclusively to his favorite study of botany. His best-known work is his *Handbook to the British Flora* (1858); but his greatest achievement is his share, the major portion, of the epoch-making *Genera Planta-*

*rum* (3 vols., 1862–83) written with Sir Joseph Hooker. Bentham's *Labiatarum Genera et Species* (1833–6) and *Flora Australiensis* (5 vols., 1863–70), the last in conjunction with Ferdinand von Müller, were also important works. He was president of the Linnean Society from 1861 to 1874.

**Bentham, JEREMY** (1748–1832), one of the most productive and influential of English writers on politics and jurisprudence, was the son of a prosperous London attorney. He was granted his bachelor's degree from Queen's College, Oxford, in 1763, and in the same year entered Lincoln's Inn. His first important work, *A Fragment on Government* (1776), was a daring attack on the accepted theories expressed by Blackstone in the first volume of his *Commentaries*, and met with immediate success. Like all Bentham's works, it is distinguished by a reckless contempt for time-honored formulae. It has, however, a terseness and simplicity of expression not often found in his later writings. A more comprehensive work, *Introduction to the Principles of Morals and Legislation*, appeared in 1789, setting forth the principles by which, in the author's view, the whole conduct of private citizens and rulers alike should be guided. These principles may be summed up in the single word 'utilitarianism,' or the doctrine of 'the greatest happiness of the greatest number.'

In 1785 Bentham had visited Russia, to see his brother, Samuel Bentham, then engaged in the service of the Tsar, and from that country he brought back his famous idea of a *Panopticon*, or model prison, which occupied him for many years, and on which he wrote in 1791. In 1792 he came into an easy fortune by the death of his father.

On the outbreak of the French revolution Bentham threw himself with enthusiasm into the voluntary work of advising the leaders of the revolutionists, and when he visited Paris in 1823, he was received with the utmost honor. The reform of the poor law, the amplification of judicial procedure, the recasting of the law of evidence, were some of the more important subjects which occupied his long years of untiring industry at Ford Abbey, in Wiltshire, to which he retired in 1814, and where he spent the remainder of his life.

Consult Stephen's *English Utilitarians*; Atkinson's *Jeremy Bentham: His Life and Work*.

**Bentinck, ben'tingck, LORD WILLIAM CAVENDISH** (1774–1839), governor-general of India, son of the third Duke of Portland. He acted as governor of Madras

(1803–07), saw service in the Peninsula under Moore, and commanded the British forces in Sicily (1811–14). He was governor of Bengal in 1827, and from 1828 to 1835 was governor-general of India. His administration was marked by financial and legal reforms, the abolition of suttee or widow-burning, the suppression of the Thugs, and measures directed towards educating the natives and opening to them a larger share in the government of India.

**Bentinck, LORD WILLIAM GEORGE FREDERICK CAVENDISH** (1802–48), son of the fourth Duke of Portland, commonly known as Lord George Bentinck. Though elected M.P. for King's Lynn in 1826, he devoted himself largely to the turf, where he did much to raise the tone of racing circles. He promoted the enfranchisement of the Irish and Jews, and in 1845 headed the Protectionist party in their opposition to and defeat of Sir Robert Peel.

**Bentley, RICHARD** (1662–1742), English scholar and divine, was born in Oulton, Yorkshire, the son of a yeoman. He was educated at Cambridge, became headmaster of Spalding grammar school, in 1682, and afterward delivered, at Oxford, the Boyle lectures on the Evidences of Natural and Revealed Religion. In 1691 he published his exhaustive *Letter to Mill* on the Greek chronicler John Malelas, which showed him to be a master of textual criticism. In 1697 he appended to a second edition of Wotton's *Reflections on Ancient and Modern Learning* a few notes demonstrating the spuriousness of the reputed *Epistles of Phalaris*. Atterbury and Smallridge replied, whereupon Bentley published his *Dissertation on the Epistles of Phalaris*, proving that the epistles were forgeries of about the fourteenth century. In 1700 he was appointed master of Trinity College, Cambridge, and in 1717 regius professor of divinity. Bentley's life at Cambridge was one of unceasing warfare with the authorities; but although he was nominally deprived of his university degrees in 1718, and deposed from his mastership in 1734, he actually retained possession of both until his death.

In 1711 Bentley edited *Horace*, in 1726 *Terence*, and in 1732 *Paradise Lost*. In 1720 he propounded a scheme for printing an edition of the Greek New Testament, in which the text should be corrected by a careful comparison with the Vulgate and all the oldest existing Greek MSS., but these principles of criticism met with opposition from his contemporaries, though they have since been generally

adopted by Biblical scholars. After Bentley's death appeared his *Discursus on Latin Metres, Remarks upon a late Discourse of Free Thinking* (1743), and *Eight Sermons preached at the Hon. R. Boyle's Lectures* (1724). Consult Monk's *Life; Correspondence*, edited by C. Wordsworth, bishop of Lincoln; Dyce's unfinished edition of Bentley's works (3 vols.); R. C. Jebb's *Bentley*, in the 'English Men of Letters' series.

**Bentleyville**, borough, Pennsylvania, in Washington county, on the Pennsylvania Railroad; 40 miles south of Pittsburgh. Pop. (1910) 1,922; (1920) 3,679.

**Benton**, town, Arkansas, county seat of Saline county, on the Chicago, Rock Island and Pacific, and the Missouri Pacific Railroads; 25 miles southwest of Little Rock. Pop. (1910) 1,708; (1920) 2,933.

**Benton**, city, Illinois, county seat of Franklin county, on the Chicago and Eastern Illinois, the Illinois Central, and the Missouri Pacific Railroads; 70 miles northeast of Cairo. It has extensive coal mining interests and manufactures stoves and display signs. Pop. (1910) 2,675; (1920) 7,201.

**Benton, JAMES GILCHRIST** (1820–81), American soldier, was born in Lebanon, N. H. He was graduated (1842) from West Point, was assigned to the ordnance service, and in 1847 assisted, at Washington, in preparing the *Ordnance Manual*. He commanded the Charleston, S. C., arsenal, 1853, and was occupied at Washington, 1853–7, with experiments which resulted in the adoption of the Springfield rifle in place of the old musket. Benton was at Washington during the Civil War, filling high offices in the ordnance department, and was in command of the national armory at Springfield, Mass., from 1866 until his death. He invented many appliances for artillery, including a device for determining the velocity of a projectile by the use of electricity. He published *A Course of Instruction in Gunnery and Artillery* (1861, new ed. 1873).

**Benton, THOMAS HART** (1782–1858), American statesman, was born near Hillsborough, N. C. He studied for a short time in the University of North Carolina, and about 1799 removed to Tennessee. There he began the practice of law and served a term (1809) in the state senate. In 1812 he commanded a regiment in the Natchez expedition under Jackson, with whom he was to be closely associated in future years. In 1813 the friendship between the two was interrupted by misunderstanding over a duel in which Benton's brother was involved.

About 1815 Benton removed to St. Louis, where he practised law and was for a time editor of the semi-weekly *St. Louis Enquirer*, in which he untiringly advocated the admission of Missouri to the Union as a slave State. Upon the admission of Missouri as a State, Benton was chosen U. S. Senator (Democratic), serving until 1851.

Having become reconciled to Jackson, he assumed the leadership of the Jacksonian forces in the Senate. He energetically and ably carried on the fight against the second U. S. Bank, and, after a dramatic contest, secured the expunging from the Senate's records of the vote of censure passed on Jackson for his removal from the Bank of the government deposits. He was also the principal supporter in the Senate of President Van Buren.

Benton was a consistent expansionist, in this as in other things representing what was then the newer West. He opposed the tariff of 1828 and the compromise tariff of 1833—indeed he was never a protectionist as that term is now understood; he fought any inflation of the currency, thus earning the sobriquet 'Old Bullion'; contended for the rights of the United States in Oregon; and opposed the Mexican War, though after it had begun, he advocated its efficient prosecution. Though himself a slaveholder and heartily opposed to Abolitionist propaganda, he came more and more to see the evils of slavery and to disapprove of its extension. He insisted that the South had rights which should not be disregarded, but he was a staunch Unionist. He vigorously opposed the compromise measures of 1850, and this brought him, for the first time, into thorough disfavor in his State and cost him his seat in the Senate. Subsequently he served one term (1853-5) in the House of Representatives, bitterly opposing the Kansas-Nebraska Bill. In 1856 he was an unsuccessful candidate for the governorship of Missouri. It was chiefly after his retirement that he prepared, with prodigious industry, his *Thirty Years' View*; or a *History of the Working of the American Government 1820-50* (1854-6), and in his *Abridgement of the Debates of Congress 1789-1856* (16 vols. 1857-61), both works of great value. Benton died at Washington, D. C., April 10, 1858. Consult *Lives* by Roosevelt, Meigs, and Rogers.

**Benton Harbor**, city, Michigan, Berrien county, on the Cleveland, Cincinnati, Chicago and St. Louis, the Michigan Central, and the Pere Marquette Railroads;  $1\frac{1}{2}$  miles from Lake

Michigan and 3 miles northeast of St. Joseph. It has manufactures of furniture, lumber, flour, machinery, and beet-sugar, and is an important grain and fruit centre, having the largest fruit market in the State. It is also a health resort, known especially for its mineral waters, which are exported. Pop. (1910) 9,185; (1920) 12,233.

**Bentonville**, town, Arkansas, county seat of Benton county, on the St. Louis-San Francisco Railroad; 160 miles northwest of Little Rock. It is the centre of an important apple-growing district and it has medicinal springs. Industrial establishments include a cannery, bottling works, fruit evaporators, barrel and brick works, rolling mills, and cider and vinegar factories. Pop. (1910) 1,956; (1920) 2,313.

**Bentonville**, village, North Carolina, in Johnston county; 17 miles west of Goldsboro. A battle was fought here March 19, 1865, between a Confederate force under Gen. J. E. Johnston and the left wing of Sherman's army, which resulted in a Federal victory.

**Benue**, ben'wē, or BINUE, river, West Africa, rises in Adamawa, flows west with a northerly curve, and enters the Niger nearly opposite Lokoja. It is about 900 miles long, and is navigable for about 600 miles (above Yola) for boats of 5 feet draught.

**Benvenuto**, ben-vā-nōō'tō, properly TISIO DA GAROFALO (1481-1559), Italian painter, last of the Ferrara school, called 'the miniature Raphael.' He adopted the Roman manner, sometimes producing great splendor of coloring. A gillyflower (*garofalo*) was often his signature. His chief works are at Ferrara, and in the London, Edinburgh, Dresden, Milan, Munich, and Berlin National Galleries. During the last years of his life he was blind.

**Ben'wood**, city, West Virginia, Marshall county, on the Ohio River, and on the Baltimore and Ohio, the Benwood and Wheeling Connecting, and the Pennsylvania Railroads; 5 miles south of Wheeling. The surrounding district is rich in iron. Pop. (1910) 4,976; (1920) 4,773.

**Benzac'onine**, an alkaloid formed by the partial hydrolysis of aconitine.

**Benzaldehyde**. See ALMONDS, OIL OF.

**Benzene**, or BENZOL ( $C_6H_6$ ), a light (sp. gr. .88), colorless, mobile liquid with a peculiar odor. It freezes at  $6^\circ C.$ , and is insoluble in water, but dissolves in alcohol, paraffins, and the like, and is itself a good solvent of fatty, resinous, and other substances that do not dissolve in water. It is very volatile, and

burns in air with a smoky, luminous flame. Chemically it is a hydrocarbon in which six carbon atoms are symmetrically arranged in a ring, one hydrogen atom being attached to each carbon atom.

Benzene is obtained from coal tar (q. v.), being separated in the first place by fractional distillation, which, however, does not yield an entirely pure product. The benzene so obtained is designated as 90 per cent., 50 per cent., etc., the percentage figure representing the proportion that distils under  $100^\circ C.$  As pure benzene boils at  $80^\circ C.$ , 90 per cent. benzene contains about 70 per cent. benzene.

Benzene is the parent substance of the aromatic series of organic compounds, yielding innumerable derivatives by the substitution of alkyl and other groups for the hydrogen atoms. Of these, nitro-benzene (obtained by the action of nitric acid on benzene) and aniline (obtained by the reduction of nitro-benzene) are among the more important. Benzene is used commercially as a solvent, and for the preparation of its derivatives, which are largely employed in the color industry (see COAL-TAR DYES).

**Benzdine**, ben'zi-dēn ( $NH_2, C_6H_5, C_6H_4, NH_2$ ), a derivative of benzene, used in the coal-tar color industry. See COAL-TAR DYES.

**Benzine**, ben'zēn, or BENZOLINE, a mixture of the lower boiling paraffin hydrocarbons, known also as petroleum spirit or petroleum naphtha, obtained by the distillation of crude petroleum. It is not to be confused with benzene or benzol. Like benzene, it dissolves oils, waxes, and resins, and is a light, colorless liquid, with an ethereal odor and low boiling point,  $45-75^\circ C.$  It is used as a cleaning fluid, as an ingredient of varnishes, for enriching coal gas, and for other purposes.

**Benzoate of Soda**, a sodium compound,  $C_6H_5CO_2Na$ , sometimes used as a food preservative (see PURE FOOD AND DRUG LAW). It is employed medicinally in gout and rheumatism.

**Benzoic Acid** ( $C_6H_5COOH$ ), an aromatic acid, occurring in gum benzoin, storax, and Peru and Tolu balsams. It may be obtained from benzoin by sublimation, but is almost exclusively prepared from the toluene of coal tar by chlorination, followed by heating with milk of lime. Benzoic acid is a volatile crystalline solid, soluble in 280 parts of cold and 15 parts of boiling water, and 2 parts of alcohol. Its vapors have a peculiar odor, which produces an irritating effect on the lungs. Benzoic acid forms a series of salts, the

benzoates, which, like the acid, are employed in medicine. It acts as an antiseptic and expectorant, though the acid itself and its salts are antipyretic.

**Benzoin**, ben-zō-in, GUM BENZOIN, or GUM BENJAMIN, a balsamic resin, obtained from *Styrax benzoin*, a thick-stemmed tree of Java and Sumatra. It is extracted from the trees, when they are six to eight years old, by incision with a knife; the resin exudes, and is allowed to remain till it hardens into reddish-brown brittle tears, which are subsequently scraped off. The resin has an agreeable odor; when heated it fuses and gives off white vapors of benzoic acid. There are two commercial varieties, the Sumatra and Siam benzoin, which differ as to relative color and degree of opacity of the masses. It is used in medicine and in the manufacture of perfumery and incense. The official preparations are the tincture and compound tincture (benzoin, aloes, storax, Tolu).

**Benzoline**. See BENZINE.

**Benzyl Chloride**, ben-zil klō'rid ( $C_6H_5CH_2Cl$ ), a compound obtained by passing chlorine into boiling toluene. It is a pungent-smelling liquid, which is converted into benzyl alcohol on heating with water, and benzaldehyde (artificial oil of bitter almonds) by boiling with water and lead nitrate. *Benzol chlorid* ( $C_6H_5CHCl_2$ ) and *Benzotrichlorid* ( $C_6H_3Cl_3$ ) are also prepared by the prolonged action of chlorine on boiling toluene. These upon oxidation yield benzoic acid. All of these substances are employed in the coal-tar color industry.

**Beograd**. See BELGRADE.

**Béothy**, bâ'û-ti, ZOLTAN (1848-), Hungarian author, was born in Komorn. He became professor (1882) of the fine arts at Budapest University, and published a number of meritorious novels, including *Kálózdí Béla* (1875). He also wrote *Rajzok* (sketches, 1879) and a *History of Hungarian Literature and of Hungarian Prose*.

**Beowulf**, bâ'ō-wōōlf, the earliest English epic poem. It was probably composed in the latter part of the seventh century, but the date, and still more the place of action, is matter of discussion. The single ms. is in the British Museum. It is in West Saxon dialect; but most scholars hold it to be a transcription from a northern or midland dialect. The following is a brief outline of the story:

Beowulf, nephew of Hygelac, King of the Geatas, hearing of the ravages committed by Grendel, a monster in human form, at the court of Hrothgar, King of the Danes, sets sail for Hrothgar's court with fourteen com-

panions, is kindly received by Hrothgar, and, lying in wait by night for the monster, succeeds, after a fierce struggle, in tearing off its arm. By means of blood-stains Grendel is traced to his lair, which lies beneath a distant mere. The night following, the king's hall (Heorot) is visited by Grendel's mother, who carries off a noble. Beowulf follows, plunges into the mere, fights with and kills the female monster, cuts off the head of the dead Grendel, and returns in triumph. Handsomely rewarded by Hrothgar, Beowulf returns to his own land, succeeding eventually to his uncle's kingdom, where he reigns happily for some fifty years. At the end of that time a fiery dragon begins to lay waste his country; Beowulf, now an old man, goes forth against the monster, which he succeeds in slaying, but also receives mortal hurt from its flaming breath. The text of the poem has been edited by Zupitza (Early English Text Society) and by Wyatt. There are translations by William Morris and Wyatt, and by Dr. Clark Hall.

**Bequest**, strictly speaking, a testamentary gift of personal property. The term is, however, frequently employed to denote any gift of property, whether real or personal, by last will and testament, and its use in a will is adequate for either purpose. See DEVISE; WILL.

**Berabra**, ber-ä'brä, a Nubian people living on both banks of the Nile from Assuan to Wadi Halfa, and scattered south in Kordofan, Dar Fur, and on the banks of the Blue and the White Nile. They number about 50,000, and are industrious agriculturists, and trustworthy.

**Béranger**, bâ-rän-zhâ', PIERRE JEAN DE (1780-1857), the greatest of French song writers, was born in Paris, and attended school in Péronne, where even as a child he became imbued with Republican principles. Having quarrelled with his father, he took up his abode in a Paris garret, celebrated in his later verse, and there devoted himself to his poetic aspirations. In 1804 Prince Lucien Bonaparte granted him a pension of \$200 a year, and his income was further augmented in 1806, by a clerkship in the office of the Imperial University. By the year 1812 Béranger had found his real vocation—that of a national song writer. Such songs as the world-renowned *Petit homme gris* were succeeded in 1813 by *Roi d'Yvetot*, which first made its author popular. In 1815 appeared *Chansons patriotiques et autres*, including the patriotic pieces, *Les enfants de la France*, *Le Cinq Mai*, *Le*

*vieux drapeau*, and other songs full of biting sarcasm and bitter hostility to the priests and reactionaries. The appearance of a second volume in 1821 led to Béranger's imprisonment, but this served only to increase his popularity and his political influence. In 1825 he published *Chansons nouvelles*, and in 1828 *Chansons inédites*, for which he was tried, fined 10,000 francs, and condemned to nine months' imprisonment in La Force, where he was visited by Hugo, Dumas, Sainte-Beuve, and others. His fifth collection of verse, *Dernières chansons*, written between 1834 and 1851, appeared after his death. Béranger was disinterested, simple, and just, consistently refusing to be bribed by honors or wealth. His songs are instinct with humanity, and overflow with wit, humor, and noble sentiment. Consult his *Ma biographie* (1857); Janin's *Béranger et son Temps*; W. H. Pollock's *French Poets*.

**Berar**. See HAIDARABAD.

**Berat**, ber-ät', or BIELAGORAD, town, Albania, on the banks of the Ergene; 30 miles northeast of Avlona and 50 miles southeast of Durazzo, near the site of the ancient Elyma. It is the seat of a Greek archbishop. The surrounding valley is fertile, and the town has trade in agricultural products. Pop. 8,500.

**Berber**, bür'ber, town, Nubia, Egypt, on the east bank of the Nile, 30 miles north of its confluence with the Atbara, and nearly 200 miles north of Khartoum. The town is noted for its camels. It is a market for cotton, silver work, leather goods, and camel saddles and equipment. Pop. 13,000.

**Berbera**, ber-bä'rä, seaport, British Somaliland, on the Gulf of Aden; 160 miles southeast of Zeyla. It has a good harbor. An annual fair of inland tribes lasts from October to April, when caravans with the produce of the interior crowd the town. At that period the population increases from about 3,500 to over 20,000. Berbera was occupied by Britain in 1875.

**Berberidaceæ**, bür-ber-i-dä'si-ē, an order of 135 species of plants, placed between the buttercup and laurel orders, and found in temperate regions of both hemispheres (except in Africa and Australia), also in tropical mountains such as the Himalayas. All the species of the genus *Berberis* are shrubby. The flowers of the order are mostly yellow; the perianth leaves are usually in sets of three, of which the inner have honey-glands like the petals of buttercups. The stamens are usually six; the pollen escapes from the anthers by valves, as in laurels. Common barberry,

(*Berberis vulgaris*) is found in Europe, Asia, and North America; it forms an ornamental bush, especially in autumn, when its graceful pendulous racemes of small yellow and scarlet berries produce a flame of color. Its use as a hedge is restricted, however, by the attacks of a parasitic cup fungus (*Aecidium berberidis*), the spores of which are blown to fields of wheat, and cause 'rust of wheat,' which is a second stage of the fungus, known as *Puccinnia graminis*; it may also attack other cereals and grasses.

**Berbers**, a people of Hamitic race ranging over North Africa southwards to the Senegal, forming three-fifths of the population of Algeria, and a still larger proportion of the people of Morocco. Till the ingress of the Arabs in the 1st and 2nd centuries the Berbers had Mauritania for their exclusive habitat. The Moslem invasions of the 7th and 11th centuries drove them inland into the Atlas Mountains, and imposed on them their religion, and in many places their language and usages. They have thus been largely assimilated with the kindred Arabs, from whom they can often be distinguished only by their somewhat coarser features and less finely shaped oval head. Blue eyes and light hair are prevalent in many parts of Morocco, Algeria, and the Sahara, whence comes the now widely accepted view that the Berbers form the original stock of the European races. The term 'Afro-European' has been introduced to express this relation. Sharing the Arab's sense of personal dignity, the Berber, less fanatical, is more settled and more given to husbandry and manufacture. The Berbers, who are believed to represent the Tamahu of the Egyptian monuments, comprise four main divisions—the Kabyles of Algeria and Morocco, as far south as Fez; the Shellala (Shuluhs) of the upland Atlas valleys; the Haratin (Black) Berbers of the south Atlas slopes; and the Saharan Tuaregs. The Imazighen ('freemen,' 'nobles'), as the Berbers generally call themselves, number collectively perhaps 8,000,000.

**Berbice**, ber-bēs', river of British Guiana, 350 miles long, with a drainage area of 13,500 square miles. It enters the Atlantic north of New Amsterdam. Vessels drawing 7 feet can ascend the river for 165 miles, but the bar has only 7 feet of water on it at low-water springs.

**Berbice**, a division in the eastern part of British Guiana, drained by the Berbice River. It has fertile soil, and produces cocoa, vanilla, and tobacco. The capital and chief town is Berbice

or New Amsterdam. Pop. about 60,000.

**Berceuse**, ber-sūz' ('cradle song'), a melody with a lulling, rocking accompaniment. *Sweet and Low* is a good example.

**Berehem**, berch'em, town, Belgium, a suburb of Antwerp. Pop. (1920) 32,853.

**Berehem**, or BERGHEM, properly NIKOLAAS (or CLAAS) PIETERSZ (1629-83), Dutch painter,

*Lettera semiseria di Grisostomo*, following which his influence, both on the Italian romantic school and on the political ideas of his countrymen, was considerable. Because of his political opinions he was an exile from 1829 to 1848. On his return home in the latter year he was made Minister of Education at Milan. His works, among which are the *Profughi di Parga* (1824), *Clarina*,

© Ewing Galloway, N. Y.

Three Generations of Berbers in Native Costume

son of Pieter Claas, an artist, was a pupil and follower of Weenix. Though he lived in Holland he generally painted Italian scenery and excelled in sunny atmospheric effects. The Wallace collection, the National, Edinburgh, Dulwich, and most Continental galleries contain examples of his work.

**Berchet**, bār'shā, GIOVANNI (1783-1851), Italian poet, was born in Milan. He first won recognition in 1816 with his

and *Fantasia* (1829), were collected and prefaced with a biography by F. Cusani (1863). As a poet he was obscure and often commonplace but he nevertheless enjoyed extraordinary popularity.

**Berchta**, berch'tä, BERGDA, or BERTHA, a female being in European (chiefly Teutonic) tradition, whose fête-day occurs on or about Epiphany. In the south of Germany she is described as a shaggy monster, with broad

'goose feet,' a long nose (or, according to some accounts, an *iron* nose), who walks round the house at night and tears bad boys to pieces. She rules over night-hags, enchantresses, elves, dwarfs, and the souls of unbaptized children.

**Berehtold**, berk'tolt, LEOPOLD ANTHONY, COUNT VON (1863- ), Austrian statesman, was born in Vienna. He entered the diplomatic service, and in 1895 was made secretary of the Austrian embassy in Paris, going to London as counselor of legation in 1899 and to Russia in 1903. He was ambassador at St. Petersburg in 1905-11 and in 1912-15 was foreign minister of Austria-Hungary. He was appointed Lord High Steward to Charles Francis Joseph in 1916, but after the fall of the royal house retired from politics.

**Berdichev**, ber-dyē'chef, town, Union of Socialist Soviet Republics, in the Ukraine; 115 miles southwest of the city of Kiev. Its chief products are iron goods, tobacco, ribbons, sugar, and leather. It is the site of the ancient monastery of the 'Bare-footed Carmelites.' Pop. (1926) 51,536.

**Berdyansk**, ber-dyānsk', seaport, Russia, capital of a district in Taurida government, on the Bay of Berdyansk; 265 miles northeast of Simferopol. It has a good harbor and is a great centre of grain trade and to a less extent of salt and coal. There are extensive manufactures of reaping-machines. Pop. about 30,000.

**Berea**, be-rē'a, town, Kentucky, in Madison County, on the Louisville and Nashville Railroad; 34 miles southeast of Lexington. It is the seat of Berea College, a non-sectarian institution (q.v.). Pop. (1910) 1,510; (1920) 1,640.

**Berea**, town, Ohio, in Cuyahoga County, on the New York Central, the Baltimore and Ohio, and the Cleveland, Cincinnati, Chicago and St. Louis Railroads; 13 miles southwest of Cleveland. It is the seat of Baldwin-Wallace College, a Methodist Episcopal institution, and is noted for its grindstone quarries. Pop. (1910) 2,609; (1920) 2,959.

**Berea**, a suburb and park at Durban, or Port Natal, Natal, South Africa, beautifully situated above the harbor.

**Berea College**, a non-sectarian institution in Berea, Kentucky, founded in 1855. The whole plant comprises four separate schools, the College; the Normal School, which trains students for teaching in the rural schools and includes the work of the tenth, eleventh and twelfth grades; the Academy, which is a senior high school accredited by the Associa-

tion of Colleges and Secondary Schools of the Southern States; and the Foundation-Junior High School, offering work through the first nine grades. No student is admitted under fifteen years of age, and very few students are accepted who come from outside of the mountain region. As a college, Berea is recognized by the Association of Colleges and Secondary Schools of the Southern States and by the Association of American Universities. There is no tuition charge. Every student gives daily service in payment in part or whole for his privileges. They man the power plant, care for the grounds and buildings, even help to erect the latter, cook and serve their own food, and as craftsmen manufacture a large amount of products for which there is an outer market. The institution also offers vocational work in the fields of agriculture, home economics, industrial arts, weaving, nursing and business. For recent statistics see Table under the heading COLLEGE.

**Bereg**, county, Czechoslovakia, in the eastern part, between the river Tisza (Theiss) and the Carpathians. It is well wooded and has deposits of iron and alum. Pop. 225,000, nearly one-half being Ruthenians and one-ninth Germans, the rest Magyars. The chief town is Berezasz.

**Berendt**, bā'rent, KARL HERMANN (1817-78), German ethnologist, was born in Danzig. He studied medicine at Königsberg and from 1843 to 1851 practised in Breslau, lecturing at the university in that city. In the latter year he went to America, having been concerned in the revolution of '48. He travelled and resided in Nicaragua and Mexico, engaged in the study of the ethnology and linguistics of the Mayan tribes, making his headquarters in Washington, D. C., and preparing a number of reports for the Smithsonian Institution.

**Berengar I.**, bā'ren-gār, king of Italy (d. 924), was crowned king in 887, and emperor of the West in 915. His reign was marked by successive struggles with his own turbulent nobles, and with invading Saracens, Hungarians, and Burgundians. In 904 he imprisoned Louis, king of Lower Burgundy, and blinded him, but in 923 suffered a crushing defeat at the hands of Louis' successor, Rudolf. Berengar was assassinated at Verona in the following year.

**Berengar II.**, son of Albert, Marquis of Ivrea, and grandson of Berengar I., was crowned king in 950. His rule was arbitrary, and in 961 he was deposed by Otto I., emperor of Germany.

**Berengaria**, bā-ren-gā'rē-ā (?-c. 1230), queen of Richard I. of England, was the daughter of Sancho VI. of Navarre. While Richard was on his way to the Crusades in 1191, she was married to him in Cyprus, whither she had gone with Eleanor, the king's mother. She remained for a time in Acre but leaving there in 1192, she proceeded to Rome and later resided in Poitou.

**Berengarius of Tours** (998-1088), French theologian, was born in Tours. About 1040 he became director of the cathedral school of St. Martin's, but developing liberal views concerning transubstantiation, he was condemned by a Church synod, and was imprisoned by Henry I. of France. Rescued by friends, in 1059 he reached Rome, where he retracted his views, but, returning to Tours, promulgated them anew. Persecuted by Pope Gregory VII. and Lanfranc of Canterbury, he retired to St. Côme, near Tours, where he spent the rest of his days. A selection from his works was published by Vischer in 1834.

**Berenice**, ber-e-ni'sē (mod. *Sakayt-el-Kubla*), ancient seaport, Egypt, on the west coast of the Red Sea, 20 miles southwest of Cape Ras Benas. It was founded (225 B.C.) by Ptolemy II. and was once an important trading centre. Numerous interesting sculptures and inscriptions have been found here.

**Beresford**, ber'es-ferd LORD CHARLES WILLIAM DE LA POER (1846-1919), noted British admiral, a son of the fourth Marquis of Waterford, was born in Waterford, Ireland. He entered the navy in 1859, became a captain in 1882, and rear admiral in 1897. He commanded the *Condor* at the bombardment of Alexandria in 1882; was in charge of the naval brigade at the battles of Abu Klea, Abu Kru, and Metemeh; and took the steamer *Saba* up the Nile to the rescue of Sir Charles Wilson's party. In 1875-76 he accompanied the Prince of Wales (Edward VII.) to India. From 1874 to 1880 he represented Waterford in Parliament; from 1885 to 1889, Marylebone; from 1898 to 1900, York; and in 1902, Woolwich. From 1886 to 1888 he was a lord of the Admiralty, resigning on the ground that his colleagues were not providing for the proper organization of the navy. In 1903 he resigned his seat in Parliament on his appointment as commander in the Channel squadron. In 1905, from second in command he was appointed commander-in-chief in the Mediterranean, and in 1907 of the Channel fleet. He retired from active service in 1911. He compiled, with Mr. H. W. Wilson, a *Life of Nelson* (1898). He

also wrote *The Break-up of China* (1899), *The Betrayal* (1912), and essays on naval affairs.

**Beresford**, WILLIAM CARR, VISCOUNT BERESFORD (1768-1854), British general, saw service at Toulon with Hood; in Corsica, Egypt, and the Cape (1805); and commanded the regular troops when Sir Home Popham seized Buenos Aires in 1806. After these troops were captured, Beresford made his escape (1807), and served in the Peninsula under Moore. In 1809 he undertook the reorganization of the Portuguese army, helped to win the battle of Busaco (1810), commanded at the battle of Albuera (1811), and took part at Badajoz, Salamanca, and Toulouse (1814). He was made a baron in 1814, and a viscount in 1823.

**Berezin**, ber-yā'zēn, ELIAS NICOLAIEVITCH (1818-96), Russian Orientalist and traveller, was born in Perm. After serving as professor in the University of Kazan, in 1842 he began a series of journeys in Asia Minor, Persia, Egypt, and afterward (1848) in Siberia, for linguistic and ethnographical studies. After 1855 he was professor of the Turkish language at St. Petersburg University, director of the Oriental Numismatic Museum in St. Petersburg, editor of the Oriental part of the great Russian *Encyclopaedia*, and published several important books in Russian. The only book in French is *Recherches sur les dialectes musulmans* (2 vols. 1848-53).

**Berezina**, ber-yā'zē-nā, river in Russia, rising in Minsk government and joining the Dnieper after a course of 340 miles. It is famous for the disastrous passage of the French Grand Army during its retreat (1812). The Berezina Canal unites the river with the West Dvina.

**Berg**, berch, DUCHY OF, a former duchy of Germany, situated on the right bank of the Rhine, between Cologne and Koblenz, with an area of over 1,000 square miles. In 1806 it was ceded to France, and Napoleon made it a grand-duchy under Joachim Murat. At the same time it was enlarged to an area of 6,700 square miles. Its capital was Düsseldorf. At the Congress of Vienna in 1815 it was ceded to Prussia.

**Bergaigne**, ber-gā'ny', ABEL (1838-88), French Orientalist and philologist, was born in Vimy. In 1868 he was appointed reader in Sanskrit, and later director, at the *Ecole des Hautes Etudes* at Paris; afterward he became professor of Sanskrit and of comparative grammar at the Sorbonne. Among his numerous works are *Essai sur la construction grammaticale* (1873); *La religion védique d'après les hymnes*

*du Rig-Veda*, his most important work (1878-83); *Les inscriptions sanscrites du Cambodge* (1882); *Chronologie de l'ancien royaume Khm̄r* (1884); *Manuel pour étudier la langue sanscrite* (1884); *Etudes sur le lexique du Rig-Veda* (1885); and several translations from the Sanskrit. After his death appeared *Manuel pour étudier le Sanscrit védique* (1890), a work in which he was assisted by V. Henry.

**Bergamo**, bār'-gā-mō, province, Italy, partly in the Lombardy Plain and partly in the Dolomite Alps; area, 1,076 square miles. It has pastoral, agricultural, and manufacturing (silk, cloth, machinery) interests. Pop. (1921) 555,686.

**Bergamo** (anc. *Bergomum*), town, Italy, capital of the province of Bergamo, stands at the foot of the Alps; 34 miles north-east of Milan. It consists of a mediæval old town crowning a hill 480 feet above the new town. In the former, among the features of interest are the cathedral (begun in 1350), a 9th century church with the tomb of Donizetti, and the library of the Broletto (1354). The business quarters are in the new town, the chief industries being the manufacture of cottons, silks, cloth, hats, paper, and metal wares. Its churches and the Carrara Academy contain paintings by Lorenzo, Lotto, Moroni, Romanino, and other artists of the Lombard school. Pop. (1921) 65,022.

**Bergamot**, bŭr'ga-mot, variety of citrus fruit (*Citrus aurantium*, var. *bergamia*) with an aromatic rind from which is extracted oil or essence of bergamot, used in perfumery. The fruit is cultivated chiefly in Italy and France. Certain varieties of pear, whose flavor recalls that of bergamot, are called by this name.

**Bergen**, berch'en, the Flemish name of Mons (q.v.) in Belgium.

**Bergen**, bar'gen (formerly *Björgvin*), town and seaport, Norway, built on a hilly peninsula separated from the mainland by the narrow Buddefjord. In the background rise seven hills ranging from 932 to 2,100 feet in height. The climate is mild and humid and the city is a popular resort. Among the interesting features are the cathedral, the ancient church of the Holy Cross, the Vestlandske Museum, the Berghus, the Mariakirche and the Hanseatic Museum. Fishing is the leading industry and the fish market where the fish are kept alive in tanks until sold is interesting. The spacious harbor is protected against the northwest wind by a mole. Bergen is the chief tourist centre for Western Norway. It is the birthplace of the poets Holberg

(1684) and Welhaven (1807), the violinist, Ole Bull (1810), and the musician Grieg (1843).

Historically, Bergen is one of the most ancient and interesting towns in Norway. Founded by King Olaf Kyrre about 1070-75, it was an important trading place in the 12th century, and attracted the North German merchants. In 1181 a great naval battle was fought off the headland Nordnes, between Kings Sverre and Magnus. In 1198 the Clerical party of the Bagler besieged King Sverre in his fortress, and in the beginning of the 13th century there were several battles fought here between them and the popular party of the Birkebeiner. The first coronations of the Norwegian kings were held at Bergen, and some were buried there. From 1164 to 1271 several Rigsdags assembled at Bergen. From the middle of the 13th century the Hansa League made its influence felt at Bergen, and in 1343 erected its own factory, which survives in the Tsykebyggen. In 1665 the town was the scene of an engagement between the English fleet and the combined Dutch fleet and Norwegian garrison. Pop. (1920) 91,443.

**Bergenfield**, town, New Jersey, on the West Shore Railroad; 10 miles east of Paterson. The leading industries are ice and ice cream making. Pop. (1910) 1,991; (1920) 3,667.

**Bergen-op-Zoom**, berch'en op-zōm, town, Netherlands, in the province of North Brabant, near the head of the East Scheldt; 20 miles north of Antwerp. The leading industries are pottery and brick making. It was formerly a strong fortress but was taken by the French in 1747. Pop. (1926) 20,930.

**Bergen Point**, bŭr'gen, village, New Jersey, now a part of Bayonne (q.v.).

**Bergerac**, ber-zh'rāk', town, France, in the department of Dordogne, on the right bank of Dordogne River, 55 miles east of Bordeaux. It is a flourishing industrial place. Besides flour mills, breweries, and paper mills, there are foundries, workshops for the making of railway supplies, and chemical factories. The celebrated white wine Montbazillac is produced in the neighborhood. Bergerac was English in 1450. Pop. (1921) 17,041.

**Bergerac**, SAVINIEN CYRANO DE (1619-55), French author, was born at Château de Bergerac in Périgord. He went to Paris, and served with distinction in the army (1639-41). Always of a turbulent disposition, he fought many duels, mostly in consequence of insulting or satirical references to his unusually large nose. His work while not having great literary value is important

in its influence on realism. The most famous productions of his pen are *Histoire comique des états et empires de la lune* (1656), and a corresponding *Histoire comique . . . du soleil* (1661), books written in a mocking spirit. Besides these he wrote a satire on Mazarin, a tragedy, *Agrippine* (1653), and one of the earliest French comedies of character in *Le pédant joué* (1654). Bergerac is the subject of a modern play by

he founded the Society for the Prevention of Cruelty to Children. (See CHILDREN, CRUELTY TO.)

**Bergh, JOHAN EDVARD** (1828-80), Swedish landscape painter, was born in Stockholm; the forerunner of the modern school. He studied at the Rhineland Academy in Paris, and in Geneva under Calame. His delicate landscapes, which are full of sentiment, are painted with fresh,

published numerous charts, as *General Map on Mercator's Projection* (1859; 2d ed. 1869); the eleventh edition of the *Chart of the World* (1866); *Mural Physical Map of Europe* (1875); *Map of the Alps* (1878); *Mural Physical Map of Africa* (1881).

**Bergk, BERK, THEODOR** (1812-81), German humanist, was born in Leipzig. He filled the chair of philology at Marburg (1842), Freiburg (1852), Halle (1857),

Bergen as Seen from Surrounding Hills

© Ewing Galloway, N. Y.

the French poet Rostand; the title rôle was first played (1897) by Coquelin.

**Bergh, BÛRG, HENRY** (1820-88), American humanitarian, was born in New York City, and was educated at Columbia University. He passed several years in Europe, and was U. S. secretary of legation at St. Petersburg (1862-4). On his return to America he began his campaign against cruelty to animals; in 1866 the New York legislature passed the laws suggested by him; and the Society for the Prevention of Cruelty to Animals (see CRUELTY TO ANIMALS) was organized with him as president. Bergh devoted the rest of his life to this reform, and lived to see similar societies established in nearly all the States and in several foreign countries. In 1874

clear color. His *View of Uri* is in the Berlin Academy. After 1861 he was professor in the Academy of Stockholm.

**Berghaus, BERCH'HOUS, HEINRICH** (1797-1884), German geographer, was born in Cleves. He was professor of mathematics at Berlin (1824-36), and afterward director of the geographical school at Potsdam. The best known of a vast number of charts is his *Physikalischer Atlas*. He also published a German edition of Catlin's *Indians of North America*.

**Berghaus, HERMANN** (1828-90), German cartographer, nephew of Heinrich Berghaus (q.v.), was born in Herford in Westphalia, and was employed after 1850 in Gotha, where he died. He prepared several maps for the atlases of Stieler and Sydow, and

and Bonn (1869). He is best known for his *Poeta Lyrici Græci*.

**Bergman, BERCH'MÄN, TORBERN OLOF** (1735-84), distinguished Swedish chemist and mathematician, was born in Katherinberg. He studied at Upsala, where (1758) he became professor of physics, and subsequently of mineralogy and chemistry. He developed the theory of the determination of chemical processes by the various degrees of affinity between substances, which was corrected by Berthollet in his conclusion that the quantitative difference of the substances concerned is also a factor in such determination.

**Bergmann, KARL** (1821-76), German-American musician, was born in Ebersbach, Saxony, and went to New York in 1848. He was himself a virtuoso with

the piano and violoncello, and composed much orchestral music. Professor Bergmann was conductor of the Germania Society at New York (1850-2); first produced German opera at Niblo's Garden (1856), and was a leader in German-American musical affairs. For some years before his death he conducted the New York Philharmonic Society concerts.

**Bergmehl**, an infusorial earth. See KIESELGUHR.

**Bergson**, berg'sôn, HENRI LOUIS (1859- ), French philosopher, was born in Paris. After leaving the Ecole Normale Supérieure, he was professor of philosophy at several lycées from 1881 to 1900, when he became professor at the Collège de France. In 1901 he was elected a member of the Academy of Moral and Political Sciences, and in 1914 of the French Academy.

Bergson's philosophical ideas have had considerable influence on contemporary thought. According to them, the fulness of reality cannot be grasped by the intellect because the universe is continuously changing, whereas concepts are fixed. The mind is an instrument of action, created by life, the whole of which it is therefore incapable of grasping. Intuition is the interpreter, which alone can perceive the *élan vital* (life impetus) at the heart of reality. His writings, characterized by lucidity of style and richness of imaginative illustration, include *Time and Free Will* (1910); *Matter and Memory* (1911); *Laughter* (1911); *Creative Evolution* (1911); *La Perception du Changement* (1911); *Dreams* (1914); *Life and Matter at War* (1915); *Mind Energy* (1920). Consult William James' *Pluralistic Universe* (1909); Gilouin's *Henri Bergson* (1911); Coignet's *De Kant à Bergson* (1911); Stewart's *Critical Exposition of Bergson's Philosophy* (1911); Lindsay's *Philosophy of Bergson* (1911).

**Bergström**, berk'ström, HJALMER (1868-1914), Danish playwright, taught in the Brockske Commercial School (1893-1905) and was a member of the Danish commission to preserve that country's neglected manuscripts. Among his dramatic works are *Ida's Wedding* (1902); *Mint Street 39* (1904); *Lynggaard & Co.* (1905), which has been translated into English by Björkman; *Karen Borneman* (1907), also translated by Björkman; *The Golden Fleece* (1908); *The Birthday Party* (1910); *The Way to God* (1912).

**Bergues**, berg, fortified town, department of Nord France, is situated at the junction of three canals, one of which connects it with the sea; 5 miles southeast of

Dunkirk. Noteworthy buildings are the Hôtel de Ville, containing an interesting collection of paintings, and the church of St. Martin, with a Gothic belfry of the 16th century. There are salt and sugar refineries and manufactures of beer and oil. Bergues has frequently been captured by French, Spanish, Dutch and English forces but in 1793 it successfully resisted the English. Pop. (1911) 4,856.

**Bergün**, (Romansh, *Bravuogn*), bergün, a finely placed village and summer resort (alt. 4,544 ft.) in the Swiss canton of the Grisons, on the route over the Albula Pass. It is 19½ miles by road from Thusis, and 30½ miles from Ponte, in the Upper Engadine. These distances, however, are shortened by the railway under the pass (opened in 1903). Pop. 1,300.

**Berhampore**, bur'um-pöör or pöör' (BAHRAMPUR), municipal town, Murshidabad district, Bengal Presidency, India, on the Bhagirathi River, 5 miles south of Murshidabad. It was formerly a cantonment, but the old barracks are now occupied by courts and municipal offices. There is a first-grade college. Industries include oil pressing and cane and bamboo work. It was the scene of the outbreak of mutiny in 1857. Pop. (1911) 22,777.

**Berhampur**, bur'um-pöör or pöör' (BARAMPUR), municipal town, Ganjam district, Madras Presidency, India; 16 miles southwest of Ganjam. It was until recently a cantonment for native troops. It has a college, a district jail, and a hospital. There is a large trade in sugar and silk. Pop. (1911) 31,456.

**Beriberi**, a disease due to the use of a diet lacking in the accessory food factors, or vitamins (q. v.). It consists in a polyneuritis and a myocardial degeneration like those resulting from acute diphtheritic toxemia. It is commonly a subacute or chronic malady, but may be sudden in onset and rapidly fatal from acute heart failure.

Beriberi is endemic in extensive parts of Eastern Asia, in the tropical and subtropical zones, including China, Indo-China, Japan, the Straits Settlements, and the Dutch East Indies, and is prevalent in the Philippines. Its occasional epidemic occurrence depends upon certain restrictions in the diet of large bodies of men, as in institutions, on sailing vessels, or under military service conditions.

The subacute and mild forms, which constitute the bulk of cases, begin insidiously and run an afebrile course. Gastric symptoms may be absent at the onset, and the patient usually

comes under notice for gradually increasing weakness and aching pains in the legs. Slowly, a typical polyneuritis develops, which tends to become chronic unless treated early and thoroughly. Symptoms due to cardiac weakness also come on—breathlessness on exertion, palpitations, giddiness, precordial distress, and tachycardia. When the neuritis is of long standing, muscular atrophy and contracture deformities of the limbs usually develop, continuing sometimes for years.

In treatment the correction of dietary defects is of primary importance. In the East, where the disease is due to an almost exclusive diet of decorticated rice, this food must be replaced by the undermilled variety, or be supplemented by the addition of rice bran. For the polyneuritis, rest is indicated, and strychnine is valuable, as are hot-air baths, massage, and active and passive movements. The cardiac symptoms require appropriate measures.

**Bering**, bé'ring; *Dan.* bá'ring, or BEHRING, VITUS (1680-1741), explorer, was born in Horsens, Jutland. Taken (1706) into the Russian naval service, he so distinguished himself in the wars against Sweden that Peter the Great charged him (1725) with the conduct of an exploring expedition. Reaching Kamchatka, he determined (1728) that Asia was not, as supposed, joined to America. Later, in 1741, he traversed the Sea of Okhotsk and made the north coast of America (Alaska) but died on Bering Island. An account of the voyage was written by the survivor, Steller. Consult also Laridson's *Life*.

**Bering Sea** (BEHRING), named from Vitus Bering (q. v.), the most northerly division of the Pacific Ocean, from which it is demarcated by the Aleutian Islands (q. v.). Its area is estimated as 878,000 square miles and its greatest depth, in the south, as 13,422 feet. On the north, Bering Sea communicates with the Arctic Ocean through Bering Strait, about 50 miles wide, which is narrow, shallow, and bordered by bare, rocky shores. On the west it washes the shores of Northern Asia and on the East the shores of Alaska. It receives the Yukon River from Alaska, and the Anadyr from Siberia. From November to May, it is generally impassable, owing to fog and ice. A cold current flows from the Arctic Ocean through Bering Strait; a warm current runs through it from the Pacific. A proposal to tunnel under the strait and link the Siberian Railway with the Canadian system has been made but has been adjudged impracticable owing to the

depth of water in the strait (160-170 feet). Consult De Windt's *Through the Gold Fields of Alaska to Bering Strait*.

**Bering Sea Controversy**, a dispute between the United States and Great Britain, arising out of the practice of pelagic sealing in the Bering Sea. In order to check the rapid diminution of the herd, the United States claimed (1) that the Bering Sea is a closed sea, over which the United States has exclusive jurisdiction; and (2) that seals are domestic animals, and therefore American property wherever captured. The contentions of the American Government were overruled by the High Court of Arbitration, provided for by the Blaine - Pauncefote treaty of 1892, which convened in Paris in March of the following year, under the presidency of Baron de Courcel, the French representative. The arbitrators further decided that a zone of sixty miles around the Pribylov Islands, the property of the United States, should be established, within which the pursuit, capture, or killing of seals by the citizens of either of the governments should be prohibited; they established a close season, from May 1 to July 1, and laid down other rules for vessels engaged in sealing.

The regulations adopted to prevent indiscriminate slaughter of seals proved ineffectual, although pelagic sealing was forbidden by the United States to American citizens. Several later commissions considered the question anew, and in December, 1911, a convention, effective for fifteen years, was proclaimed between the United States, Great Britain, Russia, and Japan, prohibiting the citizens of those countries from engaging in pelagic sealing in the Pacific Ocean north of 30 degrees north latitude. See SEALS AND SEAL FISHERIES. Consult Stanton's *Bering Sea Controversy*; *National Geographic Magazine* (December, 1911).

**Bering Strait**. See BERING SEA.

**Beriot**, bā-rē-ō', CHARLES AUGUSTE DE (1802-70), Belgian violinist, the husband (1836) of Malibran (q. v.), the eminent vocalist. He was professor in the Conservatory of Music in Paris (1843), and of Brussels (1843-52), and composed numerous popular works for the violin.

**Berislav**, bye-rē-sláf', or BORISLAV, town, Ukraine, is situated on the right bank of the Dneiper River, 45 miles northeast of Kherson. It has a large trade in grain. A town called Kize-Kerman is reported to have been founded here by the Turks about 1450, but was wrested from them in 1696 by Peter the Great and renamed Berislav. Pop. about 12,000.

**Berja**, ber'hā, town, province Almeria, Spain; 31 miles west of Almeria. It is situated in a mining and fruit-growing district, exports grapes, and has foundries, cotton mills, and candle works. Pop. 15,000.

**Berkeley**, būrk'li, city, California, Alameda county, on San Francisco Bay, and on the Southern Pacific and the Atchison, Topeka, and Santa Fé Railroads; 10 miles northeast of San Francisco. It is the seat of the Letters and Science Colleges of the University of California; the university's Greek theatre (seating 12,000) and stadium (seating 24,000); the State Agricultural and Mechanical College, and the State Institution for the Deaf, Dumb, and Blind; seven private schools and colleges, and a high school accommodating 1,200 pupils. Formerly almost exclusively a residential city, it has retained and extended many of the industries that were driven across the bay by the San Francisco earthquake and fire in 1906. According to the Census of Manufacturers for 1919, it had 114 industrial establishments with a total capital of \$16,565,000, and products valued at \$28,332,000. These include foundries, canneries, and manufactures of gloves, candy, furniture, glass, pumps, machinery, matches, castings, chemicals, boots and shoes, gypsum, and soap. The commission form of government was adopted in 1909. A movement to amalgamate the bay cities has thus far been unsuccessful. Pop. (1900) 13,214; (1910) 40,434; (1920) 56,036.

**Berkeley**, būrk'li or bārk'li, parish and market town, Tewksbury division, Gloucestershire, England, on the River Avon, 15 miles southwest of Gloucester. Berkeley Castle, a splendid example of early feudal architecture, was the scene of the murder of Edward II. (q. v.), in 1327. Edward Jenner (q. v.), the discoverer of vaccination, was a native of the town. The Vale of Berkeley is famous for Gloucester cheese. Pop. of parish (1911) 6,554; (1921) 4,687.

**Berkeley**, GEORGE (1685-1753), Irish metaphysician and philanthropist, was born in Dysert, Kilkenny. In 1700 he entered Trinity College, Dublin; in 1707 he published his first works, *Arithmetica* and *Miscellanea Mathematica*, and in 1709 he took orders. In his *Essay toward a New Theory of Vision* (1709) he argued that the immediate objects of sight are all mind-dependent appearances, which form what is practically a natural language whereby mankind are 'instructed and regulate their actions.' This essay was followed by the *Principles of Human*

*Knowledge* (1710), in which he boldly represents as 'self-evident truth' that all those bodies which compose the mighty fabric of the world could have no real subsistence after the extinction of all percipient mind, nor active power after the extinction of all voluntary agency. By an unmetaphysical generation this was supposed to imply that the material world is only an idle dream, having no practical significance. To correct this misunderstanding, Berkeley published *Three Dialogues between Hylas and Philonous* (1713), in which the questions at issue are discussed after the manner of Plato.

His next eight years were spent in England, France, and Italy. In 1713 he is found in London, introduced by his countrymen Swift and Steele to the brilliant society in which Addison and Pope were prominent. He again visited France and Italy, as chaplain to the Earl of Peterborough, in 1714, and was once more abroad from 1716 till 1720.

Berkeley's return to England in 1720 marked an era in his life. He found the country disturbed, economically and socially, by the South Sea Scheme (q. v.). The prevailing tone of morals shocked him, with its indifference to lofty ideals, and its selfish secularism, which had taken the place of the fanatical spirituality of the preceding century. He proposed a remedy in a fervid *Essay toward Preventing the Ruin of Great Britain* (1721).

Despairing of the Old World, and ready to look elsewhere for Utopia, he told his friend Lord Percival, in 1723, that he was determined to spend the rest of his life in Bermuda, at the head of an institution which might become a fountain of Christian civilization for the American Indians. To the carrying out of this project all his energies were now directed. In 1724 preferment came in the form of the deanery of Londonderry. Later in the same year he moved to London, where he spent the four following years collecting money for his enterprise, for which he proposed to surrender the deanery. His social charm and enthusiasm attracted Sir Robert Walpole, and a promise of \$100,000 for Bermuda was voted by the House of Commons. In 1728 we find him, newly married to the daughter of the Speaker of the Irish House of Commons, embarked, on his way to Bermuda, for Rhode Island, where he waited for three years for the promised endowment. During his residence in Rhode Island he officiated in Trinity Church, Newport. He was in the end disappointed by Walpole, and in 1731 returned to London,

where he published (1732) *Alciphron*; or, *The Minute Philosopher*, a book of dialogues on the philosophy of religion, pondered and prepared in the seclusion of Rhode Island. A supplementary tract on *Visual Language*, 'showing the immediate presence and providence of a deity,' appeared a year after *Alciphron*.

The year 1734 was another turning point in Berkeley's life, when he became bishop of Cloyne by the favor of Queen Caroline. The change found him on the eve of a controversy concerning *mysteries* in religion, suggested by a dialogue in *Alciphron*—its mysteries being fatal to its authority, according to certain free-thinking mathematicians. The *Analyst* (1734) was Berkeley's rejoinder, in which he showed that even mathematics is as open as religion to the charge of ultimate mystery.

The social state of Ireland next engaged his attention. In the *Querist* (1735-7) he raised questions of political economy that anticipated David Hume and Adam Smith. Berkeley's philanthropic zeal found varied exercise. In 1739 the diocese of Cloyne was ravaged by famine and fever. His American experience reminded him of the marvellous medicinal properties of tar, and his own experiments served to expand the conception. It assimilated curiously with studies in Plato, the Neoplatonists, and the mystics, in which he had been immersed for years; an eccentric ingenuity connected the medicine with metaphysics; and tar, as a possible panacea, suggested the final interpretation of the universe. This train of thought found expression in *Siris* (1744), the most curious book in English metaphysics, and Berkeley's last word on philosophy. Its profound speculation was, however, obscured by the prolonged controversy to which its therapeutic doctrines gave rise. Indifferent health induced Berkeley in 1752 to remove from Cloyne to an academic home in Oxford, where he died in 1753. He was buried in the cathedral of Christ Church.

One need not look in Berkeley's works for an all-comprehensive system, as in Spinoza or Hegel. 'I had no inclination,' he tells his friend Johnson, 'to trouble the world with large volumes. What I have done was rather with a view to giving hints to thinking men who have leisure and curiosity to go to the bottom of things and pursue them in their own minds.'

The works of Berkeley first appeared in a collected form in 1784. About the middle of the nineteenth century he began to receive more sympathetic treat-

ment in Britain from Ferrier and Collings Simon; also, from a different point of view, in essays by Campbell Fraser (1863-4); and in 1871 the University of Oxford published an annotated edition of the *Collected Works* (3 vols.) by Professor Fraser, along with a supplementary volume of *Life and Letters*. Those works which had been published in his lifetime appeared in 1898, with a biographical introduction by the Right Hon. A. J. Balfour. Consult Fraser's *Berkeley* (Blackwood's 'Philosophical Classics'); *Works* (edited by Fraser); Mill's *Three Essays on Religion*; Schwab's *Der Utilitarismus Berkeleys*; *The Querist* (new ed. by Johns Hopkins Press, 1910); Mead's *Bibliography of George Berkeley, Bishop of Cloyne* (1910).

**Berkeley, Sir George Cranfield** (1753-1818), British admiral, son of Augustus, fourth earl of Berkeley, was in 1778 in the *Victory* in the action off Ushant. His captain's commission dated from 1780. At the relief of Gibraltar, in 1782, he was in command of the frigate *Recovery*, and at Lord Howe's victory in 1794 was wounded while in command of the *Marlborough*. In 1799 he was in command of a squadron blockading Brest, and in 1810 became an admiral in the British navy. He was also lord high admiral of Portugal. He was M.P. for Gloucester (1781-1812).

**Berkeley, James, Third Earl of** (1680-1736), British admiral, known in earlier life as Lord Dursley, was made a captain in 1701, and commanded the *Boyne* with great credit in Rooke's action off Malaga in 1704, and the *St. George* at the siege of Toulon. In 1717 he was appointed first commissioner of the Admiralty, and two years later was advanced to the rank of admiral and commander-in-chief of the fleet and vice-admiral of England.

**Berkeley, Miles Joseph** (1803-89), English botanist, was born in Northamptonshire. He was educated at Cambridge, took orders, and in 1868 became vicar of Sibbertoft. He published an *Introduction to Cryptogamic Botany* (1857) and important papers dealing with vegetable pathology, his chief interest being in the study of fungi and fungoid diseases. He contributed the section on fungi to Hooker's *British Flora*, wrote *Outlines of British Fungology* (1860), and for eleven years edited the Journal of the Royal Horticultural Society (1866-77).

**Berkeley, Sir William** (c. 1609-77), English colonial administrator, was born probably near London. He was graduated from Oxford in 1629, and served

as governor of the colony of Virginia (1642-52 and 1660-77)—his first term being marked by his severity toward the Puritans, and his staunch adherence to the king rather than to Cromwell during the English Revolution; and his second term by his arbitrary and overbearing conduct, and by the outbreak and conclusion of Bacon's Rebellion (q. v.), the participants in which he punished relentlessly. He published a play, *The Lost Lady* (1638), and *A Discourse and View of Virginia* (1663). Consult Wise's *Ye Kingdom of Accawmacke, or the Eastern Shore of Virginia in the Seventeenth Century* (1911).

**Berkhamstead**, bürk-ham'sted or bärk-ham'sted, or GREAT BERKHAMSTEAD, parish and market town, Hertfordshire, England, 26 miles northwest of London. It has a ruined castle. Cowper the poet was born here in 1731. There are straw plaiting and carved and turned wood-ware industries. Pop. of the town (1921) 4,746.

**Berkshire**, bürk'shir or (in England) bärk'shir, an inland county of England, south of the River Thames and west of Surrey. Within its borders are Windsor Castle, whence it is known as the 'royal county,' and the royal seats of Frogmore, Cumberland Lodge, and Cranbourn Lodge. The surface is generally undulating and moderately well wooded. The principal hills are the Berkshire Downs, or White Horse Hills, with Cumnor Hurst in the northwest and Inkpen Beacon near the southwestern boundary. The county is watered by the Thames, Ock, Kennet, Cole, Lambourn, and Pang. Agriculture and dairy farming are the chief industries. Manufactures are limited, and are mainly centred in Reading (q. v.), the principal town. Whiting is made from the chalk at Kintbury.

Berkshire was the scene of the struggles between Alfred and the Danes in the ninth century, and played an important part in the Civil Wars from the reign of Stephen to the death of Charles I. Interesting historically is the Great 'White Horse,' nearly 400 feet in length, cut on a chalk hillside in Vale of Ock, traditionally said to commemorate the battle of Ashdown (861) but probably pre-Roman. Area, administrative county (1921) 463,830 acres; registration county, 575,152 acres. Population, administrative county (1921) 294,821; registration county, 313,190.

**Berkshire Hills**, the hill region of Berkshire county, Massachusetts. Lying in the western end of the State, these hills are a continuation of the Green Moun-

tains of Vermont. Though not lofty (few summits exceed 2,000 feet), they are varied and picturesque. Greylock (q.v.), which has an altitude of 3,535 feet, is the highest mountain in Massachusetts. The region has many associations with Hawthorne, Longfellow, Bryant, and other men of letters. It contains several towns noted as summer resorts, and places of historic interest, as Pittsfield, Lenox, Stockbridge, and Great Barrington.

through the exertions of his friends, Georg von Frundsberg and Franz von Sickingen. In the Peasants' War of 1525 he headed a party of the revolted peasants, and after the dissolution of the Swabian League (1540) he took part with Charles v. (1542) against the Turks and Francis I. (1544). His autobiography, edited and published by Pistorius, furnished Goethe with materials for his drama.

**Berlin**, bûr-lin'; *Ger. pron.*

latter housing paintings, engravings and Egyptian collections. Nearby are the National Gallery; the Cathedral, in later Renaissance style (built in 1894-1905 at a cost of \$2,500,000); the National Monument to Emperor William I. (1897); the new Pergamon Museum (1925), containing ancient sculptures from several Greek cities of Asia Minor; and facing the river, the Emperor Frederick Museum (1897-1903), in the Italian baroque style.

From the island stretches westward the most famous street in Berlin, 'Unter den Linden' ('under the lime trees'), 198 feet wide and about a mile in length from the Palace to the Brandenburg Gate. It has been largely rebuilt of late years, and is bordered by hotels, shops, and handsome public buildings, including the Arsenal (1695-1706), now used as a military museum and Hall of Fame for the Prussian Army; the Opera House (1741-3); the Royal Library (1,230,000 volumes), completed in 1909 at a cost of \$2,500,000; the Town Hall (1861-70); the University; the Palaces of William I. and the Emperor Frederick III., and the monument to Frederick the Great by Rauch (1851). The Triumphal Arch at the west end of the street, the Brandenburg Gate (a copy made in 1788-91 of the Propylæa at Athens), forms the entrance to the large park (630 acres) of the Tiergarten, extending to Charlottenburg. In the east is the magnificent avenue of the Siegesallee ('Avenue of Victory'), adorned (1898-1901) with thirty-two marble groups of the rulers of Prussia and Brandenburg. In the north-east part of the Tiergarten stands the most imposing building of the city, the Parliament building, erected from designs by Walpolt in 1884-94, at a cost of more than \$5,000,000. In the south-west are the famous Zoological Gardens and the Emperor William I. Memorial Church (1891-5). Near the northwest is the royal palace of Bellevue. The Tiergarten Quarter, to the south of the park, bordering the Landwehr Canal, is a fashionable residential section. The canal is crossed by the Potsdam and Victoria and the Hercules bridges.

In Wilhelm Strasse are the Prussian Parliament Houses (1893-8), the Post Office (1871-98), and the handsome Anhalt railroad station (1875-80). The churches of Berlin are generally of brick, the oldest being St. Mary's and St. Nicholas'. The Roman Catholic Church of St. Hedwig is in rotunda form, built in the style of the Pantheon in Rome. Educational, artistic, and scientific institutions are numerous, and some of them are of more

Berlin and Environs.

ton (qq. v.). Consult Phillips' *Pathfinder to Greylock Mountain, the Berkshire Hills, and Historic Bennington* (1910).

**Berlad**, bûr-lăt, city, Roumania, capital of the district of Tutova, on the River Berlad and the state railway from Galatz to Jassy. It is situated in an agricultural region, and is an important *entrepôt* for the corn trade to Galatz. Pop. (1914) 25,367.

**Berlichingen**, ber'lich-ing-en, GOETZ or GOTTFRIED VON, 'of the Iron Hand' (1480-1562), was born in Jagsthausen, Wurtemberg. He was a typical example of the baronial robbers of the Rhine—stern, bloody, and rapacious, but frank, generous, and, after their fashion, courteous. He is the subject of Goethe's tragedy, *Goetz von Berlichingen*, translated by Scott in 1799. At the siege of Landshut (1505) he lost his right hand, and the artificial one which he used in its place was the origin of his nickname. Fighting against the Swabian League, he made a heroic defence of Möckmühl, but was taken prisoner at Heilbronn (1519), and was released only

ber-lên', city, capital of Germany, is situated on the River Spree, an affluent of the Elbe; 84 miles by rail from Stettin and 178 miles from the North Sea. The Spree, which runs through the centre of the city, is connected with the Oder and the Baltic by canals. It is crossed by a large number of bridges, of which the Palace and Emperor William are perhaps best known. The city is the centre of the North German Railroad system, and has five terminal railroad stations.

Berlin is the most modern of all European capitals. The narrow byways and old walls of the thirteenth-century city have long since disappeared, and wide streets, open squares, and modern buildings have taken their places. On an island in the centre of the city stands the former royal palace, a four-square pile begun in 1451. Opposite it are the old (1824-8) and new (1843-55) Museums—the former containing Greek and Roman works of art, including sculptures and specimens of ornamental and industrial art, the

VOL. II.—Mar. '26

than national reputation—*e.g.*, the Observatory, the Seminary for Oriental Languages, high schools for music, the fine arts, and veterinary science, the Academy of Sciences, Industrial Art Museum, Ethnological Museum, Oceanographical Museum (1906), Royal Museum of Traffic and Engineering (1906), and Mining Academy. The city contains, besides numerous theatres and music halls supported by private enterprise; the Opernhaus and the Schauspielhaus, which receive state support.

Other parks of Berlin, besides the Tiergarten, are Exhibition Park, where the annual summer art exhibition is held; the Invaliden, containing the National Warriors' Monument to the soldiers of 1848; Humboldthain (90 acres) and Friedrichshain; Victoria Park (1888-94), and Schiller Park (1909-10).

Berlin has five railway stations to accommodate the thirteen lines which carry through traffic. The Stadtbahn, a city railway, runs from Charlottenburg on the west, to Stralau-Rummelsburg on the east. An electric elevated and underground railroad also serve the city. Tramways traverse the principal streets, centring at Potsdamer Platz. Omnibuses and cabs are also largely used in city transportation.

Higher education is provided by the University of Berlin (see BERLIN, UNIVERSITY OF), the Academy of Architecture, and schools of music, Oriental languages, arts, mining, engineering, artillery, agriculture, and other similar institutions. There are numerous academic, technical, and commercial high schools, secondary and primary schools, and kindergartens. The German Institute for Foreigners offers assistance to those wishing to study the German language and customs.

Berlin is important as an industrial and trade centre, the industrial quarters lying to the northeast, southeast, and northwest of the old town. It is estimated that the electrical industry alone employs 170,000 workers. Brewing is an important industry, and there are manufactures of wool, silk, iron, steel, and their by-products, linen, hats, paper, books, porcelain, pottery, chemicals, confectionery, dairy products, musical instruments, tobacco, shoes, clothing, and jewelry.

Trade is carried on in corn, wines, spirits, and building materials. Economic conditions since the war have been so unsettled that statistics give little idea of the city's commercial possibilities. In a single year preceding the war, the land traffic of Greater Berlin (not including transit)

amounted to 12,697,965 tons, and the water-borne traffic to 8,848,900 tons; 60,883 vessels entered the port of Berlin and 25,264 vessels entered the port of Charlottenburg.

**Government.**—Prior to the Great War Berlin was governed by the Police Department, under the direction of the Prussian Minister of the Interior, and by a Common Council. The police administration had charge of trade regulations, markets, building, criminal and passport regulations, and all matters pertaining to fires and the general order. The Common Council was elected for a term of six years by popular vote, the voters being divided into three classes on the basis of income and taxes. The Council elected the mayor and his immediate advisers. The surrounding towns—Charlottenburg, Schöneburg, Rixdorf, Wilmersdorf, and others—were included in the metropolitan police district of 'Greater Berlin,' but were under separate civil administration.

Following the war a law was enacted (1920) to bring all these communities under a single government, and a new metropolis was created, including, besides the old city, eight formerly independent towns, fifty-nine rural communities, and twenty-seven large agricultural estates. The central government was entrusted to a magistracy of about thirty members and a central council not to exceed 225 in number. The Greater City was divided into twenty districts, each with its assembly and executive body with a mayor at the head. A radical change took place, also, in the franchise. The old division of the voters into classes was done away with, and the universal franchise was established. The city revenues are derived from public utilities conducted by the municipality.

Berlin has long been known for its progressive policy as regards public ownership of utilities, as gasworks, cattle yards, slaughterhouses, markets, and transportation facilities. In 1925, in order to help solve the housing problem, which had assumed serious proportions, the city undertook to advance considerable sums on second mortgages to co-operative construction and private builders, who in turn agreed that rent for the new dwellings should not exceed 115 per cent. of the pre-war rates.

**Population.**—In 1890 the population of Berlin proper was 1,578,794; in 1900, 1,888,848; in 1910, 2,070,695 (of 'Greater Berlin,' 3,702,962). The population of the Greater City in 1919 was 3,803,770. The estimated population in 1924 was 4,000,000.

**History.**—Berlin was originally a Wendish fishing village named Kölln. First known in the twelfth century, it was granted municipal rights about 1240; and in the middle of the fifteenth century it set up an independent mint and courts of justice. In 1448 it was chosen as their place of residence by the Hohenzollern rulers of Brandenburg. During the Thirty Years' War it was besieged and destroyed by the Swedes and Imperialists, to be rebuilt by Frederick William (1640-88), who began the work of making it one of the finest cities of Europe. This work was continued by Frederick I., Frederick William I. (who named the city Berlin), Frederick the Great, and William II.; but it is from the successful issue of the Franco-Prussian War (1870-1) that the city dates its rapid growth and its pre-eminence. In 1881 it was separated from the province of Brandenburg and made an administrative centre. In 1878 the Berlin Congress (q. v.) of European Powers, and in 1884-5 the Congo Conference, met in the city.

The most important development of the last few decades in Berlin has been the creation of the Greater City under a single administration. With the growth of the suburban communities, the need of some form of centralization became apparent both for the prevention of intercommunity friction and for the more efficient conduct of public utilities.

Accordingly, in 1911 came the creation of what was known as Greater Berlin, whereby the suburban districts associated themselves with the city proper for certain special objects coming under the police administration. The union proved, however, too loose a one to meet the more serious problems arising during the war and in the period immediately following, and in 1920 the old city of Berlin, the outlying cities, rural municipalities, and large agricultural estates were brought together under a central administration, as described above (see *Government*).

Berlin suffered seriously from the general economic disorganization following the war. Unemployment reached serious proportions (235,853 unemployed, Jan. 1, 1924), and was reflected in a lower marriage rate, increased number of suicides, and increased infant mortality. Shortage of food and lack of housing facilities also told heavily, especially on the middle classes. During 1924 and 1925, however, there was a marked change for the better.

Consult *Berlin und seine Bauten*, issued by the Architects'

Association; Ring's *Die Deutsche Kaiserstadt* (2 vols.); historical works by Fidicin, Streckfuss, and Schwebel; Geiger's *Berlin, 1688-1840*, a history of the city's intellectual development; Osborn's *Berlin* (1909); Dickie's *In the Kaiser's Capital* (1910); Paszkowski's *Berlin in Wissenschaft und Kunst* (1910); Eberstadt's *Gross Berlin* (1910); Siepen's *Berlin* (1911); Grieben's *Berlin and Environs* (1912); Bædeker's *Berlin and Its Environs* (1912); Marc Henry's *Trois Villes; Vienne - Munich - Berlin* (1917); Kaerber's *Berlin im Weltkrieg* (1921); Laforgue's *Berlin, la cour et la ville* (1922).

**Berlin**, former name of Kitchener, Ontario. See KITCHENER.

**Berlin**, village, Connecticut, Hartford county, on the New York, New Haven, and Hartford Railroad; 11 miles south of Hartford. It is connected by trolley with Hartford through New Britain, its banking point. There are manufactories of iron and steel, hardware, pressed brick, envelopes, and paper bags and boxes. Pop. (1910) 3,792; (1920) 4,298.

**Berlin**, city, New Hampshire, Coos County, on the Androscoggin River, the Boston and Maine, and Grand Trunk and New England Lines Railroads; 15 miles northeast of Mount Washington. It has a public library, municipal building, and hospital. Abundant water power afforded by the river is utilized in the manufacture of pulp, paper, and lumber. According to the Federal Census for 1919, industrial establishments number 25, with \$39,300,580 capital, and products valued at \$30,652,522. Pop. (1900) 8,886; (1910) 11,780; (1920) 16,104.

**Berlin**, city, Wisconsin, Green Lake and Waushara counties, on the Fox River and the Chicago, Milwaukee, and St. Paul Railroad; 20 miles west of Oshkosh. It has boot and shoe and fabric glove factories, granite quarries, a fur goods factory, brick yards, a milk condensery, and dairy and cranberry interests. Berlin was settled in 1847 and incorporated in 1856. Pop. (1910) 4,646; (1920) 4,400.

**Berlin, Congress of** (June, 1878), a meeting of representatives of the European powers invited by Prince Bismarck to revise the Russo-Turkish treaty of San Stefano (1878). Its sessions were held in Berlin, in the Radziwill Palace, and Bismarck acted as president. Germany, Austria, Russia, England, France, Italy, and Turkey were represented. Delegates from other European countries were also in attendance but not as members. The Congress recognized the independence of Roumania, Servia, and

Montenegro. Bulgaria was reduced in size and became a self-governing Turkish tributary state, with an elected prince not a member of any reigning European dynasty. Eastern Roumania received administrative autonomy and a Christian governor, but remained under the control of the Sultan. Greece was promised a modification of her frontier, which was carried out in 1881. Bosnia and Herzegovina were placed under the administrative control of Austria, while Roumania returned to Russia the Bessarabian territory taken from her by the Treaty of Paris, receiving in return the Dobrudja. Ardahan, Kars, and Batum were ceded by the Porte to Russia. Great Britain, by establishing herself in Cyprus, assumed virtual control of the eastern part of the Mediterranean. See EUROPE, *History*.

**Berlin Decree**, a decree issued by Napoleon at Berlin on Nov. 21, 1806, after the Battle of Jena, and marking the beginning of Napoleon's 'Continental System.' The decree declared the British Islands under blockade, prohibited all commerce with them, and ordered all ports to exclude vessels sailing from Great Britain or from any of her colonies. The decree drew forth the British Orders in Council of Nov. 11, 1807, and, in America, was one of the causes which led to the enactment of the Embargo of December, 1807. See CONTINENTAL SYSTEM; EMBARGO.

**Berlin'er, EMILE** (1851- ), German-American inventor, was born in Hanover, Germany. He came to the United States in 1870. In 1877 he invented the loose-contact principle of the modern telephone transmitter; and in the same year first used induction coils in connection with telephone transmitters. He has patented many other valuable inventions connected with the telephone. He was chief instrument inspector of the Bell Telephone Company from 1879 to 1882. In 1887 he invented the gramophone (see PHONOGRAPH). He was the first to make and use in aeronautic experiments a light-weight revolving cylinder internal combustion motor which was later used on aeroplanes. After 1901 he became active in the campaign against impure milk and other dairy products and wrote pamphlets on various phases of hygiene. He acted as president of the Washington Tuberculosis Association (1917-22).

**Berlin, University of** (FRIEDRICH WILHELM UNIVERSITY), dates its foundation from 1809. When Napoleon I. suppressed the University of Halle, Friedrich

Wilhelm III., advised by Schmalz, Fichte, Schleiermacher, Wolf, and other men of prominence, planned for a new university to take its place in Prussia. Through Wilhelm von Humboldt, then minister of the education department, these plans were brought to completion at the end of 1808; the new university was placed under the direction of the Minister of the Interior; an appropriation of 150,000 talers was made; and the Palace of Prince Henry of Prussia, on the Avenue Unter den Linden, was set aside for its use. In 1810 the University opened, with some of the faculty from the University of Halle on its staff. Among the first corps of teachers were Hegel and Niebuhr. Other illustrious men who have served on the faculty are the Grimm brothers, Schelling, Carl Richter, Virchow, Helmholtz, Von Ranke, Mommsen, Harnack, Curtius, Brunner, Du Bois Raymond, and Koch.

The University is still lodged in Prince Henry's Palace, though it has outgrown its present quarters. It is supported by the state, under the Minister of Education. The immediate administration is in the hands of the rector and a senate composed of the full body of the professors. It is a self-governing body, and has police and judicial power over its members. A University court, made up of members of the faculty of law, exercises judicial power. This court may punish by reprimands, fines, imprisonment in the University prison, deprivation of credit, suspension, and expulsion. There is no dormitory system, as in American universities.

The University includes schools of Theology, Jurisprudence, Medicine, and Philosophy. Provision for technical education is made elsewhere. The degrees of doctor and licentiate are granted. The University has numerous institutes, clinics, seminars and other similar organizations, the seminar for oriental languages being especially important in training for foreign service. In 1922, the total enrollment of students was 12,724, of whom 1,484 were women. The University library contains over 330,000 volumes, besides the theses of applicants for degrees. In 1910 the University celebrated its one hundredth anniversary. Consult Lenz' *Geschichte der Friedrich-Wilhelms Universität* (4 vols., 1910).

**Berlioz**, bër'lë-ös', HECTOR (1803-69), French musical composer, was born in Côte Saint André, near Grenoble. He studied at the Paris Conservatoire, and in 1830 was awarded the Prix de Rome. On returning to Paris in 1832, he became a jour-

nalist in order to support his family, meantime spending his spare time in musical composition. In 1841 he made the first of a series of European tours which established his reputation as a composer and conductor of the first rank. In 1856 he became an Academician and in 1859 was appointed librarian of the Conservatoire. Among his best known works are his symphonies, *La damnation de Faust* (1846), *Symphonie fantastique* (1828), *Romeo et Juliette* (1839), *Symphonie funèbre* (1840), and *Harold* (1834); a sacred trilogy, *L'Enfance du Christ* (1854); the operas, *Les Troyens* (1866), *Benvenuto Cellini* (1838), and *Beatrice et Bénédicte* (1862); the overtures, *Le carnaval romain* (1840), *King Lear* (1831), and *Waverley* (1828); a requiem, *Messe des morts* (1837), and a celebrated *Te Deum*.

Berlioz is comparable to Wagner in his supreme command of orchestration. He especially excelled in novel, even bizarre, musical combinations and effects, sometimes obtained by the use of rare instruments. He belonged to the romantic school, and was an advocate and exponent of 'programme music.' Besides a *Traité d'instrumentation* (German translation, with additions, by Richard Strauss, 1906), he wrote several books of witty and forceful comment on music and musicians, including *Voyage musicale en Allemagne* (1844), *Soirées de l'orchestre* (1852), and *Les grotesques de la musique* (1859). His *Mémoires* have been translated into English. Consult, also, Dunstan's *Life and Letters*; Mason's *Romantic Composers*; Hadow's *Studies in Modern Music* (first series).

**Bermejo**, ber-mä'hē, RIO, river, South America, rises in Bolivia, flows southeast through Northern Argentina, and enters the Paraguay River 35 miles from its confluence with the Parana. It is navigable for light craft over the greater part of its course. Total length, over 1,100 miles.

**Bermondsey**, a borough of London. See LONDON.

**Bermuda Grass**, or BAHAMA GRASS. See CYNODON.

**Bermuda Hundred**, ber-mū'da, a tract of land in Chesterfield county, Virginia, said to be the land granted in response to a petition (1639) from Bermuda, then over-populated. It played a prominent part in the Civil War. After an engagement at Drury's Bluff (May 16, 1864) with the Confederate forces under Beauregard, General Butler and the Army of the James, weakened by the withdrawal of two-thirds of their number to reinforce the Army of the Potomac under Grant, were shut up in Bermuda

Hundred for the rest of the month, unable to risk a battle. Pop. of the district (1910), 2,554; (1920) 3,379.

**Bermudas** (discovered by the Spaniard Bermudez in 1515), or SOMERS ISLANDS (so-called from Sir George Somers, who was wrecked here in 1609), a group of about 350 small coral islands belonging to Great Britain, in the Atlantic Ocean, between the parallels of 32° and 33° n. lat., 575 nautical miles from Cape Hatteras, the nearest land. Twenty of the islands are inhabited; but most of the land area (19½ square miles) is contained in the five islands of Hamilton or Bermuda (13 miles long), St. George, St. David, Somerset, and Ireland. The highest point is Sear's Hill (260 ft.). The climate is temperate and healthful, and the islands are a popular winter resort for Americans. Numerous picturesque and beautiful caves, several of which are lighted by acetylene gas, are an interesting sight. There are about one hundred miles of excellent roads, but no railroads. A causeway, running the length of the chief islands, was completed in 1871, at a cost of \$160,000. Water is supplied by collecting rain water in cisterns, there being only three or four wells on the islands. The inhabitants, about two-thirds of whom are colored, are chiefly occupied in growing potatoes, onions, arrowroot, and lily bulbs. The chief town is Hamilton—pop. (1921) 2,578—which is connected with Halifax and Jamaica by telegraph. Ireland is a naval station, and has a dockyard and victualling yard. In 1902 one of the largest floating docks in the world was fixed here.

Trade is carried on chiefly with the United States, Great Britain, Canada, and the West Indies; exports amounted in 1921 to £224,626; imports to £1,340,240. Exports to the United States reached \$1,164,713; imports from the United States, \$4,237,079. The port of Hamilton was entered in 1921 by sailing and steam vessels totalling 2,387,797 tons.

The colony is administered by a governor appointed by the Crown, assisted by an executive council (6), a legislative council (9), and a house of assembly (36). The Bermudas were colonized by the British in 1612. They were much resorted to by Confederate blockade runners during the American Civil War. In September, 1922, a hurricane caused considerable damage to hotels and other buildings in Hamilton. Pop. (1921) 20,127, of whom 7,006 were white. Consult Ober's *Guide to the West Indies and Bermuda*; Hayward's *Bermuda Past and Present* (1910).

**Bern**, Switzerland. See BERNE.

**Bernadotte**, bür'na-dot, French general who in 1810 became king of Sweden, and founded the dynasty now reigning in that country. See CHARLES XIV. of Sweden.

**Bernard**, bür'närd or bër-närd'; *Fr. pron.* ber-när', CLAUDE (1813-78), French physiologist, was born in St. Julien, near Villefranche. He studied medicine at Paris; was appointed to the chair of general physiology there in 1854, and in 1855 became professor of experimental physiology in the Collège de France. He was elected to the French Academy (1869), and became president of the Academy of Sciences and of the Biological Society (1867-78). On his death his obsequies were conducted at public expense, and his eulogy was pronounced by Renan.

As an original investigator, Bernard stands among the foremost of the century. His earliest researches were devoted to the physiological action of the various secretions of the alimentary canal. His proof that the sole use of the pancreatic juice in the digestive system is so to modify the ingested fats as to render them capable of being absorbed by the chyle ducts, is a masterpiece of biological demonstration. Another important discovery established the saccharine function of the liver. Still more important was his demonstration of the connection between this function of the liver and the nervous system. For these discoveries he received the physiological prizes of the French Academy in 1851 and in 1853. Later researches were on the change of temperature of the blood in its passage from one organ to another; on the absorption of oxygen by the blood, and the respective amount of it in arterial and venous blood; on the comparative properties of the opium alkaloids; on the sympathetic nerves in general; as well as numerous investigations on the individual processes in the act of digestion.

Among his works are *Lessons in Experimental Physiology Applied to Medicine* (1865); *Lessons in Experimental Pathology* (1871); *Lessons on Anesthetics and Asphyxia* (1875); *Lessons on the Life Common to Animals and Vegetables* (1879).

**Bernard**, SIR FRANCIS (c. 1711-79), English colonial administrator in America, was born in Nettleham, England. He was graduated from Oxford in 1736; practised law in London; was governor of New Jersey (1758-60), and of Massachusetts (1760-9) during a period marked by an acrimonious conflict between the colonists and the British govern-

ment, especially over the Stamp Act of 1765. Bernard, as the Royal representative, opposed the claims of the colonists, becoming extremely unpopular in Massachusetts, but winning approval at home.

**Bernard, MOUNTAGUE** (1820-82), English lawyer and jurist, was born in Gloucestershire. He was educated at Oxford, where he was appointed the first professor of international law in 1859. He visited the United States in 1871, in connection with the treaty of Washington; and Geneva in 1872, on the question of the *Alabama* arbitration.

**Bernard, WILLIAM BAYLE** (1807-75), Anglo-American dramatist, was born in Boston, Mass., the son of British parents. He was taken to England by his father, and received his education there, filling a government position until his dramatic work won success. After 1830 he rapidly produced plays and farces—over one hundred in all. The best known are *Rip Van Winkle* (1832); *The Nervous Man* (1833); *Man about Town* (1836); *His Last Legs* (1839). He edited *Retrospections of the Stage* (1830), from his father's papers, and in 1874 published a biography of Samuel Lover.

**Bernard (Great Saint) Pass**, the easiest pass over the Pennine Alps (8,111 feet), leads from Martigny (in the Swiss canton of Valais) to the Italian valley of Aosta, above Ivrea. It was known to the Romans as 'Alpis Pœnina,' and as 'Mons Jovis' (Montjoux) because of the temple of Jupiter on the summit. A hospice was established there as early as the ninth century, and was refounded in the eleventh century by St. Bernard of Menthon, archdeacon of Aosta (not to be confounded with St. Bernard of Clairvaux), whence its name. Since the twelfth century the hospice has been served by Austin Canons Regular, who extend hospitality to travellers, and with the help of the dogs that are called by St. Bernard's name, succor those who have succumbed to cold and fatigue. It has been crossed many times but perhaps the most famous passage was when Napoleon led his army across in May, 1800. The construction of railways has greatly diminished the importance of the pass. A carriage road to the summit was completed on the Swiss side in 1893, and on the Italian side in 1905.

**Bernardin de Saint-Pierre.** See SAINT-PIERRE.

**Bernard (Little Saint) Pass** (7,179 feet), leads from the French valley of the Upper Isère (or Tarentaise) to the Italian valley of Aosta, and is traversed by a carriage road completed

about 1870. It was known to the Romans as 'Alpis Graia' (as it was the chief pass over the Graian Alps), and later as 'Mons Joveti' or Montjouvét (from an old temple of Jupiter, the name being the diminutive to distinguish the pass from its neighbor, the Great St. Bernard).

**Bernard of Morlaix**, also known as BERNARD OF CLUNY, French Benedictine monk of the twelfth century, author of a dactylic poem, *De Contemptu Mundi*, in three books, each of 1,000 verses. Published in 1483 at Paris, it is well known through Neale's translation, which contains the beautiful hymns, 'Jerusalem the Golden,' 'The World is Very Evil,' 'For Thee, O Dear, Dear Country.' The first known complete translation of the *De Contemptu Mundi* appeared in the *American Journal of Theology* (vol. x., 1906).

**Bernard, St., of Clairvaux** (1091-1153), a notable theologian of the Middle Ages, came of a noble Burgundian family. After two years spent in the Cistercian monastery of Cîteaux, in 1115 he became first abbot of the newly founded monastery of Clairvaux, in Champagne. Bernard's saintly life and eloquence gave him an unexampled influence in Christendom, and he founded no fewer than seventy monasteries. Men of all ranks were drawn to him, and he became known as 'the Mellifluous Doctor.' In 1128 he drew up, by request, the statutes of the Knights Templar, and it was owing to him that Innocent III. was recognized by the sovereigns of Europe. He was largely instrumental in securing the condemnation of Abelard at the Council of Sens (1140). Pope Eugenius III. was his disciple. At the Council of Vezelay (1146) he moved the enthusiasm of France for the second crusade; and thousands of religious enthusiasts, fired by his eloquence, took up arms against the infidel. He prophesied great success for the venture and was so disheartened by its failure that his last years were clouded by sorrow. Bernard was canonized in 1173.

The reformed Cistercians, an order instituted by him, are often called Bernardines. His writings, which comprise letters, sermons, and hymns, hold high rank in the literature of mysticism. Many of his noble hymns (e.g., 'Jesus, the Very Thought of Thee,' and 'O Sacred Head, Now Wounded') have been translated. Mabilon printed his works at Paris in 1690.

**Bernardville**, borough, New Jersey, in Somerset County, on the Lackawanna Railroad; 21 miles southwest of Newark. It is a fashionable summer resort,

and has a healthful climate and picturesque scenery. Pop. (1910) 4,608; (1920) 4,243.

**Bernauer**, ber'nou-er, AGNES, a beautiful German girl, born in Augsburg, of plebeian descent. In 1432 she was secretly married to Albert of Bavaria, the only son of Ernest, Duke of Bavaria. Thereupon she was imprisoned by order of the duke, condemned as a witch, and drowned in the Danube, near Straubing, on Oct. 12, 1435. This tragic story furnished a fruitful theme for German dramatists and novelists.

**Bernay'** (ancient *Bernacum*), town, France, in the department of Eure, in the valley of Charentonne; 26 miles west of Evreux. It is an important industrial place, and has a mineral spring. The chief industries are cotton spinning and weaving. There is also a market for horses, cattle, and corn. Pop. 7,500.

**Bernays**, bär'nis, AUGUSTUS CHARLES (1854-1907), American surgeon, was born in Highland, Ill. He was graduated (1872) from McKendree College, took his degree in medicine at Heidelberg, and visited European hospitals. He settled in practice at St. Louis (1878), was appointed professor of anatomy at the St. Louis College of Physicians and Surgeons (1883) and later served in the Woman's Medical College. He made numerous improvements in the methods of operative surgery, and was a pioneer in antiseptic surgery in the United States. His works include *Chips from a Surgeon's Workshop*, surgical papers (1880-6), and several medical monographs.

**Bernburg**, bern'boörch, town, Germany, in the Free State of Anhalt, on both banks of the Saale River, 44 miles by rail south of Magdeburg. It has a Gothic church and a ruined château dating partly from the fourteenth century. There are iron works, and manufactures of machinery, sugar, paper and pottery. In the vicinity are the saline springs of Leopoldshall. Pop. (1925) 34,305.

**Berne** (Bern), the most populous of the Swiss cantons, and the second in size, stretching northwest toward the German and French frontiers. The central portion is formed by the valley of the Aar, from its source to Büren, northwest of Berne; area 2,657 square miles (2,172 being productive). Of the 485 unproductive square miles, 111 are occupied by glaciers. The Jura Mountains are found in the northeastern part, while the Alps cross the southern portion. The population is German-speaking and Protestant, except in the Bernese Jura, where it is French and Roman Catholic.

The leading industries are

cattle raising, dairying and the manufacture of clocks, apparel, boots and shoes, cheese, and condensed milk. Sixty per cent. of the entire Swiss clock output comes from this canton. Fruit and cattle are exported. Pop. (1920) 674,394.

**Berne**, city, Switzerland, capital of Berne canton, and (since 1848) of the Swiss Confederation. It is finely situated on a high bluff, washed on all sides but one by the Aar, flowing in a deep valley below, and commands a superb view of the snowy

tains and a famous clock tower. The principal modern buildings are the Federal Houses of Parliament, the Historical Museum, and the National Library. The University, founded in 1834, in 1926-7 had 1,384 students.

Berne is the seat of several international bureaux, as International Telegraphic Union (opened Jan. 1, 1869); the International Postal Union (formed as the result of the postal congress held at Berne on Sept. 15, 1874); the International Bureau for the Protection of Artistic and

**Berne Convention.** See COPYRIGHT.

**Berners**, *bûr'nerz*, or BARNES, DAME JULIANA (flourished in the first half of the fifteenth century), by tradition, daughter of Sir James Berners of Berners Roding, Essex, and prioress of Sopwell nunnery, near St. Albans. Of the treatises ascribed to her—*Hawkyng*, *Huntynge*, *Fysshynge*, *Lynage of Coote Armiris*, *Blasyng of Armys* (all of which, except *Fysshynge*, appeared in the *Boke of St. Albans* in 1486)—probably only that on *Huntynge* and a part

Berne, Switzerland

© Ewing Galloway, N. Y.

The West Gate of the Old Town and the Zahringen Fountain in the foreground.

Bernese Oberland Alps. Lofty bridges span the river and connect the old and new parts of the city. It ranks as the fourth town in Switzerland, coming after Zürich, Basel, and Geneva. The name seems really to be derived from 'bear,' and live bears have for centuries been kept in a pit outside the town. The chief mediæval buildings are the fifteenth-century Münster or Collegiate Church (wrongly called a cathedral, as there never has been a bishop of Berne), the fifteenth-century Town Hall, and some quaint watch towers in the main street which is adorned with delightful arcades, foun-

Literary Property (formed Jan. 1, 1888); and the International Transport (opened Jan. 1, 1893). The industries include the manufacture of clothing, boots and shoes, and chocolate. A national bank established in 1907, with headquarters divided between Berne and Zürich, has the exclusive right to issue bank notes. Berne was founded in 1191 by Berthold v., Duke of Zähringen. Pop. (1925) 107,960.

**Berne**, commune in the republic of Oldenburg, Germany, near the Weser, 9 miles northeast of Oldenburg. It was formerly the capital of the Steinger Land. Pop. 4,000.

of that on *Fysshynge* were written by her. A facsimile of the treatise on *Fysshynge* appeared in 1880, and of the *Boke of St. Albans* in 1881.

**Bernese Oberland Alps**, a chain of the Alps rising to the north of the main chain, from which they are separated by the upper portion of the Rhône valley. In the narrower sense the Bernese Oberland Alps extend from the Grimsel Pass, on the northeast, to the Gemmi Pass, on the southwest. But the term is also used, in a wider sense, to comprise, on the northeast, the district between the Grimsel Pass and the Lake of Lucerne

and Upper Reuss valley, thus including the Dammastock or Rhône Glacier region (11,920 feet), the Titlis group (10,627 feet), and the Uri Rothstock group (9,620 feet); while to the southwest of the Gemmi Pass the Oberland range is held to extend through the Wildstrubel (10,673 feet) and the Wildhorn (10,709 feet) to the Diablerets (10,650 feet).

The most popular tourist resorts are Thun, Interlaken, Meiringen, Lauterbrunnen, Mürren, Grindelwald, and Kandersteg. The principal summits are the Finsteraarhorn (14,026 feet), Aletschhorn (13,721 feet), Jungfrau (13,669 feet), Gross Schreckhorn (13,386 feet), Gross Viecherhorn (13,285 feet), Eiger (13,042 feet), Bietschhorn (12,970 feet), and Wetterhorn (12,166 feet). Among the more important passes may be mentioned the Lauithor (12,140 feet), Mönchjoch (11,680 feet), Jungfrauoch (11,385 feet), Strahlegg (10,995 feet), and Petersgrat (10,516 feet). See ALPS.

**Bernhard**, DUKE OF SAXE-WEIMAR (1604-39), a Protestant general in the Thirty Years' War, son of John, third Duke of Saxe-Weimar. He entered the army of Christian IV. of Denmark (1625), and in 1630 joined Gustavus Adolphus. In the famous storming of Wallenstein's entrenched camp at Nuremberg (1632) he played an honorable part, and in the following year was created Duke of Franconia by the Swedish crown. On the fall of Gustavus, at the battle of Lützen (1632), he took the command, completed the victory, and drove the Imperialists out of Saxony. In the following year he captured the strong imperialist city of Regensburg (Ratisbon)—an exploit which was, however, neutralized by his defeat at Nördlingen by Gallas (1634). Then, refusing to accede to the Peace of Prague (1635), and making an agreement with Richelieu, he defeated the Imperialists at Rheinfelden (1638), and finished up the campaign by the capture of the strong fortress of Breisach. Death put an end to his plan of making Breisach the centre of an independent principality.

**Bernhardt**, bern'härt, SARAH (christened ROSINE BERNARD), (1845-1923), French actress, was born in Paris, on Oct. 23, 1845. Her parents were Dutch, her mother being of the Jewish religion and her father Catholic. Entering the Paris Conservatoire in 1860, she made her *début* at the Théâtre Français in 1862 in Iphigénie, when she received favorable notice from the critic Francisque Sarcey. But her impetuous disposition led to trouble

with a senior member of the company, and she was forced to leave the Français. In 1867 she secured an engagement at the Odéon, and made her first hit there, in 1869, as Zanetto, in Coppée's *Le Passant*. In 1872, as the Queen in *Ruy Blas*, she gained great success, and was warmly praised by Victor Hugo. Returning to the Français, she played in *Mademoiselle de Belle-Isle*, and as Phèdre, in 1874, was recognized as the successor of Rachel. Two other great successes of this period were *Dofia Sol* in Victor Hugo's *Hernani*, and in *La dame aux camélias* by Dumas the Younger.

In 1881 Bernhardt visited the United States, appearing in *Adrienne Lecouvreur*, *La dame aux camélias*, and other plays; and the next nine years were a triumphal progress around the world. In 1882 she married M. Damala, a member of her company, but soon left him. She was seen in New York in 1887 and again in 1891. Her great parts, such as *Fédora*, *Théodora*, *La Tosca*, etc., were designed to exhibit one personality. Her appearance as Jeanne d'Arc at the Porte St. Martin (1890) marked the beginning of her career as a manager in Paris. Jean Coquelin *ainé* now joined her company, and appeared with her in *L'Amphitryon* and in Sudermann's *Magda*. Her *Hamlet* (1899) was received with unanimous applause—the Danish prince was for the first time made intelligible to a French audience; and her impersonation of the title rôle in Rostand's *L'Aiglon* (1900) was a marvel of dramatic power. In 1900 she brought *L'Aiglon* to America, and in 1905, 1910, 1913 and 1916 was again in the United States, where she appeared in *La Tosca*, *Fédora*, *Jeanne d'Arc*, and other plays.

Mme. Bernhardt long retained her extraordinary vitality, her unique grace, and her wonderful voice. She engaged in painting and sculpture, and directed (after 1892) the Théâtre Sarah Bernhardt. She was a professor at the Conservatoire, and an officer of the Academy. Consult her own *Memories of My Life* (1907); Huret's *Biography* (Eng. trans.).

**Berni**, ber'nē, FRANCESCO (1497-1536), Italian poet, was born in Lamporecchio. He travelled for some time with Ghiberti, whose secretary he had been, and in 1530 settled in Florence, where he gained the favor of the Medicis. His poems, mainly comic and burlesque, are unsurpassed for their wit, lightness, and elegance of form, notably his *Rime Burlesche* (1538). He recast in the same spirit Boiardo's epic, under the title of

*Orlando Innamorato* (1541), which ranks next to Ariosto's *Orlando Furioso*.

**Bernicia**, ber-nish'i-a, an Anglian kingdom founded by Ida (547-559) during the period (500-580) when the Angles conquered the northeast of England. The kingdom extended from the Tees to Grangemouth, and divided with Strathclyde the wide south of Scotland. It was ultimately united to Deira under Ethelric, and in the 7th century with it became Northumbria. See NORTHUMBRIA.

**Bernina Alps**. See RHÆTIAN ALPS.

**Berni'na Pass** (7,645 feet), a mountain pass leading from Sâmâden, the capital of the Upper Engadine (Switzerland), to the Italian Valtellina (valley of the Adda) at Tirano. It is now traversed by a carriage road, and has a hospice on the summit.

**Bernini**, ber-nē'nē, GIOVANNI LORENZO (1598-1680), Italian architect and sculptor in the baroque style, was born in Naples. He was carefully trained by his father and studied the treasures of the Vatican. He enjoyed the patronage of Urban VIII. for whom he designed a palace, as well as the great colonnade of St. Peter's, the colonnade enclosing the courtyard of the Vatican, and numerous fountains in Rome. Under Urban VII., and Clement x., he was superintendent of the building of St. Peter's and director of public works in Rome and was the recipient of the highest honor and appreciation. Among other well known works are *David*, *Apollo and Daphne*, *The Rape of Proserpine*, and *Sante Bibbiano*.

**Bernoulli**, ber-nōō'yē, family of mathematicians, refugees from Antwerp and Alva, settled at Frankfurt (1583), and afterward at Basel, where all but Daniel were born.

JAMES (1654-1705), versifier in Latin, French, and German, self-taught in geometry, published tables on dialling, a system of teaching mathematics to the blind, a treatise on comets (1680); visited England, where he knew Boyle; discussed the weight of the air (1683); and was professor of mathematics at the University of Basel (1687). From a hint of Leibniz he developed and made his own the differential calculus; solved the problem of the logarithmic spiral (1690)—*'Eadem mutata resurgo'* and the spiral were graven on his tombstone—of the isochronous curve, catenary, and of isoperimetric figures (1696), as to which he quarrelled with his brother John; applied the calculus of probabilities to life and its accidents; and in his *Ars Conjectandi* (1713)

prepared the way for Lagrange's calculus of variations. His collected works were published at Geneva (1744). German translations of his works may be found in Ostwald's *Klassiker der Exakten Wissenschaften* (vol. CLXXI., 1909, and vol. CLXXV., 1910).

JOHN (1667-1748), brother of James, was professor of mathematics at Groningen (ten years), and his brother's successor at Basel. He was a rival of Newton and Leibniz, and excelled in differential, integral, and especially exponential calculus. He sided with Descartes, as James did with Newton. He wrote on navigation, the planets, and the laws of motion.

DANIEL (1700-82), was born in Groningen, 'son of John Bernoulli' (his signature and pride). He published *Exercitationes Mathematicae* (1724); was a professor of mathematics at St. Petersburg (1725-32); wrote his treatise, *Hydrodynamica* (1738), the first on the subject, in which he advocated the Bernoulli system of propulsion for ships; was professor, at different times, of anatomy, physics, botany, and filled the chair of natural and of speculative philosophy at Basel.

Not so distinguished, but men of mark, were NICHOLAS (1687-1759), professor of mathematics at Padua; JOHN (1710-90), wrote on capstan, magnet, light; JOHN (1744-1807), astronomer royal of Berlin at nineteen; JEROME (1745-1829), naturalist; JAMES (1759-89), professor of physics at Basel, died in St. Petersburg; CHRISTOPHER (1782-1863), professor of natural history at Basel.

**Bernstein**, bern-shün, EDUARD (1850- ), German political writer and Social Democratic leader, was born in Berlin. After spending twelve years in the banking business (1866-78), he turned his attention to writing, and became a contributor to and editor of several socialistic publications. He lived in Switzerland (1878-88) and in London (1888-1901). On his return to Germany he was elected to the Imperial Reichstag, and served from 1902 to 1906 and again in 1912. In 1919 he allied himself with the Majority Socialists. He published *Gesellschaftliches und Privateigentum* (1891); *Zur Geschichte und Theorie des Sozialismus* (1900); *Die Geschichte der Berliner Arbeiterbewegung* (3 vols., 1907-10); *Die Arbeiterbewegung* (1910). *Erinnerungen eines Sozialisten* (1918); *Die deutsche Revolution, ihre Entstehung, ihre Verlauf und ihr Werk* (1921). His book, *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* (1899; Eng. trans., under the title *Evolutionary Socialism*, 1909), in which he advocated a

more opportunist policy, gave rise to keen discussion in the German Socialist party.

**Bernstorff**, bern'störf, ALBRECHT, COUNT VON (1809-73), German diplomat, was born in Dreylützw, Mecklenburg. He studied in Göttingen and Berlin, and started his diplomatic career as Prussian *attaché* at Hamburg. After filling numerous diplomatic posts, he served as Prussian ambassador to St. James (with the exception of a short but notable period as minister of foreign affairs, 1861-2) from 1854 until his death.

**Bernstorff**, ANDREAS PETER, COUNT (1735-97), Danish statesman, was born in Hanover, Germany. As minister of foreign affairs (1773) he concluded a defensive alliance with Russia directed against Sweden. In 1780 he was induced by Russia to join the armed neutrality compact; but an agreement with Britain five days previously, fixing the meaning of the phrase 'contraband,' was taken so ill by Russia that he was forced to resign. He returned to power in 1784, and during the revolutionary wars rigorously observed the non-intervention principle.

**Bernstorff**, JOHANN HARTWIG ERNST, COUNT (1712-72), Danish statesman, son of the Hanoverian baron and minister, Joachim von Bernstorff, was born in Hanover. From 1733 to 1744 he was in the Danish diplomatic service, but was recalled in 1751 to succeed Schubin as minister of foreign affairs, a position he held for the next nineteen years, during which period he earned the reputation of being one of the greatest of European statesmen. A war with Russia in 1762 was happily averted by the dethronement of Czar Peter III., and Bernstorff succeeded in satisfactorily adjusting the long-outstanding Got-torp difficulty, whereby Denmark surrendered Oldenburg and Delmenhorst in exchange for Schleswig. Bernstorff, regarding Russian support as a necessary counterpoise to the hostile Franco-Swedish league, was successful in subsequently forming an alliance with Russia. He was styled by Frederick the Great the 'Oracle of Denmark.'

**Bernstorff**, COUNT JOHANN HEINRICH VON (1862- ), German diplomat, was born in London, where his father, Albrecht (q.v.), was ambassador. He was educated at Ratzeburg and Dresden, and entered the army in 1881. In 1887 he married Miss Jeanne Luckmeyer, of New York. He became *attaché* at Constantinople in 1889, and was secretary of legation successively at Belgrade, Dresden, St. Petersburg (Leningrad), and Munich.

From 1902 to 1906 he was councillor and secretary to the German embassy at London; in 1906 consul-general, and in 1908 minister plenipotentiary, at Cairo, Egypt. In 1908 he became German ambassador to the United States, a post he retained until the United States' entrance into the Great War, when he returned to Germany. He was ambassador to Constantinople, 1917-18. He became a member of the Democratic party in the Reichstag after the revolution and was chairman of the German League of Nations Union.

**Berœa**, ber-ê'a, (now VERRIA), an ancient town in Macedonia, southwest of Pella, and about 20 miles from the sea. It was unsuccessfully besieged by the Athenians (432 B.C.), but occupied by the Romans (168 B.C.).

**Berœa**, the modern Aleppo, a town in Syria, near Antioch, enlarged by Seleucus Nicator, who gave it the name of Berœa.

**Berœans**, or BERREANS, a religious sect in Scotland, founded in 1773 by John Barclay (q.v.).

**Berosus**, ber-ô'sus, (c. 330-250 B.C.), a priest of Belus at Babylon, who wrote a history of Babylon in the Greek language. Though it is lost, Josephus, Eusebius, and the Christian fathers have preserved a number of fragments.

**Berre**, **Etang de**, salt-water lagoon (60 square miles), in the department Bouches-du-Rhône, France, connected with the Mediterranean by the Canal de Bouc (3 miles long). It has a fishing industry, salt-pans, and factories for chemical products, and its shores are lined with olive groves and orchards.

**Berri** (BERRY), CHARLES FERDINAND, DUC DE (1778-1820), younger son of Charles X., was born in Versailles. He fled (1789) to Italy at the Revolution; served with Condé against France, and later was in the Russian service. In 1801 he went to England, where he married an English lady, whom he abandoned on his return to France in 1814. He married Marie, Duchess of Naples in 1816, and in 1820 was assassinated at the opera.

**Berruguete**, ber-roô-gâ'tá, ALONZO (c. 1480-1561), Spanish sculptor, painter, and architect, was born in Parades de Nava, near Valladolid. He studied in Florence (1503) under Michelangelo, whom he accompanied to Rome in 1505. Returning to Spain (1520), he was appointed royal sculptor and painter to Charles V. He was the architect of Charles' unfinished palace at Granada, and also of the palace of the archbishop of Toledo at Alcala. His sculptures are numerous, and include his masterpiece, the archbishop's

stall in the cathedral of Toledo, representing *The Transfiguration*, worked in marble, and the tomb of Cardinal Tavera in St. John's, Toledo. Berruguete introduced the Italian *cinquecento* style into Spain. He died in Toledo.

**Berry.** See FRUIT.

**Berry, MARTHA MCCHESENEY** (1866- ), American educator and philanthropist, was born near Rome, Ga. She was educated at the Edgeworth School, Baltimore, and in 1902 started, on her own farm in Mount Berry, Ga., a school for a few poor children from the remote mountain districts, which subsequently developed into the Martha Berry Schools, training from 600 to 700 boys and girls annually. In recognition of her work, Miss Berry was in 1925 awarded the Roosevelt Medal for Distinguished Service in promoting the welfare of women and children.

**Berry, MARY** (1763-1852), English author, was born in Yorkshire. In the winter of 1788 she and her sister Agnes, fourteen months her junior, met Horace Walpole, then almost seventy years of age, and a close friendship developed. Walpole established the sisters at Little Strawberry Hill, and bequeathed to them the house and garden there, his manuscripts, and £4,000 each. Mary Berry published an edition of *The Works of Horace Walpole* (1798) and *England and France; a comparative View of the Social Condition of both Countries* (1844). Consult her *Journals and Correspondence*.

**Berryer, ber-ē-ā', PIERRE ANTOINE** (1790-1868), French lawyer and politician, was born in Paris. He aided his father, Pierre Nicholas Berryer (1757-1841), in the defence of Marshal Ney, and also defended Lamennais (1826), Chateaubriand (1833), Prince Louis Napoleon (1840), and Montalembert (1858). From 1829 to 1852 he was uninterruptedly a deputy, and one of the leaders of the Legitimist party. In 1854 he was elected a member of the Academy. Berryer was a great and eloquent speaker, with a brilliant imagination and high intelligence. Although a fervent royalist and Catholic, he held liberal views. His works were published under the titles *Discours parlementaires* (5 vols. 1872-4) and *Plaidoyers* (4 vols. 1875-8).

**Bersaglieri, bār-sā-lyer'ē** (It. 'marksman'), a corps of sharpshooters of the Italian army, conspicuous by their felt hats, which bear the distinctive badge of a plume of cock feathers. They were organized in 1850, and became prominent during the long struggle for Italian unity. They number more than 100,000, but

more than half of these are in the reserve.

**Berseem, or EGYPTIAN CLOVER** (*Trifolium alexandrinum*), a species

*Berseem, or Egyptian Clover*  
1. Single flower

of Trifolium allied to the ordinary red clover. It is a leguminous annual growing from two to five feet in height, with rather small whitish flower heads. It is the principal green fodder plant of Lower Egypt and has been successfully grown in the Southwestern United States.

**Ber'serks, or BERSERKERS**, the name given to Norse warriors who figure in the ancient sagas, probably because they fought in their *serks* ('shirts') without mail. They were subject to savage, animal-like frenzies, in which they bit their shields, bellowed and howled, and rushed like mad dogs among their foes, striking terrible blows with their weapons. The Berserks are also described as 'shape-changers,' taking on the shape as well as the ferocity of brutes, a fact which connects them with werewolves.

**Bert, bār, PAUL** (1833-86), French physician, was born in Auxerre. He studied law and medicine, becoming professor of natural sciences at Bordeaux (1866), and afterward professor of physiology at Paris (1869). He was appointed prefect of the north in 1870, and minister of public instruction in the Gambetta ministry in 1881. He carried on important research work in physiology, especially in skin grafting, respiration, and the action of anaesthetics.

**Bertha, BERCTA, or ADILBERGA**, the name of several famous women, real and legendary. Among them are the following:

St. Bertha (d. before 616), daughter of Charibert, king of the Franks, married Æthelbert, king of Kent (c. 560). On her marriage it was agreed that she should be permitted to profess Christianity, and the Church of St. Martin in Canterbury was set apart for her use. She was influential in spreading Christianity among the Anglo-Saxons.

Bertha, the daughter of Burkhard, duke of Alemannia, and wife of Rudolf II. (937), king of Upper Burgundy, acted as regent for her infant son Conrad.

Bertha, *alias* Agatha, was the betrothed of Hereward.

Bertha (d. 783), called 'Bertha with the big foot' (*au grand pied*), because one of her feet was larger than the other, was the daughter of Charibert, Count of Laon. She married Pepin the Short, and was mother of Charlemagne.

**Berthelot, ber-t'lo', PIERRE EUGÈNE MARCELLIN** (1827-1907), French chemist and statesman, was born in Paris. He was educated at the Collège Henri IV., and was appointed professor in the School of Pharmacy (1860), and in the Collège de France (1865). He was inspector-general of higher education (1876); became a life-member of the Senate (1881); and was minister of education (1886-7) and of foreign affairs (1895-6). His studies in the synthesis of organic substances were of great importance in the advance of science, as well as in the improvement of industrial processes. His publications include: *Traité élémentaire de chimie organique* (1872; 4th ed. 1898); *Sur la force de la poudre et des matières explosives* (1872; 3rd ed. 1883); *La synthèse chimique* (1875; 8th ed. 1897); *Traité pratique de calorimétrie chimique, fondée sur la thermo-chimie* (1879); *Thermo-chimie* (1897); *Les carbures d'hydrogène* (1901). He was author, also, of books on the alchemists (1885 and 1888), and on mediæval chemistry (1893).

**Berthier, ber-tyā', LOUIS ALEXANDRE** (1753-1815), French marshal, was born in Versailles. He began his military career as an officer of Louis xv., and fought under Lafayette in the American Revolution (1778-82). As chief of the general staff, he took a leading part in all Napoleon's great campaigns, and was created a marshal of France by Napoleon in 1804, Prince of Neuchâtel in 1806, and Prince of Wagram in 1809. He was Napoleon's proxy in his marriage to Marie Louise in 1810. After his leader's downfall he made peace with Louis XVIII., and upon Napoleon's return from Elba, retired to Bamberg, where he either committed suicide or was mur-

dered. His *Mémoires* were published in 1827.

**Berthold von Regensburg**, ber'tolt fon rä'gens-boörch (c. 1220-72), a Franciscan friar, one of the most popular preachers of the Middle Ages in Germany, was probably born in Regensburg. He began his work as an itinerant preacher about 1250 and frequently officiated in Alsace, Switzerland, Austria, Hungary, Poland, and Italy. His sermons, generally of a missionary character, are written in a language abounding in graphic imagery and intense realism. Luxury he strenuously opposed, and did much to accelerate the decline of Middle High German poetry by his condemnation of the elegant world of chivalry. His *Sermons* (2 vols.) have been edited by Pfeiffer and Strobl.

**Berthollet**, ber-tō-lā', CLAUDE LOUIS, COUNT (1748-1822), French chemist, was born in Talloire, Savoy. He studied at Turin, and in 1794 received a professorship in Paris. He was sent in 1796 to Italy, to make a selection from the art treasures extorted by Napoleon, and in 1799 accompanied the latter to Egypt. He was elected to the Academy of Sciences in 1781. Berthollet was an ardent reformer of chemical nomenclature; he was the first to analyze ammonia, discovered chlorate of potash and fulminating silver, and studied the properties of chlorine. He also introduced and applied the principle of chemical equilibrium. He was created senator and count by Bonaparte, and was raised to the peerage by Louis XVIII. His published works include monographs on chemical nomenclature (with Lavoisier, 1787), dyeing (1805), bleaching with chlorine (1795), the laws of chemical affinity (1801), and *Essai de statique chimique* (1803).

**Bertholletia**. See BRAZIL NUT.

**Berthoud**. See BURG DORF.

**Bertillon**, ber-tē-yōn', ALPHONSE (1853-1914), French penologist, was born in Paris. He studied medicine with his father, a famous statistician and anthropologist, and was admitted to practice. In 1880 he perfected the famous system of criminal identification with which his name is associated, and in 1882 it was introduced into the Paris police system. He was also a handwriting expert and figured conspicuously in the Dreyfus case (q. v.).

**Bertillon System**, an anthropometric method devised by M. Alphonse Bertillon (q. v.) for the identification of criminals, based upon the fact that no two persons ever give exactly identical physical measurements. Certain measurements are taken from every

convicted person, and recorded on cards, which can readily be located by an elaborate system of classification. The following are the measurements made: the length and width of the head; the length of the left foot, and of the middle and little fingers of the left hand; the stature of the whole body, as well as the length of its upper and lower portions; the span of the outstretched arms; the length and breadth of the right ear, and the length of the left forearm. The color of the iris of the eye, and the characteristic lines made by the print of the finger, are also recorded. The system has been introduced into the United States and has been adopted in the larger penal institutions. Consult Bertillon's *Identification of Criminals* (trans. by Gallus Muller).

**Bertin**, ber-tan', LOUIS FRANÇOIS (1766-1841), French journalist, called L'AINÉ to distinguish him from a brother of the same name, was born in Paris. During the revolution he edited *L'Éclair* (which was suppressed in 1798 by the Directory), and in 1800 began to conduct the powerful *Journal des débats* (founded 1789). He was banished to Elba by Bonaparte in 1801, but resumed his work in Paris in 1804, under the title of *Journal de l'Empire*. After the restoration of the Bourbons, he resumed the editorship of the *Débats*.

**Bertrand**, ber-trān', HENRI GRATIEN, COUNT (1773-1844), French general, was born at Châteauroux. He served under Napoleon in Egypt, Austria, and Russia, distinguishing himself at Austerlitz, Grossbeeren, Leipzig, and Waterloo. He was created count and governor of Illyria (1809), and shared in Napoleon's banishment to St. Helena, remaining there until the Emperor's death. On his return to France he was made commandant of the Polytechnic School. His *Campagnes d'Égypte et de Syrie*, *Mémoires pour servir à l'histoire de Napoleon, dictés par lui-même à Sainte Hélène*, was published by his sons in 1847.

**Bertran de Born** (c. 1140-1215), Provençal troubadour, was born in the viscounty of Limoges (diocese of Périgueux). He was of noble family, and in 1169 joined the barons of Limoges, Poitou, and Périgord in their endeavors to throw off the yoke of Richard Cœur de Lion (1182-3). In the last years of his life he became a monk in the Cistercian abbey of Dalon, where he died. His poems, forty-five of which have come down to us, are mostly *sirventeses*, or satirical lays, in support of the barons and Henry of England, and against Richard Cœur de Lion and his

ally. They are rough and often unpolished, but highly effective and picturesque, while his love songs are tender without being sentimental. The poems have been edited by Stimming (1879 and 1892) and by Thomas (1888). Consult Hueffer's *The Troubadours*.

**Bervic**, ber-vēk', CHARLES CLÉMENT (1756-1822), French engraver, was born in Paris. He studied under J. G. Wille, and is best known by his portrait of Louis XVI., although his *chef-d'œuvre* is his engraving of the *Laocöon*. He was elected a member of the Academy in 1784 and received the Legion of Honor in 1819.

**Berwick**, bur'wik, borough, Pennsylvania, in Columbia county, on the north branch of the Susquehanna River, and on the Delaware, Lackawanna and Western and the Pennsylvania Railroads; 28 miles southwest of Wilkes-Barre. It has important car manufacturing interests, the first all-steel passenger coach having been produced here in 1904. Other industries are silk mills, wood working plants, and the manufacture of shirts and automobile accessories. Pop. (1910) 5,357; (1920) 12,181.

**Berwick**, ber'ik, JAMES FITZ-JAMES, DUKE OF (1670-1734), French marshal, was born in Moulins, France, the natural son of James II. and Arabella Churchill, sister of the Duke of Marlborough. He was educated in France and entered the army, serving in Hungary under the Duke of Lorraine. In 1688 he went to England and in 1690 was wounded at the Battle of the Boyne. In 1706 he was created a marshal of France and sent into Spain, where, by the victory of Almanza (1707), he firmly seated Philip V. on the throne. In 1709 he conducted a skilful defensive campaign in Dauphiny, in 1714 he captured Barcelona, and in 1716 he was appointed commandant of Guienne. At the siege of Philippsburg in June, 1734, he was killed by a cannon-ball. His *Mémoires*, written by himself, were completed by Abbé Hosk and published in 1778.

**Berwick-on-Tweed**, seaport and market town, England, at the mouth of the Tweed; 60 miles southeast of Edinburgh. It is a border town and forms of itself an independent county of 8 square miles, although for election purposes it is considered a part of Northumberland. It is still surrounded by ramparts and contains many ancient buildings. A magnificent bridge of fifteen arches and a railway viaduct, designed by Robert Stephenson, connect it with Spittal and Tweedmouth. The chief industries are fishing, iron-found-

ing, shipbuilding, and agricultural implement making. Authentic records of Berwick date back to the 12th century. It was involved in much of the Border warfare, the siege by the English in 1296 being especially memorable. It was by an Act of Parliament (1885) included in England. Pop. (1921) 12,994.

**Berwickshire**, a border county in the southeastern part of Scotland, with an area of 457 square miles. The land is in general low and flat toward the south, rising gradually in the north. The coast is bold and rocky, and the few harbors are much exposed. The chief mountain range is the Lammermuir; the highest peak, Seenes Law (1,683 ft.). The principal rivers are the Tweed—which forms the boundary for 21 miles—and its tributaries. Agriculture is the chief industry. Cattle raising is important, there are valuable fisheries, and sandstone is worked for building purposes. The manufactures include woolen, linen, leather, and paper. Duns is the county town; other large towns are Lauder, Eyemouth, and Coldstream. Pop. (1921) 28,395.

**Berwyn**, bŭr'win, city, Illinois, Cook county, on the Chicago, Burlington and Quincy, and the Illinois Central Railroads; 7 miles west of Chicago, of which it is a residential suburb. Pop. (1910) 5,841, (1920) 14,150.

**Beryl**, ber'il, a silicate of aluminum and beryllium occurring in hexagonal prismatic crystals and in columnar and granular masses. The lustre of beryl is vitreous, and the color usually a light green blue or yellow. The bright green and pale blue or green transparent varieties are known respectively as emerald and aquamarine (qq. v.).

**Beryllium**, be-ri'l'i-um, (Be), also known as GLUCINUM (Gl; 9.1.), a rare metallic element occurring in beryl and other silicates. It is prepared from its chloride by displacement by sodium, and is steel-colored, hard, and crystalline. It is not easily oxidized directly, though it forms an oxide, BeO, with a sweetish taste.

**Berzelius**, ber-zē'i-us, JÖNS JAKOB, BARON (1779-1848), celebrated Swedish chemist, was born in Väfuersunda, East Gotland. He studied chemistry and medicine at Upsala, was graduated in 1804, and went to Stockholm, where he became successively assistant professor and professor (1806) of medicine and chemical pharmacy in the University. In 1810 he became president of the Royal Academy of Sciences at Stockholm and in 1818 Secretary. He was knighted in 1815 and made a baron in 1835. Berzelius' contributions

to chemical knowledge are of the greatest importance; he discovered selenium, thorium, and cerium; isolated silicon and other elements; and investigated the compounds of fluorine. His chief work, however, was the determination of the combining proportions and atomic weights of the elements by an improved analytical method. He introduced a system of symbols which are the basis of those used to-day, and was a pioneer in organic chemistry. He wrote *Text-book of Chemistry* (3 vols. 1808-48), translated into various languages; also *Annual Reports on the Progress of Physics, Chemistry, and Mineralogy* (27 vols. 1821-48).

**Bes**, bās, an Egyptian god, probably of foreign origin. He is the god of art, of song and dance, and is represented as a grotesque figure, clad in a panther hide. He was worshipped also in Cyprus and Phoenicia.

**Besançon**, be-zān-sōn', town, first-class fortress, and episcopal see, France, capital of the department of Doubs, is situated on a peninsula almost surrounded by the river Doubs, which forms a canal between the Rhine and the Rhone; 60 miles southwest of Belfort. Noteworthy features are the citadel, the cathedral of St. Jean, a museum with a good collection of paintings and antiquities, the university, and the Porte de Mars, a triumphal arch erected in A. D. 167. Besançon is a flourishing industrial town, having manufactures of watches, silk, flour, and hardware. It is also an important railway centre.

Besançon was made a free town in the 12th century and was the meeting place of several diets. It is the birthplace of Cardinal Granville, Charles Nodier, and Victor Hugo. Pop. (1921) 55,652.

**Besant**, bez'ant, MRS. ANNIE, née WOOD (1847- ), English theosophist, was married in 1867 to the Rev. Frank Besant, vicar of Sibsey, Lincolnshire, from whom she legally separated in 1873. The following year she joined the National Secular Society. She co-operated with Charles Bradlaugh in the 'seventies and 'eighties in his free-thought and radical movement, and was co-editor with him of the *National Reformer*. From 1887 to 1890 she was a member of the London School Board. In 1889 she became a disciple of the theosophist, Madame Blavatsky, and in 1907 she was elected president of the Theosophical Society. In 1898 Mrs. Besant founded the Central Hindu College at Benares, and in 1918 began work toward the founding of the University of India. She wrote numerous works on theosophy, and an autobiography,

*Through Storm to Peace*, appeared in 1893.

**Besant**, SIR WALTER (1836-1901), English novelist and critic, was born in Portsmouth. He was educated at King's College, London, and at Cambridge, and from 1861 to 1867 was senior professor in the Royal College of Mauritius (the 'Palmist Island' described in more than one of his novels). In consequence of ill-health he returned to England in 1868, and began to publish novels written in conjunction with his friend James Rice—e. g. *Ready-money Mortiboy* (1871), *The Golden Butterfly* (1876), *The Monks of Thelma* (1878), *The Chaplain of the Fleet* (1881), *The Seamy Side* (1881). Rice died in 1882, but Besant continued writing, his most successful novels being *All Sorts and Conditions of Men* (1882), *All in a Garden Fair* (1883), *Dorothy Forster* (1884), *The World Went Very Well Then* (1887), *Armored of Lyonesse* (1890), and *Beyond the Dreams of Avarice* (1894). His novel *All Sorts and Conditions of Men*, considered 'utopian' in theory, led to the erection of the People's Palace (1887) in the East End of London. In 1873 he wrote *The French Humorists, from the 12th to the 19th Century*. For a time he acted as secretary to the Palestine Exploration Fund, and, in conjunction with Professor E. H. Palmer, wrote a *History of Jerusalem* (4th ed. 1899). In 1883 he published a sympathetic memoir of Palmer. Other works include *Rabelais*, for the 'Ancient and Foreign Classic' Series; *Coligny*; *Whittington*; *The Eulogy of Richard Jefferies*; *Captain Cook*, in the 'English Men of Action' Series; and *The Story of King Alfred*. Besant's novels reveal an extensive knowledge of London life in its humble aspects, and are eminently readable from their excellent blending of humor and pathos.

**Besika Bay**, be-sē'kā, on the northwest coast of Asia Minor, opposite the island of Tenedos, south of the Dardanelles. It was a station of the British navy during the Crimean War, and again in 1877-8. It was shelled by the British in 1915.

**Beskid**, bes'kēd', or BIESKID MOUNTAINS, a range of the Carpathians, linking together the West Carpathians and the East Carpathians, and forming the frontier between Czechoslovakia and Poland. The principal peaks are Babia Gora (5,650 ft.), Smrk (4,400 ft.), and Liassa Hora (4,360 ft.). The range is crossed by the Jablunka Pass (1,970 ft.), through which runs the Budapest-Breslau Railway.

**Beskow**, bes'kov, BERNHARD VON, BARON (1796-1868), Swed-

ish author, a determined opponent of the Swedish new romanticists. His best works are the dissertations and biographies (1860-6, 1870) published by the Academy, whose secretary he was from 1834 to his death—notably his noble and eloquent panegyric of Gustavus III., *Gustaf III. som Konung och Människa*. His most meritorious poems were *Karl XII.* (1819) and *Sveriges Anor* (1824), and his best tragedy *Torkel Knutsson* (1830).

**Besnard**, bās'nār' (PAUL) ALBERT (1849- ), French artist, was born in Paris. He studied at the Ecole des Beaux-Arts, under Cabanel, exhibited at the salon of 1868, and received the Prix de Rome in 1874. He decorated the vestibule of the School of Pharmacy, in Paris, the Hôtel de Ville, the Sorbonne, the Casino at Evian, the Théâtre Français, and the Peace Palace at the Hague. In 1911 Besnard made a trip to India, and some of his most notable paintings are of scenes from that country. His works, which are numerous, include *Portrait of Madame Roger Jourdin*, *The Artist's Family*, *Princess Mathilde*, *Weeping Woman*, *The Steps at Benares*, *Indian Dancing Girl*, and *Portrait of Madame Besnard*.

**Bessarabia**, bes-ā-rā'bi-a, province, Roumania, lying between, the Black Sea and the Dniester, Pruth, and Danube Rivers, with an area of 17,146 square miles. The northern part is thickly wooded, with fertile valleys planted with vines, while to the south stretch the steppe lands with great sweeps of good pasture and fields of corn and flax. The province is watered by the Dniester, the Pruth, and the Danube, and their tributaries. Agriculture is the chief industry, the famous 'black earth' bearing luxuriant crops. Cereals, all kinds of fruits, particularly grapes, and vegetables are produced in abundance, and the rivers abound in fish. Manufacturing is but little developed, but commerce is actively carried on. The capital is Chisinau (Russian Kichinev). Bessarabia became a Turkish possession in 1503. Russia annexed it in 1812, and in 1856 Moldavia annexed a small portion, which in 1878 was restored to Russia. Following the Great War the province was allotted to Roumania. Pop. (1919) 2,344,800.

**Bessarion**, bes-ā'ri-on, JOHANNES (1403-72), Greek cardinal, was born in Trebizond. He was made archbishop of Nicæa by John VII. (Palæologus) in 1437, accompanied him next year to the Council of Ferrara, and was created a cardinal by Pope Eugenius IV. in 1439. He died at Ravenna, on returning from an embassy to

Louis XI. He was one of the small band who revived the study of Greek in Italy, and so initiated the humanistic movement in Europe. His works are collected in Migne's *Patrologia Græca*.

**Bessel**, bes'el, FRIEDRICH WILHELM (1784-1846), Prussian astronomer, was born in Minden. In 1810 he was appointed director of the new Königsberg observatory, and professor of astronomy at Königsberg University. His most notable achievements were the discovery of the parallax of the fixed star 61 Cygni, and his great *Fundamenta Astronomiæ* (1818), a reduction of Bradley's Greenwich observations of fifty years before, with continuations in 1830 and 1841-2. In the field of astronomical mathematics he also distinguished himself. He embodied the results of many years of labor in *Astronomische Beobachtungen* (1815-44).

**Bessels**, bes'els, EML (1847-88), German Arctic explorer, was born in Heidelberg, and studied natural science and medicine. In 1869 he undertook his first Arctic expedition to the eastern part of the sea between Spitzbergen and Novaya Zemlya and Gillis Land. In 1871 he was entrusted by the U. S. Government with the leadership of the scientific staff of the polar expedition under Charles Francis Hall. The expedition (1871-3), in the *Polaris*, reached lat. 82° 26'; but unfortunately the ship was wrecked, and all the collections were lost. Bessels wrote *Report on the Scientific Results of the 'Polaris' Expedition* (1876), and *Die Amerikanische Nordpolexpedition* (1878).

**Bessemer**, city, Alabama, Jefferson county, on the Illinois Central, the Southern, the Louisville and Nashville, the St. Louis-San Francisco, and other Railroads; 12 miles southwest of Birmingham. Industrial establishments include blast furnaces, foundries, structural steel works, rolling and planing mills, clay products plants and machine shops. There are iron and coal mines near the city. Pop. (1900) 6,358; (1910) 10,864; (1920) 18,674.

**Bessemer**, city, Michigan, county seat of Gogebic county, on the Duluth, South Shore and Atlantic, the Chicago and North Western, and the Minneapolis, St. Paul and Sault Ste. Marie Railroads; 100 miles southeast of Duluth, Minnesota. It is situated in the Gogebic iron range, with mining as the most important industry. Pop. (1910) 4,583; (1920) 5,482.

**Bessemer**, SIR HENRY (1813-98), English metallurgist and inventor, was born in Charlton, Hertfordshire, and received his mechanical training in his fa-

ther's type foundry. He is known chiefly for his process for the manufacture of steel, put forward in 1856, which revolutionized that industry throughout the world. He also patented inventions for die casting, railway signalling, and bronze painting. For preventing sea-sickness he invented a ship with an adjustable cabin which should always preserve a horizontal floor, but this device proved a failure. Bessemer was knighted in 1879.

**Bessemer Process**. See STEEL.  
**Bessières**, be-syār', JEAN BAPTISTE (1768-1813), Duke of Istria (1809) and marshal of France (1804), was born in Preissac (Lot), and served as a private soldier under Louis XVI. Attracting the attention of Napoleon, he became one of his most trusted lieutenants, and served brilliantly in Egypt and at Marengo, where his cavalry charge decided the day; and again at Austerlitz, Jena, Eylau, and in the Spanish and Russian campaigns. He was given the command of the cavalry of the grand army in 1813, and was killed at the battle of Lützen.

**Best**, WILLIAM THOMAS (1826-97), English organist, was born in Carlisle. He held his first appointment as organist when fourteen years of age, and subsequently filled important posts in Liverpool (1840), London (1852), and again in Liverpool (1854). Best did much to familiarize the public with the organ works of Bach, and besides making numerous arrangements for the instrument, published several important educational works on organ playing.

**Bestiary**, bes'ti-ā-ri, (Fr. *bestiaire*), a popular series of mediæval books, consisting of descriptions of animals which are afterward treated as allegorical types of the spiritual life. These bestiaries (or *physiologi*, as they were first called) were the product of the allegorizing tendencies of the early Christians applied to the natural history of the elder Pliny. The foundation of the class is the unpublished Greek *Physiologus*, which must date back before the 4th century, as Epiphanius refers to it in his controversy with Origen. The oldest translation into a European language is the 8th century Anglo-Saxon version of the *Panther*, the *Whale*, and the *Partridge*, found in the Exeter Book (edited for the Early English Text Society by Mr. Israel Gollancz). The Old High German version dates from before the 11th century. Philippe de Thaun produced in the 12th century his French *Liures des Créatures* and *Le Bestiaire* (printed in T. Wright's 'Popular Treatises on Science,' 1841). A middle English 13th cen-

**VOL. II.—Mar. '23**

tury version will be found, along with the Latin text, of Bishop Theobald, in Morris' *An Old English Miscellany* (Early English Text Society, 1872). See also Wright's *Reliquiæ Antiquæ* (1841-3).

**Bestuzhev**, be-stōō'zhev, ALEXANDER ALEXANDROVITCH (1797-1837), Russian writer, about whose early life little is known. He first achieved prominence as editor, with Ryleyev, in 1822, of the *Polar Star*, the first Russian literary annual, modeled after the German *Almanache*. This ceased publication after its second year and in 1825 Bestuzhev, being implicated in a conspiracy in St. Petersburg, was deprived of his commission in the guards and exiled to Siberia. He was later transferred to a regiment stationed on the Persian frontier and soon resumed his literary work, writing under the name of Marlinsky. His work of this period consists chiefly of romantic tales and sketches of a military character, of which *Amalek Bek* is probably the best. His collected works were published in St. Petersburg (1st ed. 1835), under the title *Marlinsky's Tales*.

**Besuki**, bā-zōō'kē (Dutch *Be-soeki*), residency of Java, Dutch East Indies, the easternmost in the island, with an area of 3,922 square miles.

**Beta**. See BEET.

**Betanzos**, bā-tān'thōs, city, Spain, in the province of Corunna; 14 miles southeast of Corunna. It has interesting churches of the 13th and 14th centuries and a ruined Moorish castle. There is a trade in wine and grain. Pop. (1910) 8,826.

**Beta Rays**. See RADIUM.

**Betelgeux**, bet'el-gūz, (α Oriōnis), a red star of the first magnitude, but slightly variable. It forms a huge equilateral triangle with Procyon and Sirius.

**Be'tel Leaf**, or BETEL PEPPER, the foliage of several species of climbing peppers (*Piper*), which is used to wrap the pellets of betel nut and lime chewed in India and the Malayan Archipelago. The plants are often cultivated.

**Betel Nut Palm**, or PINANG (*Areca catechu*), a graceful spineless palm, a native of the Malay Peninsula. The fibrous fruit, about the size of a hen's egg, is bright orange or red in color and contains a hard seed or nut as large as a filbert. The natives cut the nuts into slices, add lime to them, roll them in a betel pepper leaf, and chew them. This habit, which is common to all Indian and Malayan races, colors the mouth and lips red and blackens and eventually destroys the teeth. Europeans in general do not care for it but it is immensely popular in the Orient.

A kind of catechu is extracted from the nuts. The palm is cultivated, and the nuts are exported.

**Betham-Edwards**, beth'am, MATHILDA BARBARA (1836-1919), English novelist and poet, was born in Suffolk, England, and was educated at home and in France. Her published works include *The White House by the Sea* (1855); *John and I* (1862); *Doctor Jacob* (1864); *Kitty* (1869); *A Dream of Millions* (1891); *A Storm-rent Sky* (1898); *A Suffolk Courtship* (1900); *Poems* (1885); *The Roof of France, or Travels in Lozère* (1899); *France of To-day* (1892-4); *East of Paris* (1902); *Barham Brockleband, M.D.* (1904); *Home Life in France* (1905); *Literary Rambles in France* (1907); *Poems* (1907); *French Men, Women and Books* (1910); *In French Africa* (1913); *Hearts of Alsace* (1916). Consult her *Reminiscences* (1898) and *Anglo-French Reminiscences* (1899).

**Bethany**, beth'a-ni, an ancient village on the southeastern spur of the Mount of Olives, Palestine; about 2 miles southeast of Jerusalem. Its site is occupied by the modern town of El Azariyeh. Bethany is frequently mentioned in the New Testament, and was a favorite resort of Jesus. It was the home of Martha and Mary and their brother Lazarus, whose reputed tomb is still shown to visitors. The house of Simon the leper, where the woman anointed Jesus with the precious ointment, was also in Bethany, and Christ's ascension took place 'over against Bethany' (Luke xxiv. 50-51).

**Bethany**, city, Missouri, county seat of Harrison county, on the Chicago, Burlington, and Quincy Railroad, and the Lincoln Highway; 6 miles northeast of St. Joseph. It has manufacturing interests and quarries of building stone. Pop. (1910) 1,931; (1920) 2,080.

**Bethany College**, a Lutheran institution for both sexes at Lindsborg, Kansas, founded in 1881. It comprises a graduate department, a school of liberal arts, a preparatory department, and schools of pedagogy, oratory, music, art, and business, and maintains a summer session. Special attention is given to the study of Swedish. For latest statistics see Table of American Colleges and Universities under the heading COLLEGE.

**Beth'el** ('house of God'), a town in Palestine about 12 miles north of Jerusalem. It was originally called Luz and its modern name is Beitin. The town stands on a hill 2,890 feet high and is now merely a collection of wretched hovels. Abraham pitched his tent and built

his altar near Bethel (Gen. xii. 8); and it was the scene of Jacob's vision (Gen. xxviii. 19). It was captured and occupied by the tribe of Ephraim (Judges i. 22), and later it was allotted to the tribe of Benjamin as their frontier town. Under Jeroboam it became the centre of the worship of Jehovah.

**Bethel**, town, Connecticut, in Fairfield county, on the New York, New Haven and Hartford Railroad; 16 miles northeast of New Haven. Silk, hats and leather are manufactured here. Pop. (1910) 3,792; (1920) 3,021.

**Bethell**, RICHARD, first LORD WESTBURY (1800-1873), English jurist, was born in Bradford-on-Avon and was graduated, at the age of eighteen, from Wadham College, Oxford. He was called to the bar as a member of the Middle Temple in 1823, was made a queen's counsel in 1840, entered parliament in 1851, and in the same year was appointed vice-chancellor of the duchy of Lancaster. In 1856 he was made Attorney General, which office he held, except for the interval 1858-59, until his appointment as Lord Chancellor in 1861. Owing to certain scandals connected with the granting of a pension, he resigned his office in 1865 and retired to private life. He soon resumed his seat in the House of Lords, however, and his last years were ones of great activity. Among his most important acts were his efforts to improve the methods of legal training, his advocacy of the codification of the law, and his zealous attempts at law reform.

**Bethesda**, be-thez'da or bethes'da ('house of the stream'), a pool with five porches, in Jerusalem, where Christ healed the infirm man (John v. 2-9).

**Bethesda**, town, Carnarvonshire, Wales, in the great Penrhyn slate quarrying district; 4½ miles southeast of Bangor. It has been a scene of great labor disputes. Pop. (1911) 4,716; (1921) 4,134.

**Beth-ho'ron**, LOWER and UPPER, two villages, Palestine, 12 miles northwest of Jerusalem, commanding an important pass on the frontier between Benjamin and Ephraim. After his victory at Gibeon, Joshua pursued the fleeing Amorites by way of Bethoron to Azekah (Josh. x. 10-11), and here Judas Maccabæus defeated the Syrians in 166 B.C. The modern name is Beit-Ur.

**Beth'lehem**, village in Palestine; 5 miles south of Jerusalem. Its modern name is Beit Lahm and it is a thriving town whose inhabitants live chiefly by agriculture and breeding cattle. They also make rosaries, crosses, and other articles of wood, mother-of-pearl, coral, and stink-

stone. The most important building is the Church of the Nativity, erected over the traditional birthplace of Christ, in the eastern part of the town. There are three monasteries and several schools. Pop. about 11,000, mostly Christians.

Bethlehem is famous as the home of David and the birthplace of Jesus Christ (Matt. ii. 1-6). On the approach of the Crusaders the Arabs destroyed the town but it was rebuilt by the Franks. In 1489 it was again destroyed; in 1831 the Moslems were expelled by the Christians and at present only a few remain.

**Bethlehem**, city, Pennsylvania, Northampton county, on the Lehigh River and Canal and on the Central of New Jersey, the Lehigh Valley, the Lehigh and New England, and the Philadelphia and Reading Railroads; 56 miles northwest of Philadelphia.

Bethlehem is especially celebrated for its annual Bach festival. The Moravian settlers here held a *Singstunde* as early as 1742, and from 1744 a Collegium Musicum was steadily maintained. This was replaced in 1820 by the Philharmonic Society, and in 1882 the Bethlehem Choral Union was organized. This gave place, in 1900, to the Bethlehem Bach Choir, which has been assisted since 1912 by members of the Philadelphia Orchestra. The festivals occupy two days.

Bethlehem is the seat of Lehigh University (q. v.), of Moravian Colleges for men and women, and of several private schools. St. Luke's Hospital, the public library, and the Church of the Nativity are noteworthy buildings. The Bethlehem Steel Corporation and Shipbuilding Corporation have their main offices here, and there are publication and construction plants, silk, knitting, hosiery, flour, and graphite mills, and manufactures of paint, spark plugs, and furniture. According to the U. S. Census of Manufactures for 1919, industrial establishments number 86, with 14,961 wage earners, a capital of \$115,110,210, and a product valued at \$102,567,075. The city is also a distributing centre of importance.

Bethlehem was founded by the Moravians about 1741, and became the headquarters in America of that sect. It was incorporated in 1845, and in 1904 West Bethlehem and in 1917 South Bethlehem and Northampton Heights were consolidated with it. Pop. (1910) 12,837; (1920) 50,358.

**Bethlehemites**, a name assumed by several orders in the Catholic Church. Of these, one was established in 1257, in Eng-

land, with a monastery at Cambridge. Another was founded in 1459, to resist the advance of the Ottoman power. A third and more important arose about 1665 in Guatemala, Central America, for the special purpose of teaching and nursing, but was secularized in 1820 and before many years became extinct. The name Bethlehemites has also been given to the disciples of John Huss (q. v.), who preached in the Bethlehem Church at Prague.

**Bethlen**, bet'len, GÁRBOR—i. e. GABRIEL—(1580-1629), Transylvanian prince, of a celebrated Hungarian family, was elected to the throne in 1613. He invaded Austria in 1619 in support of the Bohemians, and was crowned king of Hungary in 1621. Owing to the antagonism aroused by his alliance with the Turks, he was obliged to relinquish the throne.

**Bethmann-Hollweg**, bāt'mān-hōl'vāk, THEOBALD VON (1856-1921), German statesman, was born in Hohen-Finow, Brandenburg and educated at Bonn, where he met, and became the friend of, Emperor William II. He was president of the province of Brandenburg, 1899-1905. In the latter year he became Prussian Minister of the Interior, and in 1907 Prussian Vice-Chancellor and Minister of Imperial Home Office. In 1909 he succeeded von Bülow as German Chancellor and continued in office with but one interruption during the Great War (1914-18). Bethmann-Hollweg upheld Germany's invasion of Belgium in 1914 and the phrase 'a scrap of paper' in reference to international treaties is attributed to him.

**Beth'nal Green**, a metropolitan and parliamentary borough of Greater London. See LONDON.

**Beth-pe'or**, a place east of the Jordan whose exact site is at present a matter of controversy. It was near the ravine (Deut. iii. 29; iv. 46) in which Moses was supposedly buried (Deut. xxxiv. 6) and was in the possession of the tribe of Reuben.

**Beth'phage**, village of Palestine, on Mount Olivet (Matt. xxi. 1; Mark xi. 1; Luke xix. 29), apparently near Bethany. It was to this village that Christ sent the disciples for the ass upon which he made his triumphal entry into Jerusalem.

**Bethsaida**, beth-sā'i-da, town in Palestine, on the east bank of the Jordan, near its entrance into the Sea of Galilee. Here the miracle of the feeding of the five thousand (Luke ix. 10-17) took place and just outside the city Jesus healed the blind man of his infirmity (Mark vii. 22-27).

**Beth-she'mesh** ('house of the sun'), the name given to several places mentioned in the Old Testament. The most important of

these towns was in Judah, between Kirjath-yearim and Timnah. It was the scene of an encounter between Jehoash, king of Israel, and Amaziah, king of Judah (2 Kings xiv. 11-13); was occupied by the Philistines (2 Chron. xxviii. 18); and was the first place where the Ark rested on its return from the Philistines (1 Sam. vi. 9 ff.). It is identified with the ruined village of Ain Shems, in the valley of Sorek, 15 miles southwest of Jerusalem. The name Beth-shemesh was also applied to an unidentified city on the border of Issachar (Joshua xix. 22); to a fenced city of Naphthali in Upper Galilee (Joshua xiv. 22); and to an idolatrous temple in Egypt (Jer. xviii. 13).

**Bethune**, bā-tün', town, department of Pas-de-Calais, France, 25 miles by rail southeast of Lille, with which it communicates by canal. Numerous rich coal mines occur in the vicinity. The chief industries are sugar making, distilling, and linen weaving; and there is trade in corn, cattle, and horses. Its celebrated belfry was erected in 1388. During the Great War Bethune was an important point in British communications. Pop. (1911) 15,309.

**Bethune**, bē-thōōn', GEORGE WASHINGTON (1805-62), American clergyman and poet, was born in New York, and was graduated (1822) from Dickinson College, Pa. He prepared at Princeton for the Presbyterian ministry, and was ordained in 1825, but the following year entered the Dutch Reformed ministry, in which he held several pastorates until his acceptance of that of the church on the Heights, Brooklyn, N. Y. (1848-59). He is remembered for his interest in public affairs, his eloquence, and his poetical works.

**Bethune**, THOMAS. See BLIND TOM.

**Bet'ony** (*Stachys betonica*), a hardy herbaceous perennial belonging to the order *Labiatae*. It has oblong leaves, three to six inches in length, and purple flowers borne in a dense terminal spike. It blooms from July to September and is often known as 'Wood Betony'.

**Beto'yan**, a linguistic stock of South American Indians found in eastern Colombia, and in the adjacent lands of Venezuela and Brazil.

**Betroth'al**, an engagement or agreement by a man and woman for a future marriage between them. In the earlier history of marriage in the Christian nations a betrothal was in effect an irregular but legalized union. It was either an engagement for a present union (*sponsalia per verba de presenti*), which, though without

the sanction of the church, made the parties legally man and wife; or for a future union (*per verba de futuro*), which did not amount to a marriage unless followed either by cohabitation (called the 'consummation' of the marriage) or by the prescribed religious ceremony. The betrothal *per verba de presenti* still exists in the United States, where not restricted by statute, under the name of the Common Law marriage, though it is in some states required to be entered into in the presence of witnesses or reduced to writing and signed by the parties thereto. Cohabitation no longer has the effect of consummating a betrothal *per verba de futuro*. See MARRIAGE.

**Betsiboka**, riv., Madagascar, rises N. of Antananarivo, flows N. and N.W. for 200 m. to the Bombetoke Bay, Mozambique Channel, and receives the Ikopa. In the rainy season there is a navigable waterway from Majunga to the mines of Mevatanana, on the Ikopa, 148 m.

**Betsileo**, a negro people living in the mountainous part of Madagascar. They were subjugated by the Hovas (whom they resemble in many of their customs) at the beginning of the 19th century, and now occupy a fertile region with a healthy climate (3,750 ft. alt.), and are good agriculturists. They number about 300,000. Principal tn. Fianarantsoa.

**Bettelheim**, ANTON (1851), Austrian man of letters, born at Vienna; worked as a journalist (1881-6); has distinguished himself as biographer and literary critic—writing lives of Anzengruber (1891; 2nd ed. 1897) and Marie von Ebner-Eschenbach (1900); editing an excellent biographical series called *Führende Geister*, afterward *Geistesheiden* (from 1890 onwards), and *Biographisches Jahrbuch* (1898 onwards). His essays were collected as *Die Zukunft unsers Volkstheaters* (1892), *Deutsche u. Franzosen* (1895), and *Acta Diurna* (1899).

**Betterton**, THOMAS (1635-1710), English actor, dramatist, and theatrical manager, was born at Westminster. He appeared at the Cockpit Theatre about 1659-61. A visit made to Paris at the command of Charles II. brought him under the influence of Moliere with the ultimate effect of transforming the producing and staging of plays in England. Betterton was an admirable actor, and his character ranked high in a dissolute age. He was buried in Westminster Abbey. Of the seven plays attributed to him, some are adaptations from the French or from the older dramatists, but all of them are poor in quality. See Coll'y Cibber's *Apology*

*for my own Life* (new ed. 1888); R. W. Lowe's *Life of Betterton* (1891).

**Bettia**, tn., Champaran dist., Bengal Presidency, India. Pop. (1901) 24,636.

**Bettinelli**, SAVERIO (1718-1808), Italian writer, was born at Mantua. A Jesuit, he was successively teacher of rhetoric at Venice (1748), of history and literature at Parma (1751), and of eloquence at Modena. He was the author of many tragedies and poems, but he is best known in Italian literature as the writer of an elaborate treatise on *Il Risorgimento d'Italia, negli Studii, nelle Arte e ne' Costumi dopo il Mille* (1775). In 1801 an edition of his collected *Opere* was published in 24 vols. See Nاپione's *Vita* (1819), and Tiplado's *Biografia degli Italiani Illustre* (10 vols. 1834-45).

**Betting**. The common method of betting on races in the United States is by what is known as bookmaking. At the race tracks a part of the enclosure is set aside for bookmakers who offer odds against every horse in a race, and the astute layer of odds so arranges his book, making his risks on the percentage plan, that he may win no matter which horse is first. If he finds that one horse is a popular favorite he will give odds which either discourage betting on it or reduces the amount he risks to a minimum as far as possible and induces the public to bet on other horses by offering longer odds against them until he has succeeded in rounding out his book. He constantly shifts the odds according to the market and his accounts, and thus generally succeeds in getting every horse backed by the public. If he finds toward the close of the betting on the race that he has overloaded himself with too much on one horse he generally goes to some other bookmaker and bets with him to make his own book more even. But occasionally he fails to protect himself and loses, which, however, is not often if he is cautious.

His plan is about as follows: With the betting at 4 to 5 against A, 2 to 1 against B, 7 to 1 against C, and 10 to 1 against D, he would lay \$2,000 against \$2,500 A, \$3,000 against \$1,500 B, \$4,200 against \$600 C, and \$4,000 against \$400 D. Thus if A wins he wins \$500, B, \$500; C, \$200; and D, \$600. This is an ideal sheet, and every bookmaker would like the public to accept such a rating. Competition, however, forces changes in these odds, and the layer may have to alter his figures a dozen times in the half hour allowed before each race for the betting, and it has to be a clear-headed man who can keep the run of his accounts and

make them show him a winner when he takes the last bet on the race. Sometimes the bookmaker fancies a certain horse in a race and takes liberties with the others to his loss. Sometimes he may 'lay against' the favorite, that is, give longer odds than the market warrants owing to his belief that the horse cannot win, but the long-headed, winning bookmaker always works on the percentage plan and is satisfied to make a book which will leave him a moderate winner at the end of the day. Books are also made outside of the racetrack on the same principle, particularly what are known as 'winter books,' in which the bookmaker lays odds on the big races as soon as the weights are allotted. These can be much more easily rounded up as they are absolutely on the percentage plan, and every horse that is scratched from the race is clear profit, as the bets are made 'play or pay.'

In most of the United States betting is illegal, while in a few states open betting is permitted.

In New York State, until 1908, it was illegal to conduct a betting establishment outside of a race track, but there betting was allowed, in spite of constitutional prohibition. When Gov. Hughes assumed office in that year, he had bills prepared which made gambling in or out of race tracks illegal, and bookmaking a misdemeanor, punishable by a year's imprisonment. After vigorous opposition, which prevented the passage of the bills in regular session, the Governor called an extra session of the Legislature, and the Percy-Gray measure became law, passing the Senate by a majority of only one vote. This law, vigorously enforced, caused a great falling off in attendance and value of purses at the Metropolitan tracks.

The *paris-mutuels* or 'mutual bets' system of wagering, is used in America rarely. In this system all the money bet on a race is taken in by the club conducting the event, and the total amount received is divided by the number who have bet on the winning horse, each bettor receiving a ticket for each time he bets \$5. Before the division is made a certain percentage of the total is taken out by the club for expenses. See also article on GAMING.

**Betto**, BERNARDO DI. See PINTURICCHIO.

**Betts**, SAMUEL ROSSITER (1787-1868), American jurist, was born at Richmond, Mass., and graduated (1806) at Williams. He served in the War of 1812, and in Congress. In 1823 he was appointed judge of the U. S. district court, retiring the year before

his death. He became a great authority on maritime law, and published a standard work on *Admiralty Practices* (1828).

**Bettws-y-Coed**, par. vil., and tourist resort, Carnarvonshire, Wales, 3 m. s. of Llanrwst; beautifully situated among pine-clad hills, at the junction of the Llugwy with the Conway. The Swallow Falls, Fairy Glen, and Miner's Bridge are much visited by tourists. It was a favorite haunt of David Cox, and is an excellent centre for fishing, and for exploring the Snowdon district. Pop. (1911) 925.

**Betty**, WILLIAM HENRY WEST (1791-1874), a precocious boy actor, known as the 'Young Roscius,' was born at Shrewsbury. He first appeared at Belfast in 1803, and till 1806 played in London and the provinces. He retired from the stage in 1807 with a large fortune. He reappeared in 1812-24, without success. See his autobiographical *Life of Young Roscius* (1804), and Hutton in *Actors and Actresses of Great Britain and the United States*, vol. ii. (1886).

**Betul**, a hilly dist. in Central Provs., India; forms the w. section of the great Satpura plateau. It was once the centre of the ancient Gond kingdom of Kherla. Coal is found. Area, 3,826 sq. m. Pop. (1901) 285,363.

**Betwa**, riv., rising in the Vindhya Mts., Bhopal, Central India Agency; flows N.E. through Bundelkhand, and joins the Jumna on the r. bk. near Hamirpur, after a course of nearly 400 m.

**Beulé**, CHARLES ERNEST (1826-74), French politician and archaeologist, became professor of rhetoric at Moulins, and in 1849, while teaching at the archaeological school of Athens, he discovered the propylæa of the Acropolis. Appointed professor of Archaeology at the Bibliothèque Nationale of Paris in 1854, his prolific literary activity was interrupted in 1858-9 to pursue investigations on the site of Carthage. Entering the National Assembly as an Orleanist in 1871, he held the portfolio of the interior under MacMahon in 1873. He published *L'Acropole d'Athènes* (1854); *Etudes sur le Péloponnèse* (1855); *Les Monnaies d'Athènes* (1858); *L'Architecture au Siècle de Pisisstrate* (1860); *Phidias, Drame antique* (1863); *Causeries sur l'Art* (1867); *Histoire de l'Art grec avant Périclès* (1868); *Le Sang de Germanicus*, and other works. See Idéville's *Monsieur Beulé, Souvenirs Personnels* (1874).

**Beust**, FRIEDRICH FERDINAND, COUNT VON (1809-86), German and Austrian statesman, was born at Dresden. He entered (1831) the Saxon diplomatic service, and be-

came minister of foreign affairs in 1849. He defended the rights of the smaller German states against the aggressions of Austria and Prussia; but in 1866, after the defeat of the former power, he was obliged to resign office. On the invitation of the Emperor Francis Joseph, he became minister of foreign affairs for Austria, and at once began a complete reorganization of the Austrian empire. In 1867 he became president of the ministry and chancellor of the empire. He succeeded in conciliating Hungary, and secured the emperor's coronation as king of Hungary at Pesth, and carried out many reforms. He was dismissed from the control of the government and the office abolished, after the proclamation of the German empire in 1871, and was subsequently appointed ambassador to Britain (1871), and to Paris (1878). Beust's *Memoirs* have been translated into English, with an introduction by Baron Henry de Worms (1887).

**Beuthen**, tn., prov. Silesia, Prussia, 120 m. by rail S.E. of Breslau, and only 2½ m. from the Polish frontier; stands in the middle of the Upper Silesian coal, iron, and zinc industries. Pop. (1880) 22,811; (1900) 51,404.

**Beveland**. (1.) NORTH, isl., prov. Zeeland, Netherlands; lies N. of Walcheren and S. Beveland, and is washed on the N. by the E. Scheldt. It is 12 m. long by 4 m. broad. (2.) SOUTH, isl., prov. Zeeland, Netherlands; lies between the E. and W. Scheldt, behind the island of Walcheren. It is 25 m. long by 5 to 6 m. wide, and is bisected by the S. Beveland Canal, made in 1866. In 1530 and 1532 it was overwhelmed by the sea, but has since been entirely reclaimed. Its chief town is Goes, or Ter Goes.

**Beveridge**, ALBERT JEREMIAH (1862), American senator, was born on a farm at the junction of Adam and Highland cos., O., and graduated (1885) at De Pauw University, Ind. He studied law in the office of Senator McDonald, became his managing clerk, and was associated with the law firm of McDonald & Butler until he began practice on his own account. He gained a wide reputation as a public speaker, and was elected Republican U. S. senator from Indiana for the term ending 1905, and was reelected on its expiration. Author of *The Russian Advance* (1904), *The Young Man and the World* (1905), and many magazine articles.

**Beveridge**, KÜHNE (1877), American sculptor, grand-daughter of ex-Gov. John L. Beveridge, was born at Springfield, Ill., and

studied with W. R. O'Donovan in New York, and with Rodin at Paris. She was married, first, to Charles Coghlan, 1893, and second, to William B. Branson, of Johannesburg, Transvaal, 1903. Exhibited at the New York and London academies, and at Paris, where she received an honorable mention at the Exposition of 1900.

**Beverley**, par. and munic. bor., E. Riding of Yorkshire, England, 8 m. N.W. of Hull. The twin-towered church of St. John (Beverley minster) is one of the finest ecclesiastical buildings in England, the 14th century 'Percy shrine' being of exquisite design and workmanship. The other parish church is that of St. Mary's. Beverley is the seat of a suffragan bishop. Tanning, brewing, iron-founding, and agricultural implement making. Pop. (1911) 13,654.

**Beverley**, ROBERT (1675-1716), American colonial historian, born in Va. He was educated in England, and for some time was assistant in charge of the Va. colonial records. Primarily in order to correct Oldmixon's *British Empire in America*, the proofs of which he saw while in London in 1703, he wrote a *History of Virginia* (1705; new ed. considerably enlarged, 1722; re-issued, 1855), the first history of the colony written by a native Virginian, and a work of great value, particularly those parts which deal with the Indians and with contemporary affairs.

**Beverly**, seapt., Essex co., Mass., 16 m. N.E. of Boston, on the N. side of a narrow bay separating it from Salem, and on the Bost. and Me. R. R. It is the seat of the New England School for the Deaf, a hospital and a public library. Its manufactures include carriages, machinery, shoes, morocco, oiled clothing, belting, etc. The fisheries and navigation afford employment to a large number of the inhabitants. Pop. (1910) 18,650.

**Beveziers**, BATTLE OF. See BEACHY HEAD, BATTLE OF.

**Bevis of Hampton**, or the French *Beuve d'Hanstone*, was the name of one of the oldest Italian romances of chivalry, popular in mediæval England. Included in the Carolingian cycle of romances, the subject is an old French story, written in *ottava rima* in the beginning of the 14th century, published in 1489, and printed by Vérard as a French prose romance in 1500. An English poetical version of the story was edited by Dr. E. Kölbing for the Early English Text Society (1885).

**Bewick**, THOMAS (1753-1828)

the sanction of the church, made the parties legally man and wife; or for a future union (*per verba de futuro*), which did not amount to a marriage unless followed either by cohabitation (called the 'consummation' of the marriage) or by the prescribed religious ceremony. The betrothal *per verba de presenti* still exists in the United States, where not restricted by statute, under the name of the Common Law marriage, though it is in some States required to be entered into in the presence of witnesses or reduced to writing and signed by the parties thereto. Cohabitation no longer has the effect of consummating a betrothal *per verba de futuro*. See MARRIAGE.

**Betsiboka**, bet-si-bō'kā, river, Madagascar, rises north of Antananarivo and flows north and northwest for 300 miles to Bombetoke Bay, Mozambique Channel. Its chief tributary is the Ikopa.

**Betsileo**, bet-si-lā'ō, a Malayan people living in the mountainous region of South Central Madagascar. They were subjugated by the Hovas, whom they resemble in many of their customs, at the beginning of the 19th century. Their lands are fertile, and they are good agriculturists. They number about 480,000. Their chief town is Fianarantsoa.

**Bettelheim**, bet'el-him, ANTON (1851- ), Austrian man of letters, was born in Vienna. He worked as a journalist (1881-6) and distinguished himself as a biographer and literary critic. He wrote lives of Beaumarchais (1886, 2d ed. 1911), Anzengruber (1891; 2d ed. 1897), Marie von Ebner-Eschenbach (1900), Louise von François und Conrad Meyer (1905), Auerbach (1907), and Prince Hohenlohe (1910), and edited an excellent biographical series called *Führende Geister*, afterward *Geisteshelden* (from 1890 onwards), and *Biographisches Jahrbuch* (1898 onwards). His essays were collected as *Die Zukunft unsers Volkstheaters* (1892), *Deutsche und Franzosen* (1895), and *Acta Diurna* (1899).

**Bettendorf**, city, Iowa, Scott county, on the Mississippi River, and on the Chicago, Burlington and Quincy, the Chicago, Milwaukee and St. Paul, and the Davenport, Rock Island and Northwestern Railroads; 3 miles east of Davenport. The manufacture of steel cars is the chief industry. Pop. (1910) 909; (1920) 2,178.

**Betterton**, THOMAS (1635-1710), English actor, dramatist, and theatrical manager, was born in Westminster. He was apprenticed to a bookseller, but further accounts of his early life are somewhat conflicting. He

seems to have joined a theatrical troupe and appeared at the Cockpit Theatre about 1659. In 1661 he became a member of Sir William Davenant's company at Lincoln's Inn Field Theatre, and soon gained a high reputation. A visit made to Paris at the command of Charles II. brought him under the influence of Molière, with the ultimate effect of transforming the producing and staging of plays in England. Betterton was an admirable actor, of fine personal character. His repertoire included many of Shakespeare's plays as well as his own and other contemporary dramas. As a playwright he is less notable. Of the seven plays attributed to him some are adaptations from the French or from the older dramatists, but none of them takes high rank. Betterton's wife was an actress of high attainments.

Consult Howe's *Thomas Betterton*; Baker's *History of the London Stage and Its Famous Players*.

**Bettia**, bet-ē'a, or BETTIAH, town, Bengal, India. It has trade in indigo. Pop. 25,800.

**Bettinelli**, bet-tē-nel'ē, SAVENIO (1718-1808), Italian writer, was born in Mantua. He entered the Jesuit order, and was successively teacher of rhetoric at Venice (1748), of history and literature at Parma (1751), and of eloquence at Modena. He was the author of many tragedies and poems, but he is best known in Italian literature as the writer of an elaborate treatise on *Il risorgimento d'Italia, negli studii, nelle arte e nei costumi dopo il mille* (1775). In 1801 an edition of his collected works was published in 24 vols. Consult Napione's *Vita dell'Abbate S. Bettinelli*, and Tiplado's *Biografia degli Italiani illustre*.

**Betting** may be defined as a system of making contracts, under which payment by one party to another is dependent on an uncertain event, usually the result of a game or race. An ordinary commercial transaction in which a party buys property in the hope of selling it at a higher price is not regarded as such, nor is a contract of insurance or of indemnity against risks a wager unless the party taking out the policy has no insurable interest.

At common law no form of wagering is criminal, but there has been a difference of judicial opinion whether contracts of this description are *per se* valid and enforceable in a court of justice. The English courts have held that they are, the American courts that they are not. The views which modern legislation as a rule has taken of the matter is that the mere conclusion of a bet is not criminal, but keeping a

betting house or using the street or other public place for carrying on a betting business is an offense against public order.

Until comparatively recently the staking of money on horse races was the chief form of public betting in the United States. The common method is by what is known as bookmaking: At the race tracks a part of the enclosure is set aside for bookmakers, who offer odds against every horse in a race, so arranging their books, making their risks on the percentage plan, that they may win no matter which horse is first. If one horse is a popular favorite, the bookmaker will give odds which either discourage betting on it or reduce the amount he risks to a minimum, inducing the public to bet on other horses by offering longer odds against them until he has succeeded in rounding out his book. He constantly shifts the odds according to the market and his accounts, and thus generally succeeds in getting every horse backed by the public.

In most of the United States betting is forbidden or restricted by law. In New York State, until 1908, it was illegal to conduct a betting establishment outside of a race track, but there betting was allowed, in spite of constitutional prohibition. In that year Governor Charles E. Hughes secured the enactment of legislation prohibiting the posting of odds at race-courses and elsewhere, and forbidding the passing of money from hand to hand. In 1910 a more drastic series of laws was passed in the same State, whereby betting of every description, 'orally or otherwise,' became a misdemeanor.

The 'Pari-mutuel' or 'totalizer' is a betting machine fitted with a number of receptacles. The backer places his stake in the receptacle appropriated to the horse he favors, and at the end of the race the supporters of the successful horse divide up all the money staked on the different horses, less 10 per cent., which goes to the owner of the machine. In England and the United States generally all such betting machines are illegal.

See also GAMBLING; HORSE RACING; LOTTERY.

**Betto**, BERNARDO DI. See PINTURICCHIO.

**Betts**, SAMUEL ROSSITER (1787-1868), American jurist, was born in Richmond, Mass. He was graduated from Williams College (1806), served in the War of 1812, and in Congress. In 1823 he was appointed judge of the U. S. district court, in which capacity he served until the year before his death. He was an authority on maritime law, and published a standard

work on *Admiralty Practices* (1838).

**Bettws-y-Coed**, bet'ōos-i-kō'-ed, urban district, Carnarvonshire, Wales, 3 miles south of Llanrwst. It is beautifully situated among pine-clad hills, at the junction of the Llugwy with the Conway, and is much visited by tourists. It was a favorite haunt of David Cox, and is an excellent centre for fishing, and exploring the Snowdon district. Pop. (1921) 1,027.

**Betty**, WILLIAM HENRY WEST (1791-1874), boy actor, known as the 'Young Roscius', was born in Shrewsbury. He made his first stage appearance in Belfast in 1803, and till 1806 played in London and the provinces. He retired from the stage in 1807 with a large fortune. He reappeared in 1812-24, without success. Consult his autobiographical *Life of Young Roscius* (1804), and Hutton's *Actors and Actresses of Great Britain and the United States*.

**Betul**, bā-tōōl', town and district, India, in the Central Provinces. The district forms the western section of the great Satpura plateau. It was once the centre of the ancient Gond kingdom of Kherla. Cotton and teak are produced. Area, 3,826 square miles. Pop. (1911) dist. 390,386; town 5,473.

**Betula**. See BIRCH.

**Bet'wa**, river, British India, rises in the Vindhya Mountains, Bhopal, flows northeast through Bundelkhand, and joins the Jumna near Hamirpur, after a course of nearly 400 miles.

**Beulé**, bē'lā', CHARLES ERNEST (1826-74), French politician and archaeologist, was born in Saumur. He became professor of rhetoric at Moulins, and in 1849, while teaching at the archaeological school of Athens, he discovered the propylæa of the Acropolis. He was appointed professor of archaeology at the Bibliothèque Nationale of Paris in 1854, and in 1858-9 was engaged in investigations on the site of Carthage. Entering the National Assembly as an Orleanist in 1871, he held the portfolio of the interior under MacMahon in 1873. He published *L'acropole d'Athènes* (1854); *Etudes sur le Peleponnese* (1855); *Les monnaies d'Athènes* (1858); *L'architecture au siècle de Pisistrate* (1860); *Phidias, drame antique* (1863); *Causeries sur l'art* (1867); *Histoire de l'art grec avant Péricles* (1868); *Le sang de Germanicus*, and other works. He met death by suicide. Consult Ideville's *Monsieur Beulé, souvenirs personnels*.

**Beust**, boist, FRIEDRICH FERDINAND, COUNT VON (1809-86), German and Austrian statesman, was born in Dresden. He entered the Saxon diplomatic service in

1831, and became minister of foreign affairs in 1849. In 1853 he was also placed at the head of the interior department and as chief of the two most politically important departments was the leading minister of the cabinet. He defended the rights of the smaller German states against the aggressions of Austria and Prussia; but in 1866, after the defeat of the former power, he was obliged to resign office. In 1866, on the invitation of the Emperor Francis Joseph, he became minister of foreign affairs for Austria, and at once began a complete reorganization of the Austrian Empire. In 1867 he became president of the ministry and chancellor of the Empire. He succeeded in conciliating Hungary, and secured the Emperor's coronation as king of Hungary at Pesth, and carried out many reforms. He was dismissed from the control of the government, and the office of chancellor was abolished, after the proclamation of the German Empire in 1871. He was subsequently ambassador to Great Britain (1871-8), and to France (1878-82). Beust's *Memoirs* have been translated into English, with an introduction by Baron Henry de Worms.

**Beuthen**, boi'ten, town, Prussia, in Upper Silesia, 120 miles southeast of Breslau and close to the Polish frontier. There are a good Rathaus, a sixteenth century church, and an old timber church standing in the town park. It is an important mining centre. Pop. (1919) 53,238.

**Beveland**, bā've-lant, NORTH AND SOUTH, two islands of the Netherlands, in the province of Zeeland, lying in the estuary of the Scheldt. North Beveland is 12 miles long and 4 miles wide; while South Beveland, lying just back of Walcheren, is about 25 miles long and 5 to 6 miles wide. In 1532 South Beveland suffered a terrible inundation of the sea and 3,000 persons were drowned. The chief town is Goes.

**Beveridge**, ALBERT JEREMIAH (1862- ), American senator and author, was born on a farm at the junction of Adam and Highland counties, Ohio, and was graduated (1885) from De Pauw University. He studied law in the office of Senator McDonald, became his managing clerk, and was associated with the law firm of McDonald & Butler until he began practice for himself. He gained a wide reputation as a public speaker, and was U. S. Senator (Republican) from Indiana (1899-1911). He wrote *The Russian Advance* (1904), *The Young Man and the World* (1905), *The Bible as Good Reading* (1906), *Americans of Today and Tomorrow* (1908), *Work and Habits* (1908), *Life of John Marshall* (1916).

*Died Apr. 27, 1927*

**Beverley**, market town, England, in East Riding, Yorkshire; 8 miles northwest of Hull. The twin-towered church of St. John (Beverley minster) is one of the finest ecclesiastical buildings in England, the 14th century 'Percy shrine' being of exquisite design and workmanship. St. Mary's church is also unusually beautiful. The chief industries are tanning, brewing, iron founding, and the manufacture of agricultural implements. Pop. (1921) 13,469.

**Beverley**, ROBERT (1675-1716), American colonial historian, was born in Virginia. He was educated in England, and for some time was assistant in charge of the Virginia colonial records. Primarily in order to correct Oldmixon's *British Empire in America*, the proofs of which he saw while in London in 1703, he wrote a *History of Virginia* (1705; new ed. considerably enlarged, 1722; re-issued, 1855), the first history of the colony written by a native Virginian, and a work of great value, particularly for its discussions of the Indians and contemporary affairs.

**Beverly**, city and seaport, Massachusetts, Essex county, on the north side of a narrow bay separating it from Salem, and on the Boston and Maine Railroad; 16 miles northeast of Boston. It is the seat of the New England School for the Deaf, a hospital, and a public library. According to the Federal Census for 1919, industrial establishments number 70, with \$18,064,021 capital, and products valued at \$21,829,684. They include manufactures of carriages, machinery, shoes, oiled clothing, and belting. Fishing and navigation afford employment to a large number of the inhabitants. Pop. (1900) 13,884; (1910) 18,650; (1920) 22,561.

**Beverly**, city, New Jersey, Burlington county, on the Delaware River, and the Pennsylvania Railroad; 14 miles northeast of Camden. Pop. (1910) 2,140; (1920) 2,562.

**Beveziers**, BATTLE OF. See BEACHY HEAD, BATTLE OF.

**Bevis of Hampton**, also known as *Beuve de Hunstone*, originally perhaps a viking tale of the tenth century; in its extant form a typical romance of adventure popular in mediæval England. Bevis seems to have been an international character, as there are versions of his wanderings and exploits in French, Italian, Dutch, Welsh, Scandinavian, and Russian, and his travels include the length and breadth of Europe. The writer of the English version probably followed a French original, adding many details. Consult Laura Hibbard's *Three Middle English Romances*.

**Bewick**, THOMAS (1753-1828),

English wood-engraver, who revived the art, first attracting notice in 1775, and brought it to a perfection which it had never previously attained. Among his best works were the illustrations to a *General History of Quadrupeds* (1790), *History of British Birds* (1809), *Æsop's Fables* (1818), and blocks for editions of the poets printed by Bulmer of the Shakespeare Press. His woodcuts are much prized by collectors. In 1870 an edition of over two thousand *Bewick Woodblocks* was issued by Reeve. See *Memoir of T. Bewick by himself* (1862), and *Lives by Thomson* (1882), *Dobson* (1884), and *Rosin* (1888); *Jackson and Chatto's Hist. of Wood-engraving* (1861), *Linton's Hints on Wood-engraving* (1879), *Hamerton's Graphic Arts* (1882), *Clement's Painters, Sculptors, Architects, and Engravers* (1899); also *Anver's Elementary History of Art* (1875).

**Bexhill**, or BEXHILL-ON-SEA, coast par. and wat.-pl., E. Sussex, England, 5 m. s.w. of Hastings; 7,999 ac.; a *kursaal* of the continental type. Pop. (1901) 12,210.

**Beyle, MARIE HENRI** (1783-1842), French author, known under the pseudonym of 'Stendhal' (from Stendal, the home of Winckelmann, whom he greatly admired), was born at Grenoble, and served in the army during the Napoleonic invasions of Italy and Russia. From 1830 to 1833 he was French consul at Trieste, which post he exchanged for a similar one at Civita Vecchia (1833-41). In 1831 his greatest novel, *Le Rouge et le Noir*, appeared; and in 1839 *La Chartreuse de Parme* brought him additional fame. Among his other works are *L'Histoire de la Peinture en Italie* (1817) and *De l'Amour* (1822). He also attracted notice by *Shakespeare et Racine* (1825), a manifesto in favor of romanticism. His writing is brilliant, morbid, and cynical; but the plots of his novels are weak, displaying a constant straining after effect which is never realized. Prosper Mérimée is regarded as his pupil. Two excellent accounts of Beyle and his literary career have been written—*Paton's Henry Beyle* (1874) and *Rod's Stendhal* (1892). See also *Sainte-Beuve's Causeries du Lundi*, *Maurice Hewlet's introduction to La Chartreuse de Parme* (1902), *Chuquet's Stendhal-Beyle* (1902), and *Stryjenski's Comment a vécu Stendhal?* (1900).

**Beyrich, HEINRICH ERNST** (1815-96), German geologist and palæontologist, born at Berlin, where he became (1856) professor of geology and palæontology at the university, and (1873) director

of the geological department. He published the geological chart of Germany, due in great part to his labors. Among his principal works are *Untersuchungen über Trilobiten* (2 vols. 1846); *Konchylien des Norddeutschen Tertiärgeländes* (1853-7); *Ueber einige Cephalopoden aus dem Muschelkalk der Alpen* (1867).

**Beyrout.** See BEIRUT.  
**Beyschlag, WILIBALD** (1823-1900), German evangelical writer, and professor of theology at Halle (1860-1900). He published numerous works, including *Die Christologie des Neuen Testaments* (1866), *Das Leben Jesu* (3rd ed. 1893), *Neutestamentliche Theologie* (1891-2; trans. 1896), *Der Brief des Jakobus* (6th ed. 1897), *Der Altkatholizismus* (3rd ed. 1883), and *Aus meinem Leben* (1896-9).

Wood-Engraving by Bewick: the Yellowhammer.

**Beza, THÉODORE, or DE BÈZE** (1519-1605), Genevan reformer, was born at Vézelay. In 1548 his religious convictions became so strong that, on recovering from a severe illness, he felt compelled to join Calvin at Geneva. Earlier in the same year appeared his *Poëmata Juvenilia*, the publication of which he afterward deeply regretted. For about ten years he was professor of Greek at Lausanne; but returning to Geneva in 1558, he was appointed professor of theology and president of the college. While at Lausanne he published (1550) a drama, *Abraham's Sacrifice*. The consummate tact with which he conducted negotiations on behalf of the oppressed Vaudois, or Waldenses, in 1557 and 1558, led to his appointment as representative of the Protestants at the conference of Poissy (1561). Detained in Paris by the religious wars, he became the most

trusted adviser of the Reformed leaders. In 1563 he returned to Geneva, and on Calvin's death, in the following year, was appointed his successor. In 1562 the French government permitted the publication of the Huguenot Psalter, most of which was written by Beza. To him also the Huguenots owed the final revision of their Bible. He presented Cambridge University with the uncial New Testament ms. known as the *Codex Bezae*. (See BIBLE.) His best-known works are his edition of the Greek Testament (1565), his *Histoire Ecclesiastique des Eglises Réformées du Royaume de France* (1586; new ed. 1883), and his translation of the New Testament into Latin (1556). See *H. M. Baird's Life of Beza* (1899), and bibliography there.

**Bezant**, in heraldry, one of the charges called roundels; is a small disk of gold. On the

Bezant of Manuel I. (1143-1180).

Continent it may be either gold or silver.

**Bezants**, the coins of the Byzantine empire, but specially the gold bezant (*bizantium*, *nummus aureus* or *solidus aureus*), struck between 395 and 1453, and varying in value between ten shillings and twenty shillings for

the gold piece, and between one and two shillings for the silver. The *dinar* of the caliphate was called by the crusaders the 'Saracen bezant,' and this latter coin gradually displaced the Greek bezant. For centuries the bezant was used as the basis of all transactions between the East and the West, but it eventually gave way before the Venetian ducat.

**Béziers**, tn., dep. Hérault, France, beautifully situated on the slope of a hill overlooking the fertile valley of the Orb, and on the Canal du Midi, 50 m. by rail s.w. of Montpellier. There are remains of a Roman amphitheatre. Largely a commercial town, Béziers has an important market for wines, fruit, and cattle. The crusade against the Albigenses resulted, in 1209, in the wholesale massacre of the inhabitants. Pop. (1901) 52,310.

**Bézique**, a card game in which the name *bézique* is applied to the occurrence in one hand of the knave of diamonds and queen of spades, may be played by two, three, or four persons, with two, three, or four packs of cards from which have been removed cards with from two to six pips; the remaining cards rank in this order—ace, ten, king, queen, knave, nine, eight, seven. If two are playing, eight cards are dealt to each, thus leaving forty-eight to form what is called 'stock,' the top card of which is turned up for trumps. It is laid at the side of the stock, of which it is the last or bottom card. The non-dealer leads, the dealer follows, not necessarily in the same suit. If he play a higher card of the suit led, or trumps, he secures the lead. After every trick the players each draw a card from the stock, the winner of the trick taking the top one, his opponent the next. Thus they continue to play and draw alternately until the stock is exhausted. After that point the second player must follow suit when possible, and take the trick when he can. The first to score 1,000 points wins the game. If his opponent has not scored 500, the game counts double.

The objects of the play are (1) to promote in the hand certain combinations of cards to which, on being declared, different scores attach; (2) to win aces and tens; and (3) to win the so-called last trick—so named not because it is the last trick of the hand, but because it is the trick just before the drawing of the last cards from the stock. Combinations of cards are declared by the winner of a trick before he draws from the stock, the cards (one of which must not have been declared before) being placed face upwards upon the table, where they re-

main still part of the hand and still playable, as though they had not been declared. A player is not obliged to declare, though he may win a trick and hold scoring combinations. Only one declaration may succeed one trick. The combinations, on being declared, count as follows:—Class 1. Marriage (king and queen of any suit), 20; royal marriage (king and queen of trump suit), 40; sequence of five highest trumps (ace, ten, king, queen, and knave), 250. Class 2. Bézique (queen of spades and knave of diamonds), 40; double bézique (all the bézique cards), 500. Class 3. Any four aces, 100; any four kings, 80; any four queens, 60; any four knaves, 40. Each ace and ten won in tricks counts 10. The last trick counts 10. In turning trumps, the dealer scores 10 if he turn the seven; either player scores 10 for exchanging from the hand a seven of trumps for a turned trump not a seven, and 10 for declaring the second seven of trumps, which is simply shown on being declared, and not put on the table. See A. Howard Cady's *Bézique*.

**Bezoar**, a morbid concretion occasionally found in the stomach and intestines of ruminants (e.g. antelopes, llamas, chamois, wild goat, and domestic cattle), formed by lime or magnesium phosphate adhering to some foreign substance, or by a portion of undigested food. The 'Oriental bezoar stone,' as it is termed, sometimes consists of a ball entirely of hair or vegetable fibre; and the one regarded as most efficacious as cure for disease, to which use this substance has long been applied, is taken from the Persian wild goat. These hair balls are frequently found in the stomachs of British cattle, their origin being ascribed to the common habit of a cow licking the hide of its calf or of another cow. In the East it was believed that the bezoar was an antidote for poison. Lionel Wafer, in his *Voyage and Description of the Isthmus of America* (1699), says that out of the stomach of a llama he took thirteen bezoar stones, some resembling coral, some round, and all green at first, though afterward they turned of an ash color.

**Bezwada**, tn., Krishna district, Madras Presidency, India; of some commercial importance since the introduction of the railway. Has rock-cut Buddhist temples. Pop. (1901) 24,224.

**Bhagavad Gita** ('The Song of the Blessed One') is the work of an unknown author, and the date of its inclusion in the *Mahabharata*, of which it forms part of book vi., is also unknown. The song inculcates that remark-

able development of Hinduism called *bhakti*, the doctrine of faith. The poem has at all times exercised a powerful influence on the hearts and minds of the worshippers of Vishnu. Attempts have been made to identify the Krishna of the poem with Christ, and to ascribe the striking resemblance of many of its verses with those of Holy Writ to the influence on Hinduism of early Christians and Jews—a theory combated by the late Kasinath T. Telang of Bombay in his scholarly treatise on the *Bhagavad Gita* in vol. viii. (1898) of Max Müller's *Sacred Books of the East*. It has also been translated into English by Davies (1882) and Sir Edwin Arnold, *The Song Celestial* (1885).

**Bhagavatapurana**. See PURANAS.

**Bhagirathi**. (1.) Branch of the Ganges, in Bengal, India; passes through the Murshidabad dist., joins the Jalangi, becoming the Hugli. (2.) River in Garhwal state, India; joins the Alaknanda at Deoprayag, and forms the Ganges.

**Bhainsror**, tn., and fort in Udaipur dist., Rajputana, India, 120 m. S.E. of Ajmere; has vast ruins of ancient temples to Siva.

**Bhamo**, tn. on l. bk. of Irawadi 40 m. W. of Chinese frontier, and over 200 m. by rail and river N.E. of Mandalay, Upper Burma. It is an important caravan centre between China and Burma, and marks the limit of navigation on the Irawadi. Pop. (1901) 9,134.

**Bhandara**, tn., Bhandara dist., Central Provinces, India, on the Wainganga R. Pop. (1901) 14,023.

**Bhang**, BANG, or BANGUE, the Indian name for the dried leaves of the hemp plant (*Cannabis indica*); strongly narcotic, and used either with or without tobacco or opium for smoking. An infusion gives the drink *hashish*, which produces a peculiar delirium, and catalepsy. A sweet-meat called *majun* is also made with the leaves. The drug is used in medicine as an anodyne, hypnotic, and antispasmodic.

**Bhanpura**, walled tn., 60 m. S. of Kotah, Indore state, Central India. Pop. about 20,000.

**Bhartpur**, or BHURTPORE, cap. of the feudatory state of the same name, in Rajputana, India. In 1805, the British, under Lord Lake, made four unsuccessful attempts to capture the fort, which was stormed by Lord Combermere in 1827. Pop. (1901) 43,601. The state has an area of 1,982 sq. m., and a pop. in 1901 of 626,665.

**Bhartrihari**, a Hindu poet who is believed to have flourished in the 1st century. He is the reputed author of the *Three Centuries* (*Satakas*) of Sanskrit apophthegms upon love, wise conduct of life, and renunciation of the world. The best edition of his writings

is that edited by K. T. Telang, in the 'Bombay Sanskrit Series'; and there are translations by C. H. Tawney (1877) and B. H. Workham (1886).

**Bhaunaghar**, bou'nug-ur, or BHAVANAGAR, chief town and port of the state of Bhaunaghar, Kathiawar peninsula, Bombay, India. It has large exports of cotton. Pop. (1921) 59,392.

**Bhavabhuti**, buv-a-bōō'ti, a celebrated Indian dramatist of the 7th and 8th centuries, who, with Kalidasa and Harsha, completes the great dramatic trio. Three of his plays have survived—*viz.*, the *Malati-madhava*, *Maha-viracarita*, and *Uttara-rama-carita*; the history of Rama forming the subject of the latter two. The first, which is sometimes called the Hindu 'Romeo and Juliet,' has been translated by H. H. Wilson in *Theatre of the Hindus* (3rd ed. 1871), the second by J. Pickford (1871), and the third by C. H. Tawney (1874).

**Bhavishyapurana**. See PURANAS.

**Bhel**. See BAEL and EGLE.

**Bhils**, bēlz, an aboriginal tribe who inhabit the hilly tracts of the Vindhya range, Central India, and the jungles of Khandesh district, Bombay Presidency. They are a primitive, dark, sturdy race of hunters. Their territory is traversed by the Narbada, which they regard with the utmost veneration and fear. Of a low civilization, they are improving under British rule, and are remarkable for their truthfulness and fidelity. They number nearly two millions.

**Bhiwani**, bē-wā'ni, town, Punjab, India, in Hissar district, 70 miles northwest of Delhi. It is a commercial centre, with an important trade in sugar, salt, pepper, and metals. Pop. (1921) 33,270.

**Bhopal**, bō-pōl', chief town of the feudatory state of Bhopal, Central India, 105 miles northeast of Indore. The Bhopal dynasty was founded at the beginning of the 18th century by Dost Mohammed, an Afghan in the service of Aurungzebe. Pop. (1921) 45,094.

**Bhor**, bōr, a feudatory state, Bombay Presidency, India; area, 1,491 square miles. Pop. (1921) 130,420. The capital is Bhor.

**Bhotan**. See BHUTAN.

**Bhuj**, bōj, capital of feudatory state of Kutch, Bombay Presidency, India; 180 miles southeast of Haidarabad. It has several interesting mosques and is famed for its gold and silver articles. Pop. (1921) 19,281.

**Bhurtpore**. See BHARTPUR.

**Bhusawal**, bōō-sā'wal, town, Bombay Presidency, India, in Khandesh district; 115 miles south of Indore. It is headquarters for the shops of the

Great Indian Peninsula Railroad. Pop. (1921) 25,557.

**Bhutan**, bōō-tān', or BHOTAN, an independent state in the Eastern Himalayas, bounded on the north by Tibet, on the east by Assam, on the south by Bengal, and on the west by Sikkim. It is traversed by many lofty mountains. The elephant, bear, wild boar and rhinoceros are found in its forests. Manufactures comprise coarse woollen and cotton goods, and tanned buffalo leather. Buddhism of a very simple form is the prevailing faith. The government of Bhutan resembles that of Tibet, the supreme authority being divided between the Deb Raja, or the secular head, and the Dharm Raja, or the spiritual head of the state. The Bhutanese are a hardy and industrious race, but poor and oppressed. The chief towns are Punakha, the winter capital, and Tashichong, the summer capital.

**Bhuvanewar**, bōō-va-nes'-wur, the temple city of Siva, Bengal Presidency, India; in the district of Puri. It was the capital of the Kesari or Lion dynasty of Orissa (500-1104 A.D.) and contains the ruins of five or six hundred shrines.

**Biafra**, bē-āf'ra, BIGHT OF, large and deeply indented bay on the west coast of Africa, between the mouth of the Niger and Cape Lopez (400 miles). It receives the Niger, Old Calabar (Cross and Calabar), Rio del Rey, and other rivers. Fernando Po, Prince's, and St. Thomas are the principal islands.

**Biala**, byā'lā, town, Poland, 30 miles southeast of Warsaw. The chief industries are hemp growing, cattle-rearing, and tanneries. Pop. (1921) 12,966.

**Bialystok**, byāl'e-stok', town, Poland, in Bialystok County, on the Bialy River; 120 miles northeast of Warsaw. The leading industries are soap, hats, leather and woollen goods manufacture. Pop. 77,000.

**Biana**, byā'nā, town, Rajputana, India, in Bhartpur state; 50 miles southwest of Agra. It is one of the oldest towns in India and is a sacred spot to the Mohammedans. Pop. (1921) 6,954.

**Biancavilla**, byāng-kā-vē'lā, town, Sicily, in the province of Catania, on the southwestern slope of Mt. Etna; 19 miles northwest of Catania. Lava paves many of the streets. The leading industries are cotton manufacture and wine production. Pop. 15,000.

**Bianchini**, byāng-kē'nē, FRANCESCO (1662-1729), Italian astronomer, was born in Verona. He is remembered chiefly for his tracing of the meridian. He founded the Academy of the Altophili ('lovers of truth') in 1686, and was chosen by Pope Alex-

ander VIII. secretary of the committee for the reformation of the calendar. His published works include *Istoria Universale* (1697) and various memoirs and dissertations.

**Bianco**, byāng'kō, or BIANCHO, ANDREA, Italian cartographer, was born in Venice early in the 15th century. He left a collection of hydrographical charts, in one of which, dated 1436, two islands are placed to the west of the Azores, and named Antillia and De laman Satanaxio. This fact has been regarded as indicating a knowledge of the Americas prior to Columbus' voyages.

**Biard**, byār, FRANÇOIS (1798-1882), French painter, was born in Lyons. He was destined for the Church but gave it up to follow an artistic career. His subjects were derived from travels in various lands, as Syria and Egypt (1833), Gold Coast of Africa, Greenland and Spitzbergen (1839), and Brazil (1858). He excels in comic and burlesque situations, as *Les saltimbanques*, *Après un bal masqué*, *Un concert de famille*. Of his Greenland sketches the best known is *A Struggle with Bears*, now in the municipal gallery of Leipzig.

**Biarritz**, byā-rēts (Basque 'the two rocks'), famous winter and summer seaside resort, France, in the department of Basse-Pyrénées, on the Bay of Biscay; 493 miles southwest of Paris and 16 miles from the Spanish frontier. The climate is mild and delightful, and the beach, divided by two rocks into three parts, is especially fine. A magnificent promenade extends along the shore and there is a casino, with saline baths. The castle, built by Empress Eugénie, was burned down in 1886, and its site is occupied by the Hôtel du Palais. Napoleon III. and his family did much to make the place famous and it was a favorite resort of Edward VII. of England. Pop. (1921) 18,353.

**Bias**, bi'as (c. 550 B.C.), of Priene, in Ionia, was famous as one of the Seven Wise Men of Greece. His reputation seems to have been due to a certain practical wisdom, the fruit of experience rather than of any philosophical system.

**Bib**, POUT, or BRASSY (*Gadus luscus*), a small fish, allied to the haddock, found in the North Sea and the Arctic Ocean, and brought to European markets.

**Biban-el-Muluk**, bē-bān'el-mū'look, valley, Upper Egypt, near the ruins of Thebes. It contains tombs of ancient kings (18th, 19th, and 20th dynasties).

**Bibliena**, bēb-byā'nā, CARDINAL (1470-1520), Italian prelate and comic writer, whose real name was Bernardo Dovizio, but who was generally called Bib-

biena, from his birthplace. He was made cardinal (1513) by Leo x., whose secretary he had long been, and became a great patron of art and learning. He is the author of what is generally regarded as the earliest regular Italian comedy, the *Calandria*, which, though not acted till 1513 and not printed till 1521 (at Siena), appears to have been written about 1490. It is based on the *Menachmi* of Plautus, and borrows numerous traits from Boccaccio's *Calandrino*. Though remarkable for indecency even in that age of loose morals, it is still prized by reason of its natural dialogue, sparkling wit, and admirable prose.

**Bibescu**, PRINCE DIMITRIE. See STIRBEY, BARBO.

**Bibiri**. See GREENHEART.

**Bible. Language and Text of Old Testament.**—The Old Testament, omitting the Apocrypha, is written in Hebrew, with the exception of the following portions, which are written in Aramaic, a kindred Semitic language: Dan. ii. 4-vii. 28; Ezra iv. 8-vi. 18, vii. 12-26, and a single verse of Jeremiah (x: 11). No ms. of the Old Testament is reckoned to be earlier than the 9th century A.D., and it has been thought that those MSS. which are extant are all descendants of a common ancestor not earlier than the 2nd century A.D. We have, however, two sources of evidence which are of great value—the *Targums* and the *Versions*. An interpretation became necessary as soon as the sacred books were read in a language which had ceased to be the ordinary speech of the people. In course of time, as this oral interpretation became more elaborate and stereotyped, it was reduced to writing; and these written Targums are among our most valuable helps, both for fixing the text as read in the Jewish synagogues, and for determining the interpretation which the Jews attached to difficult passages. But it is upon the *Versions*, or translations made from the Hebrew in early times, that we chiefly depend both for the determination of the true text and for its explanation. Following is an account of various versions.

1. *Greek Versions.*—Of these by far the most important is the *Septuagint*, which was produced in Egypt from about 300 B.C. to 150 B.C. As a translation it is of unequal excellence, but as it is the oldest translation of the Hebrew Bible, and as all the other early translations are made from it, with the exception of the Peshito Syriac and Jerome's Vulgate, its study is of prime importance. It is constantly quoted by the writers of the New Testament. The remaining Greek versions belong to a later date,

and the translators of them are better known. They were collected in the first half of the 3rd century by the great Christian scholar Origen, in the work he called the *Hexapla* (or sixfold), on account of the six columns into which each page was divided; and these six columns contained:

	1.	2.
Hebrew text.	Hebrew text	in
		Greek letters.
3.	4.	
Translation	Translation	
of	of	
Aquila.	Symmachus.	
5.	6.	
Translation	Translation	
of the	of	
Seventy	Theodotion.	
(the Septuagint)		

If this work of Origen had come down to us, we should have had three Greek translations to compare with the Septuagint. Unfortunately, there is nothing preserved beyond a number of quotations. Of the translators mentioned, Aquila was a Jewish proselyte from Pontus, who wrote in the beginning of the 2nd century. He was a very literal translator, and aimed at rendering even the untranslatable Hebrew particles. Theodotion was also a Jewish proselyte, from Ephesus; he aimed at reforming the text of the Septuagint, and his rendering of Daniel was accepted by the Church as superior to that of the Seventy. His date is somewhere in the latter half of the 2nd century. Symmachus, a Samaritan Ebionite, belongs to the end of the 2nd century.

2. *Syriac Versions.*—The principal Syriac version, the Peshito (which means either *simple* or *vulgate*), was made (2nd century) direct from the Hebrew, with occasional reference to the Septuagint. There is also another Syriac version made direct from the Septuagint as it stood in the Hexapla of Origen, hence called the *Hexaplar* (616-618 A.D.).

3. *Latin Version.*—The Old Latin, or *Itala*, was a literal translation of the Septuagint, made in the 2nd century, A.D. The *Vulgate* is in the New Testament the revision of this, in the Old a translation of the Hebrew, made by Jerome in Bethlehem between the years 392 and 404 A.D. To fit himself for this work Jerome acquired the Hebrew somewhat late in life. The work of revision is very unequally done; some books underwent very little change; others were much more carefully treated. In particular the Psalter had already been twice revised by him on the basis of the Septuagint; these revisions are known respectively as the Roman and Gallican Psalters.

4. Other ancient versions—such as the *Arabic*, the *Persian*,

and the *Ethiopic*—are of less value.

**The Canon of the Old Testament.**—The whole collection of books contained in the Bible is usually spoken of as the Canon, or canonical Scripture, any single book being said to be in the canon, or canonical. Before Origen's time, the truth recognized by the Church had come to be spoken of as the canon or test of doctrine; and the books that were in accordance with the traditional rule of faith, and embodied it, were therefore said by Origen to be canonized or canonical. But since the Scriptures themselves contain in written form this standard of faith, they themselves came to be spoken of, in an active sense, as the canon, or rule by which other books or statements might be tested.

It is probable that in Israel the first religious documents were collections of laws to be used by the priests in the instruction of the people, and records of events which had influenced the national consciousness. Later on, the prophets, or their amanuenses, wrote down the discourses they had delivered in God's name. But the first approximation to what we call the canon seems to have been the law-book, believed to have been Deuteronomy, found in the temple in the reign of Josiah (2 Kings xxii, xxiii), which was immediately acknowledged by king, prophets, priests, and people as an authoritative record of religious law. It cannot be determined when the other elements of the Pentateuch were composed, but it would seem that all the parts were gathered in one collection by Ezra between 444 and 400 B.C., and accepted by the people as an exhaustive record of the *Law (Torah)*, the first great division of the canon. But by this time the chief historical books were written, as well as the greater part of the prophetic books; and precisely to such books the attention of the thinking part of the nation turned for knowledge of the past history, and for instruction and consolation in their present position. Accordingly, we find that the books which, in the Hebrew Bible, immediately follow the Pentateuch are the books of Joshua, Judges, Samuel, and Kings, which give a connected history of the nation from the death of Moses to the Babylonian captivity; and then, with the exception of Daniel follow all the books which we call prophetic.

This addition to the national religious literature became known as the *Prophets*, for even the historical books were written in a prophetic spirit. They must have been written after the time of Malachi (who was somewhat later than

Nehemiah), and probably a considerable time later, and when there was no longer any hope of other prophetic books being written. At all events, the earliest available notices on the subject speak of the Law and the Prophets together, or give clear indication that the prophetic books were then in the canon. After a time, though it is impossible to fix a date for the beginning of the practice, it was customary to read parts of the prophetic Scriptures in the stated worship, a section being assigned to accompany the lesson of the Law for the day. Finally, after the Law and the Prophets had been thus joined together, there remained a considerable number of books, some of which are certainly earlier in date than some of the books that had been included. These remaining works have a more diversified character than either of the classes of Law and Prophecy, and they have never received a more definite designation than *Kethubim*, or 'writings,' and we usually apply to them the equivalent Greek name of *Hagiographa*, or 'sacred writings.' We find them referred to in the book of Ecclesiasticus (Prologue) as 'the other books that follow' the Law and the Prophets, or simply as 'the rest of the books.'

The canon, thus completed, containing precisely the books now found in the Old Testament, was, according to the Talmud, ratified by the Council of Jamnia (or Jabneel, between Joppa and Ashdod), c. 90 A.D. The three great divisions, frequently referred to in the New Testament, in varying phraseology, mark the three stages by which the collection assumed its final form. The total number of books, according to Jewish enumeration, is twenty-four, so that the whole Hebrew Bible is sometimes spoken of as 'the four and twenty.' The divisions and the enumeration are exhibited in the following table:—

	Books.
I. Law, <i>i.e.</i> , the Pentateuch, or five books from Genesis to Deuteronomy . . . . .	5
II. Prophets—	
1. Former prophets: Joshua, Judges, Samuel, Kings . . . . .	4
2. Latter prophets: Isaiah, Jeremiah, Ezekiel, and the Twelve . . . . .	4
III. Writings—	
1. Three poetical books: Psalms, Proverbs, Job . . . . .	3
2. Five rolls: Song of Songs, Ruth, Lamentations, Ecclesiastes, Esther . . . . .	5
3. Three books: Daniel, Ezra-Nehemiah, Chronicles . . . . .	3
	24

The 'former prophets' are so called simply from their position, not from any assumption of their

date. As already explained, they are historical books; and it is to be noted that Samuel and Kings are reckoned each as one book; for these books, as well as Chronicles and Ezra-Nehemiah, were not divided by the Jews till the 16th Christian century. Among the latter prophets, the 'Twelve,' which are now usually termed minor prophets, have always gone together and been reckoned as one book, owing to their limited compass, which admitted of their being written on one roll. The three books, Psalms, Proverbs,

phetical or rather apocalyptic book, does not come with the other prophets; the most probable explanation being that it did not exist, at least in its present form, when the other prophetic books were included in the canon.

*Connection between the Testaments.*—Between the last Old Testament writing and the rise of the New Testament literature there intervened about one hundred and fifty years. Although this period is a blank so far as contributions to the canonical Scriptures are concerned, there was

Portion of Manuscript (Exod. 26:7) in Square Hebrew. (Earliest dated Hebrew MS. in the British Museum.)

and Job, are taken together and provided with a special system of accentual marks for cantillation. It is misleading to speak of them as the poetical books, for some of the other books—*e.g.* The Song of Songs and Lamentations—have an equal claim to the title, and many portions of the prophetic books are in the form of poetry.

The 'five rolls' are so denominated because each was written on a roll by itself, and they came to be associated with, and publicly read at, five great sacred seasons. Daniel, though a pro-

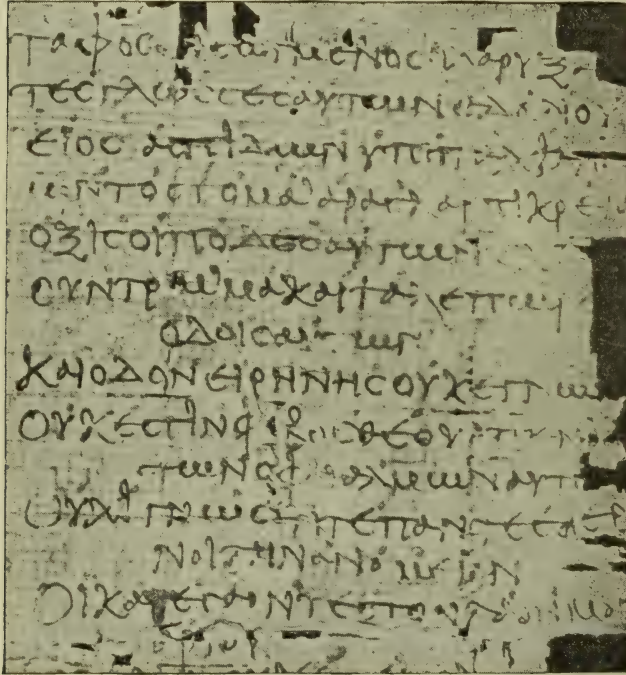

really no cessation in the literary activity of the people. But the religious productions of this time, though indispensable for the history of Judaism, and not without value for devotional purposes, manifest neither the lofty genius of the preceding literature, nor the inspired glow of that which was to follow. For this and for other reasons, not the least being that they were (mainly) written in Greek, the Jews never invested them with canonical dignity. They are known as the Apocrypha of the Old Testament. The

Greek fathers, as also Augustine, seem to draw but little distinction between these apocryphal writings and the accepted Scriptures, and the Council of Trent put them alongside of the Old Testament and New Testament as 'sacred and canonical'; but the reformed churches have usually regarded them as of lower rank. Their merit, particularly for purposes of edification, was not denied—was, indeed, in the modern confessions, generally asserted—and they were until the beginning of the 19th century bound up with the Bible, though the use of them

salem to Rome. The epistles, written by men of varied personal character and temperament, among whom by far the most prominent and the most fertile was the apostle Paul, set forth the significance of the gospel facts as revealed to them according to our Lord's promise (John 16:12,13). The single prophetic book (the Revelation of St. John, or the Apocalypse), however it is to be interpreted, shows the Lamb as King, to become victor on earth, where His church is preparing through conflict to share His triumph. In

according to assumed types of doctrine. Biblical theology properly discusses the theology of the several writings; but the theology of the New Testament is one, whatever progress is discernible. Moreover, the advance in St. Paul's teaching, as indicated by a comparison of Thessalonians with Ephesians, is almost as marked as that between the general epistles of St. James and St. John, which are regarded as presenting the respective extremes in the progress of doctrine. The gospels cannot be classified by any such principle; for while that of St. John, from its purpose, presents the most mature statements, there is no appreciable advance in doctrine from St. Matthew to St. Luke. The same Lord Jesus Christ was apprehended by all the writers in substantially the same way. See also GOSPELS and PAUL.

*Language and Text of the New Testament.*—The New Testament is written entirely in the Greek language. The existence of a number of various readings in the text of the New Testament necessitates an inquiry into the materials from which the text is derived, and into the causes which have produced the divergent readings. Most of these divergences are mere trifles, caused by careless copying and insufficient correction. The materials of textual criticism are usually reckoned under the heads of Copies, Versions, and Fathers, which might be grouped as—(1) Copies + Patristic Citations from Copies; (2) Versions + Patristic Citations from Versions. For convenience the books are grouped under the heads of Gospels, Acts and Catholic Epistles, Pauline Epistles, and Apocalypse; and the enumeration of MSS. is made *de novo* with each group. Sometimes this is indicated by writing a few letters above the sign representing the MS., as D<sup>Paul</sup>, E<sup>Act</sup>, or by adding a subscript numeral, as D<sub>2</sub>, E<sub>2</sub>. Only a few fragments of the New Testament exist written on papyrus. It is, however, almost certain that that was the primitive material on which the apostolic documents were written (*cf.* 2 John 12: 'I did not wish to write with paper and ink'). Of MSS. written on vellum, the most important are those belonging to the 4th, 5th, and 6th centuries, which pass under the name of the 'Five Great Uncials.' They are as follows:—1.  $\aleph$  (Aleph; 4th century)—the Codex Sinaiticus, discovered by Tischendorf in 1844 (and 1859), in the monastery of St. Catherine, on Mt. Sinai. The greater part of this MS. is now in St. Petersburg. It contains the whole of the New Testament com-

Fragment of Psalter, from Septuagint (Ps. 117 ff.).

(Earliest MS. of any portion of the Bible known to be in existence. Written on papyrus, in uncial, in third century. Found in Egypt, 1892; now in British Museum.)

as sources of doctrine was held to be illegitimate.

*The New Testament.*—The New Testament is a collection of twenty-seven distinct writings, from eight (or more) different hands. The books are usually classed as Historical (five), Didactic (twenty-one), Prophetic (one), though the writings of the first class include much more than one-half of the entire matter. The unity of the whole is remarkable; all the books find their centre in Jesus Christ. The four gospels narrate His life on earth; the fifth historical book tells how the new life, that came from Him through the Holy Spirit, passed from Jeru-

usalem to Rome. The order of these writings is not chronological. In ancient MSS. there was much variation in position; the seven general epistles were usually placed immediately after Acts, the gospels coming first, though not always in the order now universal. The Pauline epistles seem to have been arranged according to length, so that the earliest and the latest stand together (1 and 2 Thess., with 1 and 2 Tim. and Titus). There is evidence in these writings of an advance of Christian thought towards maturity; but the progress is along divergent lines, nor can all the books be classified

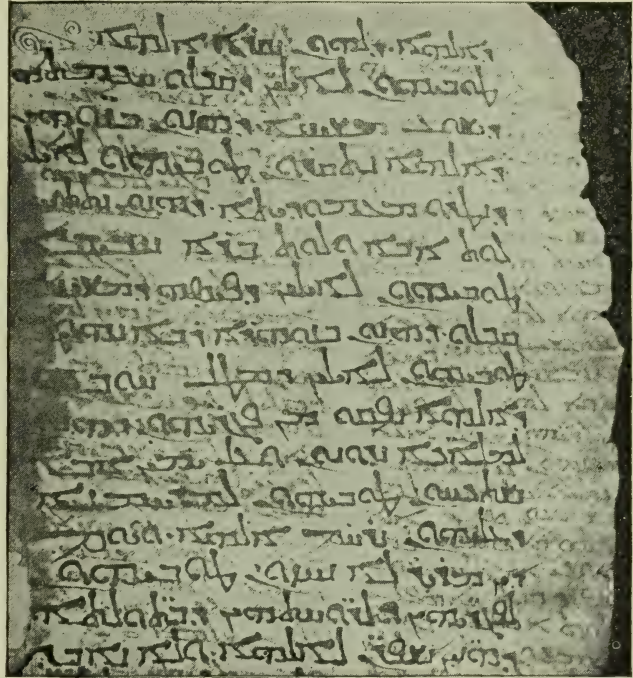

plete, together with the Epistle of Barnabas, and a large part of the Shepherd of Hermas. The last twelve verses of Mark are wanting; but it is suspicious that the page where they should occur appears to be a cancel. 2. B (Vaticanus; 4th century) is in the Vatican Library at Rome. It contains the New Testament as far as the middle of Heb. 9:14; but the rest of Hebrews, as well as the Pastoral Epistles and the Apocalypse, are wanting. N and B probably proceeded from a common workshop, perhaps the library at Caesarea; and this may explain why both lack the last twelve verses of Mark. 3. A (Alexandrinus; 5th century) is now in the British Museum. There seems no reason to doubt the tradition which assigns to it Alexandria. This ms. contains the whole New Testament, the first Epistle of Clement and a part of the second Epistle. 4. C (Ephræmi Syri rescriptus; 5th century) derives its name from the fact that the original text of its Greek Bible was washed out in the 12th century, in order to make room for a Greek translation of some works of St. Ephrem the Syrian. The ms. is now in Paris, but almost nothing is known of its origin and history. About three-fifths of the New Testament have been recovered from its pages. 5. D (Codex Bezae; 6th century) derives its name from Beza the reformer, who presented it in 1581 to the University of Cambridge, in whose public library it is exposed to view. This ms. is a bilingual, containing, besides the Greek text of the Gospels and Acts, a parallel Latin version of great antiquity. The whole number of Uncial MSS. known to the critical world is estimated at something over 120; but in this enumeration a number of MSS. are counted more than once. The Cursive MSS. are, as might be expected on account of their later dates, much more numerous; probably we might set their number at between 2,400 and 2,500 (the numeration being repeated for the different groups of books as before). Of all this number only a very few have been rendered available for criticism by exact collation; a fact which is much to be regretted, as there are preserved in Cursive MSS. many rare and curious readings which are of great antiquity, and yet have no attestation in Uncial MSS. It is not meant that all Cursive MSS. deserve complete and exhaustive collation, but most of them merit more careful study than they have hitherto received. It is also to be admitted that they are, relatively to the Uncial MSS. and the versions, of much less value in the determination of the text. But

we must bear in mind that the texts of Cursive MSS. are merely the descendants of lost Uncial MSS., and that the maxim that 'all various readings are early' applies to them as well as to the more imposing Uncial MSS. Where a number of Cursive MSS. can be proved to come from a common lost original, it is often possible to restore the lost (Uncial) ancestor by a critical comparison of the texts that are descended from it.

A word must be said in passing of *Lectionaries*, or copies of the Gospels, or the Acts and Epistles, arranged for reading in churches.

of the versions lies in the evidence which they furnish as to the state of the New Testament text at the time when it was translated, though it must be borne in mind that, as they are only copies in a foreign language, they are subject to the same changes and accidents as are ordinary Greek MSS. We may divide the earliest versions into the following groups:—1. SYRIAC VERSIONS; 2. LATIN VERSIONS; 3. EGYPTIAN VERSIONS.

Each of these versions is believed to go back in some form to the 2nd century; and this may be taken as proved for the first

Portion of Manuscript in Syriac (Luke 7:44-47).

(Found in the convent of Sinai by Mrs. Lewis, 1892.)

They are very numerous, and almost unknown as to text; but enough is known to enable us to affirm with certainty that they often contain fragments of very early texts. When the lectionary is made up out of lessons from the Gospels, it is commonly called an *Evangelistarium*; when the lessons are taken from the Acts and Epistles, it is known as an *Apostolos* or *Praxapostolos* or *Epistolarium*.

We come now to *Versions*, a class of witnesses to which greater weight is continually being assigned in the determination of the text. The great value

two groups. The third group has not yet been adequately studied.

1. SYRIAC VERSIONS.—The Syriac New Testament is known to us in the following forms:—(1.) *Old Syriac* (Lewis's Syriac) from Mt. Sinai, discovered in palimpsests in 1892 by Mrs. Lewis. (2.) *Old Syriac*, from the Nitrian Desert (commonly called Cureton's Syriac, after its discoverer, who detected it amongst the treasures brought from the Syrian convent in the Nitrian Desert to the British Museum). This is so nearly the same text with the Sinai version, that they must stand in some close genealogical relation. (3.)

*Tatian's Harmony* of the Four Gospels must be considered with the two foregoing versions; for although it is not extant in the original Syriac, but only in Armenian, and in Arabic versions derived from it, yet is it certain that it was in close agreement with the old Syriac version. (4.) The *Peshito* is the next stage in the history of the version. This is a revision of the Old Syriac

508 A.D. Its first form appears to have been lost, but we possess it in a later recension made by Thomas of Heraclea in 616 A.D. From him it is often known as the Harklean or Heracleian version. (6.) The *Jerusalem* or *Palestinian Syriac*. The history of this version is still a problem, but enough of the text has come to light to show that it is in very close connection with the Tatian

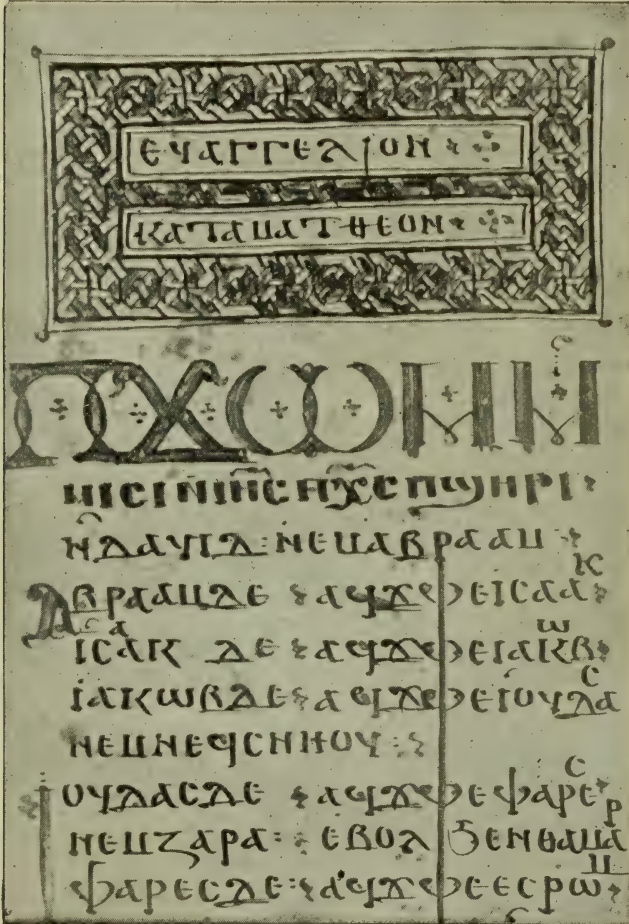

the Vulgate, is to-day the final authority of the whole Roman Catholic Church.

3. THE EGYPTIAN NEW TESTAMENT appears in a number of translations and dialects, of which the chief are:—(1.) The Coptic or Memphitic version of Lower Egypt, sometimes called Bohairic (3rd to 4th century). (2.) The Thebaic or Sahidic version of Upper Egypt, slightly later than the Memphitic. (3.) The Fayyûm version, of which fragments have recently been recovered.

Besides the above there are the *Ethiopic*, connected with the Egyptian; the *Armenian*, derived from the Syriac; the *Gothic* (Ulfilas); the *Arabic*; the *Slavonic*, etc.

*The Fathers*.—As already said, the Greek copies of the New Testament, as well as the versions made from the Greek, derive collateral confirmation from the citations made by the fathers of the church. And here we have the advantage that almost every quotation made by a patristic writer is a dated landmark in the history of the text; so that from a study of Origen's works we recover large portions of the MSS. which he used in the 3rd century, and so on. But we are as yet only at the beginning of the studies which would enable us to make proper use of such valuable material.

*New Testament Canon*.—Previous to the middle of the 2nd century after Christ, the church found its final authority in the scriptures of the Old Testament and in the words of Jesus. Various gospels were already in circulation, and there seems to have existed also a large mass of oral tradition regarding the teaching and work of Jesus; and both written and verbal material was used as the source of information and doctrine. But the apostles having been long dead, as also most of those who had known them, the church began to feel the need of a better defined and a more stable standard of religious truth. This was found in the four gospels, Matthew, Mark, Luke, and John; these accordingly were declared to have authority as Scripture, and to be worthy of co-ordination with the Old Testament. This canon of the gospels had received such universal recognition before the close of the 2nd century, that Irenæus is found giving reasons why it should consist precisely of *four*. The second stage, the canonization of the epistles, etc., followed almost immediately, though many years elapsed ere the church reached unanimity regarding some of them. The conditioning circumstance of the rise of an accredited collection of the epistles was the spread

Portion of Matthew's Gospel (ch. 1) in Coptic.

in order to bring it into closer agreement with the Greek text, as well as, no doubt, to improve the diction and clear it of harsh or ungrammatical forms. The result of the revision is a version of such beauty that it has been often called the queen of the versions. (5.) The *Philoxenian Syriac* is a Syriac version, made apparently in the interests of literal translation for Philoxenus of Mabug in

Harmony and with the Old Syriac, as well as with many of the best Greek MSS.

2. THE LATIN VERSION is known to us in a variety of forms, of which the principal are as follows:—(1.) *Old Latin*, an African version made in the 2nd century. (2.) The *Vulgate*. The Old Latin was revised by Jerome during the last quarter of the 4th century, and this revision, known as

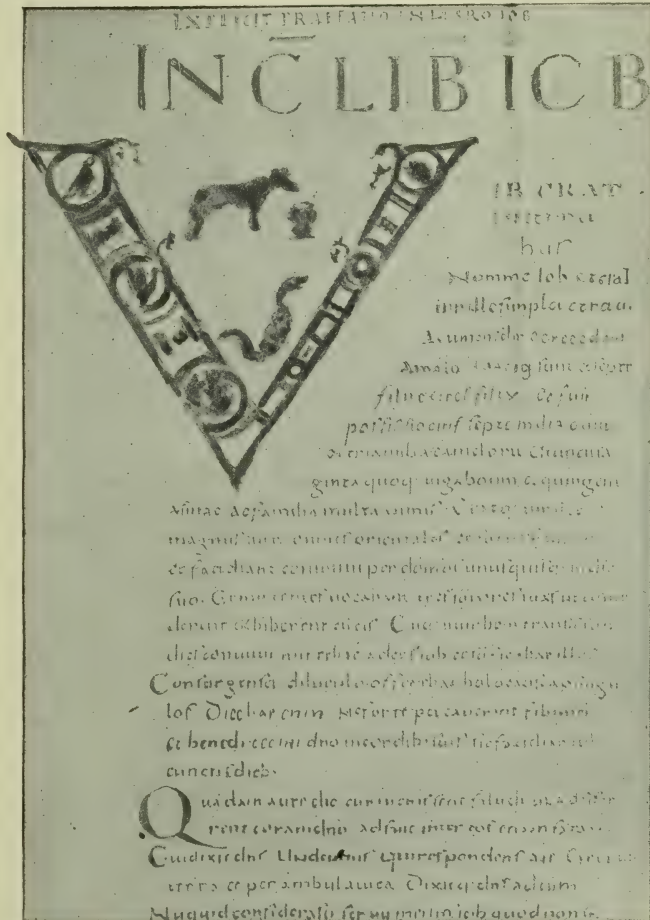

of heresy, particularly of Gnosticism, within the church. To combat this it was found necessary to make appeal to the apostolic teaching regarding Christ, and as this had, unsystematically but with wonderful fullness, been set forth in letters, etc., from various men of apostolic standing, a collection of these was made, and their regulative character declared. Considerable doubts existed at first about the admission of certain books—e.g. Hebrews, the Apocalypse, and some of the smaller epistles—as it was questioned whether these were from apostolic hands; but by A.D. 200 something like unanimity was reached, and the New Testament nearly as we have it became the accepted standard of the whole church.

*The English Bible.*—Portions of Scripture were translated into Anglo-Saxon as early as the 8th century, but the first complete rendering into what may be called English was made by Wycliffe about 1382. It is, however, to Wm. Tyndale that we owe the first printed Testament, issued at Worms in 1525. Tyndale translated also the Pentateuch, printed in 1530. The first complete printed English Bible was that of Miles Coverdale, a folio volume of the highest bibliographical value, printed in 1535, probably at Zürich, and based upon the Swiss-German edition (6 vols. Zürich, 1527-9). Next we have Matthew's Bible (1537), which largely utilizes the versions of Tyndale and Coverdale. Taverner's Bible was printed in London in 1539, whole as a folio, in parts as a quarto, that the poor might purchase portions of the Bible. The Great Bible (so named from the large size of its pages) was prepared at the suggestion of Cromwell, Earl of Essex, and finally issued from London in 1539. The Geneva Bible (often called the 'Breeches Bible,' from its rendering of Gen. 3:7), the work of Wm. Whittingham and others, with notes of a distinctly, even aggressively, Calvinistic trend, was issued in 1560, and was held in high favor for three-quarters of a century thereafter. The Bishops' Bible (called also the 'Treachle Bible,' from its translation of Jer. 8:22) was executed, as a kind of offset to the last named, under the supervision of Archbishop Parker, and published in 1568. Then came the Catholic Rheims New Testament (1582) and the Douay Old Testament (1609). But meanwhile, in consequence of the Hampton Court Conference of 1604, the preparation of what is now known as the Authorized Version was in progress. The Bishops' Bible was adopted as its basis, but most of

the above-named translations, particularly the Rheims and the Geneva, were made use of, and the work was finally given to the public in 1611. This edition has exercised an outstanding influence on English thought and literature, and might well have been considered final, had not the recent science of textual criticism shown that its Greek origi-

nal was itself frequently unsound. This fact, together with the admitted want of uniformity in its language, led scholars to propose a further revision; and when the House of Convocation in 1870 sanctioned the proposal, steps were immediately taken to carry it out. Scholars representing widely different sections of the church were invited to take part in the work, and at length,

in 1881, the Revised New Testament was issued, the Old Testament following four years later. Interesting particulars regarding the methods and labors of the revisers are given in the published prefaces to their work. Of Bibles printed in America the following are the most noteworthy. The Eliot Bible, translated by John Eliot for the In-

*The Latin Bible, St. Jerome's Version (Vulgate)—Job 1.  
(Written in 840 A. D., with gold and silver initials. Now in British Museum.)*

dians of Massachusetts; the New Testament appeared 1661, the complete Bible, 1663, 2d ed., 1685. A Bible for the Germans of Pennsylvania, repeating Luther's version, was printed by Dr. C. Saur in Germantown, 1743. The first Bible in the English language printed in America was the Aiken Bible, Philadelphia, 1782, the only copy known being in the British Museum. An

dians of Massachusetts; the New Testament appeared 1661, the complete Bible, 1663, 2d ed., 1685. A Bible for the Germans of Pennsylvania, repeating Luther's version, was printed by Dr. C. Saur in Germantown, 1743. The first Bible in the English language printed in America was the Aiken Bible, Philadelphia, 1782, the only copy known being in the British Museum. An

edition of the Douay version appeared in Philadelphia, 1790, 4to. In Worcester, Mass., the first folio and royal quarto Bible was printed by Isaiah Thomas, 1791, the same year as that of the Collins Bible, Trenton, N. J. Charles Thomson published at Philadelphia the first American translation of the Septuagint, 1808.

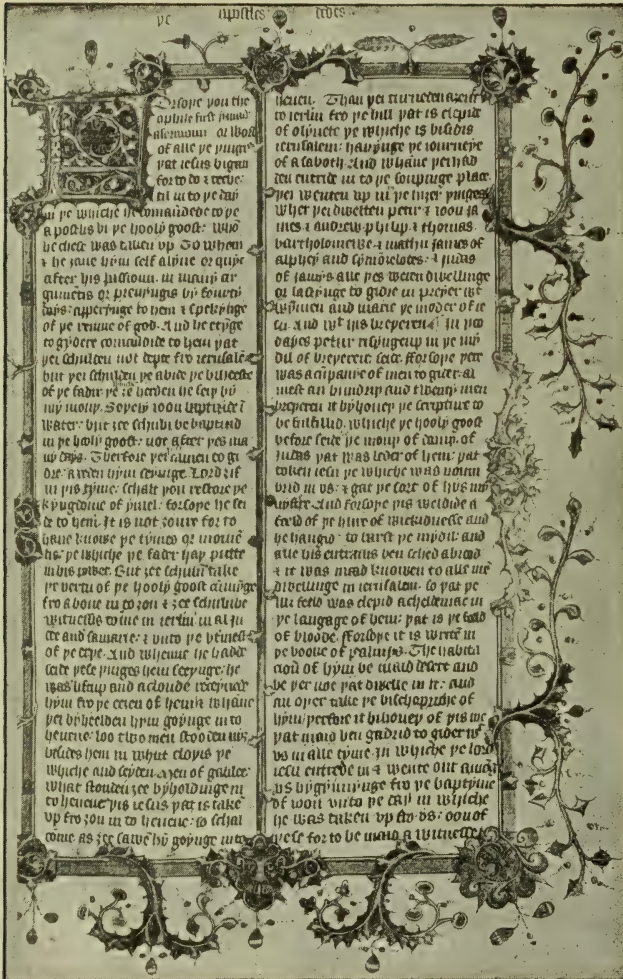

lished in 1901 (copyright, Thomas Nelson and Sons). It is the latest revision of the Bible in English. The American revisers who collaborated with the British revisers made a large number of emendations, which were not incorporated in the text of the English revision, but were published as an appendix which

American committee had not been sufficiently recognized, and that the completed work was unsatisfactory. This committee therefore continued, throughout the whole period of fourteen years, to revise not only the appendix, but the entire Bible, making use of the rich contributions made during the entire period of the sciences of linguistics, archæology, and textual criticism, and in 1901 this new version (the *American Standard*) was published. The charter of the American Bible Society was amended in order to enable it to publish this version. A noteworthy enterprise is that of Dr. Haupt of Johns Hopkins, at the head of an informal association of scholars in England, Germany and the United States, to produce *The Sacred Books of the Old and New Testaments* with the sources printed on a background of different colors. This is known officially as *The Polychrome Bible*, popularly and unofficially as the 'Rainbow Bible.' The object is first to produce a more critical text than is at the basis of the Revised Version, and next to render that into pure but not obsolete English. Mr. H. II. Furness is the editor for expression in English. Several books have already appeared, the first part having been published in 1898.

*The Twentieth Century New Testament* (Horace Marshall and Sons, 1904) is a translation into modern English from the text of Westcott and Hort. Several Bibles are published expressly for children's reading.

**Bible Publishing.**—The right to publish the King James Version in England is vested in the King's Printers (Eyre and Spottiswoode) and the Universities of Oxford and Cambridge. Other publishers must obtain a license (granted gratuitously) and conform to certain regulations of the Bible Board. The issue of Bibles in Scotland is authorized under license of a similar Bible Board for Scotland. In America there are no restrictions on the publishing of the Bible, which is largely done by the American Bible Society.

Translations into other modern languages have become too numerous even for mention here. They have been to a large extent the work of the agents of the British and Foreign Bible Society. The history of Bible translation in the chief European languages runs parallel to that of the English Bible. One of the finest of modern renderings, comparable in its literary and religious influence to the English Authorized Version alone, is Luther's German Bible (1534). A revision by a company of scholars, under the leadership of E. Kautzsch, was pub-

Wycliffe's Bible (Brit. Museum)—'the Apostles' Dedes.' (Acts ch. i.)

In 1851 Jas. Murdock issued a translation of the Syriac New Testament in New York. The American Bible Union has published many editions of its translations, having its renderings conformed to the views of the Baptists on the method of administering that rite. Most noteworthy of all is *The American Standard Revised Bible*, pub-

lished in 1901 (copyright, Thomas Nelson and Sons). It is the latest revision of the Bible in English. The American revisers who collaborated with the British revisers made a large number of emendations, which were not incorporated in the text of the English revision, but were published as an appendix which

lished 1896. Excellent translations exist also in Dutch (authorized by the Synod of Dort, 1637), Swedish (1774), Danish (1607, revised 1647), French (by Olivetan, 1545, revised by Calvin and by Beza), and other languages, but the history of some of these is, from want of contemporary evidence, often difficult to trace.

**Literature.**—The literature in all departments of Biblical study is enormous, and additions are constantly being made. Germany, perhaps, takes the lead in productivity, but England (with America) has been making giant strides of late. We can only indicate a few of the most prominent or most accessible books. General.—Bible Dictionaries by Smith, Hastings, and Cheyne and Black. The *King's Printers' Aids*, the *Cambridge Companion*, and Nelson's *Bible Treasury* are useful to non-professional students. Introduction.—Old Testament: Driver, C. H. H. Wright (with excellent bibliographies), Cornill (Ger.); New Testament: Moffat (*Historical New Testament*), Dods, Weiss (trans.), Holtzmann, Jülicher (Ger.). Commentaries.—*International Critical Commentary* (O.T. and N.T., appearing), Cambridge Bible for Schools, vols. in Clark's Handbooks for Bible Classes, Temple Bible (including Apocrypha), Century Bible (N.T. complete). Concise German.—*Kurzer Hand-Commentar zum Alten Testament* (issuing), and *Hand-Commentar zum Neuen Testament* (Holtzmann, Schmiedel, Von Soden, etc.). Theology.—Schultz (O.T. trans.); Beyschlag (N. T. trans.); G. B. Stevens. Canon.—Ryle, Wildeboer, Buhl (both trans. O. T.), Reuss (N. T. trans.). Original Text.—Hebrew: Van der Hooght, Baer-Delitzsch, Sacred Books of the O.T. (appearing); Greek: Westcott and Hort, Revisers' Text. Textual Criticism.—Buhl, T. H. Weir (O.T.); Hammond, Scrivener, Tischendorf-Caspari (N.T.).

**Bible Christians.** See METH-ODISTS.

**Bible Communists.** See PERFECTIONISTS.

**Bible Societies,** societies formed for the printing and distribution of the Bible. Their characteristics are that they are voluntary associations, non-ecclesiastical, non-sectarian, Protestant, and benevolent. The first Bible Society was the Canstein Bible Institute, in the Orphans' Home in Halle, founded by the Marquis of Canstein in 1710, which distributed, before 1719, 40,600 Bibles and 100,000 New Testaments. In the year 1879 the copies printed by the institute had reached the enormous number of 6,100,000. In 1780

was formed in London The Bible Society, which subsequently changed its title to the Naval and Military Bible Society. It confines its operations to the naval and military service of the United Kingdom. The British and Foreign Bible Society was founded in 1804, with the object of encouraging a wider dispersion of the Scriptures both at home and abroad, the first year's subscriptions reaching £5,600. Similar societies were formed on the Continent, at Basel (1804), Berlin and Regensburg (1805), with two in Africa, five in Asia, and others in Nova Scotia, Canada, and the W. Indies. Other continental societies were formed as follows: The Russian, 1813, suppressed in 1826, another still active was founded 1869; the Swedish, 1814; the Danish, same year; that of the United Netherlands, 1815; the Norwegian, 1816; the Protestant Bible Society of Paris, 1818. The British and Foreign Bible Society is the largest in the world. It has 1,200 auxiliaries and branches, with upwards of 3,000 Bible associations in connection, mainly conducted by women. The National Bible Society of Scotland is the result of the union of all the Scotch organizations, which had been working independently since 1827, but which united in 1861. It has issued since that time more than eleven million copies or portions of the Scriptures.

The American Bible Society was the result of a concerted movement by a number of existing societies. The earliest of these were organized in Philadelphia, 1808, Hartford, Conn., Boston, New York, and Princeton, N. J., 1809. In 1816 delegates from thirty-five societies, those just mentioned among them, met in New York and organized the American Bible Society, to which the societies already existing became auxiliary. With this and the British and Foreign Bible Societies some 16,000 smaller societies are affiliated.

In 1836 the American and Foreign Bible Society was founded in New York by the Baptist denomination, 'to endeavor to ascertain the exact meaning of the original text of the Bible, to express that meaning as literally as the nature of the languages into which they should translate the Bible would permit, and to transfer no words which were capable of being literally translated.' In 1850 the American Bible Union was formed—a society which was instituted with the object of publishing revised versions of the Bible in conformity with the principles of the Baptists that the word βαπτίζεω should be

translated 'to immerse.' With this exception, the various Bible societies have worked in harmony with each other. See J. Owen's *Hist. of the Brit. and Foreign Bible Society* (1816); *Jubilee Memorial of British and Foreign Bible Society* (1854); J. Brown, *Hist. of the British and Foreign Bible Society* (1859); W. Canton, *History of the British and Foreign Bible Society* (1904), and *The Story of the Bible Society* (1904); W. P. Strickland's *Hist. of American Bible Society* (1856); *Jubilee Memorial* (1866); *Manual of the American Bible Society* (1877).

**Biblia Pauperum,** or POOR MEN'S BIBLE, the name given by modern writers to a series of MSS. and printed books containing illustrations of events in the life of Christ, with the corresponding Old Testament prefigurations or types, and a small amount of explanatory text in rhyming Latin verse. As early as 1181, fifteen subjects from the life of Christ, each with two Old Testament parallels, were executed in enamels on an antependium, or altar-front, in the Leopold Chapel of Klosterneuburg in Austria. The earliest known MS. containing this triple arrangement dates from the beginning of the 14th century, and is preserved at St. Florian, Austria. The text, as well as the pictures, was cut in wood, and the books contain from thirty to forty leaves, printed on one side only. There have been several reproductions (e.g., London, 1884, with introduction by Dean Stanley). See Heineken's *Idée Générale d'une Collection d'Estampes* (1771), in which the fantastic name *Biblia Pauperum* was first used; Sotheby's *Principia Typographica* (1858); Schreiber's *Manuel de l'Amateur de la Gravure* (1891-95); and an article by Sir E. M. Thompson, 'On a Manuscript of the Biblia Pauperum,' in *Bibliographica*, vol. iii. (1897). See also BLOCK-BOOKS.

**Bibliography.** Derived from the Greek βιβλιογραφία, which means 'the writing of books,' and used in the 17th century in England in this sense, the word bibliography was reintroduced in the early years of the 19th century to denote the writing, not of books, but about books, and this in two different shades of meaning which correspond roughly with their form and their matter. One school of bibliographers, whose interests are reflected in the publications of the Bibliographical Society, which has its headquarters in London, the Edinburgh Bibliographical Society, etc., the Grolier Club of New York, etc., concerns itself chiefly with the accidents of the produc-

tion of books—e.g. the history of handwriting, of printing, book-binding, paper-making, book-selling, publishing, book illustrations, book-collecting, book plates, book stamps, and kindred topics. Information on each of these subjects is given under its own heading. No very good general treatises on them exist, but reference may be made to the publications of the societies already named, to numerous periodicals (mostly short-lived), such as the *Bookworm* (1888-94),

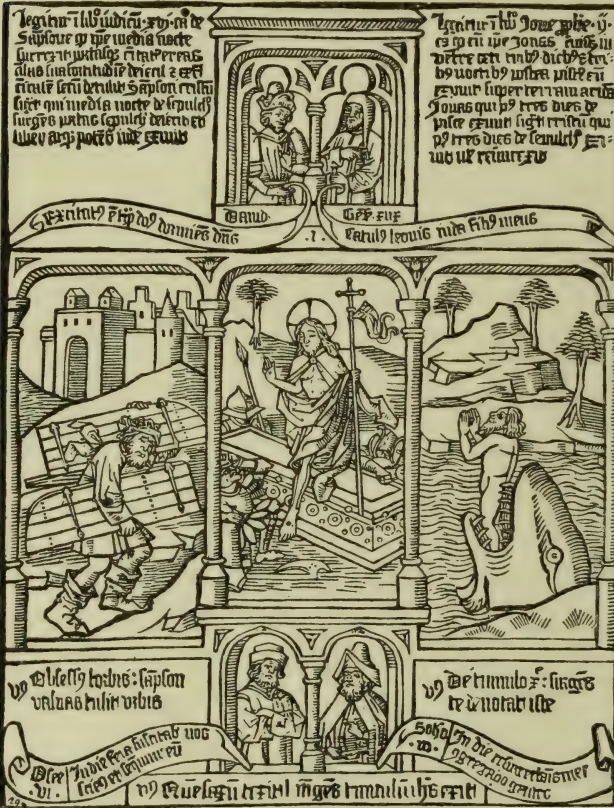

which collectors value for various reasons, will be found in Brunet's *Manuel du Libraire et de l'Amateur des Livres* (5th ed. 1860-80), Graesse's *Trésor de Livres Rares et Précieux* (1850-69), and in Lowndes's *Bibliographer's Manual of Eng. Lit.*, these being chiefly English (1857-64); also in the annual volumes of *American Book Prices Current* (annually since 1894) and Slater's *Book Prices Current* (begun in 1887).

In the sense in which it con-

with the subjects to which they refer, but the following short list of general works may be found useful:—1. Bibliographies of bibliographies.—Petzholdt's *Bibliotheca Bibliographica* (1866); Vallée's *Bibliographie des Bibliographies* (1883-87); Fortescue's *List of Bibliographical Works in the Reading Room of the Brit. Museum* (1889); Stein's *Manuel de Bibliographie Générale* (1897); Ferguson's *Some Aspects of Bibliography* (1900); Josephson's *Bibliography of Bibliographies Chronologically Arranged* (1901). 2. General catalogues.—*General Catalogue of the Brit. Museum Library* (1881, etc.); *Subject Index to the Modern Works added to the Brit. Museum since 1880* (3 vols. 1902-3); Sonnenschein's *The Best Books: a Reader's Guide to the Choice of the Best Available Books in every Department of Science, Art, and Literature* (1891, 1895). 3. National bibliographies.—Watt's *Bibliotheca Britannica* (1824); Low's *Brit. Cat.* (1837-52), and *Eng. Cat.* (1864, etc.); S. A. Allibone's *Critical Dict. of Eng. Lit.* (1859; Supplement, 1891, includes both English and American works); Roorbach's *Bibliotheca Americana* (1852-61); Kelly's *American Cat. of Books published in the U. S. from January, 1861* (1866, etc.); Leypoldt's *The American Cat.* (1880, etc.); *The Publishers' Weekly, Publishers' Trade List Annual, Monthly Cumulative Book Index* (since 1898); Quérard's *La France Littéraire* (1829-39; Supplement, 1854-64), and *La Littérature Française Contemporaine* (1842-57); Lorenz's *Catalogue de la Librairie Française*, from 1840 (1877, etc.); Heinsius's *Allgemeines Bücher-Lexikon*, from 1700 (1812, etc.); Kayser's *Index Locupletissimus Librorum: Vollständiges Bücher-Lexikon, enthaltend alle von 1750 in Deutschland gedruckten Bücher* (1834, etc.).

**Bibliomancy**, divination by means of opening the Bible and noting the first passage which the eye lights on, or by entering a church and observing the first words of the Bible which are heard. It was in extensive practice for centuries, especially in the case of the election of bishops.

**Bibliothèque Nationale**, the great library and museum in Paris. The magnificent edifice in which it is now housed was put up under the direction of Labrousse (1854-75). It includes five departments—(1) printed books; (2) manuscripts; (3) prints, etc.; (4) maps; (5) coins and medals. Of printed books there are more than 2,500,000, and the number grows by about 70,000 annually; of mss. there are more than 100,000; of prints,

*Biblia Pauperum. From an example in the British Museum.*

the *Library* (begun in 1889), *Bibliographica* (1895-7), *Le Livre* (1880-9), *La Bibliographie Moderne* (begun in 1897), *Zeitschrift für Bücherfreunde* (1897); and to such works as E. Rouveyre's *Connaissances Nécessaires à un Bibliophile* (5th ed. 1899), *The Library*, by Andrew Lang (1893), and *The Printed Book*, translated from the French of Henri Bouchot by E. C. Bignore (1890). The titles and descriptions, with notes of former prices (now quite out of date), of a large number of books

cerns itself chiefly with the matter of books as opposed to their form, bibliography aims at enumerating all the books of a given author or group of authors, or those published in a given period, or in a given country, province, county, or town, or those dealing with any given subject, or such selected books as may be especially useful to students of such subject or subjects. Information as to special bibliographies of this kind will here be found under the articles that deal

etc., over 300,000; and of coins and medals, about 200,000.

**Bicar'bonate.** See CARBONATES.

**Bi'ceps** ('two-headed'), as generally used, the muscle on the front of the upper arm, which flexes the elbow, and which has two separate attachments above. This is the *biceps flexor cubiti*. The *biceps flexor cruris*, one of the three ham-string muscles, runs the full length of the back of the thigh, and bends the knee.

**Bicêtre**, bē-sā'tr, suburb of Paris to the southeast. Its castle, built in 1285 by the archbishop of Winchester (whence the name), was rebuilt in the 17th century, and served successively as a hospital for retired soldiers, a prison, a poorhouse, and a lunatic asylum. It is called officially Kremlin-Bicêtre. Pop. 15,000.

**Bichat**, bē-shá', MARIE FRANÇOIS XAVIER (1771-1802), French anatomist and physiologist, was appointed in 1797 as lecturer on anatomy, surgery, and experimental physiology, and in 1800 as physician at the Hôtel-Dieu. He did much to systematize the study of anatomy and physiology, and published: *Recherches physiologiques sur la vie et la mort* (1800); *Anatomie générale, appliquée à la physiologie et à la médecine* (1801); *Traité des membranes*.

**Bichir.** See POLYPTERUS.

**Bichloride of Mercury.** See CORROSIVE SUBLIMATE.

**Bichromate Cell.** See CELL, VOLTAIC.

**Bick'erstaff**, ISAAC, a pseudonym used by Dean Swift when he burlesqued Partridge, the almanac-maker, in 1709. Steele also used the name, in the *Tatler*.

**Bickerstaffe**, ISAAC (c. 1735-1812), Irish dramatist. His most successful works were *Love in a Village* (1762), a comic opera; and *Maid of the Mill* (1765), an after-piece.

**Bickerstaffe-Drew**, COUNT FRANCIS BROWNING DREW (1858- ), English Roman Catholic prelate and author, was born in Headingly, Leeds, and was ordained priest in 1884. He was acting chaplain (1886-92) and chaplain (1892-9) to the Forces at Plymouth; Roman Catholic chaplain at Malta (1899-1905); private chamberlain to Pope Leo XIII. (1891) and of Pope Pius X. (1903). In 1904 he was created domestic prelate to the Pope. He served in the Great War (1914-15). Under the pseudonym 'John Ayscough' he wrote: *Mayotz* (1908); *Dromina* (1909); *Faustula* (1912); *Gracechurch* (1913); *Monksbridge* (1914); *French Windows* (1917); *Jacqueline* (1918); *Abbotscourt* (1919); *First Impressions in America* (1921); *Pages from the Past* (1922); *Dobachi* (1923).

**Bick'more**, ALBERT SMITH

(1839-1914), American naturalist, was born in St. George, Knox county, Me. He was graduated from Dartmouth College (1860) and from 1860 to 1864 worked under Prof. Louis Agassiz at Harvard. From 1865 to 1868 he was engaged in travels in the East Indies, China, Siberia, and Japan, of which he published an account entitled *Travels in the East Indian Archipelago* (1869). He was for one year professor of natural history in Madison University (now Colgate), and in 1869 became superintendent of the American Museum of Natural History at New York. In 1884 he was made professor in the newly established department of public instruction there, and in 1904 became professor emeritus.

**Bicycle.** See CYCLING.

**Bida**, bē'dā, town, West Africa, in the British Colony and Protectorate of Nigeria (Northern Provinces), 20 miles from the left bank of the Niger. It is the capital of the native kingdom of Nupe. Pop. about 50,000.

**Bidar**, bē'dur, town, Haidarabad, India, 72 miles northwest of Haidarabad. It is noted for its metal ware of silver inlaid on iron. Pop. about 13,000.

**Bidassoa**, bē-dā-sō'ā, a small stream entering the Bay of Biscay, divides France from Spain where the main line railway and road cross the frontier at Hendaye (Irun). On the Isle of Pheasants, in mid-stream, the treaty of the Pyrenees was signed (1659) between France and Spain.

**Bid'deford**, city, Maine, York county, on the Saco River, 9 miles from its mouth, and on the Boston and Maine Railroad; 18 miles southwest of Portland. It has a public library and hospital, a fine beach, and boating and fishing facilities. Water power is developed from the falls in the river, and supplies cotton, woollen, and lumber mills. According to the Federal Census for 1919 industrial establishments number 49 with \$18,714,699 capital, and products valued at \$20,634,401. In the vicinity are great quarries of fine granite, the product of which is an important export. Biddeford was first settled in 1630; it took its present name in 1718. Pop. (1900) 16,145; (1910) 17,079; (1920) 18,008.

**Bidding Prayer**, a formula of public prayer, contained in the oldest Greek, Gallican, and English liturgies, in which the priest details what the congregation is to pray for, ending with the Lord's Prayer. In the canons of 1603 it is laid down that the bidding prayer shall be used before every sermon, lecture, or homily. A collect is now generally substituted; but in cathedrals, at university sermons, and in chari-

table and other foundations, distinctive bidding prayers are used regularly. Consult Dearmer's *Everyman's History of the Prayer Book*.

**Bid'dle**, CLEMENT (1740-1814), American soldier, was born, of Quaker descent, in Philadelphia, Pa. He headed a company of Quakers, 1764, in defence of some friendly Indians who had sought refuge in Philadelphia from a band of rowdies. He resisted the working of the Stamp Act, 1765, and in 1775 helped organize the Quaker company of volunteers formed in Philadelphia. He was elected deputy-quartermaster of the 'flying camp' of volunteers by Congress, 1776, and served in the Revolution until 1780. After the war Washington appointed him U. S. marshal of Pennsylvania, and he was subsequently quartermaster-general of the same State, in which capacity he helped suppress the 'whiskey insurrection' of 1794.

**Biddle**, JAMES (1783-1848), American naval officer, was born in Philadelphia, Pa., and entered the navy as midshipman, 1800. He was captured and held prisoner at the time the *Philadelphia* ran aground off Tripoli, 1803, and was engaged in several notable sea-fights in the *Wasp* and *Hornet* during the War of 1812, for which he was awarded a gold medal by Congress. He took possession of Oregon for the United States, 1817, negotiated a commercial treaty with Turkey, 1826, and the first treaty of the United States with China, 1845.

**Biddle**, JOHN (1615-62), 'the Father of English Unitarianism,' was the son of a tailor of Wotton-under-Edge, Gloucestershire. A close study of the Scriptures led him to reject the doctrine of the Trinity, and he was summoned before the authorities for heresy. He made a somewhat unsatisfactory confession of faith at that time, but later (1645) published *Twelve Arguments against the Deity of the Holy Spirit*. From that date much of his life was spent in prison. In 1648, despite an ordinance inflicting the death penalty upon Unitarians, he issued his *Confession of Faith touching the Holy Trinity according to Scripture*, and soon afterward his *Testimonies* of the early fathers. He used his freedom under the Act of Oblivion, 1652, to produce his *Twofold Catechism*, for which he again suffered imprisonment. In 1662 he died in prison. Consult *Life* by Toulmin.

**Biddle**, NICHOLAS (1786-1844), American financier, was born in Philadelphia, Pa. He was graduated from Princeton (1801), was secretary of legation at Paris and London (1804-6), and conducted important government financial transactions in the former city. He served occasional terms in

the Pennsylvania legislature, and having been instrumental in re-chartering the United States bank, was appointed (1819) by President Monroe government director of that institution, succeeding in 1836 to its presidency, a position which he held until President Jackson's attack upon the bank brought about his resignation in 1839, and the bank's failure in 1841. He labored for many years in behalf of the common-school system eventually introduced in Pennsylvania in 1836. He was associate editor (with Joseph Dennie) and editor of the *Portfolio*, a literary magazine, 1806-23, and edited Lewis and Clark's *Report* of their expedition to explore the territory acquired through the Louisiana purchase.

**Bid'eford**, seaport town, England, in Devonshire, near the mouth of the Torridge, 8½ miles southwest of Barnstaple. It has potteries, shipyards, and sail lofts. It was the birthplace of Sir Richard Grenville (of Tennyson's *Revenge*), and here Kingsley wrote part of his *Westward Ho!* Pop. (1921) 9,125.

**Bid'dens**, a genus of composite plants found in wet soil, or swamps, throughout the United States. Some of them have bright yellow sunflower-like heads, and are known as Bur Marigolds, or Tickseed Sunflowers (*B. laevis* and *B. trichosperma*), while others are rayless, like *B. connata*, the Swamp Beggar-tick, and *B. frondosa*, the Stick-tight. One species, *B. Beckii*, the Water Marigold, is aquatic, its submerged leaves being divided into many capillary segments, and its golden-rayed flower borne above the surface of the water. The achenes of some species (such as *B. connata* and *B. discoidea*) are flat, thin, and wedge-shaped, having at the upper corners long, downwardly barbed awns, which attach the seed to the clothing, whence they are known as Beggar-ticks. The plants of *Bidens* are commonly tall and rank, with generally opposite leaves, sometimes much lobed and divided; they bloom in late summer and autumn.

**Bidpai**, bid'pī, otherwise PILPAY, BAIDABA, and SENDEBAR, the reputed author of a collection of apologies, known as *The Fables of Bidpai*. The name, however, is probably a title of honor rather than a proper name. The original collection of tales is not now in existence, but parts are contained in the *Panchatantra*, the *Mahābhārata* and the *Hitopadesa* (qq. v.). Of the Indian original, the classical Arabic version, *Kalilah wa Dimnah* (c. 750 A.D.) is a reproduction, founded on the Pahlavi translation of the Persian physician Barzoi (about 570). An incomplete old Syriac version, dating also from about

570, was discovered in the episcopal library at Mardin, and published in 1876 by Bickell with an introduction by Benfey. This work as it exists is made up of three elements, Indian, Persian, and Arabic, three chapters being Persian, and six appearing first in the Arabic version, while twelve chapters are of Indian and Buddhist origin. Of these last, five correspond to the five chapters composing the *Panchatantra*, two appear in the first book thereof, three are found in the *Mahābhārata*, and two seem to have fallen out of the Indian literature altogether. The *Jatakas* or 'Birth Stories' of Buddha inculcate the same teaching and morals as the *Fables of Bidpai*, which would indicate that Buddhism was probably their source and inspiration. In the fables animals are endowed with human powers and often give voice to shrewd and clever bits of wisdom. Of English translations there have been twenty since the latter part of the 18th century, the earliest being that by Sir Thomas North, made in 1570 from the Italian version of 1552 by Antonio Doni. In 1888 this was reprinted, with a scholarly introduction by Joseph Jacobs.

**Biebrich**, bē'brich, or BIEBRICH-MOSBACH, town in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, 3 miles south of Wiesbaden. It has a grand-ducal palace (1704-6). There are iron foundries and manufactures of soap, gypsum, and aniline dyes. Pop. (1910) 21,194.

**Biel**, bēl, (Fr. *Bienne*), town, Switzerland, in the canton of Bern, at the northern end of the Lake of Biel or Bienne; 21 miles northwest of Bern. It is attractively situated at the foot of the Jura mountains and is connected by funicular roads with the mountain health resorts of Evillard and Malcolin. There is a Technical Institute and the Museum Schwab contains many interesting antiquities. Biel has manufactures of watches, leather, jewelry, and cotton goods. Pop. (1920) 34,599.

**Biela**, bē'lā, WILHELM, BARON VON (1782-1856), German astronomer, was born in Rossla, Prussia, near Stalberg, in the Harz Mountains. He entered the Austrian army (1805), but devoted his leisure to the study of astronomy, and discovered, on Feb. 28, 1826, the comet to which his name was given. Its period is between six and seven years, about 6.6 years, and its reappearance was observed in 1832, 1846, and 1852; since then it has not appeared, but its course has been marked by brilliant meteoric displays on several of the dates at which it was expected.

**Bielaya**, byel'ā, river of Rus-

sia, rising in the Ural mountains, in Orenburg government. It flows first southwest, then north and northwest, and after a course of nearly 500 miles, empties into the Kama.

**Bielaya-Tserkov**, byel'ā-yā-tser'kof, (Pol. *Bialacerkiew*), town, Kiev, Ukraine, 30 miles southwest of Vasilkov, on an affluent of the Dnieper. It has trade in grain, cattle, and beer. Pushkin immortalized it in his *Poltava*. The population numbers about 21,000.

**Bielefeld**, bē'lē-felt, town, Germany, in Westphalia, at the foot of the Teutoburger Forest; 35 miles southeast of Osnabrück. The most notable buildings are the Altstädter Kirche, with a fine 16th century altar, the Neustädter Kirche, with two 14th century tombs, and the Sparenburg castle, built in the 12th century and restored in 1877. Bielefeld is the centre of the Westphalian linen industry and has manufactures also of damask, plush, glass, sewing machines, and cement. Pop. (1919) 79,049.

**Bielgorod**, byel'gō-rot, or BELGOROD ('White City'—'Belgrad'), town and archiepiscopal see, Russia, in Kursk government, on the right bank of the Donetz, 90 miles south of Kursk. Agriculture is well developed; tanning and brewing are carried on, and there are manufactures of soap, candles, bricks, and leather. Pop. about 23,000.

**Bielitz**, bē'lits, town, Czechoslovakia, close to the Polish border; 45 miles northeast of Freiberg. It is the centre of an important woollen industry and has a large export trade. There are also manufactures of machinery, nails, glass, and paper. Pop. 18,580.

**Biella**, byel'lā, town and episcopal see, Italy, in the province of Novara, 30 miles northwest of Vercelli. It has a ninth century cathedral and manufactures textiles. Pop. (1911) 22,519.

**Bielo-ozero**, byel'ō-ō'zye-rō ('White Lake'), lake, Russia, in Novgorod government. It is 20 miles wide, 27 miles long, and has a total area of more than 430 square miles. It is drained by the Sheksna into the Volga, and is connected by canal with Lake Onega. The ancient town of Bielozersk stands on the south shore.

**Bielopol**, byel'o-pōl', or BYE-LOPOLYE, town, Russia, in Kharkov government; 170 miles by rail east of Kiev. It has distilleries, brickworks, and tanneries, and trade in grain and cattle. It was founded in 1672. Pop. 15,300.

**Bielostok**, byel-o-stōk', or BYE-LOSTOK (Pol. *Białystok*), town, Poland, on the Biala, a sub-affluent of the Vistula, 50 miles by rail southwest of Grodno city. Rapidly growing industrial

centre: cloth, silk, hat, and other manufactories; grain and wood trade. Scene of a terrible massacre of Jews in 1906. Pop. 80,000.

**Bielski**, byel'ski, MARTIN (1495-1576), Polish historian, the first to write history in the Polish language. Chief works: *Kronika Sviata*, or *Universal History* (1550); *Kronika Polska*, or *History of Poland* (1597), continued and published by his son Joachim.

**Bieltsi**, byel'tsi, BIELTZY, or BELTSI, town, Bessarabia, Russia, 85 miles northwest of Kishinev, on the railway line from Czernowitz to Odessa. Manufacture of bricks, soap, and candles; horse and cattle trade. Annexed 1812. Pop. 20,000.

**Bien-Hoa**, bi-en-hô'a, capital of the arrondissement of Bien-Hoa, in Lower Cochinchina, on the Don-naï, emptying into the China Sea; 14 miles northeast of Saigon. It has manufactures of furniture. Pop. 20,000.

**Bienna**, Switzerland. See BIEL.

**Bien'nials**, in gardening, are strictly flowering plants that do not flower until the year following that in which they emerge from their seed coverings, and do not live beyond the year in which they first flower. But the length of time which elapses between the birth and death of a plant is largely a matter of climate, and a plant which is biennial in certain climates is sometimes merely annual when grown in a climate with a longer summer. The gardener uses the words with a somewhat wider meaning, for often he includes as biennials all those plants which are at their best in the year following the sowing of the seed, though, strictly, many of them are annuals or perennials (q. v.).

The most familiar example of a biennial is perhaps the common Foxglove (*Digitalis*). Many cultivated plants are biennials, as the Carrot, Turnip, Parsnip, Parsley, Celery, etc.; and many of the most esteemed flowers of our gardens, as Hollyhocks, Mulleins, Campanulas (certain species and varieties), Sweet Williams, Chinese Pinks, Wallflowers, Biennial Stocks, Rockets, some of the Evening Primroses, Honesty, and Sweet Scabious.

**Bienville**, byah'vêl', JEAN BAPTISTE LE MOYNE (1680-1768), born in Montreal, Canada, son of Charles le Moyne, one of the famous four brothers so conspicuous in early French exploration and settlement. See LE MOYNE.

**Bierce**, bêrs, AMBROSE (1842), American author, was born in Ohio. He was a line officer in the Civil War, and was brevetted major for distinguished services. He was editor of the *Argonaut* and *Wasp* (1877-84), and contributed to various periodicals in London

and California, including *Fun*, *The Overland Monthly*, and the San Francisco *Examiner*. His published works are: *Cobwebs from an Empty Skull* (1874); *The Monk and the Hangman's Daughter* (1892); *Black Beetles in Amber* (1892); *Can Such Things Be?* (1893); *In the Midst of Life* (1898); *Fantastic Fables* (1899); *Shapes of Clay* (1903); *The Cynic's Word Book* (1906); *The Shadow on the Dial*, and *Other Essays* (1909); *Write It Right* (1909). His Collected Works were published in 1912.

**Bierley, North**, parish in Shipley division, 2 miles southeast of Bradford, West Riding, Yorkshire, England. It has coal mines and iron works. Pop. (1911) 22,130.

#### **Bier's Congestion Treatment.**

In recent years this method of treatment, introduced by the distinguished surgeon, August Bier of Bonn, has attracted considerable attention. The basis of the treatment is the production of obstructive hyperæmia, brought about usually by the application of a tight rubber bandage to the part, the bandage being applied above the part where the hyperæmia is desired. The continual congestion leads to improved nutrition of the part; a process of reactive inflammation is set up, which inhibits the action of, or destroys outright, the bacteria in the diseased joint or tissues below the constricted part. The obstruction to the flow of venous blood must not be so great as to block the lymphatic return; it must suffice only to produce a hyperæmia in which the skin is uniformly red. The patient should not experience any pain or discomfort from the treatment.

There are three methods employed—(1) the constriction bandage; (2) the suction apparatus; (3) the employment of hot air.

**Bierstadt**, bêr'shtät, ALBERT (1830-1902), American painter, was born in Düsseldorf, Germany, and was brought to America when an infant. Developing a taste for art, he went abroad, studied at Düsseldorf and Rome, and returned to settle in New York City (1857). He became a National Academician, and a member of the National Institute of Arts and Letters. He chiefly devoted himself to representation of the scenery of the Western United States. His works include: *Lander's Peak in the Rocky Mountains* (1863); *North Fork of the Platte* (1864); *Valley of the Yosemite* (1866); *Eruption of Vesuvius* (1868); *Valley of Kern's River* (1875); *Discovery of the Hudson River* (Capitol at Washington).

**Biesbosch**, bês'bos' (i. e., 'rush bush' or 'rush land'), a district of the Netherlands, lying between

the provinces of South Holland and North Brabant. It consists of an intricate agglomeration of islands, waterways, and marshes, some 70 to 80 square miles in extent, and originated in consequence of the bursting of a dam in the Maas in 1421. About one-half of the land then overwhelmed by the waters has since been reclaimed.

**Bifrost**, bêf'rost, or ASBRO, in Scandinavian mythology, the bridge between earth and heaven over which the gods daily pass to Doomstead, the hall of the Fates or Norns, and the judgment seat under the mystic ash tree Yggdrasil. The keeper of the bridge is Heimdall. The rainbow is the evident origin of the myth.

**Big'amny**, in modern law, consists in the contraction of a second marriage while a pre-existing one remains undissolved. Strictly speaking, *bigamy* means having two wives (or husbands), *polygamy* (q. v.) having more than two, at the same time. Under the canon law, the term bigamy signified marrying more than one wife or husband, whether the first was still alive or already dead, or marrying one who had been already married—e. g., a widow. The canonist also added two other kinds of bigamy—interpretative and similitudinary, the first of which consisted in marriage with a woman who, though not married, had had illicit intercourse with another man as a harlot or otherwise; and the second, marriage by one who was considered already married in a spiritual sense, that is, by one who was in holy orders, or had taken a vow of chastity.

The English and American law on the subject is founded on a rigorous statute of 1603. The modern English law is set forth in a statute of 1861, reproducing an older act of 1829, and its provisions may be taken as generally holding good in the United States also. The light in which this statute views the offence is as an injury to the person of the second wife. The cases in which it is not an offence to marry a second time during the life of the other spouse are (1) when the second marriage has been contracted abroad (unless in virtue of some special statutory rule); (2) if the other spouse has been absent for seven years and is *bona fide* believed to be dead, but not when the spouse contracting the marriage had the means of ascertaining whether the other was alive and failed to make inquiries; (3) if the marriage has been dissolved by divorce, pronounced by a court of competent jurisdiction, and *a fortiori* if it has been declared null and void from the beginning.

In England it has been held

that the first marriage must be a monogamous one, and such as would entitle the offspring to succeed to real estate. Thus a man who has contracted a Mormon marriage, which does not bind him to monogamy, cannot be convicted of bigamy if he marries again. This is not the law in the United States, however. Further, it is no defence for the accused to plead polygamy as part of his religious creed. It is not necessary to establish a charge of bigamy that the second marriage should be a perfectly valid one. The punishments meted out to bigamists differ throughout the United States. Congress has declared the offence a misdemeanor within the Territories and places within the exclusive jurisdiction of the United States.

SEE MARRIAGE; NULLITY OF MARRIAGE; DIVORCE.

**Big Ben**, an immense bell weighing 13½ tons in the Westminster Clock Tower, London, England, was cast by George Mears in 1858.

**Big Beth'el**, village between the York and James Rivers, Virginia, the scene of one of the early struggles of the Civil War. Here Gen. E. W. Pierce with 2,500 Federals attacked 1,800 Confederates, stationed as an outpost of Magruder's camp at Yorktown, but was compelled to retire with the loss of 76 men (June 10, 1861).

**Big Black River**, rises in Webster county, Mississippi, flows in a general southwesterly direction, and enters the Mississippi River at Grand Gulf. Length, 260 miles.

**Big Black River**, a tributary of the Porcupine River, Alaska, into which it flows just before the latter enters the Yukon, near Fort Yukon.

**Big Black River**, flows into Lake Winnipeg, Canada, from the east.

**Big Blue River**, rises in Nebraska, flows south, dividing Riley and Pottawatomie counties, and joins the Kansas River at Manhattan. Length, including branches, about 300 miles.

**Big Brother Movement**, a movement founded in 1904, in New York City, by Ernest K. Coulter. The basic idea is similar to that underlying juvenile probation (see PROBATION), the object being to supplement the work of salaried probation officers by volunteer workers, each one of whom shall play the part of a big brother and adviser to some unfortunate boy. The Big Brothers are men in many walks of life, chosen for their good will and for their fitness, by instinct, training, or experience, to deal with boys. The little brothers are mostly the children of the very poor who

have been recommended by the children's courts, children's aid societies, social service bureaus, and kindred organizations, or by individuals. Everything that concerns the material and spiritual welfare of the boy comes within the province of the Big Brother. He is urged to visit the boy, become acquainted with his parents, see that he attends school or obtains employment, make it possible for him to receive proper medical and dental attention, encourage him to attend church and Sunday School, and above all take a personal interest in his progress, reporting regularly to the central organization.

Originating with forty men in New York City, the movement has now spread until in more than one hundred cities some form of Big Brother work is carried on by men's clubs, fraternal orders, and other organizations and individuals. Among the agencies co-operating are gymnasiums, industrial classes, and boys' clubs conducted by Y. M. C. A. organizations, churches, and social settlements; hospitals, trade schools, farm schools, the Boy Scouts, and school camps.

The headquarters of the parent organization are at 200 Fifth Ave., New York City. General Secretary, Rowland C. Sheldon.

**Big'elow**, FRANK HAGAR (1851), American meteorologist, was born in Concord, Mass. He was graduated from Harvard University (1873), and studied for the Episcopal ministry between terms of service as astronomer at Cordoba Observatory, Argentine Republic (1873-6, 1881-3), receiving the degree B.D. (1880). He was professor of mathematics at Racine College, Wisconsin (1884-9); assistant in the *Nautical Almanac* office (1889-91); professor of meteorology in the U. S. Weather Bureau at Washington (1891-1910); and professor of solar physics at George Washington University (1894-1910). Since 1910 he has been professor of meteorology at the Oficina Meteorologica, Cordoba, Argentine Republic. He has served on various meteorological expeditions and commissions, and has published valuable articles and monographs on meteorological subjects.

**Bigelow**, JOHN (1817-1911), American author, journalist, and diplomat, was born in Malden, N. Y. He was graduated from Union College in 1835, and was admitted to the bar in 1838. In 1849 he became joint proprietor with William Cullen Bryant of the New York *Evening Post*, of which he was managing editor until 1861. He was U. S. consul-general at Paris (1861-4) and U. S. Minister Plenipotentiary to

France (1864-7), rendering valuable service during the trying period of the Civil War. After his return to New York he was appointed (1875) by Governor Tilden a member of the Commission for investigating the New York State Canals, and was subsequently secretary of state for New York (1875-7). For many years he was president of the board of trustees of the New York Public Library. He was a member of the American Academy of Arts and Letters. Among his publications are: *Life of Benjamin Franklin* (1875); the *Autobiography of Franklin*, supplemented by an annotated collection of Franklin's letters); *The Wit and Wisdom of the Haytians* (1877); *Molinos the Quietist* (1882); *France and the Confederate Navy, 1862-8* (1888); *Life of William Cullen Bryant* (1890); *Life of Samuel J. Tilden* (1895); *The Mystery of Sleep* (1896); *Retrospections of an Active Life* (5 vols., 1909-13). He edited the *Writings and Speeches of Samuel J. Tilden* (2 vols., 1885), and the *Complete Works of Benjamin Franklin* (10 vols., 1887-8).

**Bigelow**, MAURICE ALPHEUS (1872), American biologist and educator, was born in Milford Centre, Ohio. He was graduated from Ohio Wesleyan University (1894), Northwestern University (M.S., 1896), and Harvard (PH.D., 1901). He has been successively instructor in zoology at Northwestern University (1896-8), and instructor (1899-1903), adjutant professor (1903-07), and professor (since 1907) of biology at Teachers College, Columbia University, where he has been director of the School of Practical Arts since 1914. From 1905 to 1910 he was editor of *Nature Study Review*. His published works include: *Teaching of Zoology in the Secondary School* (1904); *Applied Biology* (with A. N. Bigelow, 1911); *Teachers' Manual of Biology* (1912); *Introduction to Biology* (with A. N. Bigelow, 1913); *Sex Education* (1916).

**Bigelow**, MELVILLE MADISON (1846), American legal writer, was born in Eaton Rapids, Mich. He was graduated from the University of Michigan (1866; LL.B., 1868; A.M., 1871; LL.D., 1912) and from Harvard University (PH.D., 1879), and took up the practice of law in Boston. He has been lecturer in the law department of the University of Michigan, and in the Northwestern University Law School, and professor and dean of the Boston University Law School. His published works include: *Placita Anglo-Normannica* (1879); *History of English Procedure* (1880); *The Law of Wills* (1898); *The Law of Bills, Notes, and Checks* (second ed., 1900); *The Law of Torts* (eighth

ed., 1907); *The Law of Fraudulent Conveyances* (second ed., 1911); *A False Equation—the Problem of the Great Trust* (1911); *The Law of Estoppel* (sixth ed., 1913).

**Bigelow**, POULTNEY (1855), American author, son of John Bigelow (q. v.), was born in New York City, and received his early education in Germany, France, and the United States. He was graduated from Yale (1879), and in 1882 was admitted to the bar of New York, but after a few years of practice devoted himself to literary work. He has four times circumnavigated the globe in his search for political and sociological data, the first time on board an American clipper, which was wrecked on the Japanese coast. Many of his studies were made on extended canoe trips in the Far East and on the waterways of Europe, and he was the first person to take a canoe through the Iron Gates of the Danube. During the Spanish-American War he was correspondent of the *London Times*.

Poultney Bigelow has lectured extensively on modern history and colonial administration. He is a life member of the more important geographical and historical societies, and is a frequent contributor to contemporary periodicals. Some of his books are: *The German Emperor and His Eastern Neighbors* (1892); *Paddles and Politics Down the Danube* (1892); *The Borderland of Czar and Kaiser* (1894); *White Man's Africa* (1897); *Children of the Nations* (1901); *History of the German Struggle for Liberty* (4 vols., 1896–1905); *Prussian Memories, 1864–1914* (1914).

**Big Game Hunting.** See HUNTING.

**Biggarsberg Mountains**, range of South Africa, branching east from the Drakenberg Mountains (q. v.), and separating Newcastle district and the north corner of Natal from the rest of the province.

**Big Hatchie River**, rises in Northeast Mississippi, and flowing north into Tennessee, enters the Mississippi 40 miles above Memphis. Length, 200 miles.

**Bighorn**, or ROCKY MOUNTAIN SHEEP (*Ovis canadensis* or *cervina*), a wild sheep of North America, varieties of which occur from Alaska and the shores of the Bering Sea southward as far as Northern Mexico. The typical bighorn stands about thirty-eight inches at the shoulder, with long pointed ears, short hair, and massive horns curving close to the head, with the tips broken, as a rule, and directed forward and upward. The color is usually grayish brown, with a darker dorsal stripe and whitish under parts.

The bighorn of the Upper Yukon, Alaska (*O. canadensis dalli*), is pure white.

**Big Horn Mountains**, a range in Northern Wyoming, part of the Rocky Mountains (q. v.), running in a northwesterly and southeasterly direction, about 180 miles in length. The highest summit, known as Cloud Peak, has an altitude of 13,165 feet.

**Big Horn River**, rises as Wind River in the Wind River Mountains, Wyoming, and flows nearly north to its junction with the Yellowstone. It is about 450 miles long, and is navigable up to the junction of its chief tributary in Montana, the *Little Big Horn*, in the valley of which occurred the massacre of Gen. George Custer and his troops in 1876. (See CUSTER, GEORGE A.)

**Biglow Papers.** See LOWELL, JAMES RUSSELL.

**Bigno'nia**, a genus of American evergreen climbers of the family Bignoniaceæ, which includes also the Catalpa and Tecoma (qq. v.). The bignonias are mostly tropical, and are characterized by a profusion of large, showy flowers. The leaves are opposite, usually compound, and the seeds are winged. Most of the species are grown as hothouse plants.

*Bignonia speciosa.*

*B. capreolata*, the Cross Vine, is the only species native to North America. It is a woody vine climbing to a height of 50 feet or more, bearing panicles of large bell-shaped, orange-colored flowers. The stem, when cut transversely, shows a distinct

cross. Other species commonly included in the genus are: *B. chereve* or *buccinatoria*, with orange tubular flowers, borne throughout the summer in a cool greenhouse; *B. clematis*, requiring a warm greenhouse, and bearing white and yellow flowers in June and July; *B. speciosa*, requiring a similar temperature, and bearing yellow and lilac bell-shaped flowers in May and June; and *B. venusta*, a stone climber, profusely blooming through autumn and early winter, with long, funnel-shaped corollas of a yellowish crimson.

**Big'od**, the name of a family founded by a Norman knight, which acquired the earldom of Norfolk in the reign of Stephen. The second earl, Roger, took a prominent part in securing Magna Charta; in 1306 the earldom became extinct.

**Bigorre**, bē-gôr', former subdivision of Gascony, now the department Hautes-Pyrénées (q. v.), France.

**Big Rapids**, city, Michigan, county seat of Mecosta county, on the Muskegon River, and the Pere Marquette and Grand Rapids and Indiana Railroads; 55 miles north of Grand Rapids. It is the seat of Ferris Institute. Water power is supplied by the river here, and there are mills, furniture factories, foundries, and machine shops. Pop. (1900) 4,686; (1910) 4,519.

**Big Sandy River**, also called CHATTERAWAH, is a navigable affluent of the Ohio, formed by the junction of two branches which rise in Virginia. The west fork traverses several counties of Kentucky, and the east fork, during the lower part of its course, is the boundary between the two States. The Big Sandy joins the Ohio at Chatlettsburg, Ky.

**Big Sioux River**, a tributary of the Missouri River. Heading in the northeast part of South Dakota, it flows south, forming the boundary between South Dakota and Iowa in its lower course, and joins the Missouri 2 miles above Sioux City, Ia. Length, about 300 miles.

**Big Spring**, city, Texas, county seat of Howard county, on the Texas and Pacific Railroad; 270 miles west of Fort Worth. It is the centre of an agricultural, stock raising, and fruit producing district, has salt deposits, and a spring from which it receives its name. Pop. (1910) 4,102.

**Big Stone Gap**, town, Wise county, Virginia, on the Louisville and Nashville and Virginia and Southwestern Railroads; 175 miles southwest of Charleston. It is in a coal mining district, and has iron manufactures. Pop. (1900) 1,692; (1910) 2,590.

**Big Trees.** See SEQUOIA.

**Bihar**, bi-hār', county, Eastern Hungary, bordering on Klausenburg in Transylvania. Area, 4,215 square miles. Pop. 530,000.

**Bihar**, or Behar, town, Northern India; 36 miles southeast of Patna. It has trade in silk, cotton, and muslin goods. Pop. 45,000.

**Bihé**, bē-ā', isolated village and *concelho* on the plateau of Benguella, Angola, Portuguese West Africa, with a climate sufficiently moderate for European settlement, and for the cultivation of corn and other crops of the temperate zone.

**Bijanaghar**. See VIJAYANAGAR.

**Bijapur**, bē'ja-pōor, town, Bombay Presidency, India; 245 miles southeast of Bombay. Its mosques and palaces are of great architectural beauty. It was until 1686 the capital of a powerful Mohammedan kingdom. During the early part of the eighteenth century it passed to the Marathas (q. v.), and became British in 1848. Pop. 24,000.

**Bijawar**, bē-jō'er, feudatory state in Bundelkhand, Central India. Area, 974 square miles. Pop. 110,000. Chief town, *Bijawar*, 80 miles southeast of Jhansi.

**Bijnaur**, bij-nour', or BIJNOR, the north district of Rohilkhand division, United Provinces, India. Area, 1,875 square miles. *Bijnaur*, the capital, is 45 miles by rail northeast of Meerut. Sugar and cotton cloth are the chief manufactures. Pop. of district, 780,000; of town, 17,500.

**Bijouterie**, bē-zhōō'ter-i; *F. bē-zhōō-t'rē'*, articles made of metal (iron, bronze, gold, steel, tin, etc.), intended chiefly for ornamental purposes, and generally set with amber, jet, mother-of-pearl, tortoise shell, coral, pearls, enamel, etc., and even costly jewels.

**Bikaner**, bik-a-nēr', BIKANIR, or BIKANEER, feudatory state in Rajputana, India. The greater part of the state is a waterless plain. The climate is extreme. Area, 23,311 square miles. Pop. 700,000.

**Bikaner**, capital of the above state; 240 miles southwest of Delhi. It is surrounded by a battlemented wall  $3\frac{1}{2}$  miles in circuit, and contains several Jain monasteries. Pottery, stone cutting, and carving and the making of blankets are industries of the town. Pop. 53,000.

**Bikrampur**, bik'rum-pōor, ancient town, Dacca district, Bengal, India. For several centuries the centre of government under the Hindu kings of Bengal, and a seat of learning.

**Bilara**, town, Rajputana, India; 45 miles southeast of Jodhpur. Pop. 11,000.

**Bilaspur**, bē-lās'pōor, or KAH-

LUR, chief town, Bilaspur district, Central Provinces, India; 250 miles by rail northeast of Nagpur. Pop. 20,000.

**Bilbao**, bil-bā'ō, city, capital of Vizcaya province, Spain, on the River Nervion; 8 miles from Portugalete at the river's mouth, and 348 miles from Madrid. The city is well built, the principal streets are straight, and the houses are substantial. Five bridges join the Old Town on the right bank of the river with the New Town on the left. Commercially, Bilbao is one of the most important seaports of Northern Spain. It is the centre of a great iron district, and exports large quantities of ore, also pig iron, red wines, and wool. There are docks for shipbuilding, and manufactures of rope, leather, hardware, hats, tobacco, and earthenware.

In the fifteenth century Bilbao was the seat of the most authoritative commercial tribunal in Spain. It suffered severely in the wars with France, in 1795 and 1808. During the Carlist struggles it withstood two sieges, in 1836 and 1874. Pop (1900) 83,306; (1910) 92,514.

**Bilberry**. See HUCKLEBERRY.  
**Bilbilis**, bil'bi-lis (modern *Calatayud*), town of ancient Spain (*Hispania*), famous as the birthplace of the poet Martial, and for the manufacture of the finest sword-blades and other steel weapons used by the Roman and Carthaginian armies.

**Bil'boes**, fetters fastened to a bar of iron, carried by the Spanish Armada for use upon the men of the English fleet.

**Bilderdijk**, bil'der-dik or -dik', WILLEM (1756-1831), Dutch poet, born at Amsterdam, and studied at Leyden (1780). He practiced law at The Hague till 1786, then went to Germany and England, where he resided some time with Southey. Returning to Holland in 1806, after spending the preceding nine years at Brunswick, he was appointed president of the Institute of Holland by Louis Napoleon; but after the abdication of the latter he left Amsterdam, and settled first at Leyden (1817), and in 1827 at Haarlem, where he died. He left ninety volumes, including an incomplete history of Holland (1832-51). His poems show little originality, though his lyrics are distinguished for mastery of form. The chief are *Buitenleven* ('Rural Life'), *Die Ziekte der Geleerden* ('Maladies of the Learned'), in 1807; and his celebrated epic, *Die Ondergang der Eerste Wereld* ('Destruction of the First World'), in 1809.

**Bile** is the secretion from the liver, and is discharged into the duodenum. It is a yellow, reddish, or green fluid, its color depending on the proportions of the

pigments bilirubin and biliverdin. It is bitter, and either neutral or slightly alkaline; specific gravity, 1.026 to 1.032; the amount secreted daily is from 18 to 36 fluid ounces in the adult. Bile contains certain salts, taurocholate and glycocholate of soda, which are of special service in the emulsification, solution, and diffusion of fatty substances in the food. Bile also acts as an antiseptic, and by increasing the turbidity of the chyme (the form in which food passes down the duodenum) it hinders its progress through the intestine, and so assists absorption. Bile is stored in the gall bladder, whence it is discharged on the passage of food. Drugs which increase the secretion of bile are hepatic stimulants (eunym, sodium benzoate, etc.); those which act on the bile-expelling mechanism are cholagogues (calomel, etc.).

It has been shown that the bile of venomous serpents, when mixed with their poison, prevents an otherwise fatal dose of the latter from causing death; and the same property is possessed, though in a less degree, by the bile of non-venomous serpents, and by that of all animals.

Calculi, or concretions in the gall bladder or gall duct, are discussed under GALL STONES. See also DIGESTION; LIVER; BLACK-WATER FEVER; JAUNDICE.

**Bilge** (sometimes spelled **BULGE**) is the part of the bottom of a ship nearest to the keel, and always more nearly horizontal than vertical. A ship usually rests on the keel and one side of the bilge when aground. The name *bilge water* is given to water which finds its way into the bilge or lowest part of a ship, and which, when not drawn off by the pump, becomes dirty and offensive. See SHIPBUILDING.

**Bilgram**, town, United Provinces, India; 52 miles northwest of Cawnpur. It contains remains of an old fort and temples of Srinagar, built by Sri Ram. Pop. 11,000.

**Bilhar'zia**, a genus of trematodes or flukes, including in *B. hæmatobius* a dangerous parasite of man, which has been prevalent in Egypt since very early times. It infests the abdominal and urinary blood-vessels, and causes hæmaturia, inflammation, and so on. The exact cause of infection, as in many similar instances, is still uncertain, but it is probable that it occurs through drinking impure water. Both sexes are found within the body of the host, the male carrying the female in a groove or gynæcophoric canal, and the embryos escape with the urine.

**Biliary Calculi**. See GALL STONES.

**Billmbi.** See BLIMBING.

**Bilin,** bē-lēn', town and spa in Bohemia, Austria; 15 miles southwest of Aussig. It exports alkaline mineral waters, Bilin pastilles, etc. Fruit is grown, and sugar manufactured. Pop. 9,500.

**Bilin River,** Burma, flows over 280 miles between the Salwin and the Sittaung to the Gulf of Martaban.

**Biliousness,** a popular term for a form of gastric duodenal catarrh characterized by nausea, retching, and sickness, with vomiting of bile. It frequently occurs in association with migraine. Treatment consists in one or two days' starvation, rest, and a dose of calomel (3 to 5 grains), followed by a morning saline.

**Bill,** or BEAK (of birds), consists of an upper and under jaw, clothed in a horny sheath, sometimes undivided and sometimes composed of several pieces. The bill varies greatly in shape and appearance in different groups of birds, and was much relied upon as a diagnostic character in the earlier classification. As striking peculiarities should be noticed the *raptorial* beak of the birds of prey; the flattened bill of the ducks and geese, with its transverse lamellæ, which act as a sifting apparatus; the *fissirostral* beak of swallows, swifts, and goatsuckers, which is short and wide and fringed posteriorly with bristles; the slender (*tenuirostral*) bills of sun birds and others. See BIRDS.

**Bill** is derived from the Latin *bullā*, 'a seal,' and in its original sense means a document under seal. Documents under the papal seal are called 'bulls.' The word is now used in a variety of senses, both in politics and law.

In legislative proceedings, a bill is a formal proposal for legislation properly submitted to a legislative body under its rules. Such legislative proposal retains the name of bill through all the stages of passage or rejection until enacted into law, when it becomes an *act* or *statute*. The term is not applied to motions or resolutions which do not aim at the enactment of laws. (See Act.)

**Bill,** in equity practice, is a statement of complaint addressed to the court, praying for relief from the unjust acts of the defendant and for proper process. It was formerly a lengthy document consisting of nine distinct heads, but the form has now been shortened by the rules of the United States courts of equity. The same process has also been effected in practically all the States where separate equity courts are still maintained. In England such bills disappeared on the fusion of law and equity in

accordance with the Judicature Act of 1873.

**Bill** is also a common expression for the two more usual kinds of negotiable instruments, bills of exchange and promissory notes. See BILL OF EXCHANGE; BILL OF LADING; BILL OF SALE; NEGOTIABLE INSTRUMENTS; PROMISSORY NOTE.

**Billaud-Varenne, JEAN NICOLAS** (1756-1819), French revolu-

tionist, born at La Rochelle, the son of an attorney. His book, *Le Despotisme des Ministres de France* (3 vols., 1789), marked him as a leading spirit in the movement, in which he was one of the most extreme and blood-thirsty enemies of the royal family and of the bourgeoisie. He served as president of the Convention, and was on the Committee of Public Safety. With Tallien and Vadier he destroyed the dictator Robespierre (1794). In

the following year he was transported to Cayenne, whence he escaped in 1816, and after visiting New York went to Haiti. He died at Port au Prince. His genuine *Mémoires* were issued by Begis in 1893; those published in 1821 were spurious.

**Bill Brokers** are persons whose business it is to study the condition of the money market and the state of credit generally, and

*Bills or Beaks: Characteristic Forms.*

who employ the knowledge so obtained in negotiating to the best advantage the sale and purchase of bills of exchange and promissory notes.

**Billerica,** bil'rik-à, town, Middlesex county, Massachusetts, on the Boston and Maine Railroad; 19 miles northwest of Boston. It has railway repair shops and woollen mills. Pop. (1900) 2,775; (1910) 2,789.

**Billet,** in architecture, an ornament belonging to the Norman

tionist, born at La Rochelle, the son of an attorney. His book, *Le Despotisme des Ministres de France* (3 vols., 1789), marked him as a leading spirit in the movement, in which he was one of the most extreme and blood-thirsty enemies of the royal family and of the bourgeoisie. He served as president of the Convention, and was on the Committee of Public Safety. With Tallien and Vadier he destroyed the dictator Robespierre (1794). In

the following year he was transported to Cayenne, whence he escaped in 1816, and after visiting New York went to Haiti. He died at Port au Prince. His genuine *Mémoires* were issued by Begis in 1893; those published in 1821 were spurious.

**Bill Brokers** are persons whose business it is to study the condition of the money market and the state of credit generally, and

style. It was formed by cutting a moulding—generally a round moulding—into notches, so that the parts left resembled billets of wood.

**Billet**, in heraldry, a small brick-shaped charge. **BILLETE**, or **BILLETY**, said of a shield *semée*, or strewn with an indefinite number of billets.

conditions. It is now regulated by the Army Act of 1881, which is renewed annually. The only parties bound to provide accommodation for the troops are keepers of victualling houses, including inns, hotels, and places where alcoholic liquors are sold in retail. Payment is made according to a government scale. On

any house without the consent of the owner, nor in time of war, but in a manner to be prescribed by law.

**Billiards.** The origin of billiards is not clearly established. The best claim seems to be that for Henrique de Vigne, a French artist, who flourished during the reign of Charles IX. (about 1571), as he designed the first tables and drew up a code of rules. Originally the game was played with only two balls. About 1775 the third ball was introduced by the French and called a *carrom*, and later a fourth ball was added, but the change did not become popular, except in England, and at present the three-ball game is practically the only one played in America and France.

In 1795, following the introduction of the third ball, the game underwent many changes. Cues were also gradually changed until the present form was adopted, although it was not until 1806 that the leather tip was used, the advantage of chalk having been discovered at that time. Slate beds for the tables were first used in 1827, and ten years later rubber cushions were adopted, the whole bed and cushion being covered with dark green cloth. Since that time no changes of moment have been made in the construction of the table except to abandon the pockets in America and France.

**United States.**—Authentic history credits the introduction of billiards into America to the English officers in garrison in New York City during the eighteenth century. Naturally, the game of those early days was the one in vogue in England, and was played on a table with six pockets. In the course of years radical changes were made both in the table and the style of play, until a distinctively American game had been evolved. The pocketless table, cushion caroms, and balk lining all had their origin in the United States; while public matches and billiard tournaments were first held in that country. The principal American changes have been adopted in France also.

The present-day game of billiards in America is the three-ball carom. It is played on a pocketless table, whose standard measurements are 10 by 5 feet. In clubs and private houses a smaller table is often used, measuring 9 by 4½ feet, or even less. Three ivory balls, 2⅝ or 2¾ inches in diameter, are employed; two of these balls are white (one with a small black spot, to identify it), and the other is red.

In playing, a carom counts one, and is made when both the other (or object) balls are hit by the ball struck with the cue (*i.e.*, the

The Game of Billiards.

**Billeting**, the compulsory quartering of troops on the civil population. In Great Britain at the beginning of the seventeenth century billeting was regarded as one of the chief popular grievances. It was declared illegal by the Petition of Right (1628), and was again prohibited by statute in 1679, but the Mutiny Act of 1689 and subsequent Mutiny Acts authorized it under certain

the continent of Europe billeting is still adopted in the course of military manoeuvres. During a campaign billeting becomes a necessity, in order to prevent the troops from being burdened with provisions and camp equipment. In the **United States**, billeting is restricted by the Constitution, the Third Amendment of which provides that 'no soldier shall, in time of peace, be quartered in

cue ball). At the beginning of play both the lead and choice of balls are determined by 'stringing' or 'banking.' At the opening shot the red ball is placed on the spot at the foot of the table, and the white ball of the second player on the spot at the head. The first player then places his ball 6 inches to either side of the second player's ball, and inside the 'string' (the space bounded by the second diamonds on each side). On the opening shot, and when for any reason the balls are respotted, the red ball must be the first one hit by the cue ball, in order to count.

For foul strokes, suitable penalties are provided. Failure to hit either of the object balls is a 'miss,' and counts one for the opposing player. No count is made if the ball is struck by any part of the cue except the point; if the cue is not withdrawn from the cue ball before the latter comes in contact with an object ball; if the striker has not at least one foot on the floor; if he touches a ball in motion; if he plays the wrong ball; if he touches the cue ball more than once, or hinders or accelerates it; if in the act of playing he disturbs any ball other than his own; if he should disturb a ball after having played a counting stroke. Should he touch his own ball previous to playing, it is foul, and his opponent scores one.

It is also a foul if the striker plays directly upon any ball with which his own is in fixed contact (*i.e.*, 'frozen'). When the balls are thus frozen he may either play directly upon the ball with which his own is not in contact; or he may, by a *massé* shot, play away from the balls, and on the return of the cue ball effect a count, provided that the cue ball first hits the ball with which it was not previously in contact; or he may play to a cushion, and on the return of the cue ball may first hit either of the object balls; or he may have the balls spotted, and play from the string, as in opening the game.

Should a ball jump off the table, it is respotted on its proper spot. Should that spot be occupied, it is placed on the other end spot; if both are occupied, on the centre spot. If a ball jumps off after a carom has been made, the count is allowed and the ball respotted.

Persistent playing for safety is not permitted. Should a player make a miss in each of three successive innings, the opponent may reject the third miss, and require him to hit an object ball.

The object balls are 'croched' whenever the centres of both lie within a 4½-inch square at any corner of the table. When so croched, only three counts are allowed, unless one or both object

balls are forced out of the crotch. In case of failure, the striker is out, and the opponent plays the balls as he finds them.

By the device of the *balk line*, more difficult methods of play were originated in American billiards. In the 14-inch game four lines are drawn on the table (from end to end and from side to side), 14 inches from the rails at every point. The spaces defined by these lines are the balk spaces. The large central space is not a balk, and there is no restriction to the number of caroms that may be made therein.

In general, the rules of three-ball carom govern the 14-inch balk-line game. The special rules are as follows: (1) The object balls are in balk when both have stopped inside any one of the balk spaces. A ball on the line is in balk, said ball being on the line when its point of contact with the table touches the line. When two object balls are on the same line, the striker has the option of saying in which balk they shall be called. (2) Only two shots are allowed when the two object balls are in the same balk space. Unless on the second shot at least one of the object balls is driven out of balk, the shot is void, the striker's hand is out, and the incoming striker plays the balls as he finds them. If on the second shot, however, an object ball is driven out and returns to the same space, the balls may be played as if in balk for the first time; so that the striker may continue in this way indefinitely by sending a ball out and back. (3) The object balls are 'in anchor' when their centres lie within a certain space 3½ by 7 inches. These spaces are eight in number, the centre (from left to right) of each being the balk line where it intersects the cushion, and each space being defined on one side by the cushion, and on the other three sides by lines drawn with chalk. When the balls are thus anchored, the striker may have two consecutive shots, but on the second shot must drive at least one of the object balls outside the anchor space, or lose both play and count. As when in balk, a ball that is driven out and returns to the same anchor space is considered 'in' for the first time.

The game most often played by professionals is the 18-inch balk line, with either two shots or only one shot in balk and anchor spaces. The lines are placed 18 inches from the cushions, and the rules are the same as for the 14-inch game.

In *cushion caroms* the cue ball must touch a cushion before the carom is completed, in order to count; in *three-cushion caroms* three cushions must be touched;

in the *bank shot game* the cue ball must touch a cushion before striking an object ball.

In making cushion strokes the player should remember that the angle of reflection is equal to the angle of incidence, but that in making the stroke the angle may depend upon whether or not the ball is struck fairly in the centre without twist, under which conditions the ball moves forward without spin, which is practically the whole principle of the game. Should the point of the cue strike the ball on either side of its vertical axis, the ball will move forward in the line directed by the cue, but will spin in the direction struck. Struck high the ball follows on its course after driving the object ball out of the way, and is called a 'follow' shot. Struck low the ball spins back to the striker after hitting the object ball and is called a 'draw' shot. It will come back straight or at an angle, depending upon the side it is struck upon. A further twist is sometimes given the ball by slight twist of the cue while on the point of striking the cue ball. The difficult *massé* shot is made by striking the cue ball on the top with the cue at right angles to the table.

See POOL. Consult Brunswick-Balke-Collender's *Modern Billiards* (1909), and *Handbook of Rules; Daly's Billiard Book* (1913).

**Billings**, city, Montana, county seat of Yellowstone county, on the Yellowstone River, and the Great Northern, Northern Pacific, and Chicago, Burlington, and Quincy Railroads; 235 miles southeast of Helena. It is situated in a cattle and sheep raising district, and has coal mines, limestone and marble quarries. There are manufactures of flour, lumber, beet sugar, and brick. The U. S. Census showed 42 industrial establishments in 1914, with capital of \$2,060,000, and products valued at \$1,634,000. Pop. (1900) 3,221; (1910) 10,031.

**Billings**, FRANK (1854), American physician, was born in Highland, Wis. He was graduated from Northwestern University (1881), and studied in Vienna (1885-6). He has served as professor of medicine at Northwestern University (1891-8); professor of medicine (1898-90) and dean of the faculty (1900-05) at Rush Medical College; and professorial lecturer (1901-05) and professor of medicine (since 1905) at the University of Chicago. In 1905 he was president of the American Medical Association; and in 1907 of the National Association for the Study and Prevention of Tuberculosis. Since 1901 he has been the editor of the *Year Book of General Medicine*.

**Billings, JOHN SHAW** (1839–1913), American surgeon and librarian, was born in Switzerland county, Ind., and was graduated from Miami University (1857). He studied medicine at the Ohio Medical College; served as surgeon in the Civil War; and after 1864 was connected with the Surgeon-General's office at Washington, for whose library he prepared the *Index-Catalogue* in sixteen quarto volumes. He supervised the vital and social statistics of the Eleventh Census. Dr. Billings retired from Government service in 1895, and the following year was made director of the New York Public Library. He was also medical adviser to the board of trustees of Johns Hopkins University; vice-president of the National Board of Health; professor of hygiene in the University of Pennsylvania; and a frequent lecturer at Yale, Harvard, Columbia, Johns Hopkins.

**Billings, JOSH.** See SHAW, HENRY W.

**Billings, ROBERT WILLIAM** (1813–74), English draughtsman, architect and author, was born in London, and was taught his art in the office of John Britton. He published several books on the practice of architecture, and works, illustrated by himself, on the Temple Church (1838), Carlisle and Durham Cathedrals (1840 and 1843), etc. But his fame chiefly rests on the *Baronial and Ecclesiastical Antiquities of Scotland* (4 vols., 1845–52).

**Billings, WILLIAM** (1746–1800), American composer, was born in Boston, Mass. He was a tanner by trade, but afterward became a teacher, and introduced into New England a spirited style of church music. He wrote the words to many of his tunes. He published *The New England Psalm Singer, or American Chorister* (1770), *The Singing Master's Assistant* (1778), *Music in Miniature* (1779), and the *Psalm Singer's Amusement* (1781). His anthems include 'Except the Lord Build the House,' and 'The Lord is Risen from the Dead.'

**Billingsgate,** a wharf and fish market on the left bank of the Thames, below London Bridge. The market was established in the reign of Queen Elizabeth, and was made free in 1699. The present buildings date from 1874. The name is often applied to the foul language characteristic of such places.

**Billington, ELIZABETH, née WEICHEL** (c. 1768–1818), celebrated vocalist, was born in London. She made her *début* in Dublin in 1783, and in 1786 was engaged for Covent Garden at the then large salary of \$5,000. She left London in 1794, and toured in Italy; then returning to Lon-

don, she sang there from 1801 to 1811. Her voice had a compass of three octaves, and she excelled in florid passages. She was a striking beauty, and Sir Joshua Reynolds painted a fine portrait of her as St. Cecilia.

**Bl'it'on', BLITUNG, or BIL-TONG,** an island of the Dutch East Indies, lies between Banka and the west coast of Borneo, with an infertile soil and heavy rainfall (100 to 125 inches annually). Tin occurs almost everywhere; the annual output is 5,000 to 6,000 tons. Other products are iron, gums, scented wood, sago, tre-pang, pepper, and tortoise shell. Area, 1,870 square miles. Pop. 40,000.

**Bill of Adventure,** a writing under the hand of a shipper of goods or a common carrier, showing that the shipment is the venture of another person, and that the shipper or carrier is responsible for nothing more than delivery of the cargo as consigned.

**Bill of Attainder.** See AT-TAINDER.

**Bill of Costs,** an account of fees and other disbursements incurred by an attorney in a suit or other legal proceeding conducted by him. In the United States the costs of a litigation are usually prescribed by statute or by a rule of court; and when, as is usually the case, they are ordered to be paid by the defeated party, the bill of costs must be 'taxed,' or approved, by the clerk of the court in which the judgment was rendered. See COSTS.

**Bill of Exceptions** is a statement in writing of objections taken to the ruling of the court upon a point of law arising in the course of the trial. The admission or non-admission of evidence is a frequent subject of such bills. The objections must be tendered at the time when the decision is given, and the bill must be authenticated by the judge, or a majority of them, if more than one. Obviously, no question can be raised as to a decision upon a point which falls within the scope of judicial discretion. The validity of the objections is determined by a court having jurisdiction in error. See APPEAL.

**Bill of Exchange** is defined as 'an unconditional order in writing addressed by one person (called the *drawer*) to another (called the *drawee* or *addressee*), signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time a certain sum in money to or to the order of a specified person (called the *payee*, who may be either the drawer himself or a third party) or to bearer.' The origin of this, perhaps the most important of all commercial instruments, is invol-

ved in obscurity. By Montesquieu and others it is attributed to the Jews, who, when banished from France and England in the 13th century, employed bills of exchange as a method of recovering the effects which they had perforce left behind them. By others the Venetians and Florentines are credited with the invention.

For several centuries bills of exchange were used only between merchants living in different countries. Their advantage is readily seen by means of a concrete example: A, a merchant in New York, owes \$1,000 to B, a merchant in London; while B owes \$1,000 to C, another merchant in New York. B draws a bill requiring A to pay \$1,000 to C at a certain date, and forwards the bill to C in payment of the debt due to him. C presents it to A, who signifies his acceptance of B's order by signing his name on the bill, and is then called the *acceptor*. When the date mentioned in the bill arrives, C can exact payment from A. Thus the accounts are squared as between all the parties without any coin passing between New York and London. The transaction might have been carried through by C drawing on A, and sending the bill to him for acceptance. On receiving it back accepted by A, C sells it to B. B would then be A's creditor for \$1,000 on the bill, and his debtor for \$1,000 on a prior transaction, so that the respective rights and liabilities of the parties would be extinguished on the principle of compensation. Such bills are now known as *foreign bills*, as opposed to *inland bills* the parties whereto are resident in the same country. In the United States, each State is a foreign country for the purposes of bills of exchange.

The utility of inland bills may be exemplified thus: A owes \$1,000 to B, the date of payment being six months hence. B cannot afford to wait for his money till the expiration of the period, so he draws on A for the amount, and obtains the latter's acceptance of the bill. He then sells the bill to a banker or other party who discounts bills for \$1,000 less the interest on the amount for six months. Foreign bills can also be used in the same manner.

The opposite of a bill of exchange is a promissory note, which is made by the debtor, not drawn by the creditor. (See PROMISSORY NOTE.)

Money alone can be made the subject of a bill or note; an order to deliver so much merchandise would be useless. The sum in question also requires to be certain. A bill must be imperative in its terms—*i. e.*, payment must

be required as a right, not merely as a favor. Acceptance can only be made by the drawee, and his signature alone, without further words, is sufficient. It must not express a promise other than the payment of money. Acceptance may be *absolute* when the drawer simply acquiesces in the order, or it may be *qualified* either in respect of being conditional, or partial, or of payment being restricted to a particular time or place.

The law merchant allows bills and notes payable to order to be transferred only by endorsement; but if payable to bearer, mere delivery is sufficient. If, however, the transferee of a bill payable to order gives full value for it, he acquires such right as the transferrer had in the instrument, and may require the latter to make an endorsement. The transfer by endorsement of a bill payable to order, or by delivery of a bill payable to bearer, is termed *negotiation*, the result being that a *bona fide* transferee for value is not affected by defects in the transferrer's title. Documents of the kind, where the transferrer can give a higher title than he himself has, are called *negotiable instruments* (q. v.).

An endorsement to be valid must be written on the bill itself; or if there be not room enough, upon a slip of paper attached to the bill. It may be in blank, when no particular endorsee is specified, and the bill thereupon becomes payable to bearer; or special, when some one is mentioned to whom or to whose order payment is to be made, or it may be restrictive when further negotiation is prohibited—*e.g.*, when payment is to be made only to the person named.

Endorsements are frequently made without recourse, especially in the United States. This means that the endorser is under no liability in the event of bill eventually turning out to be worthless. If the drawee declines to accept the bill, or to make payment when it arrives at maturity, it is said to be *dishonored*.

*Accommodation bills* are used where no debt is really due to the drawer by the drawee, but where the drawee agrees to accept the former's draft in order to raise a fund of credit. In such cases, though the drawer cannot enforce payment against the acceptor, yet if he endorse the instrument to another person in the ordinary course of business, the latter is not in any way prejudiced by the fact that no consideration was originally given.

**Bill of Health** is a certificate given to the master of a ship by the authorities of a port from which she sails, setting forth the condition of the place in regard

to infectious diseases, as at the date of departure. A clean bill certifies the absence of such diseases; a suspected (or touched) bill indicates that though an outbreak has not actually occurred, yet the same is anticipated; a foul bill that contagious disorders are in reality prevalent. If a ship arrives at a port without a bill of health she will be detained in quarantine, just as if her bill were foul.

**Bill of Indictment** is a written accusation of crime preferred against one or more persons before a grand jury. See INDICTMENT.

**Bill of Lading**, the written instrument issued by a common carrier on taking custody of the goods to be transported by him. A bill of lading performs three functions: first, it is a receipt given by the carrier to the shipper for the goods delivered to him by the latter; second, it embodies the contract of carriage between them; third, it is a document of title to the goods shipped.

In the United States, bills of lading are governed by the *Federal Bill of Lading Act* (Pomerene Act), passed in August, 1916, and effective January 1, 1917. According to this Act, two kinds of bills may be issued—*straight bills*, when the goods are consigned or destined to a specified person, and *order bills*, when the goods are consigned to the order of any person named in the bill. Straight bills are non-negotiable, and must be so marked. Order bills are always negotiable, unless it is otherwise stated on the face of the bill in writing agreed to by the shipper. 'A person to whom an order bill has been negotiated acquires such title to the goods as the person negotiating, and also such title as the consignee and consignor had or had power to convey to a *bona fide* purchaser for value, and the direct obligation of a carrier as set forth in the bill.' He is not entitled to receive the goods, however, until he has satisfied the carrier's lawful lien for freight, storage, demurrage, terminal charges, and other expenses incident to transportation and delivery; has surrendered the bill; and has signed a receipt for the delivery of the goods.

All carriers are held liable for bills of lading duly issued and signed by their properly appointed agents. They are not liable for the quantity and quality of the shipment, in case of improper loading or misdescription of goods in the bill of lading, when such goods are loaded by the shipper and the bill states that it is the shipper's weight, load, and count.

Fraudulent practice in connection with bills of lading, as forger-

ies, counterfeits, etc., are misdemeanors punishable by imprisonment for not more than five years, a fine not exceeding \$5,000, or both. See CARRIER.

**Bill of Mortality** was a weekly return, first made in 1592 after an outbreak of the plague, of the deaths occurring in the various parishes of the city of London and the diseases causing the same. Such bills ceased to be drawn up after 1842, when the modern system of registration had come into force. See LONDON.

**Bill of Pains and Penalties.**

A legislative bill providing punishment for acts previously committed, whether such acts when committed were or were not prohibited by law. When such a bill involves corruption of blood and forfeiture of estate it is called a *bill of attainder*. Bills of Pains and Penalties being retroactive in their operation are prohibited in the United States by the provision of the Constitution (Art. I, Sec. 9) forbidding Congress and the several States from passing *ex post facto* laws except where the case comes under the provision vesting in Congress the power to define the crime of treason against the United States, and to declare its punishment. See ATTAINDER; TREASON.

**Bill of Particulars**, in legal procedure, an itemized statement of account rendered in the progress of a suit by the claimant of a sum of money for which judgment is demanded. The bill is sometimes contained in the pleading of the party rendering it, but is more often delivered on the demand of the opposing party or upon an order of the court.

**Bill of Peace**, a bill in equity filed to compel the consolidation of numerous suits against the same defendant arising out of the same cause of action, or to restrain repeated attempts to litigate the same controversy between the same parties. Its principal use in the latter sense was to prevent repeated actions of ejectment of the same claimant for the same parcel of lands. See QUIA TIMET.

**Bill of Rights** is the name commonly given to the statute in which is embodied the Declaration of Rights presented by both houses of the English Convention Parliament to the Prince and Princess of Orange in 1689. After declaring the late King James II. to have done various acts contrary to the laws of the realm, and to have abdicated the government, the Bill of Rights proceeds to enact in detail the celebrated declaration as to the rights and liberties of the English people. It was laid down that the crown had no power to suspend or dispense with the ordinary laws, or form

judicial courts, or levy money without parliamentary sanction. The raising or keeping of a standing army within the kingdom in time of peace, unless with the consent of Parliament, was declared to be unlawful. Freedom of election for members of Parliament, freedom of speech in debate, and the right of the subject to petition the crown, were alike maintained. The act recognized William and Mary as the holders of the crown for their joint and separate lives, but with the administration of the government during their joint lives in William alone, and regulated the subsequent succession. A clause was finally added that the sovereign should take the test in the first parliament of his reign, and that if any king or queen should embrace the Roman Catholic religion, or intermarry with a Roman Catholic, their subjects should be absolved of their allegiance. See ENGLAND AND WALES, *History*.

**Bill of Sale**, as originally understood, is a formal deed transferring personal property under a contract of sale, and this meaning still survives in the case of sale of ships, delivery of the deed being equivalent to actual delivery of the ship. By Act of Congress of 1793 a bill of sale, setting forth at length the certificate of registry, must accompany every sale or transfer of a registered ship to a citizen of the United States. Bill of sale is, however, now more commonly employed in a derivative sense to denote a deed or instrument operating a transference in security of a debt or other obligation. Further, there is commonly held to underlie transactions by bill of sale an implication that possession of the goods has not passed to the purchaser or mortgagee.

The rule of the common law that a real right in chattels may pass without the transferee being put in possession of them is directly at variance with the principles of the civil law, and unless strictly guarded will act as a cloak to fraud. Thus A may mortgage certain of his personal goods to B by bill of sale, no change of possession taking place, and this gives B a claim over these goods preferable to that of a subsequent *bona fide* purchaser who in ignorance of the mortgage paid a full price for them. But if there is any fraud on the part of B, then at common law the transaction between him and A may be cut down. Moreover, it is settled that when possession of the goods is not transferred along with the deed, the transaction is presumed to be fraudulent unless circumstances prove it otherwise.

In some of the United States it is laid down by judicial decision

or statute that such transactions, where no change of possession takes place, are conclusive of fraud. Accordingly in these States the legal position is not materially different from that existing in countries where the civil law rule prevails, to the effect that mere agreement without delivery of possession cannot operate a transference of property.

In England it has been provided by statute that all bills of sale must be registered in a prescribed manner within seven days of their date, otherwise they will be held invalid in competitions with an executive creditor or trustee in bankruptcy. The latter are thus relieved of the necessity of proving fraud.

**Bill of Sight** is a document signed by an importer of goods who is unable to make a perfect entry as to their quantity or quality. The best description possible in the circumstances is given, and the document serves as a warrant to the customs authorities to allow the goods to be landed. But a perfect entry must, however, be made before they are actually delivered to the importer. When bills of sight are used, the goods are liable to be sold if such entry is not completed within a specified time, usually a month.

**Bill of Store**, a document giving full particulars as to goods formerly exported from a country and reimported within a limited time, usually five or six years. Import duty is not generally charged on such goods.

**Billon**, a name (originally French) for a mixed metal sometimes used in coinage, consisting of gold or silver, with a large proportion of baser metal.

**Billot**, bē-yō', JEAN BAPTISTE (1828-1907), French general and senator, born at Chaumeil, Corrèze department. After a distinguished career in Africa, he was given the command of the 18th Army Corps during the Franco-German War (1870-1). Elected in 1871 to the National Assembly, he was largely responsible for a bill to reorganize the staff of the French army in 1878. In 1882 he became Minister of War, but his refusal to deprive the Orleans family of military rank led to his resignation in 1883. He was Minister of War again in 1896-8, when he took a prominent part in the Dreyfus Affair of 1897.

**Bilroth**, bil'rōt, ALBRECHT CHRISTIAN THEODOR (1829-94), German surgeon, born at Bergen, on the island of Rügen. He was appointed professor of surgery at Zürich in 1860, and at Vienna in 1867. He was the first to operate for cancer of the stomach, and to him is largely due the modern ambulance system. His eminence

as a surgeon, and his services during the Franco-German War (1870-1), when he served in the German hospitals, were recognized by an appointment to the Austrian Upper House in 1837. His works include *General Surgical Pathology and Therapeutics*; *Care of the Sick at Home and in the Hospital* (1892).

**Bills and Notes**, a common expression for the two more usual kinds of negotiable instruments—bills of exchange and promissory notes. See BILL OF EXCHANGE; PROMISSORY NOTE.

**Bil'ma**, the southern and most important portion of the Kavar oasis, Central Sahara, Africa, in the Tibbu country (in 18° 40' N. lat., 14° E. long.). Garu (Bilma proper) has rich salt mines.

**Bil'ney**, THOMAS (d. 1531), English martyr, was born in Norfolk about 1495, and was ordained priest at Ely in 1519. He preached against the mediation of saints, and was arrested in 1527. He abjured, and after a year's imprisonment returned to Cambridge, and resumed public preaching (1531). He suffered death by fire.

**Biloxi**, bi-lok'si, a small Indian tribe, originally dwelling on Biloxi Bay, but afterward in Louisiana, thought at first to belong to the Choctaws, but proved by Gatschet, in 1886, to belong to the Sioux.

**Biloxi**, city, Harrison county, Mississippi, on Biloxi Bay, an arm of the Gulf of Mexico, and on the Louisville and Nashville Railroad; 75 miles northeast of New Orleans. An electric traction line runs to Gulfport, and there is a shell road to Pass Christian. The city has a fine government building, opera house, sanitarium, and several churches. Its six-mile beach and excellent climate make it popular as a summer and winter resort. The chief business interests are the packing and shipping of oysters and shellfish, fruits, and vegetables. There are also shipyards, sash and door factories, and ice factories. The French settled nearby in 1699, and founded a town on the present site in 1712. For a few years Biloxi was the capital of the colony of Louisiana. Pop. (1900) 5,467; (1910) 8,049.

**Bilse**, bil'se, OSWALD FRITZ (1878), a lieutenant in the German army, born at Kern. He entered the army in 1898, and in 1903 wrote a book entitled *Aus einer kleinen Garnison*, a severe arraignment of garrison life in the town of Forbach. The book was suppressed, and the author sentenced to imprisonment and dismissal. The Minister of War said that though the book 'was a disgrace to a Prussian officer, part of it was unfortunately true.' The book has been

published in England and the United States under the title *Life in a Garrison Town*.

**Bil'ston**, market town, Staffordshire, England; 2½ miles southeast of Wolverhampton. It is a typical 'black country' town. Coal, iron, and casting-sand are plentiful in the neighborhood, and there are many blast-furnaces, foundries, and hardware factories. Its grindstones are famous. Pop. (1921) 27,565.

**Bilting**. See BILLITON.

**Bima**, bē'mā, seaport town, capital of the sultanate of Bima, is situated on the north coast of Sumbawa, Dutch East Indies. Fine horses are exported. Pop. about 10,000.

**Bimet'allism**, a monetary system in which there is free coinage of gold and silver at a fixed ratio, the coins of either metal being legal tender, as opposed to monometallism, in which one metal alone has the right of free coinage. Up to the beginning of the nineteenth century what may be called unconscious bimetalism prevailed in most of the countries of the world. Gold and silver were both coined according to the convenience of the sovereigns, but their coinage was not free. There was, moreover, no recognition of the necessity for a common ratio for the coinage of the two metals; neighboring states might coin them at different ratios, and much confusion and uncertainty arose. In 1816 England adopted the policy of monometallism, defining the pound sterling as 113 grains of pure gold, but this example was not followed by other European nations, nor by the United States, until after 1870. From 1803 to 1873 France employed a system of bimetalism, which was successfully maintained until Germany joined England in her gold monometallic policy. This broke the equilibrium which France and the other members of the Latin Monetary Union had been able to maintain and caused them to join the ranks of the gold-standard nations.

Two chief advantages are claimed for bimetalism. One is the maintenance of a par of value between the two metals, and a consequent steadiness of exchange between gold-using and silver-using countries. Owing to the greater importance of demand in determining the value of money (see PRICES; MONEY), the legal ratio recognized at the bimetallic mints exerts a controlling influence over the market ratio, and is sufficiently powerful to counteract great changes in supply. Slight fluctuations in the market value are met by a tendency to bring the cheaper metal in larger quantities to the mint, and to melt into bullion

the more costly metal obtained in exchange.

A second advantage claimed for bimetalism rests on the argument that a joint standard is likely to be more stable than a single standard. The fluctuations in value of the two metals taken separately, it is true, may be greater both in amount and number than those of only one; but, taken jointly, they will probably be found to mitigate rather than to intensify each other.

On the other hand, it is argued that bimetalism presents more complications and is more artificial than monometallism; that it was tried for long periods in the past by individual nations, and caused great inconvenience, owing to the scarcity, from time to time, of one of the other metal, which had been attracted elsewhere by higher rates; that, granting that these difficulties might be overcome by the establishment of international bimetalism, it would still be difficult to secure agreement on the ratio to be chosen, or to prevent afterward the secession of one or more of the contracting parties.

The advantages of bimetalism can be attained only by the agreement of a group of the more powerful nations to coin both gold and silver at the same ratio. Such an agreement would undoubtedly bring about a demand upon these metals strong enough to keep them at the ratio agreed upon, but the increase in the output of gold since 1900 has given gold-using nations such an abundance of money and caused such a rise in prices that for all practical purposes the question of international bimetalism is dead.

Consult F. A. Walker's *International Bimetallism*; R. Griffin's *Case Against Bimetallism*; Darwin's *Bimetallism*; Laughlin's *History of Bimetallism in the United States*; White's *Money and Banking*; Sherwood's *History and Theory of Money*; T. H. Farrer's *Studies in Currency*; A. B. Hepburn's *History of Coinage and Currency in the United States*; H. D. Macleod's *Bimetallism*; J. F. Johnson's *Money and Currency* (1920); and Reports of the Monetary Commission, and of the International Monetary Conferences.

**Bimlpatam**, bim-li-pā-tām', seaport, in the Vizagapatam district, Madras Presidency, India, on the Bay of Bengal; 15 miles northeast of Vizagapatam. In the 17th century the Dutch established a factory here, which was ceded to the British East India Company in 1825. Pop. 12,000.

**Biñan**, bē-nyān', largest town in Laguna province, Luzon, Philippine Islands, on the west shore

of Laguna Bay; 19 miles from Manila. The surrounding region produces rice and timber. Pop. 10,000.

**Binche**, bañsh, town, province of Hainault, Belgium; 15 miles southeast of Mons. Lace, pottery, leather and glass are manufactured. It was a scene of operations in the Battle of Mons (Aug. 23, 1914). Pop. (1910) 11,690.

**Bindraban**. See BRINDABAN.

**Bindweed**. See CONVULVULUS.

**Binet**, bē-nā', ALFRED (1857-1911), French psychologist, was born in Nice. He studied law and medicine in Paris, but soon turned his attention to experimental and pathological psychology. He is best known for his attempts to discover some standard for the measurement of degrees of intelligence, the outcome of which were the Binet-Simon tests (1905 and 1908). He also published *La psychologie du raisonnement* (1886); *Perception intérieure* (1887); *On Double Consciousness* (1896); *La Suggestibilité* (1900); *L'âme et le corps* (1915). He edited *L'année psychologique*, to which he contributed many articles.

**Binet Tests**. See INTELLIGENCE.

**Bingen**, bing'en (anc. *Bingium* or *Vincum*), town, grand-duchy of Hesse, Germany, is situated on the left bank of the Rhine at its confluence with the Nahe; 17 miles west of Mainz. Noteworthy buildings are the fifteenth century Parish Church; the castle of Klopp, on the site of an ancient Roman fortress, now containing the municipal offices; the Rochus-Kapelle, a chapel on the brow of the Rochusberg, a high hill back of Bingen, in which the festival of St. Rochus is annually celebrated by thousands; and the Drusus Bridge, with its seven arches, built about 13 B.C. In the middle of the river opposite Bingen is the celebrated Mouse Tower where, according to legend, the cruel Bishop Hatto of Mainz was devoured by mice (969). On the opposite side of the river, a little above Bingen, is the ruined castle of Ehrenfels, erected about 1210. At a point in the river a little below Bingen are the dangerous rapids known as the Binger Loch. Widening of the channel at various times since 1834 has made navigation safe. Bingen is the seat of the Rhenish Technical College, a Technical and Industrial School, and a Commercial School. There are manufactures of tobacco, champagne, starch, and leather, and a large trade in wine and grain. Pop. about 10,000.

In the Middle Ages Bingen was a free town but later passed to the Elector of Mainz. It was often

captured in the Thirty Years War and in 1689 was almost entirely destroyed by the French.

**Binger**, bañ-zhâ', LOUIS GUSTAV (1856- ), French African explorer, was born in Strassburg. He visited Senegal and the Sudan, and published studies on the language of the Bambara. In 1887 he undertook a journey from Senegal to the river Niger. He reached Grand Bassam, on the coast, at the beginning of 1889. This journey he described in *Du Niger au Golfe de Guinée par le Pays de Kong et le Mossi* (2 vols. 1891). From 1898 to 1907 he was director of the French Colonial Department.

**Bingham**, bing'am, HIRAM (1831-1908), American missionary, was born in Honolulu. He was educated at Yale, studied theology at Andover and in 1856 entered upon missionary service, to which he devoted his life, laboring chiefly in the Gilbert Islands. He translated the Bible and other religious works into Gilbertese.

**Bingham**, JOHN ARMOR (1815-1900), American jurist, was born in Mercer, Pa. He was educated at Franklin College, O., studied law, and practised at Cadiz, O., until his election to Congress in 1855. In 1864 he was appointed judge advocate general by President Lincoln, and the same year U. S. solicitor of the Court of Claims. He was in charge of the prosecution of Lincoln's assassins; and as chairman of the impeachment committee made the closing argument against President Johnson before the Senate. He was again a member of Congress (1865-73), and was chairman of the committee to draw up the Fourteenth Amendment. From 1873 to 1885 he was U. S. minister to Japan. His last years were passed in retirement at Cadiz.

**Bingham**, JOSEPH (1668-1723), English divine, was born in Yorkshire, and is best known as author of *Antiquities of the Christian Church* (10 vols.).

**Bingham**, THEODORE ALFRED (1858- ), American soldier, was born in Andover, Conn., and was graduated from West Point in 1879. He was U. S. military attaché at Berlin in 1890-92 and at Rome in 1892-94, was in charge of public buildings and grounds in Washington, D. C., in 1897-1903, and on engineering duty in 1903-04. He was promoted brigadier-general and retired in 1904. He was police commissioner of New York City from 1906 to 1909, and Chief Engineer of Highways, New York (1911). In 1917 he was recalled to active service in the U. S. Army and acted as Chief Engineer on the staff of the commanding general, Department of

the East. In 1919 he was again discharged from active service.

**Bingham Canyon**, Utah, Salt Lake county, on the Bingham and Garfield, and the Denver and Rio Grande Western Railroads. Pop. (1910) 2,881; (1920) 2,676.

**Binghamton**, bing'am-ton, city, New York, county seat Broome county, on the Susquehanna River, and the Delaware, Lackawanna and Western, the Delaware and Hudson, and the Erie Railroads; about 81 miles southeast of Syracuse, and midway between New York and Buffalo. It contains four homes for orphan children, and is the seat of a State asylum for the insane. Notable buildings are the Central High School, Federal Government offices, State armory, opera house, and court house. Binghamton is situated in a rich agricultural region, and is noted for its dairy products. According to the Federal Census of Manufactures for 1919, industrial establishments number 228, with 7,477 wage earners, a total capital of \$27,921,000, and products valued at \$40,638,000. Automobile trucks and tires, flour, medicines, cigars, washing machines, glass, forgings, furniture, organs and pianos, carts and sleds, silk, cigar boxes, boots and shoes, valves, clocks, clothing, and leather are manufactured. Binghamton was settled in 1787, when it was known as Chenango Point. It assumed its present name in 1800. Pop. (1910) 48,443; (1920) 66,800.

**Bing'ley**, market town, Yorkshire, England, on the Aire River; 15 miles northwest of Leeds. Worsted and paper are manufactured. Pop. (1911) 18,759; (1921) 18,949.

**Binh - Dinh**, town, Annam, French Indo-China, 205 miles southeast of Hué. Eleven miles to the southeast is the town of Kwinhon, or Quinon, its port on the China Sea. Pop. 74,400.

**Binh-thuan**, small town, Annam, French Indo-China, capital of province Nha-Trang, 130 miles northeast of Saigon.

**Binmaley**, bèn'mà-lâ'è, town, Luzon, Philippine Islands, on the Gulf of Lingayen at one of the mouths of the Agno River. The chief industry is the growing of rice. Pop. 16,400.

**Bin'nacle** (originally *bittack*, from *Fr. habitacle*), a stand or case for holding a ship's compass. Formerly this consisted of a rectangular wooden locker containing three compartments with sliding shutters, the two side ones holding a lamp or candle in each, and the middle compartment having a compass suspended by a gimble ring placed in ears fastened to the sides of the compartment. The modern binnacle

is of brass or bronze and, besides supporting the compass and containing arrangements for the illumination of it by night, is fitted with various devices whereby the magnetic needle is protected against the effects of shock and vibration, as also against the permanent and induced magnetism of the vessel in which it is placed. See also COMPASS.

**Bin'ney**, HORACE (1780-1875), American lawyer, was born in Philadelphia, Pa., and was graduated (1797) from Harvard. He was called to the bar in 1800, served in the Pennsylvania legislature, and prepared the six volumes of reports of the Pennsylvania Supreme Court decisions known by his name (1807-14). He practised law with distinguished success in Philadelphia until his election to the Twenty-third Congress (1833-5), in which he was a defender of the United States' bank. He retired definitely from practice in the courts in 1836, appearing but once thereafter, to defend the Girard trust.

**Binney**, THOMAS (1798-1874), English non-conformist divine, was born in Newcastle. He was Congregational minister at Bedford; Newport, Isle of Wight (1824); and Weigh House, London (1829-69); and for a time was professor in the Congregational New College, London. He was a powerful opponent of the Established Church and of ritualism. His most popular work is, *Is it Possible to Make the Best of Both Worlds?* (1853).

**Binney**, W. G. (1833- ), American conchologist, was born in Boston, Mass., son of Amos Binney, himself an authority on molluscs. He edited an edition of his father's works and prepared for the Smithsonian Institution a work on the *Land and Fresh-Water Shells of North America* (1869), and numerous monographs on the same subject. The collection of North American shells at the Harvard Museum was made by Amos and W. G. Binney.

**Bino'mial** (Lat. *bi*, 'twice,' *nomen*, 'a name'), an algebraic expression containing two terms. By the binomial theorem any power of a binomial can be expanded into a series. The formula is—

$$(x + a)^n = x^n + nx^{n-1}a + \frac{n \cdot n-1}{1 \cdot 2} a^2 x^{n-2} + \dots + \frac{n \cdot n-1 \cdot \dots \cdot n-r+1}{1 \cdot 2 \cdot 3 \cdot \dots \cdot r} a^r x^{n-r} + \frac{n \cdot n-1}{1 \cdot 2} a^{n-2} x^2 + na^{n-1} x + a^n.$$

Ex.  $(x + a)^5 = x^5 + 5ax^4 + 10a^2x^3 + 10a^3x^2 + 5a^4x + a^5$ .

**Bintang**, island in Dutch East Indies, off Singapore, acquired by the Netherlands in 1823. It produces spices, sago, rice, and sugar. Area, 450 square miles. Pop. about

18,000, almost entirely Malays and Chinese.

**Binturong** (*Arctitis binturong*), a civet-like carnivore, a native of the E. Indies, arboreal and nocturnal in its habits, with a long, prehensile tail, tufted ears, and bristly fur.

**Binue.** See **BENUE**.

**Biobio.** (1.) River of Chile, rising in the Andes, and flowing in a N.W. direction through the prov. of Biobio, enters the Pacific at Concepcion, after a course of 220 m. The mouth is 2 m. wide, and the river is navigable for 100 m. (2.) Province of Chile, with an area of 4,158 sq. m., and a pop. (1895) of 88,749. Cap. Los Angeles.

**Biogenesis**, a term used by Huxley in his *Lay Sermons* for what he defines as 'the hypothesis that living matter always arises by the agency of pre-existing living matter.' The term for the opposing doctrine is *abiogenesis*. See **BIOLOGY**.

**Biograph.** See **CINEMATOGRAPH**.

**Biography** is the art of presenting a life-work in full and significant delineation. Memorial tributes are an early feature in literature. Even the aged Nestor utilized the privilege of the panegyrist when he harangued his juniors on the tented field; and there is a similar attitude in Plato's delineation of Socrates. Xenophon, another Socratic disciple, writes *Memorabilia* of his master; and though the same author's *Cyropædia* is romantic and fanciful, and his *Agésilus* is a panegyric, he works them round genuine individual greatness. This is the rudimentary memoir, and, somewhat later, the lament of Moschus over Bion set an elegiac example that has had momentous results. Several Latin writers have merits as biographers. Cicero shows abundantly that he might have written lives with high success. Cornelius Nepos, Sallust, Quintus Curtius, and Tacitus all contribute to this department of literature. The *Agricola* of Tacitus is an admirable presentation of life and character. Suetonius is inartistic, but not without merit. The *Anabasis Alexandron* of Arrian is valuable both for matter and style. But Plutarch, who lived in the reign of Domitian, is the first great biographer in the world's history. His *Parallel Lives* comprises forty-six biographies in pairs, a Greek and a Roman alternately, and several separate sketches, the whole constituting a work of sovereign value. It has been often translated, and North's English version of 1579 introduced Shakespeare to this gallery of noble characters.

Now and again in the middle ages there are notable products

of biographical impulse. The Venerable Bede (673-735) wrote the *Life of St. Cuthbert*. St. Adamnan (d. 704) produced in his *Vita Sancti Columbæ* a genuine memoir, edited in 1857 by Dr. Reeves. A real and worthy life-study presents itself in E. Inghard's *Vita Caroli Magni—The Life of Charlemagne* (c. 820). Of this there are various editions, and an English version was published by Mr. W. Glaister in 1877. Alfred the Great was also fortunate in his contemporary biographer, Asser Menevensis, a monk whom the king appointed bishop of Sherborne. First published in 1572 by Archbishop Parker, the best edition of it is that of Wise (1722). Six early biographies of St. Dunstan (960-988) were edited by Bishop Stubbs in his *Memorials of St. Dunstan* (1875). Ælfric's *St. Guthlac* and William of Malmesbury's *Wulfstan* both deserve mention. The biographical work of the middle ages fitly culminates in Boccaccio's reminiscences of Dante, this happy connection, as has been aptly said, supplying 'a great man to describe a greater.'

Formal biographers were somewhat late in appearing in English literature. In the 14th and 15th centuries there were choice opportunities, but the literary bias was towards other ideals. Sir Thomas Malory, Lord Berners, and Caxton might have been biographers under other conditions, for they had direct sympathy with personalities; and Caxton's devotion to earlier men of letters helped materially to establish their importance. Prose style steadily developed in the 15th century, and is well illustrated in the work of 'saintly Fisher and unbending More.' Fisher's prose is strong and not inartistic, and the funeral sermon on Henry VII. shows a capacity for a memorial record. More's *Richard III.* (1513) is more than a merely biographical study, but it recognizes the importance of grouping historical facts round an individual career. A lurid record of the times is Foxe's *Acts and Monuments of the Church*, or the *Book of Martyrs*, published at Basel in 1559 (Eng. ed. 1563). William Roper, who died in 1577, wrote the *Life of Sir Thomas More*, edited by S. W. Singer in 1817.

There are still few biographies in the Elizabethan age. Cavendish's *Life of Cardinal Wolsey*, written about 1557, and first printed in 1641, is a striking little book which was undoubtedly used in the composition of Shakespeare's *Henry VIII.* The somewhat unsatisfactory *Life of Sir Philip Sidney* by Lord Brooke, published in 1652, has supplied points that have been constantly used by subsequent biographers of

the perfect, gentle knight. There is room for regret that Ben Jonson did not write a life of Shakespeare. How much it might have told, and what fatuous speculations it might have prevented! Jonson's memorial tributes are admirable, but a biography would have enhanced his literary reputation, and earned lasting gratitude. Bacon, whose *Henry VII.* has certain biographical merits, fared somewhat better than Shakespeare; various biographies, *Baconiana*, etc., duly followed the *Life* by Rawley, published in 1657. Passing reference must be made to the biographical material in Drummond of Hawthornden's *Notes of Ben Jonson's Conversation* (Shakespeare Society Papers, 1842). Sometimes irrelevant and occasionally indiscreet, these records make a unique episode. Milton's *Life*, by his nephew, Edward Phillips, appeared in 1694, and another was published by Toland in 1699. Both were useful, but have small literary merit. Fuller's *Worthies of England* (1662) is an attractive miscellany. Mrs. Hutchinson (1620-64) produced, in her *Life of Colonel Hutchinson*, a work of uncommon merit, which was not published till 1806. Clarendon's *History of the Rebellion* has interesting biographical features; it appeared in 1704-7. But the foremost biographer of the age is Izaak Walton, whose *Lives of Donne, Wotton, Hooker, Herbert*, and Sanderson appeared, in the order named, between 1640 and 1678. A volume containing the first four was published in 1670 and the complete set was edited in 1796, with a *Life of Walton* by Dr. Thomas Zouch. Unaffected in style, and radiant with the author's genial personality, these biographies have an enduring charm. John Evelyn (1620-1706) produced a pleasing *Memoir of Margaret Blagge*, wife of Godolphin, the lord treasurer (ed. Bishop Wilberforce, 1848). Anthony Wood's *Athenæ Oxonienses* (1691) is a storehouse of information and gossip about Oxford men. To 1691 belongs also Langbaine's *English Dramatic Poets*, an explicit and faithful record. John Aubrey (1626-97) wrote curious and valuable 'Minutes of Lives' (Bacon, Milton, Hobbes, etc.), first published in *Letters by Eminent Persons* (1813). Gilbert Burnet, biographer of Matthew Hale, has much good matter in the *History of his own Time*.

Literary accomplishment marks the biography of the 18th century. Steele's tribute to Addison (*The Theatre*, 1720) makes a good beginning. Roger North (1653-1734) wrote lives of himself and his brothers, and the engaging *Lives of the Norths* appeared in 1742-44. Middleton's *Cicero* (1741) and

Jortin's *Erasmus* (1758) are standard works. Theophilus Cibber's *Poets* and his *Actors and Actresses*, both dated 1753, help to mark the onward movement. Literary grace and charm were given to biography by the illuminating pen of Goldsmith. His *Voltaire* (1759) utilizes his personal knowledge, and displays his narrative and descriptive resources. In 1762, after a sojourn in Bath, he produced his inimitable mock-heroic *Life of Beau Nash*, conferring immortality on a marionette of supreme quality. His *Parnell* and *Bolingbroke*, published in 1768 and 1770 respectively, are less important. It is an easy transition from Goldsmith to Dr. Johnson, whose *Lives of the Poets* (1779) remains, after all possible deductions, an admirable specimen of literary biography. Some of the best are those of the smaller men, some are manifest results of mere journey-work, and some—those, for example, of Milton and Gray—exhibit strong prejudice. In all, the independent critic works steadily, heedless of results. In the *Life of Dr. Johnson*, published in 1791, James Boswell took the foremost place among British biographers. His artlessness is the secret of his success. His genial affability recalls the method of Walton. 'An inspired idiot' he may have been, but he was a superb artist in biographical narration. The high character of the 18th-century biography is well sustained by William Roscoe in his strong and picturesque *Lorenzo de' Medici* (1796).

The development of the biographer's art made great advance in the 19th century, as may readily be seen from a comparison of a work like Hayley's *Cowper* (1803) with the elaborate studies of later days. Books such as Hayley's give more minute and more skilful biographers a fresh opportunity. The same thing may be said of the work of Dr. Thomas M'Crie, whose *Life of Knox* appeared in 1811, and *Life of Andrew Melville* in 1819. Whatever Sir Walter Scott wrote has value. His small biographies have interest and charm, and his *Life of Dryden* (1808) maintains its authoritative position. His elaborate work on Napoleon, produced later in life, was the result of the most serious and elaborate preparation, but it was done at a time when Scott was unable to devote to his materials those great and apparently inexhaustible powers that had so long done marvellous service. Southey was an ideal biographer, whose mastery of his art did not always imply exact and detailed knowledge of the subject under discussion. His *Life of Nelson* (1813) is one of the most readable books in the language, and he is

hardly less successful with his *Life of Wesley* (1820) and his *Life of Bunyan* (1830). His *Cromwell* and his *Dr. Andrew Bell*, both published in 1844, are not important; for in the one case the subject is too great for the treatment it receives, while in the other there could never be more than a temporary interest involved. Hazlitt, like Scott, failed with *Napoleon* (1828), but his *Conversations with James Northcote* (1830) is a personal record of unique and stimulating interest. Moore's *Byron* (1830) might well have been other than it is—it would have been somewhat less amorphous had Moore been possessed of stronger critical powers—but it has indubitable qualities of greatness. The *Life of Crabbe* (1834), by his son, does justice to a very worthy subject. With Lockport we reach one of the literary heights and resting-places of the century. His *Burns* (1828) has strength, tone, and style; and after all that has been written on the poet, it maintains its authoritative value. With his other study Lockhart was most happily fitted. He was closer to Scott than even Boswell was to Johnson, and his *Life of Scott* (1837-9) competes with Boswell's great work for the first position among English biographies.

With Carlyle the survey makes a fresh start. A unique figure in literary history, he touched nothing on which he did not leave strong marks of his personality. His lectures on *Heroes and Hero-worship* have much interest for the student of biography. His *French Revolution* is a brilliant picture gallery, that leaves, by its numerous representative delineations, impressions of the most vivid and powerful character. His *Past and Present* is a continuous and fascinating study of personal merit or demerit and the consequent moral influence. His true and sincere man he finds in the lofty poet, as in Schiller; in the comparatively unimportant man of letters—good and great if only he be worthy—as in John Sterling; and in the statesman and the ruler, as in Cromwell and Frederick the Great. Probably Carlyle has not said the last word on his poet and his men of action—other studies of Cromwell have already appeared, Carlyle's own treatment is found to need supplementing, and the *Frederick* is not immaculate—but on John Sterling he is definite and final. Him he has firmly placed with those literary friends who are commemorated in *Lycidas* and *Thyrsis*, and this consideration marks an important feature in biographical work. Carlyle's *Sterling* shows that the biographer discovers and reveals essen-

tial greatness, being himself a prophet or seer. Schiller in its first form appeared in 1825, *Oliver Cromwell's Letters and Speeches* in 1845, *John Sterling* in 1851, and *Frederick the Great* in 1858-65.

Meanwhile other biographers were at work, and making contributions to their subject that in some respects fell hardly short of even Carlyle's achievement. Dean Stanley's *Life of Dr. Arnold* (1844) at once asserted its claim to recognition as a performance of rare excellence; and the same may be said of Hill Burton's *Life and Correspondence of Hume* (1847). John Forster is one of those whose exceptionally excellent results seem to prove the saying that, like the poet, the biographer is born, not made. His *Goldsmith* (1848) was most elaborately refined into its ultimate beauty of form and feature. His *Landor* (1868) and *Dickens* (1872-4), hardly less well done, are both works of very fine quality. His *Swift* remains a promising fragment. Mrs. Gaskell's *Charlotte Brontë* (1857) has distinguished grace and charm—the author, herself an eminent novelist, being able to work with ready sympathy on her deeply suggestive subject. In his *Life of Goethe* (1859) George Henry Lewes produced a singularly bright and substantial work, giving in it one of the best studies of a foreign author made by an Englishman. The Rev. Stopford Brooke's *Frederick W. Robertson* (1865) is, on the other hand, a most successful delineation of one great English preacher by another, whose position was destined to be high in pure literature as well as in the studies peculiar to his profession. James Spedding's *Bacon* (1857-74) is the result of long and special application to his subject, and has monumental significance. By far the greatest work of Mark Pattison is his *Life of Casaubon* (1875), the author fully mastering the inherent difficulties of his task, and producing a book of high and enduring quality. Sir Theodore Martin's *Life of the Prince Consort* (1874-80) happily weaves contemporary history about a personality of unaffected dignity and attractiveness, his somewhat delicate undertaking being accomplished with spirit, tact, and thoroughness. Sir Theodore had qualified as biographer with his bright memoir of his friend Professor Aytoun in 1867, and he gave further illustration of his rare skill, sympathy, and personal devotion in his *Lord Lyndhurst* (1883) and *Helen Faucit, Lady Martin* (1900). Sir George Trevelyan's *Macaulay* appeared in 1876, and at once became a classic. Prof. Masson's *Life of Milton* (1859-80) com-

bines history with biography on a most extensive plan, and challenges criticism of its bulk while presenting the results of wide investigation and practised literary skill. Froude's *Carlyle* (1882-84), lacking in the reticence desired by some, has the countervailing recommendations of comprehensiveness and charming style. His *Julius Caesar* (1886) is a thoroughly sound little book. Mrs. Oliphant, who proved her biographical competency in the *Edward Irving* of 1862, further illustrated it in her *St. Francis of Assisi* (1870), *Montalembert* (1872), *Principal Tulloch* (1888), and her volumes on Florence and Venice. In 1897 she produced the first two volumes of *William Blackwood and Sons: Annals of a Publishing House*. John Morley's *Edmund Burke* (1867), *Voltaire* (1872), *Rousseau* (1876), *Diderot* (1878), *Richard Cobden* (1881), and *Life of Gladstone* (1903), are all standard works of distinguished character. An equally distinguished place is to be assigned to Sir Leslie Stephen's *Henry Fawcett* (1885) and Professor Dowden's *Shelley* (1886). The late nineteenth century did all possible justice to Shakespeare. The outstanding biographies are Halliwell-Phillipps' *Outlines* (7th ed. 1887) and Mr. Sidney Lee's exhaustive *Life of William Shakespeare* (1899).

The first quarter of the twentieth century witnessed a tremendous increase in biographical writing, as well as a marked change in the manner of treatment. Lytton Strachey's *Eminent Victorians* (1918) is one of the earlier examples of the modern type of biography which is not content with a mere recital of incident, but which seeks to set forth the personality of the subject, with his frailties and his weaknesses, as well as his excellencies and virtues.

The mass of material makes any selection of outstanding biographies of the twentieth century inadequate, but the following English biographies are generally considered to rank among the best: Mackail's *Life of William Morris* (1899); Huxley's *Life and Letters of Thomas Henry Huxley* (1900); Balfour's *Life of Robert Louis Stevenson* (1901); Lee's *Queen Victoria* (1902); Monypenny's *Life of Benjamin Disraeli* (6 vols. 1910-20); Benson's *Ruskin* (1911); Sinclair's *The Three Brontës* (1912); Austen-Leigh's *Jane Austen* (1913); Hudson's *Napoleon* (1914); Stacpoole's *François Villon* (1917); Robertson's *Otto Bismarck* (1918); Strachey's *Queen Victoria* (1921); Charnwood's *Abraham Lincoln* (1916) and *Theodore Roosevelt* (1923);

Steuart's *Robert Louis Stevenson* (1924).

Of biographies by American writers there may be mentioned: Marshall's *George Washington* (1804-07); Irving's *Life and Voyages of Christopher Columbus* (1828); P. M. Irving's *Washington Irving* (1909); R. W. Griswold's *Poe* (1850); Gilmore's *President Garfield* (1880); Lounsbury's *James Fenimore Cooper* (1881); Kennedy's *O. W. Holmes* (1883); J. Hawthorne's *Nathaniel Hawthorne and His Wife* (1885); William Lloyd Garrison—*The Story of His Life*, told by his Children (1885-9); J. E. Cabot's *R. W. Emerson* (1887); Nicolai and Hay's *Abraham Lincoln: A History* (1890); J. Parton's *General Jackson* (1892) and *Thomas Jefferson* (1894); E. E. Hale's *James Russell Lowell and His Friends* (1898); A. V. G. Allen's *Phillips Brooks* (1900); Lyman Abbott's *Henry Ward Beecher* (1903); Riis' *Theodore Roosevelt* (1904); Greenstreet's *Life of Thomas Bailey Aldrich* (1908); Palmer's *Life of Alice Freeman Palmer* (1908); Spargo's *Karl Marx* (1909); Gilchrist's *Life of Mary Lyon* (1910); Paine's *Mark Twain* (1912); Barrus' *John Burroughs* (1914); Laura E. Richards' and Maude Elliot Howe's *Julia Ward Howe* (1915); Beveridge's *Life of John Marshall* (1916); Bruce's *Benjamin Franklin* (1917); Will's *Life of Cardinal Gibbons* (1922); Hendricks' *Life and Letters of Walter Hines Page* (1922-5); Wm. Allen White's *Woodrow Wilson* (1924); Lowell's *Life of Keats* (1925); Werner's *Brigham Young* (1925).

Some representative Italian biographies are Vasari's *Painters, Sculptors, and Architects* (1550); Muratori's *Rerum Italicarum Scriptores* (1723-51); *Life of Boccaccio*, by Baldelli and by Tiraboschi; *Machiavelli e i suoi Tempi* (Eng. trans. 1890); Castiglione's *Raphael; Life of Benvenuto Cellini*, translated by John Symington (1917); Papini's *Life of Christ* (1922). In French, the *Vie de Saint Louis of Joinville* (1309) has distinct literary importance, as have also Brantôme's outspoken and vivid *Memoirs* (1659). The *Mémoires* of Saint-Simon (1675-1755) are a rich mine of history and biography. Later French biographers are Voltaire, Cousin, Guizot, Montalembert, and Sainte-Beuve (*Portraits littéraires, Port Royal, Causeries de Lundi*, etc.). Noteworthy also are Keim and Lumet's *Louis Pasteur* (1914); Fleury's *Eugénie, Empress of the French* (1920); Maurois' *Ariel: the Life of Shelley* (1925). German biographers include Forster, Schröckh, Herder, Bruhns, Guhr, Klein, Fischer, Varnhagen

von Ense, Barthold, Haym, Otto Jahn, Ranke, Düntzer, Köstlin, Zeller, Brandl. Brandes' *Goethe* (1923) is notable for its historical scholarship.

Cyclopædic biographical works, both general and particular, have been frequently compiled. These include: *Acta Sanctorum of the Bollandists* (1643-1794); Bayle's *Dictionnaire historique et critique* (1697, etc.); *Biographia Ecclesiastica* (1704); *Biographia Britannica* (1747-66, ed. Dr. Kippis; with additions, 1777-93); *Biographia Classica* (1778); *Biographical Dictionary, New and General* (1798); Michaud's *Biographie universelle* (1811-28; new ed. 1870, etc.); Chalmers' *Biographical Dictionary* (1812-17); Rose's *New General Biographical Dictionary* (1829-47); Chambers' *Biographical Dictionary of Eminent Scotsmen* (1835; new ed. 1859); *English Cyclopædia*, with biographical section (1856); *Nouvelle biographie générale* (1857-66); *Das geistige Deutschland: Deutsches Künstler-Lexikon der Gegenwart* (1898); J. Thomas' *Dictionary of Biography* (1870); Appleton's *Cyclopædia of American Biography* (1888); American Historical Society's *Encyclopedia of American Biography* (1916-23); *Allgemeine Deutsche Biographie* and many others. National dictionaries, in whole or in part, have been produced in Great Britain, Sweden, Holland, Austria, Germany, Norway, Italy, Spain, and Belgium. The *English Dictionary of National Biography*, one of the most comprehensive and thorough of such enterprises, was edited in 66 volumes by Sir Leslie Stephen and Sidney Lee (1885-1901). The first cast of Lee's important biography of Shakespeare was in this work, and its concluding volume contains his full and authentic life of Queen Victoria, which was subsequently published separately.

Individual writers have produced groups of biographies, of which the following are examples:—Allan Cunningham's *British Painters, Sculptors, and Architects* (1829-33); Agnes Strickland's *Queens of England* (1840-8), *Queens of Scotland* (1850-9); Mrs. Jameson's *Early Italian Painters* (1845); Campbell's *Lord Chancellors* (1845-7) and *Chief Justices* (1849-57); Lord Lindsay's *Lives of the Lindsays* (1849); Hook's *Archbishops of Canterbury* (1869-76); Smiles' *Engineers* (1862); Doran's *Their Majesties' Servants* (1864), biographies of English actors and actresses; Grove's *Dictionary of Musicians* (1879-85); Baker's *Biographical Dictionary of Music and Musicians* (new ed. 1911-20); Sir William Fraser's *Scotts of Buccleuch* (1879), and other

similar works on noble houses; Miss Thackeray's *Book of Sibyls* (1883); Hamilton's *Poets Laureate of England* (1888); Dean Burgeon's *Twelve Good Men* (1888); Bigham's *Prime Ministers of Britain 1729-1921* (1922); Buckland's *Dictionary of Indian Biography* (1906); Kelly and Burrage's *American Medical Biographies* (1920).

Many valuable monographs have been contributed to various series, which have multiplied in great profusion. Among these are: 'English Men of Letters,' an admirable biographical library, edited by John Morley; 'English Worthies'; 'English Men of Action'; 'English Statesmen,' containing Lord Rosebery's monograph on Pitt; 'Eminent Women'; 'The Queen's Prime Ministers'; 'Great Writers'; 'Heroes of the Nations'; 'Great Craftsmen'; 'Modern English Writers'; 'Westminster Biographies'; 'Makers of British Art'; 'Great Educators'; 'The World's Epoch-makers'; 'American Men of Letters'; 'American Statesmen.'

**Biological Research, Marine.** See MARINE BIOLOGICAL RESEARCH.

**Biological Survey, U. S.,** a bureau of the Department of Agriculture, established in 1885 as the Division of Economic Ornithology and Mammalogy, and after various changes of name, given its present title in 1905. The bureau studies the distribution and habits of native wild life, makes biological surveys of areas, and maps the natural life zones of the country; investigates the relation of wild birds and animals to agriculture and stock raising, with a view to the control of the harmful and the conservation of the useful species; conducts co-operative campaigns for the extermination of predatory wild animals, destructive rodents, and other injurious forms; experiments in fur farming, and studies the diseases to which fur bearers are subject in captivity; conducts investigations for the improvement of Alaskan reindeer; promotes the conservation of wild life and the establishment of wild-life reservations; maintains bird refuges and big-game preserves; administers Federal laws relating to migratory game, non-game, and insectivorous birds, to importations of foreign wild birds and mammals, and to interstate commerce in wild birds and game; and, through representation on the Alaska Game Commission, assists in the protection of game and land fur animals in Alaska.

**Biol'ogy,** the science of living things, in distinction from phys-

ics and chemistry, which deal with lifeless things. Since living things are dependent for their existence upon lifeless materials, and since matter is constantly passing from one state to the other, and is always subject to physical and chemical law, whether for the time being it is living or non-living, it is perhaps more accurate to define biology as the science which deals with 'matter in the living state' (L. L. Woodruff). As our first contacts with our environment are always through the medium of concrete objects, so man's first knowledge of living things led him to distinguish plants from animals, and the study of plants as such and of animals as such gave us the older sciences of botany and zoölogy. But the longer we study living things, the more clearly do we see that animals and plants are alike in many fundamental characteristics which distinguish them sharply from non-living objects. It is these general features which all living objects have in common that form the subject matter of the newer science of biology.

The term 'biology,' meaning literally 'life lore' was first used by Lamarck in a work which appeared in 1801. It was used in the following year, to all appearance independently, by Treviranus.

**Protoplasm.**—The material basis of life is protoplasm, a substance found in all living creatures, whether plant or animal. It contains the commonest chemical elements of the earth's crust and no others, but is very complex and unstable in its organization, so that any attempt to make a complete chemical analysis of it results in its death. We know, however, what chemical elements it contains and in what general proportions. The most abundant ones, in the order of their abundance, are oxygen, carbon, hydrogen, and nitrogen. In its physical properties, protoplasm is a jelly-like, granular, semi-liquid substance, but we commonly find associated with it formed products which are more conspicuous than the living substance itself, such as the cell-walls of plants, and the shells or skeletons of animals. There is nothing unique in its appearance or in any one of its activities to distinguish it from lifeless objects, but in combination its properties and activities are unique.

Certain lowly forms of life, such as the bacteria of the soil and green plants, are able to take up the lifeless materials of the earth's crust and convert them into protoplasm, but the great majority of organisms can

utilize as food only the bodies or formed products of other organisms. Thus all animals feed upon other animals or upon plants. Plants alone can produce the food for all other organisms from lifeless materials.

**Growth.**—The first noteworthy characteristic of living creatures is their ability to grow at the expense either of lifeless materials or of the formed products of other living creatures. Such materials they 'make over' into their own bodies, a process known as metabolism (q. v.). Their bodies, in turn, undergo destructive changes (largely oxidations) liberating energy for vital processes, such as movement, the secretion of formed products, and the elimination of waste products, as carbon dioxide and urea. Metabolism accordingly may be either constructive or destructive in character. Both types are continuously in progress in living bodies. Generally speaking, it may be said that in plants constructive processes predominate, while in animals destructive processes are more in evidence, since the animal utilizes as food the highly synthesized products of plants.

**Reproduction.**—The growth of an organism continues without interruption, so long as a suitable food supply is available, until a certain size or stage is attained, when reproduction occurs. In this process, the body divides into two or more individuals, instead of one, or it gives off smaller portions of itself, in the form of spores, buds, eggs, or other special reproductive bodies, capable of developing under suitable conditions into a form like that of the parent individual. So far as we know, living organisms never arise except as parts separated from previously existing living individuals. This is not to say, however, that this has always been the case. There may, indeed, have been a time when no living matter existed on the earth. If so, life must have had its beginning here either by the origin of living from previously lifeless matter, or by the introduction of living matter, through space, from some other world. Both views have their supporters, those who advocate the origin of life on the earth suggesting that it may have occurred when that planet was in a very different physical state from its present one.

**Cellular Organization.**—Plants and animals are alike in having bodies which are not homogeneous in structure but are made up of protoplasmic units called cells, comparable to the bricks of which a house is built. The simplest animals and plants have

one-celled bodies, comparable to buildings of reinforced concrete cast in a single piece, but all the larger and more highly organized animals and plants have multi-cellular bodies, with cells of many different kinds, performing widely different functions, united in one co-operative organization. Thus in the human body, muscle cells, bone cells, blood cells, stomach cells, kidney cells, and others all perform their diverse functions under the general control of the brain and spinal cord composed of nerve cells. All these diverse cells are descendants of an original fertilized egg cell, the earliest recognizable stage in which the individual existed as a separate and distinct living creature.

Since the simplest of living creatures are one-celled and since in general all other living creatures begin their individual lives in a one-celled stage, it is supposed that the one-celled condition was primitive, and that multi-cellular animals and plants are of secondary origin.

A cell is a unit-mass of protoplasm capable, under suitable conditions, of performing the vital functions of metabolism, growth, and reproduction. It contains, usually, a central body known as a nucleus, which is indispensable to its continued existence, and which usually takes the initiative in cell division. In the nucleus is found an organized material, chromatin, which is believed to be the physical basis of heredity. The extra-nuclear portion of the cell is known as cytoplasm. In it the formed products of the cell arise, muscle and nerve fibres, cartilage, etc., in animals; starch grains, cellulose walls, etc., in plants. The special branch of biology devoted to the study of the finer structure of the cell is called *cytology*. (See CELL.)

**Varieties of Reproduction.**—The capacity for reproduction—*i.e.* the production of new individuals like the parent individual and derived from its own substance—has been mentioned as one of the most general and characteristic properties of living things. Reproductive processes are of the most varied kinds. In general, they may be distinguished as asexual and sexual. In asexual (or non-sexual) reproduction, the parent individual gives rise to new individuals by division of its own body either equally (as in fission and sporulation) or unequally (as in budding). Asexual reproduction is prevalent among the simpler forms of life, particularly the one-celled. It is the only form of reproduction known among bacteria, as well as

among some other organisms either primitive or degenerate in character. For this reason it is supposed to have preceded sexual reproduction in the evolution of life.

Sexual reproduction consists essentially in the fusion of two reproductive cells, individuals or potential individuals, to form a single new individual. Among the one-celled animals and plants, where asexual reproduction is the common and habitual mode of multiplication, sexual reproduction may be resorted to in time of stress, when the food supply becomes insufficient, or the temperature or moisture conditions unfavorable. It is probable, indeed, that sexual reproduction originated under such conditions. It is a common device for organisms, when conditions are unfavorable for growth, to pass into a state of inactivity, becoming encysted or forming spores with thick resistant walls and dense protoplasmic contents containing little moisture. The seeds of flowering plants represent such a dormant stage, primarily adapted for carrying the species over unfavorable seasonal changes. In many groups of the lower animals and plants sexual reproduction is frequent in connection with the assumption of a dormant state. It is obvious that when unfavorable conditions are killing off the majority of the individuals in a species, a greater chance of survival is secured by such individuals as fuse in pairs, uniting their mass for the endurance of famine and becoming encysted in this form until the time of distress is over.

Sexual union occurs, even in the highest animals and plants, only between reproductive bodies in the one-celled stage. It must have originated among one-celled organisms and because of its obvious advantages been continued into the many-celled forms of life. Cells capable of sexual union are known as *gametes*. The fusion of two gametes to form a new individual is known as *fertilization*, and the new cell or individual which it produces is called a *zygote*. Gametes which unite in fertilization must, in general, be alike; that is, they must be of the same kind of living substance, belonging to the same species. Indeed, the ability of gametes to unite in fertilization has long been utilized to determine origin from individuals of the same species. As a test, however this is not entirely satisfactory, since some species will cross with each other, producing remarkably vigorous but completely sterile offspring. This is the case with the mule, product of a mare mated with

an ass. If gametes are to produce fertile offspring, a certain degree of similarity is necessary. From recent studies it seems probable that the requirements are met when the chromosome number (see HEREDITY) is substantially the same in the uniting gametes, and these chromosomes contain many homologous genes and are capable of conjugation in pairs. A certain diversity between the uniting gametes is, however, obviously advantageous. Hence the superiority of cross fertilization over close or self fertilization among flowering plants and the advantages of outbreeding in animal husbandry. (See HEREDITY.)

Gametes have become differentiated in form among the higher animals and plants into two types, egg and sperm (pollen in the case of plants). The egg is a non-motile gamete in which or with which is deposited nourishment for the development of the new individual; the sperm is motile and travels light (without storage materials), carrying to the egg a new set of chromosomes and imparting to it the stimulus to development. The *dissimilarity* of gametes capable of union in fertilization makes for variability among later generations of the offspring, and this has undoubtedly been an important factor in the evolution of animals and plants.

*Parthenogenesis* is a form of degenerate sexual reproduction, in which the egg develops without the ordinary stimulus of fertilization. The inheritance is in this case purely maternal.

**Sex.**—The differentiation of individuals as male or female is a phenomenon distinct from the development of sexual reproduction, that is the origin of new individuals by fusion of gametes, for sexual reproduction may exist where individuals differentiated as male or female do not occur (see HERMAPHRODITE). Sexual individuals, males and females, are recognizable when an individual is restricted to the production of one kind of gamete, pollen or egg cell, but not both. Thus ash trees and poplar trees regularly produce only one type of gamete and are distinguishable either as male trees (pollen producers) or female trees (producers of egg cells and seeds). In all the higher animals (crustacea, insects, and vertebrates), male and female sexes are differentiated, but in most of the older (lower) animal groups hermaphroditism (production of both male and female gametes in the same individual) occurs very commonly, just as it does in flowering plants. In the flatworms, hermaphroditism is the

rule; in the mollusca, it is common, but is complicated in some cases by the development of the male and female gametes at different periods of the animal's existence, a condition known as *successive hermaphroditism*. A comparable situation exists in cucumbers, squashes, and related flowering plants, which produce male and female blossoms on the same plant.

The condition of complete sexual separateness was probably preceded by hermaphroditism in the evolution both of the higher animals and of the higher plants. In both cases the advantage arising from cross fertilization probably favored the attainment of the sexually separate state, since in hermaphroditism self fertilization would naturally predominate unless prevented by the ripening of male and female gametes at different times in the same individual, or by some physiological device. Such devices are, in fact, common in perfect (hermaphroditic) flowering plants, resulting in self sterility. The pollen will not grow fast enough on the stigma of a flower of the same plant to secure fertilization of the flower. Thus, foreign pollen, which will grow faster, commonly effects fertilization and produces a seedling of greater vigor, because it is crossbred. In at least one species of hermaphroditic animal (*Ciona intestinalis*), a similar incompatibility between eggs and sperm produced by the same parent ensures the occurrence of cross fertilization, even when eggs and sperm are being produced simultaneously.

The sexually perfect or hermaphroditic condition is perpetuated in a species, like any other specific character, by heredity. The capacity inheres in every new individual to produce at maturity both male and female gametes in appropriate containers and with suitable efferent ducts or other secondary sexual characters. This does not violate the fundamental rule that like produces like. The same is apparently not true among sexually separate organisms. Here a male and a female parent produce offspring which are like one or the other in sex, but not both. One sex is invariably suppressed, the other fully expressed in the zygote. It has long been a source of speculation how this sexually separate condition is perpetuated, how sex is determined, why the sex character of one parent, rather than of the other, is expressed in the offspring.

The discovery of Mendel's law of heredity threw some light on this question, since in Mendelian inheritance (see HEREDITY) a

character of one parent may dominate or suppress an alternative character of the other parent. The idea occurred to Mendel, and has since been more fully developed by others, that maleness and femaleness were inherited, among sexually separate organisms, as a pair of alternative Mendelian characters. But the difficulty remained to account for the failure of either sex state uniformly to dominate the other, since the offspring are as often of one sex as the other. At this point a fortunate discovery of the cytologists cleared up the mystery. The squash bug (*Anasa tristis*) was the first organism in which the mechanism of sex determination was definitely ascertained. Females of this species contain in the nucleus of each body cell twenty-two chromosomes (eleven pairs). This number is reduced in the mature egg to eleven, one representative of each pair. But males contain in each body cell twenty-one chromosomes (ten pairs and an odd one). The ten pairs correspond with ten pairs of the female; the odd one corresponds with one member of the eleventh pair of the female. The sperm cells formed by the male contain either ten or eleven chromosomes. A ten-chromosome sperm, on fertilizing the invariably eleven-chromosome egg, produces a male zygote ( $10 + 11 = 21$ , the characteristic male number). An eleven-chromosome sperm, on fertilizing an egg, produces a female zygote ( $11 + 11 = 22$ , the characteristic female number). Sex determination, therefore, in this species, rests with the odd chromosome, one of which in a zygote makes it a male, two a female. In the other chromosomes, any genetic factors influencing sex are so evenly balanced (being equally represented in both sexes) that it remains for the odd chromosome to decide the issue.

In other animals and in the dioecious plants a similar (though in most cases slightly different) mechanism determines the sex of offspring. In man, as in the squash bug, there are produced two different kinds of sperm, as a rule in equal proportions and simultaneously, one kind being male determining, the other female determining. It follows in accordance with the laws of chance that about half the children born are boys and half girls, the sex of each child depending upon which kind of sperm takes part in its production. Environmental conditions, age of mother, etc., influence the result, if at all, in only a minor degree and indirectly.

In a few cases (birds and

moths) the determination of sex depends upon the existence of two kinds of eggs, rather than two kinds of sperm. In such cases an odd chromosome, or an unlike pair of chromosomes, is probably present in the female, while the male contains only pairs of like chromosomes. This is strongly indicated by the breeding evidence, though the cytological evidence is at present less complete than in the cases previously mentioned, which are typical for most insects and for mammals.

**Ontogeny.**—In the higher forms of life, development from the egg (which is one-celled) is often a complicated process. The study of this process is the special field of embryology. In general, the succession of stages which occurs in the development of one of the higher animals is similar to the gradation of forms among its supposed ancestors. One of the best substantiated generalizations of biology is the so-called biogenetic law, that ontogeny (the development of the individual) is a repetition of phylogeny (the development of the race). In a general way this is undoubtedly a valid law, though a too literal interpretation would lead one into absurdities. Many embryological processes have probably no ancestral significance but are the consequence of mechanical necessity, while many ancestral modes of development have probably been dropped from ontogeny. The similarities which persist depend probably upon the similarity in structure of the eggs produced today to those produced anciently by the ancestors of existing species. Like eggs develop in like manner, though ages apart in time. (See EMBRYOLOGY.)

**Evolution.**—One of the major deductions of biology is the theory of organic evolution, which maintains that the organisms now existing on the earth are direct lineal descendants of other organisms of past geological ages. Where differences exist between present day organisms and their ancestors, those differences have originated gradually, as they are now originating, and have replaced earlier conditions because of their adaptive character, *i.e.* because their possessors were better adapted by their possession to the conditions of their existence. This in brief is the theory of organic improvement through 'natural selection,' or the 'survival of the fittest.' (See EVOLUTION.)

Because of the similarities between different forms of life, their common cellular organization, the similarity of their processes of metabolism, growth and reproduction, it seems rea-

life' apart from the general metabolism of the body. Many of the wearisome obscurities in the discussion concerning the transmissibility of 'acquired characters' or 'modifications'—*i.e.* structural changes effected on the soma as the result of environmental or functional influence—are due to the lack of a sufficiently concrete appreciation of the facts of the case. Sometimes the germ-cells are set apart at an early stage in development; sometimes their distinct appearance is late; in either case they owe their peculiar power of reproducing to their retention of the original organization of the fertilized ovum. And though they may be strengthened or weakened by the general metabolism of the body, or even thereby prompted to vary, this fact is very different from the Lamarckian assumption that specific changes in the body can affect the germ-cells in a manner so specific and representative that the 'modifications' of the parent are transmitted to the offspring. See HEREDITARY.)

Another result involved in body-making is *natural death*. We recognize at least three ways in which a full stop may be put to the life of an individual—(1) by some violent shock which shatters the organization, as when the grouse falls before the sportsman's gun; (2) by the poisons and lesions and blockages produced by intruding parasitic organisms, as when the grouse dies of grouse disease, known to be due to bacterial infection; (3) by the accumulation of physiological arrears or fatigue effects (especially in organs like brain, heart, and liver), which mount up until the organism, in a state of physiological insolvency, dies—a natural death. This consideration of the different modes of death brings us naturally enough to another problem—the continuance of life.

*The Continuance of Life.*—While it is characteristic of living organisms that they persist in spite of their ceaseless changes (metabolism), there are in most cases limits to this endurance. The structural effects of fatigue are not always removable by rest and food; arrears accumulate quickly or slowly according to the nature of the organism; eventually they become fatal in their amount, and the creature dies. It has been maintained that the unicellular animals are exempt from this natural death; their relative simplicity of structure makes complete recuperation possible, their capacity of regenerating injured portions is perfect, and their modes of reproduction are inexpensive. The so-called 'immortality of the Protozoa' suggests that reproduction should

not be looked at as primarily an arrangement securing the persistence of a mortal race, for reproduction is more primitive than death, and is indeed one of its frequent causes.

Here the biologist has to face the problem presented by the different modes of reproduction: (a) asexual, when a portion of the parent organism, whether continuous or discontinuous, grows into or reproduces a unit-whole, more or less like the parent, as in the budding hydra or the fragmenting sea anemone, the gemma-producing liverwort or the bulb-making tiger-lily; (b) sexual, when there are definite egg-cells or ova, and sperm-cells or spermatozoa. This scheme is complicated by the occurrence of a degenerate form of sexual reproduction (parthenogenesis), when ova develop without fertilization by sperm-cells; and by the occurrence of alternations of sexual and asexual reproduction, as in the life-history of many zoophytes, or of most of the fernlike plants. Starting with the growing cell—where the increase of mass tends to outrun its increase of surface—the biologist has to endeavor to explain what 'the limit of growth' means, and to show that the reproduction which so often ensues at the limit is in its simplest expressions a mode of discontinuous growth. Experimental work shows that a non-nucleated fragment of a protozoon will for a time move and respond to stimuli, but does not feed or grow; which goes to show that what is essential in reproduction is that the separated portion or portions should have the characteristic organization of the parent organism. And this leads us again to the important general idea of 'gentle continuity'—the idea that the germ-cells have their particular power of reproducing because they are the unmodified, unspecialized lineal descendants of the germ-cells which gave rise to the parent organism.

It is especially to Virchow (1858) that biology owes the conception 'of an uninterrupted series of cell divisions, extending backward from existing plants and animals to that remote and unknown period when vital organization assumed its present form. Life is a continuous stream. The death of the individual involves no breach of continuity in the series of cell divisions by which the life of the race flows onwards. The individual body dies, it is true, but the germ-cells live on, carrying with them, as it were, the traditions of the race from which they have sprung' (E. B. Wilson).

*Fertilization.*—The study of reproduction must include an inquiry into the origin and meaning of fertilization. As to the former,

the flowing together of many cells to make a 'plasmodium,' the union of three or four in 'multiple conjugation,' the ordinary conjugation of two apparently similar units, and the union of slightly dimorphic cells are possible stages, leading towards what is certainly typical both in animals and plants—the union of a minute active spermatozoon with a relatively large passive ovum. As to the meaning of the process, there are, in the first place, many facts which suggest that the nuclei are the chief bearers of the hereditary qualities of the (usually) two parents; and, in the second place, there are other facts which suggest that the entrance of the spermatozoon supplies some dynamic stimulus, which prompts to division. In many cases it has been shown that, besides the nucleus, the spermatozoon brings into the ovum a minute corpuscle called the centrosome, which seems to play an important part in the segmentation which follows. Of much interest also is the process of maturation which precedes fertilization; in that process the number of nuclear elements or chromatin bodies in the egg-cell and in the sperm-cell is reduced, so that after fertilization the number which is characteristic of the species is still present.

In 1878 Huxley wrote: 'It is conceivable, and indeed probable, that every part of the adult contains molecules derived both from the male and from the female parent; and that, regarded as a mass of molecules, the entire organism may be compared to a web, of which the warp is derived from the female and the woof from the male.' This has been confirmed by subsequent research, and has been rendered more precise by the evidence, which goes to show that a very important part of the web is represented by the chromatin substance of the nuclei. The modern interpretation is thus summed up by Prof. E. B. Wilson: 1. From the mother comes, in the main, the cytoplasm of the embryonic body, which is the principal substratum of growth and differentiation. 2. From both parents comes the hereditary basis or chromatin by which these processes are controlled, and from which they receive the specific stamp of the race. 3. From the father comes the stimulus inducing the organization of the machinery of mitotic division, by which the egg splits up into the elements of the tissues, and by which each of these elements receives its quota of the common heritage of chromatin.

*Sex.*—The biologist finds another series of problems in the facts of sex. Of two eggs in a nest, one will develop into a male,

the other into a female; what is the difference between the eggs, and their development, and their final result? Is it that the animate mechanism which we call an organism has, so to speak, two grades of gearing, and that one or the other may be fixed by environmental influences acting on the germ-cells, or on the embryos, or in some cases (*e.g.* tadpoles) even on the larvæ? Is there one constitutional and fundamental difference, which we compare to a difference in gearing, which finds expression in the hundred and one differences in structure and habit which so often distinguish male from female? That every germ-cell has a complete specific inheritance—potentially complete for either sex—seems obvious enough from cases like that of drone bees, who, though males, have no father; but how are we to conceive of the process by which male characteristics find expression in the development of one germ-cell, and female characteristics in another, or both in a third (hermaphroditism)? From these fundamental questions, still far from answerable, the biologist will pass to the adaptive relations of one sex to another and to functions that are characteristic of each, to the problem of preferential mating and sexual selection, and so on along an ever-lengthening radius.

*Development.*—Let us suppose that the biologist has become in some measure clear that an egg-cell is able to reproduce an organism like the parent, in virtue of its genetic continuity with the fertilized egg-cell which gave rise to that parent; that he has interpreted the fertilization of the egg-cell (*a*) as an intimate and orderly union of maternal and paternal heritages (tending, on the one hand, to insure specific constancy, and yet, on the other hand, to prompt variations), and (*b*) as also implying a stimulus to that cleavage or segmentation with which all development begins. He has still before him the problems presented by each and every process of development. Out of the apparently simple there emerges the obviously complex; each stage seems to condition its successor, but the actual nexus of events is obscure. How much of the process is the unfolding of a preformed organization, how much of it is due to the reciprocal action of cells, and to the reaction of the whole embryo to its environment? How is a fit statement to be made of the fact that one of the first two cells into which an egg (*e.g.* of the frog) divides will in certain circumstances develop by itself into a one-sided embryo, and in other circumstances into a half-sized complete embryo? Again,

while it seems fairly clear that the maternal and paternal contributions which come together in fertilization form the warp and woof of the developing embryo, and that the little body—called the centrosome—which the spermatozoon brings into the egg along with the paternal heritage behaves like the weaver at the loom, how are we to interpret the fact that in the final result the hereditary resemblance is sometimes almost exclusively to one parent and sometimes an average between the two? Or, again, how is a generalization to be framed which will recognize, on the one hand, the tendency of the individual development to recapitulate the racial evolution, and, on the other hand, the fact that there are specific peculiarities which are capable of being detected almost from the first? In the life-history of the frog there are hints of a recapitulation of ancestral piscine stages, and yet, from the beginning and throughout, the developing organism is distinctly amphibian.

*Heredity.*—The problems of development are closely united to those of heredity, or the relation of genetic continuity between successive generations. This relation has its visible material basis in the germinal matter of the ova and sperm-cells, and what most distinguishes the modern conception of the germ-cells is a recognition of their continuity in character and organization with the germinal material from which the parent arose. It is to this continuity that they owe their power of developing into organisms like the parents.

While there tends to be a great completeness in the expression of what may be called the specific inheritance—like tending to beget like—the completeness of hereditary resemblance is only approximate. Thus the biologist is brought to face the problem of variations—*i.e.* inborn or congenital differences within a species as distinguished from differences due to 'modifications' or the structural effects on the body induced by changes in the functional and environmental influences. The former are heritable or transmissible, but this has not been proved for the latter.

The biologist has also to study the expression of the offspring's inheritance in relation to the characteristics of the two parents; it may be a blend, or it may be unilateral, or it may be a combination without being a blend. The inheritance is normally dual, but the contributions from the two parents may not find equal expression; moreover, since the inheritance of each parent was also dual, and so on backwards, an

inheritance is in a strict sense mosaic or multiple, made up, as it were, of contributions from many ancestors. The problems become yet more complicated when the facts of filial regression, atavism, and reversion are considered. For some higher animals, and notably for man, it is likewise necessary to take account of what may be called the external as opposed to the organic heritage—the influence, in other words, of traditions, customs, and the like. Here biology is linked to comparative psychology and sociology.

*Evolution.*—The largest problems which the biologist raises are those of organic evolution. A survey of plants and animals discloses a maze of relationships to which here and there the genetic clue has been found; in a few cases a more than plausible genealogical tree has been constructed. One species seems often to merge with another, as nebula with nebula in the heavens; even when the central or more typical forms in two or three related groups seem distinct enough, there are outliers which might equally well be affiliated to any one of the three sets. Even genera may be arranged in series, which seem to represent successive steps of progress, or it may be of retrogression; and there are not wanting 'synthetic types' or 'connecting links' uniting stocks which would otherwise appear quite discontinuous. An anatomical survey shows us the same material of bone, muscle, and nerve twisted and fashioned into manifold forms—*e.g.* in the fore or hind limbs of vertebrates—and the persistence of vestigial structures in organisms where they seem of little moment or relevancy, though they are essential organs in other organisms of lower degree. Another survey shows the plasticity of the organism, as an individual under the moulding influences of environment and functions, and as a race when we compare with precision the members of successive generations. The rock or geological record, extending back for many millions of years, shows the gradual emergence of higher and higher forms of life (higher as judged by the twofold standard of differentiation and integration), and affords the sublime spectacle of races gradually attaining a climax and then waning into extinction. And again, the study of development shows in a few days or weeks or months an individual progress from the fertilized egg-cell to the finished form—a process in which each step seems to condition and determine the next, in which obvious complexity is evolved from apparent simplicity. A survey of these different sets of facts has led to

the formulation of the general evolution idea, that the present is the child of the past and the parent of the future, that the forms of life around us have been derived by long-continued processes of change from ancestors on the whole simpler and more generalized. The evolution formula suggests a mode of origin, a process of becoming, a progress, or it may be in some cases a retrogression, from one established order of being to another; and it owes much of its cogency to the fact that it appears to be applicable to all orders of facts—from the solar system to human institutions. It cannot be exactly demonstrated, as the doctrine of the conservation of energy may be, but it is justified, like the conception of the ether in physics or the atomic theory in chemistry, by its utility as a thought-economizing general formula, unifying a multitude of facts, and contradicted by none.

But while the general idea (or, as some would say, fact) of evolution is all but unanimously accepted by biologists—and it is the only scientific interpretation in the field—there is great uncertainty in regard to the factors in the process.

These factors may be distinguished as primary and secondary. Originative factors are those that induce hereditary changes or variation; the secondary or directive factors are those that operate upon the raw material afforded by the first. As to the first, precise inquiry is only beginning, for we know almost nothing in regard to the causes of variation, and relatively little in regard to their nature and amount. It may be that environmental and functional changes affecting the body also exert an influence on the complex germinal material; it may be that the processes of maturation and fertilization induce new permutations and combinations of molecules in the material basis of inheritance; and it may be that environmental influences act directly on liberated germ-cells before fertilization occurs. But it is premature to make any definite statement. Researches into the actual occurrence of variations show that they are very frequent, that they are sometimes 'saltatory,' 'transient,' or 'discontinuous'—that is, as it were, leaps to a new position of organic equilibrium—and that they are sometimes slow and gradual, like stages of growth or phases in development; that they are sometimes genuinely new departures, often describable as 'freaks' or 'sports,' and that they are often 'definite,' expressing a little more or less of one of the parental or specific characteristics; that they

are sometimes apparently particulate, affecting one part or organ of the body, and sometimes more general, as if the organism varied as a whole and not piecemeal. But many years of work will be necessary before general statements as to the nature of variations can be made with anything like safety.

In actual practice, the biologist has to begin by recording the observed differences between members of a species, say of crab and buttercup. Then must follow an attempt to discriminate between those differences which can be demonstrably described as due to 'modifications' (bodily changes due to diversity in the environment or function of the organisms) from those which cannot be so regarded, and are therefore interpreted as the outcrops of germinal variations. If it be true that the former do not in any specific or representative manner affect the inheritance, then they can have no more than an indirect effect in evolution. But this question is still much discussed. As to the secondary or directive factors which operate upon the raw material afforded by variability, there are as yet only two which will stand much testing—*viz.* natural selection and isolation.

The first is a result of what is called, 'in a wide and metaphorical sense,' as Darwin said, the struggle for existence. From two parents many offspring usually arise; the conditions of existence put limits to the increase of population, and some form of struggle ensues. There is competition between fellows of the same kin—*e.g.* between rats, between locusts, between seedlings in a plot—competition for food, for standing-room, for mates, and so on; and there is the struggle between the variable organism and its inanimate environment, which is also variable. Similarly, there may be struggle between ova and between spermatozoa; the conception is all-embracing. It varies infinitely in its form and intensity; but wherever the effectiveness of vital response to given conditions is of critical moment, there natural selection operates. The relatively less fit tend to be eliminated, to have shorter, less successful lives, to have fewer and less vigorous offspring, and so on. The relatively more fit (which need not mean *higher*) tend to survive; and if the relative degrees of fitness depend on germinal variations (by hypothesis inheritable), there results a process of racial evolution.

The second directive factor on which some reliance may be placed is expressed in the term isolation, which includes a variety of ways in which free intercrossing be-

tween members of a species is prevented—*e.g.* by geographical barriers, by change of habit, by a reproductive variation causing mutual sterility between two sections of a species living on a common area, and so on. The importance of this factor becomes evident when we consider that without some form of isolation—corresponding to one part of the breeder's procedure—particular variations of small amount would tend to be lost or neutralized by intercrossing. But although Romanes went the length of saying that 'without isolation, or the prevention of free intercrossing, organic evolution is in no case possible,' there is still a lack of sufficiently precise evidence in regard to the alleged swamping of new variations when there is no isolation, and in regard to the supposed general prevention of free intercrossing.

In regard, then, to the factors of organic evolution, as in regard to the other difficult problems of metabolism and growth, differentiation and integration, reproduction and sex, development and heredity, biology has still to wait awhile for its foundation-stones. The outlook is, however, hopeful, especially when we consider the rapidly-increasing body of workers, the improvements in method, the more frequent recourse to experimental tests, the growing tendency to the correlation of different lines of inquiry and of the different sciences, and the dominance of the critical mood.

Some biological classics:—Carl Ernst von Baer, *Ueber Entwicklungsgeschichte der Thiere: Beobachtung und Reflexion* (1828-37); Charles Darwin's *Origin of Species* (1859; new ed. 1902), *Descent of Man* (1871; new ed. 1901), *Variation of Plants and Animals under Domestication* (1868); Goethe's *Zur Morphologie* (1790), etc.; Ernst Haeckel's *Generelle Morphologie* (1866); Lamarck's *Philosophie Zoologique* (1809); Fritz Müller's *Für Darwin* (1864); M. J. Schleiden's *Beiträge zur Phylogenesis* (1838; trans. 1847); Th. Schwann's *Mikroskopische Untersuchungen* (1839; trans. 1847); Herbert Spencer's *Principles of Biology* (1864-66); R. Virchow's *Die Cellularpathologie* (1858).

Some works discussing the general problems of biology:—W. K. Brooks's *Foundations of Zoology* (1894); Ernst Haeckel's *Generelle Morphologie* (1866); C. Lloyd Morgan's *Animal Behavior* (1900), new ed. of *Animal Life and Intelligence* (1890-1); Karl Pearson's *The Grammar of Science* (new ed. 1900); Herbert Spencer's *Principles of Biology* (1864-6); J. A. Thomson's *The Science of Life* (1899); M. Verworn's *General Physiology* (trans. 1899); J. Ward's

*Naturalism and Agnosticism* (1899); A. Weismann's *The Germ-Plasm* (1893).

Some text-books of zoology:—C. Claus's *Grundzüge der Zoologie* (4th ed. 1880-2); Hatchett Jackson's edition of G. Rolleston's *Forms of Animal Life* (1888); T. H. Huxley's *Anatomy of Invertebrated Animals* (1877), and *Anatomy of Vertebrated Animals* (1871); Ray Lankester's *Treatise on Zoology* (in progress, 10 vols. 1900, etc.); T. J. Parker and W. A. Haswell's *Text-book of Zoology* (2 vols. 1897).

Some text-books of botany:—A. B. Frank, *Lehrbuch der Botanik* (1892); Kerner von Marilaun, *Pflanzenleben* (1887 and 1891, also an English translation); F. Ludwig's *Lehrbuch der Biologie der Pflanzen* (1895); J. von Sachs's *Text-book of Botany* (2nd ed. 1883); W. Pfeffer's *Pflanzenphysiologie* (1897); Strasburger, Noll, Schenck, and Schimper, *A Text-book of Botany*, trans. by Porter (1898); S. H. Vines's *Student's Text-book of Botany* (1895).

General morphology:—Herbert Spencer's *Principles of Biology* (1864-6; first volume revised, 1898); Ernst Haeckel's *Generelle Morphologie* (1866)—a scarce classic.

See also W. His, *Unsere Körperform* (1874); G. Jaeger, *Allgemeine Zoologie* (1878); P. Geddes's article 'Morphology,' *Encyc. Brit.*; Bronn's *Morphologische Studien* (1858); treatises on Comparative Anatomy of Animals, by Gegenbaur (trans. 1878; in process of re-ed.); Wiedersheim (trans. of 2nd ed. 1897); and the older works of Owen and Huxley. Compare also K. von Zittel's *Text-book of Palaeontology* (trans. and re-ed. 1900); Hatchett Jackson's ed. of G. Rolleston's *Forms of Animal Life* (1888).

General physiology:—Max Verworm's *General Physiology* (trans. 1899); Claude Bernard's *Leçons sur des Phénomènes de la Vie commune aux Animaux et aux Végétaux* (1878); C. B. Davenport's *Experimental Morphology* (1897 and 1899, in progress).

Comparative physiology:—Jeffrey Bell's *Comparative Anatomy and Physiology* (1887)—an excellent introduction; C. F. W. Krukenberg's *Vergleichend-physiologische Studien und Vergl.-Physiol. Vorträge* (1881-9); A. B. Griffiths's *Comparative Physiology* (1891); W. D. Halliburton's *Essentials of Chemical Physiology* (4th ed. 1901); M. I. Newbigin's *Color in Nature* (1898).

Embryology:—F. M. Balfour's *A Treatise on Comparative Embryology* (1880-1)—a classic work, but now requiring to be corrected by more recent investigations; Sir M. Foster and F. M. Balfour's *Elements of Embryology*, revised by Sedgwick and Heape (1883)—

mostly occupied with the development of the chick; O. Hertwig's *Embryology of Man and Vertebrates* (trans. 1893); Korschelt and Heider's *Embryology of Invertebrates* (trans. 1895); A. Milnes Marshall's *Vertebrate Embryology* (1893); C. Sedgwick Minot's *Human Embryology* (1892); A. C. Haddon's *Introduction to the Study of Embryology* (1887); L. Roule's *Embryologie Générale* (1893), and *Embryologie Comparée* (1894); Bergh's *Allgemeine Embryologie* (1895).

For discussion of the general theory of development, see O. Hertwig's *The Biological Problem of To-day* (trans. 1896), and W. Roux's *Gesammelte Abhandlungen über Entwicklungsmechanik der Organismen* (1895).

Palaeontology:—H. A. Nicholson and R. Lydekker's *Manual of Palaeontology* (2 vols. 1889); K. A. von Zittel's *Text-book of Palaeontology* (trans. by C. R. Eastman, vol. 1. 1900); Gaudry's *Les Enchaînements du Monde Animal* (1888-90); M. Neumayr's *Die Stämme des Thierreichs* (vol. 1. 1889); also text-books by Bernard, Hoernes (1886), Koken (1882), Steinmann and Döderlein (1890), etc.

Etymology:—The works of Darwin, Wallace, Spencer, Haeckel; W. Bateson's *Materials for the Study of Variation* (1894); Samuel Butler's *Evolution, Old and New* (1879); E. D. Cope's *Origin of the Fittest* (1887); *The Primary Factors of Organic Evolution* (1896); G. H. Th. Eimer's *Organic Evolution* (trans. 1890); P. Geddes's article 'Variation and Selection,' *Encyc. Brit.*; J. T. Gulick's 'Divergent Evolution through Cumulative Segregation,' *Jour. Linnean Society* (vol. xx. 1888, etc.); St. George Mivart's *The Genesis of Species* (1871), *Lessons from Nature* (1876), etc.; C. von Nägeli's *Mechanisch-physiologische Abstammungslehre* (1884); K. Pearson's *The Chances of Death* (1897); *The Grammar of Science* (new ed. 1900); G. T. Romanes's 'Physiological Selection,' *Jour. Linnean Society* (vol. xix. 1886); *Darwin and after Darwin* (3 vols. 1892-7); Karl Semper's *The Natural Conditions of Existence as they affect Animal Life* (1881); H. de Varigny's *Experimental Evolution* (1892); M. Wagner's *Die Entstehung der Arten durch räumliche Sonderung* (1889); A. Russel Wallace's *Darwinism* (1889); A. Weismann's *The Germ-Plasm* (1893) and *The Evolution Theory* (trans. 1904).

Protoplasm:—For full and critical discussion and bibliography, E. B. Wilson's *The Cell in Development and Inheritance* (2nd ed. 1902); Yves Delage's *La Structure du Protoplasma*, etc. (1895). For physiological aspects in particular, Max Verworm's *General*

*Physiology* (trans. by Lee, 1899); a valuable address by Sir J. S. Burdon-Sanderson, *Nature*, xl., Sept., 1889, pp. 521-526, and Rep. Brit. Association for 1889; and three articles in the *Encyc. Brit.*—'Physiology' (Sir Michael Foster), 'Protoplasm' (P. Geddes), 'Protozoa,' large type (E. Ray Lankester).

For philosophical discussion, see T. H. Huxley's famous address, 'Protoplasm: the Physical Basis of Life' (in his *Collected Essays*); Hutchison Stirling's *As Regards Protoplasm* (1872); the chapter 'Vitalism' in Bunge's *Physiological Chemistry* (trans. 1890).

The cell:—Of great value in itself and in its bibliography, E. B. Wilson's *The Cell in Development and Inheritance* (2nd ed. 1902). See also R. S. Bergh's *Vorlesungen über die Zelle* (1894); Y. Delage, *op. cit.* (1895); L. F. Hennequy's *Leçons sur la Cellule* (1896); O. Hertwig's *Die Zelle und die Gewebe* (1893 and 1898, the first part trans. 1895). Two important initial works in histological analysis were Leydig's *Lehrbuch der Histologie des Menschen und der Thiere* (1857), and E. W. von Brücke's *Elementarorganismen* (new ed. 1898). For instruction as to the practical study of cells, the work of V. Haeckel, *Praxis und Theorie der Zellen- und Befruchtungs-Lehre* (1899) can be strongly recommended.

Reproduction and sex.—A convenient introduction, with bibliography, will be found in *The Evolution of Sex* (revised ed. 1901), by P. Geddes and J. A. Thomson; Darwin's *Descent of Man* (new ed. 1901). See also A. Weismann's papers on heredity and kindred subjects (trans. 1889); J. Cossar Ewart's *The Penycuik Experiments* (1899); J. T. Cunningham's *Sexual Dimorphism* (1900), with Lamarckian interpretation.

Heredity:—Yves Delage's *La Structure du Protoplasma, l'Hérédité*, etc. (1895); Francis Galton's *Natural Inheritance* (1889); Prosper Lucas's *Traité Philosophique et Physiologique de l'Hérédité Naturelle* (1847); Th. Ribot's *L'Hérédité Psychologique* (new ed. 1882); H. de Vries's *Intracellulare Pangenesis* (1889); A. Weismann's *Essays on Heredity* (trans. 1889), and *The Germ-Plasm* (1893); E. B. Wilson's *The Cell in Development and Inheritance* (2nd ed. 1902); J. A. Thomson's *Heredity* (1904).

Animal instincts and intelligence:—J. Loeb's *Comparative Physiology of the Brain and Comparative Psychology* (trans. 1901), illustrating the extreme physiological position; E. Mach's *Contributions to the Analysis of the Sensations* (trans. 1897); C. Lloyd Morgan's *Introduction to Comparative Psychology* (1894); *Animal Life and Intelligence* (1890-1), re-ed. as *Animal Behavior* (1900);

sonable to suppose that all forms of life have been derived by descent from one primitive form. But there is no certain proof of this. It may be that the earliest forms of life to originate were similar even when those origins were separated in time and space. Historically we have conclusive evidence in fossils that certain forms of life have descended from a common ancestor, as for example all vertebrates or all flowering plants. But there are so many gaps in the geological record that we can not state it as a certainty that vertebrates and flowering plants have descended along divergent lines from one and the same original form of life, much as the two have in common in their fundamental life processes. Notwithstanding all uncertainties, the theory that all organisms are derived by descent with modification from a single or a few primary forms of life renders intelligible the present multiplicity of organic forms and their interrelations, as does no other theory yet suggested.

In connection with the preceding general outline of Biology the reader is referred to the following articles in this work:

Adaptation	Hybrid
Alternation of Generations	Mendel's Law
Cell	Metabolism
Colors of Animals	Mimicry
Egg	Parthenogenesis
Embryology	Phylogeny
Environment	Protoplasm
Evolution	Reproduction
Fertilization	Sex
Heredity	Variation

See also the biographies of such biologists as Buffon, Cohn, Darwin, Huxley, and Lamarck. Consult Charles Darwin's *Origin of Species*; Huxley's essay *On the Study of Biology*; Karl Pearson's *The Grammar of Science* (1911); L. L. Woodruff's *Foundations of Biology* (1922); E. B. Wilson's *The Cell in Development and Inheritance* (3d ed. 1925).

**Biometry**, a term applied to that branch of science which deals with vital phenomena from the quantitative or statistical point of view. It involves methods of exact measurement, on the one hand, and precise and refined mathematical analyses on the other. Its fundamental point of view is that without a study of the quantitative relations of biological phenomena in the widest sense, it will never be possible to arrive at a full and adequate knowledge of those phenomena. The study of Vital Statistics is that special branch of biometry which concerns itself with the data and laws of human mortality, morbidity, natality, and demography. As a definitely recognized branch of biological

science biometry owes its origin primarily to the work of Sir Francis Galton and Professor Karl Pearson. See BIOLOGY.

**Bion**, bī'on, a poet of the Alexandrian period of Greek literature, a contemporary of Theocritus, and the friend and master of Moschus, who wrote an elegy on him. He was born at Smyrna, but spent his last years in Sicily. His poems are of the class called bucolic, but deal chiefly with the loves of gods and heroes. The best known is the *Epitaph of Adonis*.

**Bion of BORYSTHENES** (c. 250 B.C.), Greek Cynic philosopher, a contemporary of Eratosthenes and Zeno, studied and taught at Athens. Of his trenchant satires, only fragments remain, edited by Mullah (1867).

**Biondi**, bē-on'dē, GIOVANNI FRANCESCO (1572-1644), Italian romance writer, was born in Lesina, off Dalmatia, and was successively in the diplomatic service of Venice and Great Britain. He wrote *An History of the Civil Warres of England* (trans. 1641) and three romances, *Eromena* (1624, trans. 1632), *La Donzella Desterrada* (1627, trans. 1635), and *Il Coralbo* (1635, trans. 1655), which were very popular in English translations.

**Bionomics** ('laws of life'), a term suggested by Professor E. Ray Lankester to designate the study of the external life of plants and animals, their interrelations with other individuals, and their adaptations to their organic and inorganic environment. The importance of considering the organism, not as an isolated existence, but as a link in the great chain of living creatures, was first fully realized by Darwin, and his volume on *Earthworms* (1881) may be taken as a typical example of a bionomical investigation. See BIOLOGY. Consult J. A. Thomson's *Science of Life*.

**Biot**, JEAN BAPTISTE (1774-1862), French physicist, was born in Paris. He was appointed to the professorships successively of mathematics at Beauvais, of physics at the Collège de France, Paris, in 1800, and of physical astronomy at the Faculté des Sciences in 1809. He experimented on the refractivity of gases in 1803, joined Arago in measuring an arc of the meridian in Spain in 1806, and determined the length of the seconds pendulum along a British arc in 1817-18. He invented the polarimeter and in 1840 was awarded the Rumford medal for his researches on polarized light. He published valuable treatises on Curves (1802), on Physical Astronomy (1805), on Physics (1816-17), and on Egyptian Astronomy (1823). He died in Paris.

**Bi'otite**, or BLACK MICA, a mineral belonging to the mica group, but distinguished from other micas by its black color and by the presence of considerable proportions of magnesia and iron. It is a common and important rock-forming mineral, occurring in most granites, gneisses, schists, and in a great variety of crystalline rocks. It is also present as small flakes in many soils. When fresh it forms black, shining spangles, with a brilliant surface, and is easily recognized by its softness (it may be scratched like a piece of paper), and by its perfect cleavage, in consequence of which it breaks up into thin, smooth scales. It may be distinguished under the microscope from the darker colored muscovite and phlogopite by its small axial angle, which often renders it sensibly uniaxial.

**Biplane**. See FLYING MACHINES.

**Biquadratic** (Lat. *biquadratus* = twice squared), an equation involving the fourth power of the unknown quantity—i.e. of the form  $x^4 + px^2 + qx^2 + rx + s = 0$  where  $p, q, r$ , and  $s$  are constants. A biquadratic can sometimes be reduced to a quadratic, as, for instance, when it happens to be a perfect square, or can be reduced to the form  $x^2(x+a)^2 + bx(x+a) + c = 0$ . In other cases it may be solved by means of an auxiliary cubic, by Descartes', Ferrari's, or Euler's method, unless the roots are all real or all imaginary, when the cubic equation has generally real and unequal roots.

**Bir**, bër, or BIREJIK, town, Asiatic Turkey, on the left bank of the Euphrates, 80 miles northeast of Aleppo. It is the limit of Euphrates navigation and the former crossing point of the great caravan route between Syria and Mesopotamia. Pop. over 10,000.

**Birbhum**, bër-bhoom', district, Bengal, India, with an area of 1,752 square miles. The climate is dry and healthful. Rice, mulberries, sugar cane, and maize are grown. Cotton and silk are manufactured. Pop. 905,000.

**Birch**, a tree belonging to the genus *Betula*, of the family Betulaceæ. The birches, of which there are some twenty-eight species, are distributed throughout the Northern Hemisphere, ten species occurring in North America and some being found as far north as Greenland. The tree has a smooth bark, usually curling back in thin horizontal layers; ovate, serrate leaves; monœcious flowers borne in catkins, and cone-like fruit. In most species the wood is rather inferior, but if the tree is stripped of its bark as soon as it is felled, the timber is con-

siderably improved in durability. In the north of Europe birch is used for fuel in houses and smelting works; it furnishes good charcoal; the Russians use it for shoes, utensils, and furniture, and its bark yields tannin, a yellow dye, and an oil which gives Russian leather its characteristic color and odor.

The American White Birch (*B. populifolia*), of the North-eastern United States, is a small, graceful tree, about 30 feet in height, with slender horizontal branches and tremulous foliage. The bark is a chalky white or gray color, not easily separated into layers. The wood is useful for pulp, shoe pegs, and spools. The Yellow Birch (*B. lutea*) is a tall tree (70 to 80 feet) growing in damp woods in the Northern

spruce roots, to make their canoes. It was also used by them for baskets, as a substitute for paper, and for various utensils. The yellow and paper birches are sometimes known as Silver Birch. The Common European Birch (*B. alba*) is also a white-barked tree, which is commonly cultivated, especially in its 'weeping' form. The thin silvery cuticle, which scales off like slips of paper, was once used for writing paper, and the enduring character of the bark has long been known. The Laplanders use it as a house-roofing material.

Other common species are the Black or Red Birch (*B. nigra*), valuable for furniture, small woodenware, and fuel, and the Cherry Birch or Sweet Birch

His published works include: *History of Ancient Pottery* (1858; 2nd ed. 1873), *Ancient History from the Monuments: Egypt* (1885), and descriptions of the Greek Vases (1851), Ancient Marbles (1861), Rhind Papyri (1866), Hieratic and Demotic Inscriptions (1868), and other collections in the British Museum. Consult *Life*, by his son.

**Birch, THOMAS** (1705-66), English historian and biographer, was born of Quaker parents in Clerkenwell, London. He took orders in the Anglican Church in 1731, and under the patronage of the Hardwicke family was rapidly preferred, until, in 1746, he became rector of St. Margaret Pattens, London. He was secretary of the Royal Society from 1752 to 1765. His principal works were *Life of Robert Boyle* (1744), *Memoirs of the Reign of Elizabeth, 1581-1603* (1754), and *Historical View of Negotiations between the Courts of England, France, and Brussels, 1592-1617* (1749).

**Birch Creek**, river, Alaska, rises in the gold fields south of the Crazy Mountains, flows around them and northward to its confluence with the Yukon near the Arctic Circle.

**Birch-Pfeiffer CHARLOTTE** (1800-68), German actress and dramatic writer, was born in Stuttgart and made her début in her early teens. In 1825 she was married to Dr. Christian Birch, a Danish historian, and prefixed his name to her maiden name of Pfeiffer. From 1837 to 1843 she was manager of the theatre at Zürich, and in 1844 accepted an engagement at the Theatre Royal, Berlin, where she continued to play until the end of her life. She was a prolific playwright and novelist, her plays being still popular in Germany, especially *Die Günslinge*, *Hinko*, *Die Waise von Lowood* (a dramatization of Charlotte Brontë's *Jane Eyre*), and *Pfeffer-rosel*. Her collected dramatic works, in German, appeared in 23 volumes (1863-80), and her novels in 3 volumes (1863-5).

**Bird, ARTHUR** (1856- ), American composer, was born in Cambridge, Mass., the son of a well known teacher of music. He studied music under leading masters in Germany, and after filling positions as organist and choir-master of the Kirk, Halifax, N. S., again visited Europe, spending the years 1885-6 in Weimar with Liszt, who encouraged his work in composition. His first public concert was given in Berlin, 1886, where he made his permanent residence. He is a member of the National Institute of Arts and Letters. His compositions include his *Carnival*, for the orches-

Photo from A. T. De La Mare Co.

American White Birch (*Betula populifolia*)

States and Nova Scotia. Its wood, close grained and hard, is valuable for furniture, fuel, and boxes. Perhaps the most famous American birch is the Paper or Canoe Birch (*B. papyrifera*), a tall tree (70 feet), with a laminated bark, the outer layers being chalky white, the inner of a pink tinge. The outer layers of bark peel off in thin, curling strips as the trunk grows. The American Indians stretched this supple, waterproof bark over light wooden frames, and sewed it with split

(*B. lenta*), a handsome tree whose wood is stained to imitate cherry or mahogany and from the bark of which is extracted the wintergreen oil used in flavoring medicines.

**Birch, SAMUEL** (1813-85), English Egyptologist, was born in London. After studying Chinese, he became in 1836 assistant in the department of antiquities at the British Museum, and from 1866 till his death was keeper of Oriental antiquities. He was one of the founders of the Society of Bible Archæology (1870).

tra, *Symphony in A Major*, ten compositions for the organ, and pieces for the piano, songs, etc.

**BIRD, EDWARD** (1772-1819), English subject painter, was born at Wolverhampton, and educated himself. In 1809 the Royal Academy accepted his *Good News*, which at once established his reputation. Other genre paintings, *County Auction* and *Gipsy Boy*, were equally successful; his *Village Politicians* and *Blacksmith's Shop* are well known. He was elected A.R.A. in 1812, and R.A. in 1815. For the *Death of Eli* he was awarded the prize of the British Institution; and by the *Field of Chevy Chase*, his greatest work, he procured the post of court painter to Queen Charlotte. His last historical piece was the *Embarkation of Louis XVIII. for France*. See A. Cunningham's *Lives of the Most Eminent British Painters* (1879-80).

**BIRD, FREDERIC MAYER** (1838-1908), Amer. clergyman, son of R. M. Bird, born in Philadelphia, Pa., and graduated (1857) at the University of Pennsylvania. He was ordained a Lutheran minister, and served as chaplain in the Civil War. He afterward took orders in the Protestant Episcopal church, and was rector of churches in Spotswood, N. J., and Bethlehem, Pa. Mr. Bird became a leading authority on hymnology, and was co-editor of several collections of hymns. He was for several years professor of psychology, Christian evidence and rhetoric at Lehigh University, did much encyclopædia work, and was editor of *Lippincott's Magazine*, 1893-8. Author of *The Story of Our Christianity* (1893).

**BIRD, ISABELLA.** See BISHOP.

**BIRD, ROBERT MONTGOMERY**, (1805-54), American author, was born at New Castle, Del. He early turned his attention to literature, and wrote three successful tragedies—*The Gladiator* (a favorite piece with Edward Forrest), *Oraloosa*, and *The Broker of Bogota*; he was also the author of well-known novels—*Calavar* (1834), *The Infidel* (1835), *Nick of the Woods* (1837), etc. He was editor and part owner of the Philadelphia *North American Gazette*.

**BIRD, WILLIAM.** See BYRD.

**Bird-catching Spider**, the name given to the species of the genus *Miyale*, which are very large, hairy spiders found in tropical countries, especially in the Amazon Valley. They appear to live chiefly on insects, but the fact that they can kill small birds would appear to be well authenticated. The body may reach a length of 2 in., and the span is stated to be sometimes as much as 7 in.

**Bird Cherry** (*Prunus padus*) is

a species of the order Rosaceæ, and in the same genus as cherry and plum. It belongs to temperate

*Bird-catching Spider.*

Europe and Asia, and is known also as the hagberry—*i.e.* 'berry of the woods.' It differs from the wild cherry in being in full leaf before it flowers usually in May. The flowers are much smaller than those of the wild cherry, and are set in racemes from 3 to 5 in. long;

*Bird Cherry (Prunus padus).*

1, Flower (section); 2, fruit.

these are upright at first, but as the flowers expand the raceme becomes pendulous. The cherries are black, about the size of peas, somewhat astringent and bitter.

**Bird-lice**, or MALLOPHAGA, a family of Neuropterous insects which are not blood-suckers like true lice, but have mouths adapted for biting, and feed upon the feathers of birds or the hair of mammals; hence called biting

lice. An active form (*Menopon pallidum*) commonly infests domestic poultry, though other species also occur on these birds. Mallophaga occur on mammals as well as on birds, but it does not appear that they multiply with the same rapidity as true lice, or that under natural conditions they are often numerous enough to cause serious trouble.

**Birdlime**, a viscid material obtained from the bark of holly and similar trees by boiling. It is used by European and Japanese bird-snarers for smearing twigs, but is rarely, if ever, made or used in the United States.

**Bird of Paradise**, a general name given to the members of the family Paradiseidae, which includes beautiful birds inhabiting the Malay Archipelago, and extending into the Australian region. Although the birds of paradise are allied to the plainly dressed crows, they excel all other birds in their magnificent development of accessory plumes and their glory of color. As usual among birds, these statements are true only of the males, the females being relatively plain. The diet consists largely of seeds and fruits, but these are mingled with insects, and also, to a less extent, with worms, snails, frogs, and lizards. Among the most striking forms are the great bird of paradise (*Paradisea apoda*), the one commonest in collections; *Cicinnurus regius*, or the king paradise bird, which is glossy scarlet with a bright green throat patch; the glossy black rifleman (*Ptilorhis paradisea*); and the 'magnificent' bird of paradise (*Diphyllodes magnifica*), with its wonderful erectile ruff. For descriptions of the birds in their native haunts, reference should be made to A. R. Wallace's *Malay Archipelago* (10th ed. 1890). See also article BOWER-BIRD.

**Birds** constitute one of the best-defined groups in the animal kingdom, being distinguished at once from all other animals by the characteristic covering of feathers. The presence, in addition to feathers, of an epidermic covering of scales over parts of the body is an external character which suggests a descent from reptiles—a suggestion borne out alike by details of internal structure and by geological evidence. Indeed, in spite of the fact that some birds do not fly, we may say, speaking broadly, that birds are distinguished from reptiles by those peculiarities of structure and function which bear, directly or indirectly, upon the power of flight. It may, therefore, be convenient to discuss the characteristics of birds in connection with the power of flight rather than in strict systematic order.

The organs of flight in a bird

are the fore limbs, which have been converted into wings. The result of this is that the posterior limbs only can be used in supporting the body on the ground; the bird—to use an old term—is a biped. Now, these changes of function of fore limb to wing, and hind limb to sole support, have produced striking and, in a

the long palm-bone (metacarpal), which is fused to the palm-bone of the rudimentary middle finger. The first digit, or thumb, is represented by a small rod of bone, which bears a small independent tuft of feathers, known as the false wing (*ala spuria*). In the majority, though not in all existing birds, claws are absent from

clavicles, which together form the merrythought or wishbone; the strong coracoids, bones represented in ourselves only by a process on the shoulder-blade; the great keel on the breastbone to which the muscles of flight are attached; the fusion of the vertebrae in the back to form a firm fulcrum on which the wings may play, and so on.

In connection with the modified hind limbs, one would notice especially the great elongation of the pelvis, which extends both in front and behind the cup in which the top of the thigh is placed, so that the weight of the body lies partly in front of and partly behind the point of support. A comparison

*Wading and Swimming Birds.*

1. Stormy petrel. 2. Mandarin duck (male). 3. Scarlet ibis (Tropics). 4. Great northern diver. 5. Flamingo. 6. Red-breasted goose (Asiatic). 7. King penguin (Antarctic).

sense, independent modifications of structure.

Considering first the fore limb, we find that the conversion into a wing has resulted in the reduction of the hand to three fingers, of which one only (the index) is well developed. It is this first or index finger which bears the large primary feathers of flight, and it is always of considerable length. The length is partly given by

all the fingers. There are only two separate wrist-bones, and the wrist-joint possesses very little freedom of movement. Without entering into structural details, one would notice the peculiar folding up of the arm when at rest, and the strong ulna, or outer bone of the fore arm, which carries the secondary feathers of flight. Especially important in connection with flight are also the united

*Skeleton of a Bird (Falcon).*

of a living bird with a skeleton of one of the same kind will show how beautifully the body is balanced about the legs; but to this statement swimming birds form an exception, for in them the legs are placed far back, and the gait is in consequence clumsy and awkward. Again, in the limb itself the ankle-bones seem to be absent, and the bones of the sole of the foot (metatarsals) are fused together and with the missing tarsals to form a single bone. The little toe is always absent, a bird never having more than four toes.

In living birds the tail is always short, and usually ends in a bony plate, the ploughshare bone, which carries a bunch of tail feathers, of much importance in flight.

The feathers give the necessary resistance to wings and tail during flight, and keep the body warm.

Its temperature is unusually high, this being, again, no doubt associated with the quickened respiration necessitated by flight. This respiratory efficiency depends on the development of air-sacs connected with the lungs, and with it is associated a four-chambered heart, and a circulation as perfect as that of a mammal. As in swift-moving animals in general, the head is relatively small, though the brain is better developed than that of a reptile. In living birds teeth are absent, and the jaws are covered with a horny beak. Birds lay eggs as do reptiles, but they are fewer in number. Their high intelligence enables the parents to protect their eggs and young by many ingenious devices, and the young are also, in almost all cases, devotedly cherished until the dangers of early life are past. The vast migrations performed by many birds are ascribed ultimately to the desire to seek safe nesting-places in which the young may be reared. Finally, in accordance with their high specialization, we find that birds not only rank among the most beautiful and highly ornamented of animals, but also frequently possess the power of song.

The classification of birds is a matter of great difficulty, for many characteristics hitherto relied upon prove, on inquiry, to be merely adaptations to a similar method of life.

Most authorities agree that birds should first of all be divided into two great sets—the Archæornithes ('primitive birds'), including only the strange fossil known as Archæopteryx; and the Neornithes ('modern birds'), including all other known birds, fossil or living, in all of which the tail is short and the palm-bones fused. The arrangement of birds at the right is that adopted by Knowlton and Ridgeway. Consult the volume on *Birds* in the 'Cambridge Natural History,' by A. H. Evans; Beddard's *The Structure and Classification of Birds*; Pycraft's *History of Birds*; Wilson's *American Ornithology*; Coes' *Key to North American Birds*; Chapman's *Handbook of Birds of Eastern North America* (1916); Bailey's *Handbook of Birds of Pacific Coast* (1917); Allen's *Birds and Their Attributes* (1925); Henderson's *The Practical Value of Birds* (1927); Saunders' and Clarke's *Manual of British Birds* (1927).

**Birdsboro**, borough, Pennsylvania, in Berks County, on the Schuylkill River and on the Pennsylvania and Reading Company Railroads, 9 miles southeast of Reading. It has blast furnaces, rolling mills, foundries and machine works. Pop. (1910), 2,930 (1920) 3,299.

Typical Land Birds

1. Falcon. 2. Dove. 3. King bird of paradise. 4. Golden pheasant. 5. Hoopoe (Europe). 6. Great bustard (Asia). 7. Rufous tinamou (S. America). 8. Parrot (*Aprosmictus*, E. Australia).

ORDER	TYPE
1—Hesperornithiformes	Hesperornis
2—Ichthyornithiformes	Ichthyornis
3—Struthionithiformes	True Ostriches
4—Rheiformes	South American Rheas
5—Casuariiformes	Carrollaries and Emus
6—Crypturiformes	Tinamous (South America)
7—Dinornithiformes	Moas (extinct)
8—Epyornithiformes	Giant birds (extinct)
9—Apterygiformes	Kiwi (New Zealand)
10—Sphenisciformes	Penguins
11—Colymbiformes	Loons and Grebes
12—Procellariiformes	Petrels, Albatrosses
13—Ceconiiformes	Cormorants, Pelicans, Herons, Storks, Flamingos
14—Anseriformes	Swans, Ducks, Geese
15—Falconiformes	Vultures, Hawks, Eagles
16—Galliformes	Fowls, Hoatzin
17—Gruiformes	Cranes, Rails, Bustards
18—Charadriiformes	Plovers, Shore Birds, Pigeons, Sand Grouse
19—Cuculiformes	Cuckoos, Parrots
20—Coraciiformes	Rollers, Owls, Swifts, Wood- peckers, Humming-birds
21—Passeriformes	Larks, Thrushes, Swallows, Wrens, Crows, Finches, Warblers

**Bird's Eyes**, in timber, nodules in planed wood formerly said to be caused by lateral latent shoots which terminate in dormant buds, but now thought to be caused by the blow of a woodpecker hard enough to bruise and arrest the activity of the cambium for a short time without loosening the bark.

**Bird's-foot** (*Ornithopus*), a genus of plants belonging to the order Leguminosæ. The common bird's-foot grows on dry sandy or gravelly soils, and is a small plant of little importance, although eagerly eaten by sheep. *O. sativus* is the Serradilla, a forage crop of Europe.

**Bird's-foot Trefoil** (*Lotus corniculatus*), a genus of plants and shrubs belonging to the order Leguminosæ. There are some

*Bird's-foot Trefoil (Lotus corniculatus)*

eighty species widely distributed and grown for their yellow, purple and rose colored flowers. The plant is sown in permanent pasture for forage.

**Bird's Nests, Edible.** See EDIBLE BIRD'S NESTS.

**Birds of Prey**, a group of birds classed according to their predatory habits rather than according to similarity of structure. Older classifications divided them into nocturnal and diurnal birds, the former including the owls and the latter the falcons, hawks, eagles, kites, vultures and the like, but the more modern classification divides them into three orders, the owls (*Striges*), the ospreys (*Pandiones*), and the Accipitrines, which include the *Falconidae*, the *Vulturidae*, the *Carthartidae* and the *Serpentariidae*.

The members of this group are

generally characterized by strong curved beaks and talons, keen eyesight, and swift and powerful flight. Some members live by killing their own prey, while others subsist on carrion. They are far more numerous in warm climates than in cold and usually live permanently in the district of their choice. Many of them mate but once and the number of young produced is seldom more than four. The plumage is usually a plain color, black, white, red or brown, and the female is generally larger than the male. See also such articles as BUZZARD; EAGLE; FALCON; HAWK; OWL, VULTURE.

**Birejik.** See BIR.

**Biretta**, or BARETTA, a term originally used for a pontifical cap, but now for the square cap worn by Roman Catholic and certain Anglican clerics.

**Birge**, EDWARD ASAHEL (1851- ), American naturalist was born in Troy, N. Y. He was graduated from Williams College in 1873; and has been connected with the University of Wisconsin since 1875, as instructor in natural history (1875), professor of zoölogy (1879-1911), dean of college of letters and science (1891-1918), acting president (1900-03), president (1918-25) and president emeritus. He became secretary of the Wisconsin State fisheries commission in 1895, director of State geological survey in 1897, and president of the American Microscopic Society in 1903. He is the author of numerous articles and papers on zoölogy.

**Birkbeck**, GEORGE (1776-1841), English reformer, the founder of mechanics' institutions, was a native of Settle, in Yorkshire. In 1800, while a professor of natural philosophy at Anderson's College, Glasgow, he established courses of lectures in science for workmen which evolved into the Glasgow Mechanics Institution, believed to be the first of its kind to be established. In 1804 he removed to London and in 1824 he organized the London Mechanics Institution.

**Birkbeck Institute**, an institution founded by George Birkbeck (q.v.) as the London Mechanics Institute (1824), with the aid of Brougham, Bentham, Cobbett, and others. It is now known as Birkbeck College, and is held in Bream's Buildings, Chancery Lane. It was incorporated in 1891 as part of the City Polytechnic.

**Birkdale**, parish, England, in Lancashire, on the coast, 1½ miles southwest of Southport, of which it forms a populous suburb. It has well equipped hydropathic institution.

**Birkenfeld**, bër'ken-felt, province of Germany, dependent upon the republic of Oldenburg, but entirely surrounded by the Prussian province of Rhineland. Its surface is hilly and well wooded, and is drained by the Nahe. Agriculture and horticulture are carried on, and the polishing of gems (agates) is a leading industry. Pop. (1919) 51,260.

**Birkenhead**, bürk'n-hed, seaport and market town, England, in Cheshire, on the left bank of the Mersey, opposite Liverpool; 15 miles northwest of Chester. It has terminal stations on the London and North Western, the Great Western, and the Birkenhead and Hoylake Railroads. Features of interest are St. Aidan's theological college, Birkenhead Park (laid out by Sir Joseph Paxton), in Claughton, and opened in 1847, one of the finest of its kind in the country, Mersey Park and Bidston Hill (observatory). Though dating from the 12th century, it became important only after the opening of the dock at Wallasey Pool in 1847. The docks now have an area of 506 acres. Woodside Lairage is one of the largest and best equipped abattoirs in the kingdom. The tunnel under the Mersey, between Birkenhead and Liverpool, was opened in 1886. Shipbuilding forms the chief industry, the Laird shipyard (established in 1824), being of world-wide renown. Coal is largely exported and there are engineering works, breweries, and iron-smelting works. The town was incorporated in 1877 with Claughton, Oxtou, Tranmere, and part of Higher Bebbington. In 1831 it was a village of little over 200 inhabitants, but the present population (1921) is 145,592.

**Birkenhead**, FREDERICK EDWIN SMITH, 1ST LORD (1872- ), Lord Chancellor of Great Britain since 1919, was born in Birkenhead. He was educated at Oxford and was called to the bar at Gray's Inn in 1908. He was elected for Walton division, Liverpool (1906), which he continued to represent until 1919. He was prominent in the Ulster movement against Irish Home Rule (1914); was knighted on becoming solicitor general in 1915, and became baronet in 1918. During the Great War he was administrator of the Press Censorship, and later saw service in France with the Indian Corps. He is an authority on international law and the author of several books on that subject, *My American Visit* (1918), *The Indian Corps in France* (1918).

**Birmingham**, municipal borough and city (lord mayor

BIRDS OF PARADISE.

since 1893), and county borough Warwickshire, England; 112 miles by rail northwest of London. It is situated at the confluence of the rivers Rea and Tame and is the junction of the London and North Western, the Great Western, the Midland, the Birmingham, Wolverhampton, and Dudley lines. The municipal borough (1832) includes the parishes of Birmingham and Edgbaston, and part of Aston; the parliamentary borough (extended 1885) includes the local government districts of Balsall Heath, Harborne, Saltley, and the hamlet of Little Bromwich, and is divided into seven single-member constituencies.

Birmingham is the commercial capital of the Midlands, and the second manufacturing city of England. Though mentioned in Domesday, and sacked by Prince Rupert during the civil war (1643), the city is essentially modern, and has no antiquities worth mentioning, except Aston Hall and some monuments of the Berminghams (St. Martin's church), who held the manor from at least the reign of Edward I. Many of the streets, notably New Street, are wide and stately, and the public buildings are metropolitan in character. The Town Hall, of Corinthian design, with massive detached columns copied from those of the temple of Jupiter Stator at Rome, contains a fine organ, and is famed for the Birmingham musical festival (instituted 1768), which is held triennially. The council house, the corporation museum, art gallery, Victoria law courts, and many other public and educational buildings are also notable. Birmingham University, founded in 1900, possesses the usual faculties, but has a strong modern scientific and commercial tendency. It has its nucleus in Mason College, founded by Sir Josiah Mason in 1875 for scientific education. Other educational establishments are Queen's College (1828), King Edward's grammar school (founded 1552), the school of art (1885), the free grammar school (1833), the corporation technical school, and Birmingham or old library (1797). Birmingham is a bishopric of the Anglican and an archbishopric of the Roman Catholic Church. The Roman Catholic cathedral (1839-41) was designed by A. W. Pugin. Among many statues is one to the chemist Dr. Priestley, whose house was sacked and burned and whose library and MSS. were destroyed by a 'church-and-king' mob in 1791. Birmingham has ten public parks, the largest being Cannon Hill Park, covering 57 acres.

The proximity of Birmingham to the South Staffordshire coal

field makes the city the hardware metropolis of the kingdom. Steam-engines and gas-engines, small-arms (Royal Birmingham Small-arm Factory), ammunition, bicycles, screws, and metal ornaments are a few of its many manufactures. It is the chief centre of the brass trade; cheap jewelry (thus 'Brummagem'), glass, steel pens, and chemicals are largely manufactured; and electro-plating and brewing are extensively carried on. Watt perfected the steam-engine here, and in conjunction with Boulton founded the Soho Works.

Birmingham was an old Anglo-Saxon town. During the Civil War it was strongly Puritan and was burned and sacked by Prince Rupert. About the middle of the eighteenth century it began to assume importance as a manufacturing centre. It took a leading part in the reform agitations of 1832 and 1835, and was

well-paved streets, fine public buildings, and good schools. Notable edifices are the City Hall, new Post Office, Auditorium, Union Station, Tutwiler, Molton, Hillman and Morris hotels, St. Vincent's Hospital, Hillman Hospital, and Jefferson Theatre. The city is the seat of Howard College (Baptist) and Birmingham-Southern College (Methodist). There are fifteen beautiful parks, the chief of which are Capitol, East Lake, Lakeview, and North Birmingham.

Birmingham is situated in the heart of a rich coal and iron district; three great coal fields, the Warrior, the Cahaba, and the Coosa, aggregating over 8,600 square miles, are all directly tributary to the city. There are immense iron and steel works, blast furnaces, rolling mills, machine shops, boiler works, brass works, and cement fac-

Birmingham: Town Hall.

the centre of the Chartist movement (see CHARTISM), resulting in the riot of 1839. The foundation of the bishopric of Birmingham was announced on Jan. 13, 1905, and St. Philip's was made the cathedral church. Pop. (1911) 525,960. Consult Dent's *Old and New Birmingham*; Hutton's *History of Birmingham*; Jones' *A Short History of Birmingham*.

**Birmingham**, city, Alabama, county seat of Jefferson county, is situated near the centre of the State, on the Seaboard Air Line, the Central of Georgia, the Southern, the Louisville and Nashville, the Illinois Central, the Atlanta, Birmingham and Atlantic, the Alabama Great Southern, and the Mobile and Ohio Railroads; 95 miles northwest of Montgomery.

It is a well built, imposing city, with handsome residences,

and cotton, cottonseed oil, foundry facings, candy, cigars, boxes, chemical products, iron pipe, baskets, and stoves are manufactured. There is also a large trade in lumber and agricultural products. According to the Federal Census of Manufactures for 1914, industrial establishments numbered 352, with 10,863 wage earners, \$55,844,000 capital and products valued at \$43,144,000.

Birmingham is governed by a board of five city commissioners, elected for a term of four years, and representative of the municipality at large.

Birmingham was settled in 1871 and named after the English Birmingham. Since 1900 its growth has been uniformly rapid. In 1910 Wylam, East Lake, Eusley, Pratt City, Elyton, West Birmingham, North Birmingham, West End, Wood-

lawn, and Avondale were incorporated with Birmingham into Greater Birmingham. Pop. (1900) 38,415; (1910) 132,685; (1920) 178,270.

**Birnham**, bŭr'nām, village, Perthshire, Scotland, on the right bank of the Tay, less than a mile south of Dunkeld. South of the village rises Birnam Hill (1,324 feet), once covered by a royal forest (see *Macbeth*). Remains of 'Duncan's Camp,' a vitrified fort, may be seen on the southeast slope.

**Birney**, bŭr'ni, DAVID BELL (1825-64), American soldier, son of James G. Birney (q. v.), was born in Huntsville, Ala. He practised law in Philadelphia (1848-61), and during the Civil War served, with much ability, on the Federal side, rising from the rank of lieutenant-colonel of volunteers (commissioned April, 1861) to that of major-general of volunteers (commissioned Sept., 1863). He took a conspicuous part in the battles of Fredericksburg, Chancellorsville, and Gettysburg (in which he commanded a division, and, for part of the time, the Third Army Corps), and, under Hancock, in the Wilderness. He died of a fever contracted in the Virginia campaign of 1864.

**Birney**, JAMES GILLESPIE (1792-1857), leader of the conservative or constitutional Abolitionists in the United States, was born in Danville, Ky., a member of a wealthy slave-holding family. He was graduated from Princeton in 1810, studied law, practised at Danville, and in 1816-18 was a member of the lower house of the Kentucky legislature. From 1818 to 1833 he lived near Huntsville, Ala., and served in the first General Assembly of the State (1819), in which he introduced a law, which was passed, allowing slaves on trial before a jury to have counsel. By opposing a resolution endorsing Andrew Jackson for the presidency, however, he cut short his political career. Though he was himself a slaveholder, he gradually became more and more impressed with the evils of slavery, and in 1832 became agent in the Southwest of the American Colonization Society, the futility of which, however, he soon perceived. About 1827 he became a gradual emancipationist; he returned to Danville, Ky., in 1833 to urge the cause; in 1834 he freed his own slaves, and in the same year abandoned the Colonization Society, became a convert to immediatism, and identified himself with the American Anti-Slavery Society, of which he was made a vice-president. He then (1835) attempted to establish an anti-slavery journal in Danville, but

for this he was ostracized socially, and not being able to secure a printer, he removed to Cincinnati, O., and there on Jan. 1, 1836, issued the first number of *The Philanthropist*. Even here he met with fierce opposition, but his paper exerted considerable influence in the Middle West. He soon turned over the active control to Gamaliel Bailey, and, removing to New York City (1837), devoted himself to the cause, chiefly as a lecturer, and as secretary, of the Anti-Slavery Society. He was opposed to the extremists, headed by Garrison, would not join them in their advocacy of 'no government' views, and was, therefore, one of the leaders of those Abolitionists who broke away from the American Anti-Slavery Society (1840), and founded the Liberty Party, of which he was twice (1840 and 1844) the candidate for the presidency. (See ABOLITIONISTS and LIBERTY PARTY.) In 1845 a fall from his horse disabled him for life, and until his death he lived in retirement.

Birney is one of the most attractive personalities in the great anti-slavery struggle in the United States; in no sense an extremist, he deprecated the radicalism of Garrison and his followers, which, he thought, would inevitably alienate many friends of emancipation and injure the cause. He was himself tolerant and fair, but courageous and unflinching in his advocacy of what he believed to be the right. Among his publications are *On the Sin of Holding Slaves* (1834); *Letter on Colonization* (1834); *Addresses and Speeches* (1835); *Political Obligations of Abolitionists* (1839); *American Churches the Bulwarks of American Slavery* (1840), and *Speeches in England* (1840). Consult William Birney's *Life and Times of James G. Birney*.

**Birney**, WILLIAM (1819-1907), American soldier and lawyer, son of James G. Birney, (q. v.), was born near Huntsville Ala., and studied in Paris, where he participated in the revolution of 1848. He served with distinguished gallantry in the Union forces during the Civil War, was promoted to the rank of brevet brigadier-general, and took a prominent part in organizing the colored troops. After the war he practised law in Washington, D. C., from 1874 until his appointment as counsel for the District of Columbia in 1900. He wrote *The Life and Times of James G. Birney* (1890).

**Biron**, bĕ'rōn; French bĕ-rōn', family of distinguished French generals. ARMAND DE GONTAUT, BARON DE BIRON (1524-92), fought against the Huguenots. His son, CHARLES

(1561-1602), became marshal (1594) of France and (1598) duke, and governor of Burgundy. He was beheaded in the Bastille for treasonable practices.—ARMAND LOUIS (1753-94), Duc de Lauzun, accompanied Lafayette to America (1778), commanded an unsuccessful expedition to rescue New York from the British in 1781, and, returning in 1783, became general-in-chief of the army of the Rhine in 1792. He was executed during the Reign of Terror, having incurred the displeasure of Fouquier-Tinville.

**Biron**, ERNST JOHANN (1690-1772), Duke of Courland, whose real name was Bühren, was the favorite of the Empress Anna Ivanovna, niece of Peter the Great, and became practically ruler of all the Russias. A blood-thirsty tyrant, he was responsible for the execution or banishment of thousands who stood in his way. Biron assumed the regency when the empress died (1740); but a conspiracy was formed against him by Münnich, with the result that he and his family were exiled to Siberia. He was recalled (1741) shortly afterward by the Empress Elizabeth, but took no further part in state affairs.

**Birr**. See PARSONSTOWN.

**Birrell**, bŭr'el, AUGUSTINE (1850- ), English barrister and author, was born near Liverpool, was graduated from Cambridge University (1872), and became a barrister (1875). He was Quain professor of law at University College, London (1896-9), member of Parliament for West Fifeshire (1889-1900), president of the National Liberal Federation (1904-05), president of the Board of Education (1905-07), chief secretary to the Lord Lieutenant of Ireland (1907-16), and member of Parliament for North Bristol (1906-18). His works include *Obiter Dicta* (two series, 1884, 1887); *Life of Charlotte Bronte* (1885); *Res Judicata* (1892); *Men, Women, and Books* (1894); *Sir Frank Lockwood* (1898); *Collected Essays* (1900); *Miscellanies* (1901); *In the Name of the Bodeleian* (1905); *William Hazlitt* (1902) and *Andrew Marvell* (1905) in the 'English Men of Letters' series; *Frederick Locker-Lampson: A Character Sketch* (1920).

**Birs**, bĕrs, small river in Northwestern Switzerland, joining the Rhine east of Basel. In 1444, at the leper house of St. Jakob-bei-Birsfelden, a body of confederates, less than 1,500 strong, stood to the death against 30,000 Armagnac free-lances advancing on Basel.

**Birth**. For Registration of Birth, see REGISTRATION. For Statistics, see VITAL STATISTICS.

**Birth, Concealment of**, is a criminal offence in the law of all civilized countries. In the United States all the parties, including the mother, concerned in the concealment, or in the secret disposal of the body, whether born alive or dead, are guilty of a misdemeanor, and are liable to imprisonment. In England every person who endeavors to conceal a birth by a secret disposition of the dead body of the child is liable to be imprisoned, with or without hard labor, for a term not exceeding two years. See INFANTICIDE.

**Birthmark.** See ANGIOMA.

**Birthright**, the right of succession to property based on the order of birth of the several claimants. Such a right has been recognized in most systems of law, but it belongs to an order of legal ideas now generally obsolete. In its primitive form birthright did not necessarily involve the total exclusion of other heirs than the privileged one, but usually involved an unequal distribution of the estate, the birthright being a right to receive the largest share of the inheritance. See PRIMOGENITURE; HEIR.

**Biru.** See WALATA.

**Bisacquino**, bē-sāk-kwē'nō, town, province Palermo, Sicily; 11 miles south of Corleone. Pop. 10,500.

**Bisalnagar**, bis'āl-nūg-ār, or VISNAGAR, TOWN, Kadi district, Baroda, Bombay Presidency; 50 miles north of Ahmedabad. It has cotton manufactures. Pop. 20,000.

**Bisanthe.** See RODOSTO.

**Bisayas.** See VISAYAS.

**Bis'bee**, town, Cochise county, Arizona, on the El Paso and Southwestern Railroad; 80 miles southeast of Tucson, and 8 miles from the Mexican boundary. It is the centre of an important lead, silver, gold, and copper mining region, and has large smelters, with a daily output of 7,000 tons. Pop. (1910) 9,019.

**Biscay.** See VIZCAYA.

**Bis'cay, Bay of** (ancient *Cantabricum Mare* and *Aquitanus Sinus*; French, *Golfe de Gascogne*), that portion of the Atlantic Ocean which sweeps in along the northern shores of the Spanish Peninsula, and thence curves northward along the western shores of France. Except between the estuary of the Gironde and the mouth of the Adour, where it is lined by low sand dunes and lagoons, its shores are bold and rocky. Besides the two rivers just named, it receives the Vilaine, Sèvre, Charente, and Dordogne. From the extreme points (Britagne to Galicia) it measures some 340 miles. Along its northeast shore are the small islands of Belleisle, Noirmoutier, Ré, and Oléron.

Its depth along this part of the coast of France is in places as little as 20 fathoms, but increases off the north coast of Spain to 200 fathoms. Under the impact of northwest winds it becomes extremely boisterous.

**Biscegile**, bē-shāl'yā, seaport and episcopal see, Bari province, Italy; 21 miles northwest of Bari. It has a twelfth-century cathedral, and ruins of an old Norman castle. Pop. (1911) 34,425.

**Bischofswerda**, town, Saxony; 20 miles northeast of Dresden. Pop. (1910) 8,048.

**Bischweiler**, town, Alsace-Lorraine, Germany; 15 miles north-

municipal town, with manufactures of fine cotton and silk cloth. Pop. 20,000.

**Bish'op**, the highest order of the clergy in Christian churches. The word comes from the Anglo-Saxon *biscop*, an abbreviated form of the Greek *episcopos*, 'overseer.' In classical writers it signifies an inspector or superintendent of any kind; and in the Septuagint the usage of the word corresponds, on the whole, to that in classical writers. While the word itself has been retained, however, the sense attached to it has undergone a radical alteration. Throughout the New Testament *episcopus* is inter-

Bay of Biscay.

west of Strassburg. It manufactures jute and grows hops. Pop. (1910) 8,145.

**Biscuit**, in the United States, is the name given to small, round, soft cakes made from dough, raised with yeast or soda, and sometimes shortened with lard. What are known as biscuits in England are usually called crackers in the United States.

**Biscuit**, in pottery, is the name given to porcelain and other pottery after the first firing. See POTTERY.

**Bisharin**, bē-shā-rēn', or BEJA, a people inhabiting the lower part of the Blue Nile, between about 24° N. lat. and the frontier of Abyssinia. They are probably the descendants of the ancient Blemmyes (q. v.).

**Bishnapur**, bish'nā-pōōr, the ancient capital of Bankura district, Bengal, India; 80 miles northwest of Calcutta. It is a

changeable with *presbyter*; both are synonymous titles of officers who direct the discipline and administer the affairs of a single congregation. But as the Church grew, and cities contained more than one congregation, the chief presbyter superintended the clergy of all the other churches from the mother church. Gradually the idea spread to the government of a diocese, and the leading presbyter was known particularly as the *Episcopos*, or *Bishop*.

While Roman Catholics admit that in the New Testament the same persons are sometimes indifferently called 'bishops' or 'presbyters,' they hold that it was because these individuals discharged both functions. But it is their belief that Christ designed both orders, making the bishops the direct successors of the apostles, and placing the ordination of priests in their

hands alone. (See SUCCESSION, APOSTOLIC.) The High Church Anglicans consider episcopacy as necessary not only to the well-being, but to the being of a church. To Anglicans of the more moderate school, episcopacy is a venerable form of church government which descends from apostolic times, but they do not pronounce it to be so essential a matter that they should unchurch the Protestant communities which have been formed on another model. Presbyterians, on the other hand, contend that the government of the church by presbyters has, and has alone, the sanction of the New Testament, and they reject modern episcopacy as a corruption of primitive Christianity. The early Lutherans denied its divine institution, but were quite willing to tolerate it.

The bishop of the *Roman Catholic Church* belongs to the highest order of the hierarchy. He must be a man of thirty years of age, and of approved learning and virtue. He is selected by the pope out of a number of eligible priests whose names are submitted by the chapter of priests connected with the cathedral church. Before his appointment he must pass a double examination, and when selected he cannot perform the duties of his office until consecrated, which takes place before three bishops at least, within three months after his election. His duties are to exercise full spiritual control in his cathedral church and preside over the entire diocese. He ordains priests, assigns their fields of labor, dedicates and consecrates new churches, and is the court of appeal for the lower orders of the clergy. He is subject by divine law to the councils of the church and to the pope, and by ecclesiastical law he is in subordination to patriarchs, metropolitans, etc. In respect of orders—i.e., the power of consecration and the like—he has no superior. His insignia are the ring, pectoral cross, episcopal throne, mitre, pontifical vestments, gloves, and sandals.

The theory of the *Church of England* is much the same as that of the Roman Catholic Church, except that in England the authority of the crown has replaced that of the pope. The Anglican bishop is said to descend in direct line of consecration from his predecessors in the Middle Ages. He alone can ordain, confirm, and consecrate churches. He institutes to benefices and licenses curates; he has the right to preach throughout the diocese, to inspect the churches. He can withdraw the licenses of curates, who may, however, appeal to the metropolitan,

Bishops in the *Protestant Episcopal Church* perform the same duties as the Anglican bishops. They ordain priests and deacons, dedicate new churches, and exercise a general oversight in their diocese. They are chosen in a general convention of clerical and lay deputies of the diocese over which they are to preside, except in the case of missionary bishops, who are nominated by the house of bishops, and elected by the house of clerical and lay delegates.

In the *Methodist Episcopal Church*, which is somewhat presbyterial in its government, the bishops are elected in the General Conference composed of clerical and lay delegates. The bishops have no dioceses, but exercise joint jurisdiction over the entire church. Their place of residence is fixed by the quadrennial sessions of the General Conference. They itinerate as do the pastors; some being appointed to reside for a time in foreign lands as missionary bishops. Their duties are administrative, and their episcopal power has been curtailed in recent years. They preside over the annual conference of the church.

Bishops are found in all denominations in the United States holding the episcopal form of government, though the power of the bishop varies greatly in different churches. Due perhaps to the influence of a democracy, there has been a tendency toward a democracy as against a hierarchy in most episcopal churches, except the Roman Catholic, and even in that church the pope does not exercise his immediate authority in appointing bishops as in Spain and Austria.

• See EPISCOPACY; ORDERS, HOLY; ARCHBISHOP; CHURCH, ANGLICAN; PROTESTANT EPISCOPAL CHURCH; ROMAN CATHOLIC CHURCH.

Consult Hatch's *Organization of the Early Christian Churches*; Lindsay's *Christian Ministry in the First Three Centuries* (1905).

**Bishop**, a beverage composed of red wine (claret, Burgundy, etc.) poured warm or cold upon ripe bitter oranges, sugared and spiced to taste, and drunk either hot or cold.

**Bishop**, SIR HENRY ROWLEY (1786–1855), English composer, was born in London. From 1810 to 1824 he was director of music at Covent Garden, from 1825 to 1830 at Drury Lane, and from 1830 to 1833 at Vauxhall Gardens. Later he was professor of music at Edinburgh (1841–3) and Oxford (1848–55). Among his eighty-eight operatic entertainments were *Guy Mannering*, *The Miller and His Men*, *Maid Marian*, *Native Land*, and *The*

*Virgin of the Sun*. He is best known for his settings of songs, including *Should He Upbraid*, *The Bloom Is On the Rye*, and *Home, Sweet Home*.

**Bishop**, ISABELLA (née BIRD) (1832–1904), English traveller and author. Canada, Prince Edward Island, and the United States were the scenes of her first journey. She next visited the Sandwich Islands, the Rocky Mountains, and Japan. Her later travels were in Malaysia, China, Siberia, and Korea. She always took a warm interest in medical missions, and built five hospitals and an orphanage in the East. Her works include: *The Englishwoman in America* (1855); *Six Months in the Sandwich Islands* (1878); *A Lady's Life in the Rocky Mountains* (1874); *Unbeaten Tracks in Japan* (1880); *In the Golden Chersonese* (1883); *Korea and Her Neighbors* (1898); *The Yangtze Valley* (1899); *Pictures from China* (1900). Consult Stoddart's *Life* (1906).

**Bishop Auckland**, market town, Durham, England, at the junction of the Gaunless and the Wear; 9 miles southwest of Durham. Auckland Palace or Castle, the residence of the bishop of Durham, was founded about 1300. There are large coal mines in the vicinity, and engineering works in the town. Pop. (1901) 11,966; (1911) 13,839.

**Bishop's College, University of**, is situated in Lenoxville, Quebec, Canada, and is maintained by the Anglican Church. It was founded in 1843, and received a royal charter in 1853. The University grants degrees in arts (three years' course) and divinity (two years' course). In 1914 there were 60 students, with 9 instructors. The library contained 11,000 volumes.

**Bishop's Ring**, the corona or halo extending from 20° to 30° from the sun, first observed by Dr. Sereno Bishop at Honolulu on Sept. 5, 1883, after the great Krakatoa eruption. It was a diffraction corona produced by exceedingly small dust particles ejected from the volcano. The Bishop's Ring reached its maximum brilliancy in the spring of 1884, and gradually declined until June, 1886, when it disappeared. The ring and twilight glows were seen again in 1902–3 after the eruption of Mount Pelée in Martinique.

**Bishop-Stortford**, town, Hertfordshire, England, on the River Stort; 12 miles northeast of Hertford. It has malt houses, breweries, brickfields, and limekilns. Pop. (1911) 8,723.

**Bishopweed**, or GOUTWEED, also Goatweed, or Herb Gerard (*Egopodium podogaria*), an umbelliferous weed common in hedges and grass plots, and ex-

ceedingly difficult of extirpation on account of its creeping rhizomes. The leaflets are broad, triangular, and in groups of three; the flowers are small and whitish, in dense compound umbels. The plant is eaten by cattle, and the leaf stalks were formerly boiled and eaten as greens.

**Bis'kra**, or BIS'KARA (the Roman *Ad Piscinum*), town, Algeria, in an oasis watered by the Wady Biskra and by numerous artesian wells; 130 miles southwest of Constantine. A delightful winter climate makes it a popular resort, and it has several fine hotels. A French garrison is stationed here. Scenes of the neighborhood have been depicted in Hichens' *Garden of Allah*. There are sulphur springs in the vicinity. Pop. 10,000.

**Bis'ley**, village, England, in Surrey; 4 miles northwest of Woking. To Bisley Common were removed in 1890 the annual meetings of the National Rifle Association, formerly held at Wimbledon.

**Bismarck**, biz'mark, city, North Dakota, capital of the State, on the Missouri River, and the Northern Pacific and the Minneapolis, St. Paul, and Sault Ste. Marie Railroads; 440 miles west of Minneapolis, Minn. The Missouri is here crossed by a steel railroad bridge 50 feet above high water and by a \$1,250,000 highway bridge, on the National Parks Highway. The city contains the State Capitol (\$500,000) and other public buildings, and just east of its boundaries is the State Penitentiary. Industries include grain elevators, flour mill, creamery, and produce houses. The city is the wholesale and jobbing centre for Southwestern North Dakota, doing a wholesale and jobbing business of over \$11,000,000 annually. In 1909 the commission form of government was adopted. Pop. (1910) 5,443; (1920) 7,122.

**Bismarck Archipelago**, a general name for the Pacific islands lying immediately east of New Guinea, between 141° 30' and 156° E. long., and between the equator and 8° S. lat. It includes the following islands and groups of islands: New Britain, New Ireland, Lavongai, Duke of York Islands, Admiralty Islands, Mussau Islands, Gardner Islands, Nuguria, Nissan, Vitu Islands, Umboi Islands, Hermit Islands, Ninigo Group, Kaniet and Sae Islands; area about 20,000 square miles. The inhabitants are indigenous tribes of Melanesian descent, in a low stage of civilization.

Physically, as well as in their plant and animal life, these islands have a close affinity with

New Guinea, but except for the coasts they are relatively little known. They are mostly mountainous; partly of coralline formation, and partly volcanic. They have a hot, moist climate, with the northwest monsoon (December to April). In addition to the usual native fruits and vegetables, the archipelago produces copra, cotton, rubber, and mother-of-pearl. In November 1884, a German Protectorate was declared over the New Britain archipelago and the following year it was renamed the Bismarck Archipelago. In the Great War it was occupied by an Australian force and at the conclusion of the war it was assigned to Australia under a mandate. The seat of government is in Rabaul, New Britain. Pop. (1922) about 176,000.

**Bismarckburg**, bis'märk-boörch, district, now known as Kasanga, in former German East Africa (q.v.), touches the east shore of the south end of Lake Tanganyika and includes Lake Rikwa. Kasanga, the capital, is situated at the south end of Lake Tanganyika.

**Bismarck-Schönhausen**, shün'hau-zen, HERBERT NIKOLAUS, PRINCE (1849-1904), eldest son of Prince Otto von Bismarck, was born in Berlin. He entered the foreign office in 1873 and thereafter was engaged in various diplomatic missions. He was appointed *attaché* at London in 1882 and at St. Petersburg in 1884. He was Secretary of State for Foreign Affairs from 1886 to 1890 and a member of the Reichstag after 1893.

**Bismarck-Schönhausen**, OTTO EDOUARD LEOPOLD, PRINCE VON (1815-98), commonly spoken of as PRINCE BISMARCK, was the son of a Pomeranian squire. Born on his father's estate of Schönhausen—which name he assumed in after life in addition to Bismarck—he was sent in 1832 to the University of Göttingen, where he distinguished himself chiefly in physical exercises, and in fighting successfully twenty-seven duels. In 1846 he entered the Saxon provincial Diet, and in 1847 the general Diet of Prussia. He was appointed representative of Prussia at the Diet of Frankfurt in 1851. In March, 1859, he was sent as ambassador to St. Petersburg, and in May, 1862, to Paris, whence he was recalled in September, 1862, to become Minister-President and Minister for Foreign Affairs.

Bismarck, whose anti-democratic spirit had declared itself from the first, now rode roughshod over the opposition of the deputies and the press, dominating his enemies with unconstitutional severity. After the war of spoliation against Denmark, Bis-

marck carried out his long-cherished policy for the humiliation of Austria. The sanguinary war of 1866, culminating at Sadowa, extinguished the leadership of Austria in Germany, and Prussia became the dominant power. The unification of Germany now set in. Frankfurt received a Prussian garrison, Hanover was incorporated in the Germanic Confederation, and treaties were concluded with Bavaria, Baden, and Württemberg. In 1867 Bismarck organized the North German Confederation, and for his services was made Chancellor of the Confederation and President of the Federal Council. The Luxembourg difficulty between France and Prussia was adjusted by the neutralization of that territory.

In July, 1870, France declared war against Prussia (see FRANCO-GERMAN WAR), and on the capitulation of Paris, Bismarck dictated the terms of peace. In January, 1871, the king of Prussia was crowned as German emperor at Versailles. Bismarck was appointed chancellor of the German empire, and raised to the rank of prince. He now occupied himself with domestic reform, and with the promotion of the drastic Falk laws against the Roman Catholics—a measure which resulted in the temporary expulsion of the Jesuits and the imprisonment of several bishops (see KULTURKAMPF). In December, 1872, he resigned the presidency of the state ministry, but continued to advise the emperor, and was reappointed Prussian Premier in 1873. The chief object of Bismarck's foreign policy was the preservation of the peace of Europe by the isolation of France, the conciliation of Russia, and the preservation of an alliance between Germany, Austria, and Italy. In 1878 he presided over the Berlin Congress (see BERLIN, CONGRESS OF).

After the accession of William II. in 1888, difficulties arose between the new sovereign and his minister. The former was exacting and imperious, while the latter sought to retain all his old power and influence. By the middle of March, 1890, matters had come to a crisis. Bismarck refused to comply with his sovereign's demand that he draw up an order reversing a decree of Frederick William IV., which made the Prussian minister-president responsible for the acts of the ministers, and his resignation followed. The Emperor did his best to make the Chancellor's retirement appear voluntary, raising him to the rank of Field Marshal and creating him Duke of Lauenburg, but the feeling of bitterness between the two could not be thus easily dispelled, and Bismarck soon drifted into open

criticism of the government. His serious illness in 1893 brought about a pseudo-reconciliation which continued, on the surface at least, until his death, July 31, 1898.

In private life Bismarck was a man of warm affections. Though imperious in character, and sometimes unscrupulous and vindictive, he was cast in a large mould. He was tall and massive in person, fair and fresh of complexion, and quiet and cultured in manner. Though no orator, in public speeches he wielded the mother tongue with trenchant vigor. As the chief creator of modern Germany he will always hold a conspicuous place in history.

There are *Lives* in German by Busch, Görlach, Heyck, and Blum. Consult also Lowe's *Historical Biography*; Hahn's *Political Life, Labors, and Speeches*; Munroe-Smith's *Bismarck and German Unity*; *Love Letters of Prince Bismarck* (Eng. trans. 1901); *Correspondence of William I. and Bismarck* (Eng. trans. 1903).

**Bismuth**, biz'muth (Bi, 209.0), a metallic element that occurs in many places free, as well as in combination, as sulphide, oxide, and carbonate. Bismuth is extracted from the ore by melting out the free metal, the oxides and sulphides being decomposed by the addition of carbon and iron. It is a white, crystalline, brittle metal with a pinkish tinge, has a specific gravity of 9.8, is a poor conductor of electricity, and is very diamagnetic. It melts at 268° c., and solidifies with expansion. Heated in the air, it burns with a blue flame, forming yellow fumes of oxide; and unites with sulphur if heated with it. Its soluble salts are characterized by forming insoluble basic salts on addition of water—a property used in their detection.

Bismuth unites readily with other metals, forming fusible alloys, which are useful on account of their low melting points, and for expanding on solidification, thus enabling them to be employed, among other uses, in taking sharp casts of objects that would be damaged by a high temperature. Metallic bismuth is employed in making low-fusing alloys or cliché metals which are used in automatic fire sprinklers, fuses for electric wiring, and solder. (See FUSIBLE METAL.)

Bismuth forms several compounds of service in the arts and in medicine; it combines with oxygen to form several oxides, of which the trioxide, Bi<sub>2</sub>O<sub>3</sub>, is the most important. It is employed in porcelain manufacture as an agent for fixing the gilding, and for increasing the fusibility of fluxes, at the same time neutralizing the colors which are often

communicated by them. The subnitrate or basic nitrate of bismuth receives the names of *pearl white*, *pearl powder*, *blanc de fard*, and *blanc d'Espagne*.

In medicine, bismuth is used chiefly as the subnitrate, acting on inflamed surfaces, as in eczema, and on mucous membranes, as a mild astringent and anodyne; its powdery form dries a 'weeping' surface. Bismuth is also employed in all forms of gastric and intestinal inflammation. A more recent application is in the treatment of syphilis. If combined with betanaphthol, it is antiseptic for the stomach and intestines.

Bismuth is found native in England, France, Peru, and Siberia, but is obtained chiefly from Saxony. A considerable quantity is produced in the United States as a by-product of the refining of metals. In 1924, the production from this latter source was estimated at 304,640 pounds. The imports of bismuth into the United States during 1925 amounted to 99,694 pounds valued at \$187,340.

**Bison**, a genus of wild cattle closely allied to the ox, and represented by two rapidly disappearing species—the American *Bos americanus* or *Bison americanus*, and the European aurochs, or zubr, *Bos bison*, *Bos europæus*, or *Bison bonasus*. The bison is the largest quadruped now existing in Europe. It measures about 10 feet in length, stands about 6 feet high, and is extremely strong, especially in its fore-parts. Old bulls can readily cope with wolf or bear. The most striking differences between the bison and the ox are the hump just behind the neck, the broader convex forehead, the longer limbs, the shaggier head and shoulders. There are also internal differences, such as the presence of an additional rib. The females are not as large as the males, nor as shaggy on the fore-parts.

The food of the bison consists of grass and brushwood, and the leaves and bark of young trees. Its cry is peculiar, 'resembling a groan or a grunt, more than the lowing of an ox.' It does not attain its full stature until after its sixth year, and lives for about thirty or forty years. It has never been reduced to subjection by man, and the domestication even of individuals taken young has been only partial. The animal is generally shy and is easily provoked; it can be approached only from the leeward, its sense of smell being extremely acute. It runs swiftly, galloping with its head so low that the hoofs are raised above it.

The American bison, slightly smaller than the European bison, is interesting as the only living

species of the ox family indigenous to America, except the musk ox of the subarctic regions. It is popularly called *Buffalo*, (q.v.), but must be distinguished from the true buffalo. The bison was formerly abundant in America, especially in the prairies beyond

American Bison

the Mississippi, and from 63° N. lat. to New Mexico. Even in the 19th century it was still found in Ohio. Now it is nearly extinct. In recent years, however, encouraging efforts at preservation have been made by the United States and Canadian governments and American bison societies, and the number of bison has been considerably increased. The principal centres devoted to the animals are the Yellowstone National Park, the Montana and Wichita ranges, and the Canadian government reserves in Alberta and Athabasca.

The bison used to congregate in large herds, and when migrating travelled in solid columns of thousands and tens of thousands,

European Bison

which were scarcely able to turn or arrest their progress for the pressure of the masses from behind on those in front. The economic importance of the bison was considerable. The flesh, like coarse-grained beef, was tender and juicy, while the tongue, marrow bones, and hump were especially prized. The hump formed pemmican; the fat, tallow; the skins, clothing or tent and canoe covers; the hair, cloth; and the dried droppings, fuel.

Consult Allen's *The American Bison*; Hornaday's *Our Vanishing Wild Life*; *American Big-Game*

*Hunting*, by T. Roosevelt and G. B. Grinnell (1893).

**Bissagos Islands**, a group of low, sandy islands off the w. coast of Africa, opposite the estuary of the Geba, between 11° and 12° N. lat. The largest islands of the group (Bolama, Orango, Gallinhas, etc.) belong to Portugal. Area, about 1,550 sq. m. Chief tn. Bolama.

**Bisschop**, CHRISTOFFEL (1828), the painter of Friesland who, with Israels, has revolutionized Dutch painting. He paints sunlit interiors and enclosed spaces luminously warm—e.g. *The Morning Sun*, *Winter in Friesland*, *Sunshine in Heart and Home*, etc. See Muther's *History of Modern Painting* (1895-6).

**Bissell**, EDWIN CONE (1832-94), American theologian, was born in Schoharie, N. Y., and graduated at Amherst. He studied divinity at Union Theological Seminary, New York, and was pastor of various Congregational churches, and American Board missionary to Austria until his acceptance (1881) of the professorship of Hebrew in Hartford Theological Seminary. Author of *Historic Origin of the Bible* (1873), *The Pentateuch, its Origin and Structure* (1835), and other works.

**Bissell**, GEORGE EDWIN (1839), American sculptor, born at New Preston, Conn.; served in the Civil War, and subsequently was engaged in the marble business at Poughkeepsie, N. Y.; studied at Paris, Rome, and Florence (1875-6), and, until 1896, did much of his art work abroad, then settling at Mt. Vernon, N. Y.; has executed Soldiers and Sailors' Monument (Waterbury, Conn.), the relievo of Burns and Highland Mary (Ayr, Scotland), President Arthur (New York), *Hospitality* (Buffalo Exposition), and several statues and groups for the St. Louis Exposition.

**Bissell**, WILSON SHANNON (1847-1904), American lawyer, was born at New London, Oneida co., N. Y., and graduated (1869) at Yale; studied law at Buffalo, and in 1872 formed a law partnership with Lyman K. Bass, to which Grover Cleveland was admitted the following year, the firm's name being changed to Bass, Cleveland & Bissell. Till 1893, Mr. Bissell had declined office, although serving as delegate at conventions; in that year he was appointed postmaster-general of the United States by Cleveland. He resigned in 1895 to resume the practice of the law.

**Bissen**, HERMANN WILHELM (1798-1863), Danish sculptor who studied at Rome (1823) under Thorwaldsen, by whose will he was appointed to complete his master's unfinished works and

to take charge of his museum. Returning to Denmark, Bissen fostered there the classical traditions of Thorwaldsen, and he executed, among other works, a frieze for the palace hall at Copenhagen, an *Atalanta*, *Cupid sharpening his Arrows*, and *Valkyrie*. See *Life* by Plon (1871).

**Bistriz** (Hungarian, *Beszterce*), a royal free tn., Hungary, Transylvania, cap. of the co. of Bistriz-Naszód, 75 m. N.E. of Klausenburg. In the 15th and 16th centuries it was one of the principal commercial towns of Transylvania. Sawmilling and tanning are the principal industries. Pop. (1900) 10,873.

**Bistriz-Naszód**, a co. of Hungary, in the N.E. of Transylvania; is spread over the w. face of the Carpathians, and is consequently very mountainous. Timber, maize, fruit, and various minerals are the principal products. Area, 1,550 sq. m. Pop. (1900) 117,649, mostly Roumanians.

**Bithur**, tn., in N.W. Provinces (United Provs. of Agra and Oudh), India, 12 m. N.W. of Cawnpur, on l. bk. of the Ganges; is much frequented by pilgrims, and is devoted to the worship of Brahma. Here, on Aug. 16, 1857, Havelock, on his way to relieve Lucknow, defeated Nana Sahib, who had strongly fortified the town. Pop. (1901) 7,173.

**Bithynia**, dist., Asia Minor, bounded on the E. by Paphlagonia, S. by Phrygia, W. by Mysia, and N. by the Black Sea. Its inhabitants were immigrants from Thrace. In the 7th and 6th centuries B.C. it was part of the kingdom of Lydia, and then of the Persian empire, until, during its decline, the princes of Bithynia became independent, and, resisting Alexander and his successors, founded a kingdom which lasted until Nicomedes III., in 74 B.C., bequeathed it, on his death, to the Romans, of whose empire it became a province.

**Bitlis**, tn., Asiatic Turkey, 120 m. N.E. of Diarbekir; lies in a ravine, surrounded by hills above 2,000 ft. high. The people are largely engaged in the manufacture of firearms, and of cotton cloths noted for their bright-red dye. Tobacco of a very fine quality is exported. Here, in 1554, the Persians defeated Solyman the Magnificent. Pop. of vilayet, 398,600; of tn. 38,800.

**Bitonto** (anc. *Bituntum*), tn. and episc. see, prov. Bari, Italy, 9 m. W. of Bari, on the Apulian plain. The old town, surrounded by walls, and with narrow streets, has a Romanesque cathedral, a castle, and a theological seminary, and is encircled by modern quarters. It manufactures olive oil and good wine. Pop. (1901) 30,652.

**Bitsch**, a fortified tn., Alsace-

Lorraine, Germany, in Lorraine, 24 m. S.E. of Saargemünd. It is commanded by a citadel, partly hewn out of the solid rock, which was unsuccessfully besieged by the Prussians in 1815, and by the Germans in 1870-1. From 1766 to 1871 it was in the hands of the French. Pop. (1900) 3,640.

**Bitter Almonds**, OIL OF, or BENZALDEHYDE. See ALMONDS, OIL OF.

**Bitter Apple**, or BITTER CUPS. See COLOCYNTH.

**Bitter Ash**. See QUASSIA.

**Bitterfeld**, tn., prov. Saxony, Prussia, 19 m. N.E. of Halle, with lignite mines, manufacture of drain-pipes and roofing felt, iron foundries, engineering shops, and steam-sawmills. Pop. (1900) 11,639.

**Bitter Lakes**, GREAT and SMALL. The smaller is 6 m. N. of Suez, Egypt; the larger lies between that lake and Lake Tim-sah. The two lakes form part of the Suez Canal.

**Bittern** (*Botaurus*), a genus of birds allied to the herons. The bittern is a nocturnal bird, which, like its allies inhabits swampy ground, and is remarkable for the booming cry uttered at the breeding season. The common American bittern (*B. lentiginosus*) is widely distributed on this continent, and allied species occur in most parts of the globe. A smaller

*Bittern.*

and more yellowish species (*Ardeetta exilis*) is also a familiar bird in similar haunts in N. America. In bitterns the prevailing tint is brown, with black streaks or markings. They nest on the ground in marshes, and lay several plain olive-green eggs. The European species has now become a rarity.

**Bitter Root**, range of mountains on the boundary line between Idaho and Montana, a part of the Rocky Mountain system, having an altitude ranging between 9,000 and 10,000 ft.

**Bitters**, a large and important group of drugs, including gentian,

calumba, quassia, and others. Certain alkaloids have the general properties of bitters, in addition to their distinctive and more important characteristics. Their action begins in the mouth, where, by medicinal doses, the nerves of taste are stimulated, producing a flow of saliva, and thus assisting the first stage of digestion and increasing appetite. On reaching the stomach the bitter principle (berberine, quassin, quinine, or whichever may be present) acts directly on the gastric nerves, stimulating secretion and causing hunger, or, more accurately, the sense of hunger. Bitters, both in stomach and intestine, have also an antiseptic action, preventing fermentation and decomposition. In overdoses, or if too long used, they irritate rather than stimulate. They are anthelmintics, and for that purpose are used in injections. Advantage is taken of the stimulating properties of bitters in the well-known preparations angostura, calisaya and other bitters which are taken before meals. The bitter principle of hops is one of the most important ingredients in beer.

**Bittersweet**, or **WOODY NIGHTSHADE** (*Solanum dulcamara*), a climbing plant common in the north temperate zone. Its stems, which die down every winter, bear lance-shaped leaves

*Bittersweet.*

1, Fruit; 2, pistil; 3, stamen.

with two little wings at the base of each, small purple flowers, and poisonous red berries. An extract

from the stem is used for rheumatism and certain affections of the skin. The shrubby or climbing bittersweet, of North America, is *Celastrus scandens*, a woody vine, having conspicuous red and orange fruits in fall.

**Bitterwood.** See QUASSIA.

**Bitumen**, in its popular meaning, includes all those mineral products, of organic origin, which are characterized by a high percentage of carbon and hydrogen, by a powerful and peculiar smell, and by the facility with which they burn, giving off a heavy, sooty smoke. Among these are asphalt, naphtha, petroleum, pitch, elaterite, ozokerite, gilsonite, the so-called mineral resins, and the oils procured from marl and shale. The sp. gr. of bitumens is low; almost all of them float on water. See ASPHALT, PETROLEUM, etc.

**Bituriges**, a powerful tribe in Aquitanian Gaul; their chief cities were Avaricum (Bourges) and Burdigala (Bordeaux). They were conquered by Caesar.

**Bitzius**, ALBERT (1797-1854), was a Swiss Protestant minister who, under the name of JEREMIAS GOTTHELF, wrote a long series of tales illustrating Swiss peasant life. He was minister of Lützelflüh, in the Emmenthal, from 1832 to his death, and his types are mostly taken from that district. His first work was *Bauernspiegel* (1837). Others are *Uli der Knecht* (1841), and its continuation, *Uli der Pächter* (1849); *Anne Babi* (1843-4), *Käthi* (1847), and *Geld und Geist* (1842). See new complete ed. with *Life by Vetter* (1898-1900); and *Life by Bartels* (1902).

**Bivalves**, or **LAMELLIBRANCHS**, are molluscs or shell-fish in which the shell consists of two valves placed at the right and left sides of the animal. The body is bilaterally symmetrical, and compressed from side to side; there is no distinct head region as in gastropods—e.g. the snail—and there are therefore no tentacles, no jaws, no salivary glands, and no radula or tooth-ribbon; the foot is ploughshare-shaped, and may contain a byssus gland; the gill filaments are often fused into plates, hence the name Lamellibranch. Other peculiarities are that the food consists of microscopic particles; there are usually two larval stages—the veliger and trochosphere; and the nervous system consists of three pairs of ganglia. Bivalves occur both in salt and in fresh water, but none are adapted for a terrestrial life. In the oyster, mussel, scallop, cockle, clam, we have forms of considerable commercial importance; while the pearl oyster (*Melegrina*) is valued on account of the size, brilliancy, and color of the concretions or pearls

formed around minute irritants introduced between the mantle and the shell. Many bivalves are boring animals, and contribute to the disintegration of rocks—e.g. Pholas; or, as in the case of the destructive teredo, or shipworm, undermine wooden piers and breakwaters, and attack wooden ships. In tropical regions the bivalves may reach a great size, as witness the giant clam (*Tridacna*), whose valves may measure two feet across. Though the majority are sedentary or slow-moving, the Limas and scallops are capable of swimming by means of rapid jerks.

Several different classifications of bivalves (order Pelecypoda) exist, but perhaps the most satisfactory is that based on the structure of the gills, according to which the existing forms fall into four orders:—

1. Protobranchia, those with simple gills, like the gills of gastropods—e.g. Nucula.

2. Filibranchia, those with gills consisting of long, reflected filaments only slightly connected with one another—e.g. Arca.

3. Pseudo-lamellibranchiata, those with the gill filaments loosely connected to form gill-plates—e.g. Pecten, oyster.

4. Eulamellibranchiata. The gills are double flattened plates, the separate filaments being no longer obvious. To this order belong most of the living bivalves—e.g. Pholas, Mya, and Anodon. See Cooke, *Molluscs* (1895).

**Biwa Lake** (Jap. *Biwa-ko*, 'a guitar'), in prov. of Omi, Japan, 10 m. N.E. of Kioto by river and canal; is drained by the Yodogawa R., which flows into Osaka Bay. It measures 36 m. in length by 12 m. in width, and is justly celebrated for its beauty, especially at the s. end. Lake Biwa Canal, 6 m. in length, connects it with Kamogawa Canal, and is utilized to drive the mills and factories of Kioto. According to the Japanese legend, the lake was produced by an earthquake in 286 B.C., which also upheaved the volcano of Fusuyama.

**Bixa Orellana**, a plant common in tropical America, and much cultivated in the W. Indies; belongs to the order Bixaceæ, of the violet group of orders. The seeds are protected by a red pulp from which is derived the dye annatto. The S. American Indians paint themselves with it.

**Blysk**, tn., Siberia, 270 m. s. of Tomsk, on r. bk. of Biya R., near its confluence with the Obi. A pass here crosses the Altai range into China. Pop. (1897) 17,206.

**Bizerta** (Fr. *Bizerte*; anc. *Hippo-Diarrhytus*), seapt. in Tunis, on the N. coast, 60 m. by rail N.W.

of Tunis. The harbor (1894) is a canal 30 ft. deep, connecting the sea and the Lake of Bizerta (31 m. in circuit), and opens into the sea by a tide-dock of about 3,500 ac. formed by two piers. The little native town and the European town both lie to the N. of the canal. Its fisheries are very productive. Bizerta is principally a naval station and port of call, and as a commercial port it competes with Tunis. It was occupied by the French in 1881. Pop. 10,000 (3,000 Europeans).

**Bizet**, ALEXANDRE CÉSAR LÉOPOLD, called GEORGES (1838-75), French musical composer, was born at Bougival, near Paris. He studied at the Paris Conservatoire under Halévy, and gained the Grand Prix de Rome in 1857. His operas, *Les Pêcheurs de Perles* (1863), and *La Jolie Fille de Perih* (1867), based on Scott's novel, and produced at the Théâtre Lyrique, exhibited strong traces of Wagnerian influence. *Djamileh* (1872) did not meet with much success, but *L'Arlesienne* (1872) was enthusiastically received. Bizet's great masterpiece, *Carmen*, performed at the Opéra Comique in 1875, and shortly afterward in Vienna, Brussels, Berlin, and London (1878), though at first a failure, has since become his most famous work. It had much influence on the development of the lyric opera. See *Lives* in French, by Pigot (1886) and Bellaigne (1891).

**Björneborg**, seapt., Finland, N.W. Russia, province of Abo-Björneborg, on the Gulf of Bothnia, 100 m. N. of Abo. Imports about \$1,000,000 per annum; exports—wood, beer, oats, iron—about \$2,500,000. The fisheries of Björneborg are important. Pop. (1897) 13,417.

**Blörnson**, BJÖRNSTJERNE (1832-1910), Norwegian poet, dramatist, and novelist, b. in Osterdalen, and educated at Moide and the University of Christiania. From 1857-9 he was director of the theatre at Bergen. His earliest and best works were his peasant stories, *Arne* (1858), *Synnöve Solbakken* (1857), *En Glad Gut* (1860), whose vigor and originality at once established his reputation. His earlier dramas, too (e.g. *Halte-Hulda* in 1859, *Mellem Slagene* in 1855), are full of force and beauty, and both tales and plays are distinguished by a terse style in which there is not a word too much. From 1860-2 Björnson lived principally at Copenhagen and Rome. In Italy he composed the drama *Kong Sverre* (1861) and the famous trilogy *Sigurd Slembe* (1862), two of the noblest productions of Norwegian literature. On his return to Norway in 1863 the Parliament granted him an annual pension in recognition of his literary merit;

from 1861-7 he was director of the National Theatre at Christiania, and from 1866-71 editor of the *Norsk Folkeblad*, in which capacity he took an active part in politics on the Radical side, being a very eloquent public speaker. He was always a strenuous and

the dramas *Maria Stuart* (1864) and *Sigurd Jorsalfar* (1872), the tales *Friskerjenten* (1868) and *Brude-Slaatten* (1872), and the poetical romance *Arnhot Gelline* (1870). He had latterly written, though not with complete success, the analytic-psychological ro-

Bivalves.

1. Shipworm (*Teredo navalis*), in floating wood. 2, 3. Ark-shells (*Arca*). 4, 5, 6, 10. Scallops (*Pecten*). 7. A stone-borer (*Pholas*) in rock. 8. Soft-clam (*Mya arenaria*) in mud. 9 and 11. *Nucula radiata*.

somewhat violent partisan, and his anti-Swedish diatribes have done much to accentuate the differences between the Swedes and the Norwegians. The winter of 1880-81 was spent in a lecturing tour through the U. S. For a time (1882-8) he resided at Paris. Of his later works the best are

mance (e.g. *Det Flager i Byen og paa Havnen*, 1884; *Pa Guds Veje*, 1889), using social and religious questions as mediums for his advanced opinions; and in the same spirit, with more or less success, plays such as *En Fallit* (1874), *Kedaktoren* (1874), *En Handske* (1883), *Geografi og Kjaerlighed*

(1885), *Det ny System* (1879), *Over Evne* (i. 1883; ii. 1895). But in the little tales *Mors Hænder* and *Een Dag* (published in *Nye Fortællinger*, 1894) he once again shows his original power. See his novels, in English, ed. Gosse (1895); Brandes's *Björnson og Ibsen* (1882); and the *Life*, written in Norwegian, by Ch. Collin.

(1839), *Hindu Theogony* (1843), both in Swedish, and *Anteckninger*—i.e. Notes (1851-2).

**Black, ADAM** (1784-1874), Scottish politician and publisher, was born in Edinburgh, where he established the publishing house of A. and C. Black. His firm acquired (1827) the copyrights of the *Encyclopædia Britannica* and

**Black, HUGH** (1869), American theologian, born in Rothesay, Scotland, educated at Glasgow University and the Free Church College, ordained in 1891, held charge at Paisley in 1891-96 and at Edinburgh in 1896-1906, became professor of practical theology at the Union Theological Seminary, New York, in 1906.

**Black, JAMES** (1823-93), American prohibitionist, was born at Lewisburg, Pa., and practised law at Lancaster in the same state. In 1846 he assisted in organizing the Sons of Temperance in Lancaster. He was prominent in all temperance movements, was an organizer of the Good Templars, and first proposed the establishment of a prohibition party. He was the first nominee of that party for president, in 1872. He wrote *A History of the Prohibition Party* (1880), and other volumes on the same subject.

**Black, JEREMIAH SULLIVAN** (1810-83), American jurist, was born in the Glades, Somerset co., Pa., and was admitted to the bar of that county, 1831. He was appointed president-judge of his district as a Democrat, 1842, was a supreme court judge of Pa., 1851-7, in 1857 was made attorney-general of the U. S., became secretary of state in 1860, and endeavored to neutralize the efforts of the secessionists until the succession of Pres. Lincoln, when he retired. See *Essays and Speeches of Jeremiah Black, with a Biographical Sketch* (1885).

**Black, JOHN** (1783-1855), Scottish journalist, was born near Dunse. In 1810 he went to London, walking all the way, and obtained a situation on the staff of the *Morning Chronicle*. He became a parliamentary reporter, and eventually edited the *Chronicle* from 1817 to 1843. He made several good translations from German, French, and Italian works, and wrote, in 1810, a *Life of Tasso*. Charles Dickens was one of his reporters, and he was on intimate terms with James Mill, Palmerston, and Brougham.

**Black, JOSEPH** (1728-99), chemist, of Scottish extraction, was born at Bordeaux. He became professor of chemistry at Glasgow (1756), and at Edinburgh (1766). His graduation thesis, on *Magnesia Alba* (1754), published in an extended form in 1756, announced his discovery of the distinction between 'fixed' and common air, and laid the foundation of quantitative analysis. He was the first to propound the theory of 'specific heat,' but he is better known as the discoverer of 'latent heat' in 1761. See Robison's Preface to *Black's Lectures on Chemistry* (1803); Grant's *Univ. of Edinburgh*, vol. ii., p. 395.

**Black, WILLIAM** (1841-98), nov-

Björnstjerne Björnson, the Norwegian Novelist.

Also Boyesen, *Essays on Scandinavian Literature* (1895).

**Björnstjerna, MAGNUS** (1779-1847), Swedish statesman, born at Dresden. He fought (1813) in the battle of Leipzig against Napoleon, and countersigned the treaty (1814) uniting Norway and Sweden. He was ambassador to Great Britain (1828-46). He is author of *The British in E. India*

Scott's Waverley Novels in 1851. He was an uncompromising advocate of municipal and political reform. Twice elected lord provost of Edinburgh (1843-8). He represented that city in Parliament from 1856 to 1865. See Nicolson's *Memoirs of Adam Black* (1885); B. W. Crombie's *Modern Athenians*, ed. Scott Douglas (1882).

clist, was born in Glasgow, where he studied art. In 1864 he removed to London, where he joined the staff of the *Morning Star*. He represented that paper during the Prusso-Austrian War of 1866; was for some time literary editor of the *Examiner*, and editor of the *London Review*; and finally became assistant editor of the *Daily News*. He abandoned journalism entirely in 1874. His first novel, *Love or Marriage*, was published in 1866, and was followed by *In Silk Attire* (1869) and *Kilmeny* (1870). *A Daughter of Helth* (1871; several editions), perhaps the best of his many stories, established his reputation. Among the most important of his works are *The Strange Adventures of a Phaeton* (1872), *A Princess of Thule* (1873), *Madcap Violet* (1876), *Macleod of Dare* (1878), *White Heather* (1885), *In Far Lochaber* (1888), *Briseis* (1896), and *Wild Eelin* (1898). A monograph on *Goldsmith* appeared (1887) in the 'English Men of Letters Series.' As a novelist his strength lay in descriptions of Highland scenery, fishing, and yachting. A lighthouse to his memory was erected at Duart Point on the Sound of Mull in May, 1901. See Wemyss Reid's *Life* (1902).

**Black Act**, an act passed in 1722, punishing, as felons, marauders who (e.g. in Epping Forest) with blackened faces went about robbing and blackmailing. It was repealed in 1827. The name BLACK ACTS is also applied to acts of the Scottish Parliament (1424-1594) printed in black letter.

**Black-and-Tan Terrier** is bred in two varieties—the ordinary, which weighs up to twenty pounds; and the toy, which must be under seven pounds. Points: head long and narrow, flat from the base to the nose, with no bumps at the sides or cheeks; muzzle long and tapering, but not weak; eyes small and black; correct carriage of ears debatable,

Black-and-Tan Terrier.

but drop-ear favored; neck light and graceful; shoulders sloping; chest rather narrow, yet deep, and the body slightly arched, with good back ribs; fore legs quite straight, with well-arched toes and jet-black nails; hind quarters rather powerful, with

hocks well let down; tail very fine, and carried straight; coat short and close; color black, with rich tan markings along the jaws, breast, on the insides of the hind legs, under the vent, and on the fore legs up to above the pastern joint. The toes, however, have black lines, called penciling, running up them, and there is a black spot, the 'thumb mark,' just along the pastern joint, in front of the limb. Points for the toy variety precisely the same.

**Black Art.** See MAGIC.

**Black-Ash.** See SODIUM CARBONATE and ALKALI.

**Black Assizes**, a pestilence which appeared at the conclusion of the assizes at Oxford, July 6, 1577. Between that date and the 12th August following, 300 people, including the high sheriff and other officials died.

**Blackberry**, the fruit of various species of *Rubus*. The berries are black in color, and the drupelets of which cling to their receptacles until decayed. They include the high or bush blackberries and the trailing varieties, often called dewberries. All are shrubs, generally very prickly, and grow in various kinds of soil. The fruit ripens from July to September.

The most important blackberries in cultivation are derived from *R. nigrobaccus* (formerly known as *R. villosus*), which is indigenous to North America. It is upright, and tall, with long-stalked, taper-pointed leaflets, and white flowers. The cultivated

old canes being removed each year. They are usually hardy, but seem to require a little protection in the far North.

The dewberries (*R. villosus*; *R. invisus*, *R. trivialis* and *R. vi-*

High Bush Blackberry.

*jolius*) have only lately been cultivated, and with varying success. They have a trailing habit, propagating at the tips, rather than by suckers, and produce fruit earlier than do the high blackberries. They are apt to grow, when wild,

Low Blackberry or Dewberry.

varieties include: 1, long cluster berries, of which the Taylor is a good representative; 2, the short cluster (the Lawton and Snyder); 3, the leafy cluster (Early Harvest); 4, the loose cluster (Wilson). The sand blackberry (*R. cuneifolius*) is small, with recurved thorns and wedge-shaped leaflets, and is known in cultivation as the Topsy or Tree blackberry. This type of blackberries is propagated by suckers, spreading rapidly under favorable conditions, the

in warm sand, and the fruits have few but very large and sweet drupelets.

The European bramble (*R. fruticosus*) is also called blackberry, with fruit ripening in late autumn, and much smaller than that of the American species.

**Blackbird**, a name given in various parts of the world often to very different birds, whose plumage is prevailingly black. The blackbirds of the United States and Canada are of the family

Icteridæ, related to the starlings, and consist of several species of large size, half as big as a crow, the males wholly black, and called 'crow blackbirds'; also of a smaller species, the cow-bird (*Molothrus ater*), other species of which are numerous in S. America; also the red-winged blackbird, notable for gathering in autumn in great flocks on prairies and marshes. All are migratory, nest in bushes and trees, lay greenish eggs heavily marked with spots and lines, and have their females and young brown. They utter rough cries rather than a song. The cow-birds are further exceptional in laying pepper-dotted eggs, one at a time, in the nests of other birds, like the European cuckoo. The Mexican or Savanna blackbird is the ani (q.v.), a relation of the cuckoos. The East Indian blackbirds are grackles. The British blackbird is a favorite European song-bird, and one of the thrushes closely allied to the N. American robin.

**Blackbirds**, FIELD OF, or KOSOVO POLJE, a small plain in Turkey in Europe, in the vilayet of Kosovo, stretching s. from Pristina; was the scene of two great battles—(1) in 1389, when Sultan Murad I. defeated the Servians and overthrew their ancient kingdom, Lazar, their king, perishing in the battle; (2) in 1448, when John Hunyady of Hungary was defeated and captured by Sultan Murad II. and George Brancovics, prince of Servia.

**Blackbuck**, the common antelope of India (*Antelope cervicapra*), so called by sportsmen with reference to the shining brownish-black of the coat of the male, the females and young being light brown. The bucks have long spiral horns, from 16 to 25 inches long, and furnish excellent sport in all the open parts of India. See ANTELOPE.

**Black Bulb Thermometer** (also called *in vacuo* or radiation thermometer) is a sensitive maximum registering thermometer, having the bulb and a portion of the stem covered with lamp-black, the whole being enclosed in a glass tube from which all moisture and air have been removed. The instrument is fixed horizontally four feet above the ground, at a distance from walls or trees which may obstruct the full rays of the sun. The difference between the maximum temperature which it registers in the sun and the corresponding maximum in shade gives a rough measure of the amount of solar radiation.

**Blackburn** (ac. 48,281), par., munic. and co. bor., Lancashire, England, 9 m. E. of Preston and 21 m. N.W. of Manchester, and on Leeds and Liverpool Canal.

From 1650 it was famous for Blackburn 'checks,' and afterward, till 1764, for Blackburn 'grays.' After that year it began to take a foremost place in cotton-weaving, and is now the centre of the Lancashire cotton spinning and weaving industries, with 140 mills and over 55,000 looms. Here, in 1764, Hargreaves invented his 'spinning jenny.' The grammar school was founded by Queen Elizabeth in 1567. The Corporation Park and the Queen's Park are well laid out and extensive. At the sewage works precipitation is accomplished by means of ferrozene, and the sediment is made into manurial cakes. Besides cotton mills there are engineering works, breweries, etc. Pop. (1831) 36,629; (1871) 76,337; (1891) 120,064; (1911) 133,064.

**Blackburn**, JOSEPH CLAY STYLES (1838), American lawyer and legislator, was born in Woodford co., Ky., and was educated at Centre College. He was admitted to the bar in 1859, practised in Chicago, and served in the Confederate army during the Civil War. He afterward practised law in Ky., was a member of the state legislature in 1871-75, and of the House of Representatives in 1875-85. He served in the U. S. Senate in 1885-97, and was again elected in 1901 for the term ending in 1907, but was defeated for re-election. He was appointed a member of the Isthmian (Panama) Canal Commission in 1907.

**Blackcap** (*Sylvia atricapilla*), a small British song-bird, and one of the sweetest and cleverest of feathered songsters, the male of

Blackcap.

which has a black head. The blackcap is closely allied to the thrushes, and is a migrant.

**Blackcock**, also HEATHCOCK, a name strictly applicable to the male only of the true or black grouse (*Tetrao tetrix*), the female being called grayhen. The black grouse ranges through N. Europe and Asia, and is common in Scotland, and is a favorite game-bird. The male is remarkable for the lyrate tail and peculiar courting display, which is carried on in the early morning, and is accompanied by a drumming noise. The diet is varied, but is chiefly vegetable.

**Black Country**. See STAFFORDSHIRE.

**Black Death**. See PLAGUE.

**Black Earth**, a fertile soil of the nature of loess; its dark color being due to organic matter. It is noteworthy for yielding abundant crops. It lies spread over wide areas in the regions of the Dnieper, Don, Volga, and Vistula. Similar kinds of soil are known also in Siberia and in Texas.

**Blackfeet**, or SIKSIKA, a large division of the Algonquin linguistic stock formerly ranging from the Missouri river north to the Saskatchewan along the slopes of the Rocky Mountains. They are divided into three groups: the Blooch, the Piegans, and Blackfeet. At one time they were very powerful and owned great herds of horses, but the smallpox broke out among them about 1840 with such deadly effect that they never afterward gave the U. S. or Canadian government serious trouble. While they lived upon the buffalo and possessed the same general culture as the Plains Indians, they practised a highly developed form of ceremonial religion in which bundles of sacred objects with long rituals were a special feature. At present they reside upon reservations in Montana and Alberta, engaged in stock raising.

The name is also applied to a small division of the Teton, a subdivision of the Dakota Sioux. See Grinnell's *Blackfoot Lodge Tales* (1903); Coues's *New Light on the Early History of the Greater Northwest* (1897); Petitot's *Vocabulaire Pieganais* (1885).

**Blackfish**. The name of various fishes and fish-like animals prevailing black in color. Thus several of the killer-whales of the genus *Globiocephalus* are so called by both British and American fishermen, especially the ca'ing whale or bottlehead of the north-eastern Atlantic. Sailors also called various grampuses by this name. Among true fishes, this

Blackcock.

name is given locally in the east to the taetog, to a sea-bass and some others; and in Alaska to a small fresh-water fish (*Dallia pectoralis*),

which ascends the rivers in vast numbers to spawn, and is caught and preserved by the natives, to whom it is very valuable as a food resource.

**Black-fly**, a blackish gnat of the family Simuliidae which swarms in the forests of Canada and the N.E. United States in the hotter parts of summer, and often becomes an almost unendurable torment.

**Black Forest** (Ger. *Schwarzwald*), a mountainous wooded region in S.W. Germany; stretches through the grand-duchy of Baden for a distance of 100 m., with a breadth of 20 to 40 m., along the r. bk. of the Rhine, parallel to the similar range of the Volges on the l. bk. It is a region of lovely valleys winding among wooded heights (highest alt. 4,900 ft., in the Feldberg), and is inhabited by an industrious race of woodcutters and lumbermen, and makers of wooden clocks, barrel organs, musical boxes, and straw hats. The Black Forest is one of the favorite summer resorts of the Germans, and is also of great strategic importance as a barrier to the direct passage of troops east or west between S. Germany and Alsace and France, the principal bulwark being the intrenchments (1704) of Kneibis (3,180 ft.). In 1796, however, Moreau twice forced his way through its network of narrow valleys. In German legend and literature, too, the Black Forest plays no inconsiderable part. It is the home of many quaint legends. Auerback made it the scene of his peasant stories (*Schwarzwälder Dorfgeschichten*, 1843-53), and its scenery and life form the substance of J. P. Hebel's dialect poems, *Alemannische Gedichte* (1803).

**Black Hand**, a symbol used by members of a wide-spread Italian society, and affixed to blackmailing letters containing threats of personal injury and even death on failure of compliance. Recently the outrages committed and terror inspired by the society in the United States have led influential Italians in many large cities to organize White Hand societies to aid the authorities in suppressing the desperadoes of the Black Hand. In N. Y. City Italian detectives have been useful in discovering offenders.

**Black Hawk War**, a minor Indian war in the U. S. (1832), the Indians (Sacs and Foxes) being led by Black Hawk (1767-1838), who had opposed the treaties of 1804, 1816, and 1830, by which the Sacs and Foxes had alienated large portions of their lands, the main body of the tribes under Keokuk acquiescing in the cessions. The war began by Black Hawk's crossing of the Mississippi river into lands formerly occupied by the Indians; and

was ended, after several minor engagements, by the defeat of the Indians and the capture of Black Hawk (Aug. 1 and 2, 1832) near the mouth of the Bad Axe river in Illinois. Black Hawk was, however, released in the following year, and died at Des Moines, Iowa, in 1838. In the war, 1,340 U. S. regulars and 5,368 U. S. volunteers were engaged, and about 65 men were killed or wounded.

**Blackheath**, an elevated common in Kent, England, 5 m. s.e. of London, and near Greenwich Park; 70 acres. On it stands Morden College, founded in 1605 for decayed merchants who had been engaged in the Levant trade. The Danes encamped on it in 1012, and here Wat Tyler (1381) and Jack Cade (1450) assembled their followers. In the end of the 18th century the common was much frequented by highwaymen. Golf was first played on the common about 1608.

**Black Hills**, group of mountains mainly in the w. part of S. Dakota. It is an elliptical uplift, about 6,000 sq. m. in area, from the summit of which the more recent stratified beds have been eroded away, in the w. part down to the underlying Carboniferous rocks, in the e. part to the underlying granites. The remains of these younger beds surround the mountain group quite continuously in the form of ranges of hog-backs. The highest summit, Harney Peak, has an altitude of 7,216 ft.; average elevation, 2,500 to 3,000 ft. The region is one of the richest gold-producing districts in the United States, and contains also numerous other metals. The group obtains its name from the black pine forests, with which it is extensively covered.

**Black Hole**. See CALCUTTA.

**Blackhorse**, one of the edible suckers (*Cyprinus elongatus*) of the rivers of the Mississippi valley, which is almost jet black, and is among the food-fishes caught for market in spring in large numbers.

**Blackie**, JOHN STUART (1809-95), Scottish author and professor, was called (1834) to the Scottish bar, but soon devoted himself to literature, executing a translation, in verse, of Goethe's *Faust* (1834). From 1841-52 he held the chair of humanity in Marischal College, Aberdeen, and from 1852-82 that of Greek in Edinburgh University. He was an ardent student of many subjects—political, scholastic, philological, and moral. He succeeded (1874-6) in raising \$60,000 for the foundation of a Celtic chair at Edinburgh. Blackie was a voluminous writer. His chief works were a metrical translation of *Æschylus* (1850); *Songs and Legends of Ancient Greece* (1857); *Homer and the Iliad*,

in 4 vols. (1866); *Self-Culture—Intellectual, Physical and Moral* (1877); *War Songs of the Germans*, a translation (1870); *Lays of Highlands and Islands* (1872); *The Language and Literature of the Highlands of Scotland* (1875); *The Wisdom of Goethe* (1883); *Life of Robert Burns*, in the 'Great Writers Series' (1888); *Scottish Song* (1889); *Christianity and the Ideal of Humanity* (1893). See *Life* by Anna M. Stoddart (2 vols. 1895).

**Blacking**. The use of blacking and other polishes for leather dates back to the times of the ancients, but the compound now known as such was introduced into Great Britain from Paris in the reign of Charles II. The manufacture is now of considerable extent, as various polishes are required for the different leathers used for harnesses, shoes, etc.

**Black Isle**, peninsula separating Cromarty Firth from Beaulieu and Moray Firths, Ross-shire, Scotland. A branch of the Highland Ry. traverses it in a n.e. direction from Muir of Ord to Fortrose.

**Black Lead**, PLUMBAGO, or preferably GRAPHITE, an allotropic form of carbon, found in mica-schist, gneiss, granite, meteoric iron, argillite, etc., in beds, sheets, detached masses, and crystals, in Siberia, Ceylon (chief source of black lead in commerce and the arts), New Brunswick and other parts of Canada, New Zealand, and Germany. It is a stove and grate polish, and a lubricant in machinery, but black lead is most used in the manufacture of pencils and crucibles. It is also used as an inner covering of electrotype moulds, and for conductors of electricity. It can be obtained artificially by crystallizing any form of carbon from its solution in molten iron, and is prepared commercially by heating coke in the electric furnace. Graphite is a soft, dark gray, opaque solid, of a greasy metallic lustre. It crystallizes in hexagonal plates, and is volatile only at the temperature of the electric arc. It is a fair conductor of heat and electricity, and, though it can be burnt to carbon dioxide, is less combustible than diamond. On oxidation with nitric acid and potassium chlorate it yields graphitic acid.

**Black Letter**, a name invented in the 17th century for the types imitated from the handwriting in use in England in the 15th century, as contrasted with those founded on the Roman or Italian hand revived by the Italian scholars of the Renaissance. All Caxton's books are printed in black letter, and his immediate successors only used the Roman types for books in Latin. Except

SCENES IN THE BLACK FOREST.

1. Baden Baden and the Altes Schloss 2. Harnberg 3. Nussbach. 4. Triberg

for large Bibles, for proclamations, and cheap broadsides, in which it lasted nearly a hundred years longer, black letter gradually died out during the 16th century, the last important book of secular literature printed in it being the 1602 edition of Chaucer. It is now chiefly used in headlines and in fancy printing, but was revived by William Morris in many of the books printed at the Kelmscott Press. It is now known to practical printers as Old English or Elizabethan. See Duff's *Early English Printing* (1896).

**Black List.** In Great Britain, printed lists abstracted from public records, of English, Scottish, and Irish bankruptcies, insolvencies, liquidations, bills of sale, protested bills, assignments, judgments for debt, and other information affecting the financial standing of firms and individuals, issued weekly or bi-weekly, and circulated in private for guidance in mercantile transactions. The Scottish trade protection societies, from the middle of the 18th century, were among the first to supply such information. In the United States institutions known as commercial agencies are established in all commercial centres for furnishing similar information. In this country the term is more commonly applied to lists of discharged employees kept by employers of skilled labor and furnished by them to other employers in the same line of business, or to lists kept by labor unions of non-union workmen, or of persons employing the latter, or of the persons denominated 'scabs' and 'strike-breakers' with the view of enforcing some species of boycott or terrorism against the black-listed persons. This form of black-listing has in some states been made a criminal offence by statute.

**Blackmail.** In early English law, rents payable in cattle or produce, as distinguished from rents payable in white money or silver, called white mail. At a later period the same term was, probably at first as a joke, applied to the compulsory tribute of cattle and produce levied on the inhabitants of the northern counties of England by marauders from across the border. By a further extension of meaning the expression has come to denote the criminal offence of extorting money or property by threats of exposure for some real or imagined wrongdoing, or of injury to person or property. The offence is a grave one and is severely punishable by fine and imprisonment.

**Blackmore, SIR RICHARD** (d. 1729), English court physician and author, was born in Wilt-

shire. He was a voluminous writer of poetry and prose, of medical treatises and controversial divinity. *Prince Arthur*, a tedious compilation of verse, appeared in 1695. His *Satyr against Wit* (1700) provoked many enemies. His *Creation* (1712), a philosophical poem, was praised by Addison and Johnson. He also published *Modern Arians Unmasked* (1721), *National Theology* (1728), *Discourse on the Plague* (1720), and *Treatise on the Smallpox* (1723). See Johnson's *Lives of the Poets* (1779-81). He is not unjustly ridiculed by Pope in the *Dunciad*.

**Blackmore, RICHARD DODDRIDGE** (1825-1900), English novelist. *Clara Vaughan*, his first novel, appeared in 1864, succeeded in 1865 by *Cradock Nowell*, a work distinguished by its beautiful studies of New Forest scenery. *Lorna Doone*, a romance of Exmoor, and the author's most popular work appeared in 1869. The characters are cast in the true heroic mould, and the story is told in a masterly manner. The *Maid of Sker* (1872) is scarcely less vigorous. It was followed by *Alice Lorraine*, a tale of the South Downs (1875); *Cripps the Carrier*, a woodland tale (1876); *Erema*, a strong and weird story (1877); *Mary Anerley* (1880); *Christowell*, a tale of Dartmoor (1882); *Springhaven*, with glimpses of Nelson (1887); *Kit and Kitty* (1889); *Perlycross*, a story of the western hills (1894); *Fringella*, some tales in verse (1895); *Tales from the Telling House* (1896); and *Dariel*, a romance of Surrey (1897). Blackmore's novels are distinguished for their fidelity in the delineation of nature, and intimate acquaintance with the people and customs of the west and south of England. For many years he carried on the business of market gardening.

**Black Mountains**, a short range of mountains in N. Carolina, a part of the Appalachian system. Mount Mitchell (or Black Dome), which has an altitude of 6,711 ft., is the highest peak in the U. S. e. of the Mississippi R.

**Black Prince, EDWARD, THE** (1330-76), eldest son of Edward III. of England; created Duke of Cornwall (1337) and Prince of Wales (1343); commanded the van at Crécy (1346); said to be so called the Black Prince from the color of the armor he wore at this battle; defeated and took captive John, king of France, at Poitiers, and brought him to London; created Prince of Aquitaine and Gascony (1362); defeated Henry of Trastamare at Najara (1367); relinquished the principality of Aquitaine and Gas-

cony (1372). He was buried in Canterbury Cathedral.

**Black River**, or **BIG BLACK R.**, a l. bk. trib. of the White R., which heads in S.E. Mo. and flows in a general s.s.e. direction to the boundary of Arkansas, and thence s.s.w. to its confluence with the larger stream near Jacksonport. It is about 400 m. long.

**Black River**, an east affluent of Lake Ontario. It rises in Hamilton co., N. Y., crosses Herkimer, a corner of Oneida, Lewis and Jefferson cos. It is navigable for 40 m. from the mouth, and connects, through the Black Canal, with the Erie Canal. Lyons Falls in the s. of Lewis co. is 60 ft. high. The river is about 200 m. long.

**Black Rod.** The gentleman usher of the Black Rod is usher of the Order of the Garter. His symbol of office is a black rod surmounted by a gold lion. He is also an officer of the House of Lords. He, or his deputy, the yeoman usher, acts as messenger when the Lords desire the attendance of the Commons. He has the custody of persons committed for breaches of privilege or contempt, and assists at the introduction of peers and at other ceremonies.

**Black Sea** (anc. *Pontus Euxinus*), an enclosed sea in the s.e. of Europe, having Russia on the n. and e., Asia Minor on the s., and Turkey, Bulgaria, and Roumania on the w. Its shores are high where they abut upon the Caucasus region, and upon the slopes of the Istranja Mts. in Turkey. It measures some 700 m. from e. to w., and 350 m. from n. to s., and its area is estimated at 139,300 sq. m. It is a steep-sided basin with a nearly flat bottom. Immediately e. and w. of the peninsula of the Crimea, which projects into it from the n., its waters are shallow for some distance from the shores, owing to the large deposits of sedimentary matter there laid down by the rivers—the Kuban and the Don pouring into it through the Sea of Azov, and the Dnieper, Bug, Dniester, and Danube entering on the n.w. In other parts of the sea the 100-fathom line runs close to the shores, and parallel with them. Between the 100-fathom line and the 800-fathom line the slope is in general very steep, and from the 800-fathom line the depth increases very gently down to the maximum of 1,227 fathoms in the centre of the basin. During the summer there is a thin stratum of relatively warm surface water (55.4° F. in May to 78.8° in August) resting upon an almost equally thin layer of colder water (mean temp. 47.7°), below which, again, there is the bulk of the sea with

an almost uniform temperature throughout of 48.2°. The Black Sea is not only subject to annual fluctuations of level, ranging from 3½ to 6½ in. above the mean level of the year in May and June down to 2½ to 4 in. below that level in October and in February, but it also seems to fluctuate over unequal periods, in close dependence upon the volumes of rainfall which come down over its drainage basins. The restriction of the circulation to the thin upper strata is, on the whole, inimical to marine life, and is conducive to the formation in the deep parts of the sea of vast quantities of sulphuretted hydrogen, as well as of chemical precipitations on its floor. The only forms of life which thrive in these waters be-

in 1841) is maintained, power should be given to the Sultan to admit, in time of peace, the warships of friendly or allied powers if the Porte should consider such a course necessary, in order to secure the stipulations of the treaty. In the 18th protocol of the treaty of Berlin (1878) Lord Salisbury made a declaration which apparently reserved liberty to British ships of war to enter the straits with the consent of the Sultan. See Sir John Murray, 'On the Deposits of the Black Sea,' in *Scot. Geog. Mag.*, 1900, pp. 673-702; and consult also *Geog. Jour.*, 1893, pp. 49-51, and *Petermann's Mitteilungen*, 1891, pp. 33-37.

**Black Sea Government**, or CHERNOMORSKAYA, a narrow strip

six feet in length; and is extremely swift and agile, frequently climbing to the top of tall trees or exploring the rafters of buildings. It preys upon frogs, toads, other snakes (including the poisonous kinds, which it overcomes by its quickness of attack and the crushing power of its coils), and upon small birds, fledglings, eggs and insects. It is harmless, although pugnacious when attacked, and many specimens have been tamed and taught to know and follow their owners. These snakes are numerous in one or another variety throughout all the warmer parts of North America. The female lays 15 to 20 eggs in manure piles, rotting logs, and similar situations, where she burrows a little beneath the surface

John Bartholomew & Co

long to very lowly species. The Black Sea is practically destitute of islands, and seldom freezes, even along the shores. A scheme has been proposed (1904) for uniting the Black Sea and the Baltic by establishing canal connection between the Dnieper and W. Dwina, by means of the rivers Lutscheza and Orschiza and a canal 12 m. long. The treaty of Paris (1856) provided for the neutralization of the Black Sea by excluding from it ships of war of every flag, and Russia and Turkey agreed to abstain from establishing maritime arsenals on its coasts. The latter provision was abrogated in 1871, and it was then declared that while the established principle of closing the straits (recognized by treaty

of country in Transcaucasia lying along the north-east coast of the Black Sea. The country is mountainous. The temperature is high and the rainfall heavy. Novorossisk is the one great port. Area, 2,837 sq. m. Pop. 54,228, chiefly Russians.

**Blacksnake.** The most common of the larger colubrine snakes of North America (*Zamenis constrictor*), when adult black in color throughout on the upper surface, becoming slaty along the abdomen and with a white chin; but in the Southern and Western states a greenish or bluish hue prevails instead of pure black, and hence the snake is locally known as blue or green racer. The young are dusky and blotched. It often reaches and occasionally exceeds

and leaves her eggs to be hatched by the warmth of the sun-heated materials. See Cope, *Crocodilians, Lizards and Snakes* (1898).

**Blackstone**, m., Worcester co., Mass., 20 m. S.E. of Worcester on the Blackstone R., and on the N. Y., N. H. & H. R. R. It has manufacturing interests, the most important being cotton. It has a public library. Pop. (1910) 5,648.

**Blackstone**, SIR WILLIAM (1723-80), writer on English law, the son of a London silk mercer, was educated at Charterhouse and Pembroke College, Oxford, obtaining a fellowship at All Souls College, Oxford (1744). Although called to the bar in 1746, he was not very successful in practice. In 1759 he published an edi-

tion of the Great Charter, with a valuable introduction. With great courage he began to deliver voluntary lectures on English law at All Souls, and his enterprise was rewarded with the newly-founded Vinerian professorship in 1758. The publication of his famous *Commentaries*, based upon his Oxford lectures, followed in the year 1765-70. They had an immediate and overwhelming success. Their great merit is the admirable way in which the author handles an immense mass of materials, and unloads it gently upon the reader, in such quantities as the average man can bear. After having acquired reputation as a lecturer, Blackstone returned to practice, and soon gained a lucrative position. He refused the chief-justiceship of the Irish Common Pleas in 1761, being made principal of New Inn Hall in that year. In 1763 he became solicitor-general to the queen; he was already a member of Parliament, but did not distinguish himself in that capacity. In 1770 he was made a justice of the Common Pleas in England; and though he was removed to the King's Bench almost at once, he returned after a short time. He was an indifferent judge, hesitating and formal. Blackstone's only works of permanent value are the *Commentaries on the Laws of England*, and *Reports*, prefixed to which is a *Life* by J. Clitherow (1813). The last English verbatim edition of the *Commentaries* appeared in 1844, but an edition was printed in the U. S. in 1884, and the best edition of all by Lewis in 1898.

**Blacktail.** The common name in the West for two North American deer: (1) the mule deer; and (2) the Columbian blacktail. In both cases the name is due to the blackness of a part of the tail as contrasted with the conspicuous white tail of the Virginian deer. The mule deer is elsewhere described (see DEER; MULE DEER). The true blacktail is a smaller, long-eared deer of the Pacific coast from northern California to British Columbia, which has very similar habits to the mule deer, except that it is necessarily an animal of the wooded valleys, ascending in summer to timber line. See Roosevelt (and others), *The Deer Family* (1902).

**Blackthorn**, or SLOE (Lat. *Prunus spinosa*). A European shrub, of the rose family. In spring it produces miniature white, hawthorn-like sprays of flowers in profusion before the leaves expand; its branches form hard thorns; its bark is black, hence the name; and in fall its fruits or sloes ripen; they are elliptical, black, with a plumlike bloom on the skin, and sour.

**Black Vomit.** See YELLOW FEVER.

**Blackwall**, dist. of London, par. of Poplar, containing the E. India Docks and large shipbuilding yards. Blackwall Tunnel affords communication between Blackwall and E. Greenwich. It is 6,200 ft. in length, 1,220 ft. being beneath the river.

**Black Warrior**, an American merchant vessel, trading between N. Y. City and Mobile, Ala., which, stopping at Havana, Cuba, in transit, was seized (Feb 28, 1854) by the Spanish authorities in Cuba on the ground that she had violated the regulations of the port, in not manifesting her cargo. The vessel was soon released, but great excitement was caused in the United States by her seizure, and a demand was made upon Spain for redress. This demand was presented with undue insistence by Pierre Soulé, the American minister at Madrid, and was met by a virtual refusal. Certain Southern leaders, desirous of obtaining Cuba, tried to make the affair the occasion of a war with Spain, but the North, angered by the Kansas-Nebraska Bill, which was then before Congress and which became a law on May 30, 1854, refused to join in a clamor for hostilities, and war with Spain was avoided. See Rhodes's *History of the United States from the Compromise of 1850* (vol. ii, 1893).

**Black Warrior**, river in Alabama, rising in the northern part of the state and flowing into the Tombigbee in the southern part of Greene co. It is nearly 300 m. long and navigable to steam vessels to Tuscaloosa.

**Black Water.** See SHEEP.

**Blackwater**, the name of fifteen rivers and streams in the United Kingdom, the most important of which are:—(1.) River in Munster, Ireland; rises on borders of Cork and Kerry, and after a course of 100 m. falls into Youghal harbor. It is navigable to Cappoquin, 16 m. from the mouth. Next to the Shannon it is the largest river in Ireland. (2.) River in Ulster, Ireland; after a course of about 50 m. falls into Lough Neagh. (3.) River in Essex, England; rises near Saffron Walden, and enters the North Sea after a course of about 40 m.

**Blackwater Fever** is a tropical disease of a malarial type, which has been described under many different names, generally suggested by prominent signs or symptoms—e.g. hæmoglobinuria, hæmatinuria, bilious hæmaturic fever, hæmorrhagic malarial fever, yellow remittent fever, bilious remittent fever, and melanuric fever.

It is an acute infectious fever,

accompanied by rapid and great destruction of red blood corpuscles, starting very often, like most fevers, with general malaise, followed by a severe rigor and rise of temperature, which may soon reach as high as 105 or 106°. Great nausea is characteristic, with a vomit which passes from yellow to dark green. The urine quickly red, passing to the darkness of porter. Meanwhile pain appears in the hypochondriac region and the loins; and on palpation the liver and spleen are found to be swollen and tender. The skin and the conjunctivæ rapidly assume a jaundiced yellow color. Constipation is usual, but diarrhœa is not uncommon. Very often in a few hours there are profuse perspiration and a fall of temperature, with clearing of the urine, or free flow if it has been suppressed, but generally a few hours more will bring another rise of temperature, and an aggravation of all the symptoms. A paroxysm may occur every few hours for a few days, or one a day may be the rule, or there may be intervals of one or two days between the attacks. Within a week the patient may be rid of it; or his strength may fail, sometimes quickly, sometimes in five or six days, with fatal results. Relapses, even months after the first attack, are very common.

Blackwater fever is prevalent all through tropical Africa, Madagascar, Sicily, Sardinia, the Greek Archipelago, India, and some parts of South America. It has been considered essentially a malaria, but in suitable districts it seems likely to attack any whose health is below par from any cause whatever without any previous malarial attack. Some, again, have held it to follow on the excessive use of quinine, and to be, in fact, a quinine poisoning.

*Treatment.*—No quinine should be given. The patient should go to bed, have hot fomentations over the liver and spleen, copious hot alkaline drinks, and a free purge. No solid food should be taken during the attack, and no alcohol unless for extreme weakness. In E. Africa and in Dahomey it has lately been ascertained that the natives use decoctions of cassia with considerable success. See Sambon's article in the *Encyclopædia Medica*; Cantlie's and Gilman Thompson's in the *Medical Annual*, 1901.

**Blackwell, ELIZABETH** (1821), Anglo-American physician, was born at Bristol, England, was brought to the U. S. in 1832, and after her father's death taught school in Cincinnati and elsewhere, meanwhile pursuing medical studies under private instruc-

tion. After being refused admission to several medical schools on account of her sex, she was finally admitted to the medical school at Geneva, N. Y., where she took her degree of M.D. in 1849, and established a record for this country in that respect. She pursued her studies in Paris and London, and began practice (1851) in New York, where she organized (1854) the N. Y. Infirmary for Women and Children, and was active in organizing the women's relief association for sending nurses and supplies to the front in the Civil War. Dr. Blackwell zealously promoted medical education for women, and saw it generally established. After 1869 she practised in London and Hastings, England. Author of *Pioneer Work in Opening the Medical Profession to Women* (1895), and works on the training of the young.

**Blackwell, THOMAS** (1701-57), British classical scholar, born in Aberdeen; was appointed professor of Greek at Marischal College in 1723, and principal in 1748. He published anonymously, in London, *An Enquiry into the Life and Writings of Homer* (1735), and *Letters concerning Mythology* (1748). His unfinished *Memoirs of the Court of Augustus* appeared in 3 vols. (1753-64).

**Black Witch.** A bird. (See ANI.)

**Blackwood, JOHN** (1818-79), Scottish publisher, was born at Edinburgh, and assumed superintendence of the London branch of the business in 1840; became editor of *Blackwood's Magazine* (1845), and head of the publishing business after 1852. He recognized the first Lord Lytton's genius, and discovered George Eliot, all of whose novels save one were published by him.

**Blackwood, WILLIAM** (1776-1834), founder of the celebrated Edinburgh publishing house, came of an old Scottish family which has been traced back to the 15th century. One of the family was lord provost of Edinburgh from 1711 to 1713, and, in spite of loss by the Darien speculation, was able to purchase the Fifeshire estate of Pitreavie. From a nephew or a grandnephew of this Blackwood the publisher was descended. He started as an Edinburgh bookseller in 1804. The first number of *Blackwood's Magazine* was issued in April, 1817. William Blackwood undertook the editorship, and gathered round him a staff of distinguished contributors, including Scott, Lockhart, Hogg, Wilson (Christopher North), De Quincey, Galt, Maginn, Thomas Aird, and Dr. Moir (Delta). See Mrs. Oliphant's *Annals of a Publishing House* (1897-8).

**Bladder.** The bladder is the reservoir for the urine. It is a musculo-membranous sac, situated in the pelvis, behind the pelves and in front of the rectum, in the male; in the female, the uterus and vagina lie between it and that intestine. In infancy it is conical in shape; in the adult, when empty, it is a small triangular sac lying deeply in the pelvis, flattened from before backwards. When slightly distended, it is rounded in shape; when greatly distended, ovoid, and rises from the pelvis into the abdominal cavity. When moderately full, it contains about a pint, but is capable of great distention, and has been known to hold twenty pints. It has three openings into it—those of the two ureters from the kidneys, and that of the urethra. The bladder is composed of four coats, which are, from without inwards, the serous peritoneum, the muscular, the submucous, and the mucous.

**Diseases.**—Inflammation or cystitis, usually a chronic affection, and in the majority of cases due to the introduction of micro-organisms from without. When the vitality of the mucous membrane of the bladder is lowered and micro-organisms are present, pus is formed, and there is suppurative cystitis. If the urine, though containing bacteria, is free from pus, the condition is catarrhal cystitis. If the irritant is a calculus or stone, or uric acid or oxalate of lime crystals, simple cystitis may occur. Examined with the cystoscope, the mucous membrane of the bladder then appears much congested. Any obstruction to the escape of urine predisposes to cystitis. The treatment of cystitis is to remove the cause and to give urinary antiseptics, such as boric acid, salol, benzoic acid, naphthalin, benzonaphthol, benzoates of soda and ammonia. Absolute rest, hot baths and fomentations, laxatives and bland fluids are all helpful in acute cases, and sometimes opiates are needed. Alcohol must be avoided. Washing out the bladder is an effectual method of treating chronic cystitis. Tubercular disease of the bladder is usually a secondary affection, due to extension of the same condition from the kidneys, prostate, or seminal vesicles. The treatment is mainly constitutional. Ulceration of the bladder may occur in the course of chronic cystitis. Calculus, or stone in the bladder, may occur at any age, and is treated surgically. The nuclei of most calculi form in the kidney and pass down into the bladder, where they increase in size by successive deposits from the urine. Climate and the nature of the drinking water influence

their formation. In the bladder, calculi are generally from a half to one and a half inches in diameter, and are mainly phosphatic. They give rise to pain, sudden interruption in the flow of urine, hæmaturia, and frequent intense desire for micturition; they are removed by a crushing operation (lithotrity), or by a cutting operation (lithotomy). Rupture occurs from a blow when the bladder is full; immediate surgical operation gives the best chance of recovery. The bladder is frequently the seat of tumors, such as papilloma, sarcoma, and carcinoma or cancer, which may be removed by surgical operation, but are liable to return.

**Bladder Nut.** The *Staphyleas*, or bladder-nut trees, are hardy, deciduous shrubs. The best known is *S. colchica*, which is often forced into bloom in early spring. In the open air it blooms in June and July, its white flowers being borne in large terminal racemes. It commonly attains to a height of about four feet. Job's tears (*S. pinnata*) is a much taller-growing species, and its early summer flowers are followed by white nuts with pistachio flavor. *S. trifolia* is another tall species (about 15 feet), blooming in early summer. It is found in open woods, and has drooping flowers, succeeded by much inflated, veiny fruits, which rattle when touched after maturity. *S. Bolander*, of Southern California, blooms later in the year.

**Bladder-plum, or POCKET-PLUM,** is a malformation of the fruit of plum, caused by the attacks of a fungus (*Exoascus pruni*), which also occurs in other species of the same genus, such as bird cherry and blackthorn. See M. Ward's *Disease in Plants*.

**Bladder Seed** (*Physopermum cornubiense*) is an umbelliferous plant with bladder-like fruits. It occurs in the south of France and Spain.

**Bladder Senna** (*Colutea arborescens*) is a leguminous shrub with yellow flowers. It prefers a dry, sandy soil, and is a native of S. Europe. Its pods are inflated like those of the bladder nut, and its leaves have been used for mixing with true senna.

**Bladder-worms,** the larval stages of tapeworms; sometimes more dangerous parasites than the adults, owing to the great destruction of tissue which they can produce in such organs as brain, liver, etc. In the case of one of the tapeworms of man, *Tænia solium*, the eggs of the parasite leave the body of the host with the excreta, and are eaten by the omnivorous pig. Within the alimentary canal of the pig the embryos hatch from the shelled eggs, and bore their way into the muscles, where they

Died 1870.

become encysted and form bladder-worms. A bladder-worm consists of a head or scolex, and a distended bag of fluid, the so-called bladder. If imperfectly-cooked pork containing these bladder-worms is swallowed by man, the bladder-worms lose the bladder, and the head or scolex attaches itself to the wall of the alimentary canal, and grows into a tapeworm. Man may become infected with bladder-worms owing to imperfect cleanliness, and especially to close companionship with dogs whose health is not carefully looked after, for the dog is peculiarly liable to tapeworm. One of the most dangerous bladder-worms found in man is *T. echinococcus*, a common tapeworm in the dog. The bladder-worm of *T. cœnurus*, again, which is also found in the dog, is peculiarly fatal to sheep, producing the disease known as sturdy. Bladder-worms were known in man and the domestic animals before their relation to tapeworms was discovered, and they are therefore sometimes still designated by names which are different from the names applied to the adult forms: e.g. the bladder-worm of *T. cœnurus* is called *Cysticercus cerebralis*, and that of *T. solium* receives the name of *C. cellulosæ*.

**Bladderwort** (*Utricularia*), a genus of water plants which are

or purple. The common bladder-worm (*U. vulgaris*), which is widely distributed, has a stem the thickness of whipcord, and this is fringed with fine leaves which are repeatedly divided with linear segments. Some of the leaf divisions form intricate bladders, which have an aperture protected by bristles and fitted with a trap-door. Larval crustaceans and other water animals take shelter inside the bladders, but the trap-door prevents their return; they die, and the dissolved substances of their bodies provide the plant with food.

**Bladensburg**, vil., Maryland, on the East Branch of Potomac R., 5 m. N.E. of Washington. Here, on Aug. 24, 1814, the British defeated the Americans, and as a result captured the town of Washington. Pop. (1910) 460.

**Blaeu**, or BLAEUW, JAN, Dutch cartographer, died 1673, author of *Magnum Theatrum Urbium Belgicæ* (1649), *Atlas Magnus* (1656-62), and *Theatrum Civitatum Italiae* (1663). The *Atlas Magnus* includes 49 maps of Scotland prepared by Timothy Pont. Blaeu's father, WILLEM JANSZON (1571-1638), pupil of Tycho Brahé, published a map of the heavens, and *Novus Atlas* (1634-62).

**Blagodats**, mt. (1,260 ft.) on E. slope of Urals, Russia, N.E. of Perm; source of supply (some 50,000 tons annually) of magnetic iron ore worked at Kushvinsk and Goro-Blagodats iron works. Pop. of dis. 50,000.

**Blagoveshchensk**, the only town in the Amur prov., Asiatic Russia, situated on the Amur near the confluence of the Zeya, at a distance of 823 m. from Khabarovsk. It is the centre of a gold-mining district, and has a ship-building yard.

**Blaine**, JAMES GILLESPIE (1830-93), an able American political leader, born at West Brownsville, Pa., Jan. 31, 1830. On both his father's and his mother's side he was of Scotch-Irish descent, and he was the grandson of Ephraim Blaine, who had rendered services of great value as Commissary General of Purchases (1780-2) of the Continental Army, during the American Revolution. James graduated with distinction at Washington College, near his home, in 1847, taught in the Western Military Institute, Georgetown, Ky. (1848-51), and in the Pennsylvania Institute for the Blind, at Philadelphia (1852-4) and in 1854 removed to Augusta, Me., the home of his wife, by birth Harriet Stanwood, whom he had married (1850) when she was teaching school at Millersburg, Ky. At Augusta, he, with John L. Stevens, edited (1854-7) the *Kennebec Journal* (Whig), then prob-

ably the most influential news paper in the state, and in 1857-60, still living at Augusta, he edited the *Portland Advertiser*, the leading Republican organ in Maine. Blaine having joined the Republican Party soon after its organization and having been a delegate to the Republican National Convention of 1856. While still a young man, his great ability and his political sagacity made him the most influential Republican leader in Maine; he was a member of the lower house of the state legislature (1859-62) being speaker in 1861 and 1862, and from 1859 until 1881 he was chairman of the Republican State Committee. From 1863 to 1877 he was a member of the National House of Representatives, of which he was speaker in 1869-75, and from 1876 to 1881 he was a member of the U. S. Senate. His services in Congress made him one of the most conspicuous national figures of the time, and in debate he was unsurpassed for brilliance, quickness of repartee, and for ready knowledge of the political history of the country. He strenuously opposed the reconstruction policy of Pres. Johnson, whose impeachment, however, he at first opposed, though later joining his Republican colleagues; he advocated a policy of severity toward the South; he was virtually the author of the Fourteenth Amendment to the Constitution; and he vigorously opposed the greenback movement of 1867-8. As Speaker of the House, he won high praise from both parties, and is recognized as 'one of three or four great occupants of the chair, hardly second to any one' (Stanwood). He opposed the Electoral Commission as unconstitutional. In the Senate his influence was not equal to what it had been in the House, but he was, nevertheless, prominent in debate, and, as regards specific measures, opposed the Bland Silver Coinage Act, advocated ship subsidies, and urged the restriction of Chinese immigration. During his career in Congress, though he won many friends, he also made enemies, chief of whom, on his own side, was Roscoe Conkling, with whom he had his first altercation in 1866; and various charges were brought against him, chiefly to the effect that he had corruptly used his political position for private gain, particularly by accepting improper favors from the Union Pacific and the Little Rock and Fort Smith railroads. The charges were the subject of investigation by a committee of the House of Representatives (1876), culminating in one of the most dramatic episodes in Congressional history—the production of the so-called 'Mulligan

*Bladderwort.*

1. Bladder, enlarged.

rootless and grow suspended in the water. The flowers resemble those of snap-dragon, often yellow

Letters' (q.v.). It is now generally thought that none of the charges, at least in its worst form, was ever conclusively proved against him—at most he seems to have been guilty of a certain degree of impropriety but his position before the country and within his party was greatly weakened by them. In spite, therefore, of his great popularity, due largely to his

a modification of the Clayton-Bulwer Treaty and took steps to summon a Pan-American Congress, a plan that was reversed by his successor. In 1884 he finally was nominated by the Republicans for the presidency, but the charges which had been brought against him and which were now revived led a considerable number of his own party to vote for his

Salisbury concerning the Bering Sea Fisheries, the questions at issue being finally submitted to arbitration, and tried in vain to carry out the reciprocity provisions of the McKinley Act, the succeeding (Democratic) administration reversing the policy. In general his policy was one of 'national expansion, national self-assertion, national participation in world politics;' he was the precursor of the so-called imperialists of 1898 and the following years. Blaine died at Washington soon after leaving office—on Jan. 27, 1893. He published *Twenty Years of Congress, from Lincoln to Garfield* (2 v., 1884-6), a work of great value. The best biography is Stanwood's *James G. Blaine* (1905); see also Gail Hamilton's (Abigail Dodge) *Biography of James G. Blaine* (1895), bearing principally on Blaine's private, rather than on his public life.

**Blair, city, Neb.**, co. seat of Washington co., 25 m. N.N.W. of Omaha, near the Missouri R., on the Chi. and N. W. and other R. Rs. It is the seat of Blair College (Danish). It manufactures wagons and flour. Pop. (1910) 2,584.

**Blair, ANDREW GEORGE** (1844-1907), Canadian lawyer, was born at Fredericton, N. B., called to the bar in 1866, elected to the New Brunswick assembly in 1878, premier 1883-96, minister of railways and canals in Dominion cabinet 1896-1903, chief of board of railway commissioners 1903-04, then resumed law practice.

**Blair, FRANCIS PRESTON** (1791-1876), American journalist, was born at Abingdon, Va., and graduated (1811) at Transylvania University, Ky. At first a supporter of Henry Clay politically, he opposed the latter's views in regard to the United States bank, and was invited by Pres. Jackson to establish a paper in the interest of the Democratic Party at Washington. He was editor of the *Globe* from 1830 to his deposition by Pres. Polk in 1845. Mr. Blair was active in support of the Republican party from its foundation until the close of the Civil War, but opposed the party's reconstruction policy and joined forces with the Democracy.

**Blair, FRANCIS PRESTON, 2d** (1821-75), American lawyer and soldier, son of the preceding, was born in Lexington, Ky., and graduated (1841) at Princeton. He was admitted to the bar of Kentucky, 1843, and practised in St. Louis. He served as a private in the Mexican War, and for several terms in the Missouri legislature, and joined the Republican party, 1856, by which he was elected to Congress. He was again elected in 1860 and 1862. By his prompt

James G. Blaine.

remarkable personal magnetism, he failed to secure the presidential nomination of his party both in 1876 and in 1880, though in each case his nomination at the outset seemed probable. In March, 1881, he entered Pres. Garfield's cabinet as secretary of state, but remained in office only a few months under Pres. Arthur, resigning in December. In this brief period he attempted to secure

Democratic opponent, Grover Cleveland, in whom they had confidence, and Blaine was defeated. From 1889 to 1892 he was again secretary of state (in Pres. Harrison's cabinet), and during this period negotiated with Germany a treaty concerning Samoa, called and presided over the Pan-American Congress, which he had previously planned, engaged in a vigorous discussion with Lord

action, in the early days of the Civil War, in preventing the seizure of the St. Louis arsenal by state troops, it is thought that Mr. Blair preserved Missouri and Kentucky to the Union. He served in the Union army during the Civil War, rising to the rank of major-general of volunteers. After the war he opposed the reconstruction policy of the Republicans, affiliated with the Democratic party, and was its unsuccessful candidate for the vice-presidency in 1868. General Blair was U. S. senator from Missouri, 1871-3. Author of *The Life and Public Services of Gen. William O. Butler* (1848).

**Blair, HENRY WILLIAM** (1834), American senator, was born at Campton, N. H., educated himself, and was admitted to the New Hampshire bar, 1859. He served through the Civil War, was elected to his state legislature, and was a member of Congress from N. H., 1875-9. He was then elected to the U. S. senate, and reelected in 1885, and was again a member of Congress, 1893-5. Senator Blair was an advocate of national aid to state education, and was active in temperance and woman suffrage movements. He took much interest in pension matters, and drew up many of the bills granting pensions to soldiers. Senator Blair resumed the practice of the law at Washington after retiring from politics.

**Blair, HUGH** (1718-1800), Scottish divine and author, born in Edinburgh, and became minister successively of Collesie, Fifeshire (1742); Canongate Church, Edinburgh (1743); Lady Yester's Church (1754) and the High Church (1758). In 1759 he began a course of lectures on rhetoric under the auspices of Edinburgh University, and these were so popular that a professorship was founded, to which he was appointed in 1762. His *Lectures on Rhetoric and Belles Lettres* were subsequently issued in 2 vols. (1783). He was much admired as a preacher, and his *Sermons*, published at various times from 1777 onwards, the first volume mainly by the influence of Dr. Johnson, procured him (1780) a pension of \$1,000 from George III. He wrote, besides, *A Critical Dissertation on the Poems of Ossian* (1763). A Life by J. Finlayson is prefixed to the fifth volume of his *Sermons* (1801).

**Blair, JAMES** (1656-1743), American colonial preacher and educator, born in Scotland. He graduated at Edinburgh University (1673), was an Anglican rector near Edinburgh for several years, and in 1685 went to Virginia, where from 1689-1743 he was Commissary for the Bishop of London, the highest position in

the colonial church. After 1693 he was a member, and for much of the time was president, of the Colonial Council, and altogether was one of the most influential men in the colony. He is remembered, however, chiefly as the virtual founder, and as the president from 1693 until his death, of the College of William and Mary. He published *Our Saviour's Divine Sermon on the Mount* (4 v., 1722), and, with Hartwell and Chilton, *The Present State of Virginia and the College* (1727), a valuable account of colonial Virginia. See Motley, *Life of Commissary James Blair* (1901).

**Blair, JOHN INSLEY** (1802-99), American capitalist, was born in Warren co., N. J., worked in the country store of a relative until 1819, and established a similar store of his own at Blairstown, N. J., 1821. His business expanded to an extraordinary extent; he became interested in iron mines and railroads, and he had a large share in building the railroad properties which were consolidated as the Delaware, Lackawanna and Western railroad in 1852. He engaged extensively in railroad building in the West and Southwest, being one of the original directors of the Union Pacific railroad. Mr. Blair gave largely to Presbyterian educational institutions and helped to build many churches along the lines of his railroads.

**Blair, MONTGOMERY** (1813-83), American politician, was born in Franklin co., Ky., and graduated (1835) at West Point. He resigned after serving in the Seminole War, and practised law in St. Louis. After serving as U. S. district attorney for Missouri, he was judge of the Court of Common Pleas, 1843-9. Mr. Blair removed to Maryland, 1852, and severed relations with the Democratic party on the repeal of the Missouri Compromise. He was counsel for the defendant in the Dred Scott case, was postmaster-general under Lincoln, 1861-4, and brought about numerous innovations in the postal service. His retirement was due to differences with the administration, and he thereafter supported the Democratic party.

**Blair, ROBERT** (1699-1746), Scottish divine and poet, was born in Edinburgh. Was in 1731 presented to the living of Athelstaneford, E. Lothian, where he remained till his death. His well-known poem, *The Grave*, although of unequal merit, rises in places to a dignity almost Shakespearian. For his life see Dr. William Anderson's edition of *The Grave*.

**Blairsville**, bor., Indiana co., Pa., 40 m. E. of Pittsburg, on the Conemaugh R., and on the Pa. R. R. and the Pa. Canal. Its

manufactures are glass, coke, flour, etc. Pop. (1910) 3,572.

**Blake, EDWARD** (1833-1912), Canadian statesman, born in Middlesex co., Ontario, and graduated at the University of Toronto. He was admitted to the bar in 1856, and served as a Liberal in the Ontario Assembly, becoming first Liberal premier in 1871 and resigning his seat in 1872. He held a position in the federal cabinet of Hon. A. MacKenzie in 1873-4, was minister of justice, 1875-7, and president of the Council, 1877-8, resigning all these positions in turn. After further service as member of the Dominion parliament and leader of the Liberal party he retired from Canadian public life in 1892. During 1892-1909 he sat in the British Parliament as Nationalist member for South Longford, Ireland. In 1907 he retired from public life.

**Blake, FRANCIS** (1850), American inventor, was born at Needham, Mass., and received a high-school education. He entered the United States coast survey, in which he served for thirteen years. Resigning, he devoted himself to experimental physics, and invented the telephone transmitter known by his name in 1878. He patented many other electrical contrivances, and was associated with the progress of telephony.

**Blake, LILLIE DEVEREUX** (1835), American reformer, was born at Raleigh, N. C., the daughter of George P. Devereux of that place. She was twice married, the second time to Grinfill Blake, of New York. Her interest in woman suffrage dated from 1869. She was a member of the delegation that presented the woman's declaration of rights in Philadelphia, 1876, was for many years president of the N. Y. State Woman Suffrage Association, and was a founder and president of the National Legislative League from 1900. Author of *Woman's Place To-day* (1883), and several works of fiction.

**Blake, ROBERT** (1598-1657), English admiral, was born at Bridgwater, Somersetshire, and was engaged in commercial pursuits until the civil war. He sat for Bridgwater in the Short Parliament of 1640. Joining the Parliamentary forces, he became colonel, distinguished himself at the defence of Bristol (1643), held Lyme against the royalists (1643-44), and captured and defended Taunton (1644-5). In 1649, after unsuccessfully blockading Prince Rupert at Kinsale, Blake, in conjunction with two other officers, Deane and Popham, was appointed to command the fleet, and in the following year destroyed most of Prince Rupert's squadron at Malaga, in the south of Spain. In 1651 he captured

the Scilly Isles and Jersey from the royalists. In 1652, being appointed to the chief command of the fleet against the Dutch, he, assisted by Rear-admiral Bourne, defeated Van Tromp in the Downs, and then De Witt and De Ruyter off the mouth of the Thames, but himself sustained a reverse at the hands of Tromp off Dungeness. In the fol-

lowing year, after fighting in conjunction with Deane, Monck, and Penn, an indecisive action with Tromp off Portsmouth, Blake met the same antagonist once more off the Dutch coast, and finally routed him, Tromp being killed in the action. On his return to England he was summoned to Parliament by Cromwell, and

after a period of peace was sent in 1655 with an expedition to teach a lesson to the pirates of Tripoli, Algiers, and Tunis. This he successfully accomplished. In 1656, when war broke out with Spain, Blake took charge of the blockading squadron off Cadiz; but hearing of the presence of a Spanish treasure fleet at Teneriffe, he sailed thither, and finding a naval

minister Abbey, but after the restoration his body was shamelessly dug up and flung into a hole in the churchyard of St. Margaret. Blake was supremely honest, brave, patriotic, and self-sacrificing, and ranks high among the very greatest of Englishmen. See Hepworth Dixon's *Robert Blake* (1852); a *Life* by Dr. Samuel Johnson (1777); D. Hannay's *Life of Blake* (1886); *The First Dutch War* (Navy Records Society, 1899-1900).

**Blake, WILLIAM** (1757-1827), English mystic, poet, painter, and engraver, was born in London, the son of a hosier whose real patronymic is said to have been O'Neil. From the age of four to the end of his life Blake had times of exaltation, when he saw visions—a real or fancied prophetic power which affected all his future work. In 1784-87 he had a print-sellers' shop; but engraving was the practical business of his life. As painter and as poet Blake has been idolized and he has been reviled. His works, however, show him to be a true poet, a seer as well as a visionary, instinct with melody, and yet often as indifferent as his disciple Walt Whitman to the music of verse. As a draughtsman and a designer he was full of masterly power; nevertheless his Wiertz-like conceptions and barbaric coloring seem at times the inspirations of sheer frenzy. After a long life of toil and neglect, Blake died in London, where he had mostly lived. His greatest works were the *Songs of Innocence* (1789) and *Songs of Experience* (1794), and the 'prophetic' series—*Thel* (1789), *The Marriage of Heaven and Hell* (1790), *The Gates of Paradise* (1793), *The Vision of the Daughters of Albion*, and *America* (1793), *Europe* and *The Book of Urizen* (1794), *The Song of Los* and *The Book of Ahaniah* (1795); and his many pictorial designs and engravings (dissociated from his poetry), of which the most notable were his illustrations to the *Book of Job* (1826), Young's *Night Thoughts* (1777), and Blair's *The Grave* (1804-5). W. Rossetti's edition of his *Poems* (1857) in the Aldine series contains his best poetic work. See his *Life*, by A. Gilchrist (1863 and 1880); *William Blake*, by A. C. Swinburne (1868); *Works*, very fully analyzed by E. J. Ellis and W. B. Yeats (1893); and Dr. Garnett's *William Blake* (1895). *The Inventions to the Book of Job* have been reproduced by heliotype by James Osgood of Boston.

**Blakely, JOHNSTON** (1781-1814), American naval officer, was born near Seaford, Co. Down, Ireland, and was brought to Wilmington, N. C., when two years old. His father's death obliged

Engraving by Blake: 'The morning stars sang together' (Job 38:7).

force at Santa Cruz strongly protected by shore batteries, sank or burnt the former and silenced the latter. Blake then returned to his station off Cadiz; but failing health compelled his return to England, and he died on Aug. 17, 1657, on board his flagship the *George*, within sight of Plymouth Sound. He was buried in West-

minster Abbey, but after the restoration his body was shamelessly dug up and flung into a hole in the churchyard of St. Margaret. Blake was supremely honest, brave, patriotic, and self-sacrificing, and ranks high among the very greatest of Englishmen. See Hepworth Dixon's *Robert Blake* (1852); a *Life* by Dr. Samuel Johnson (1777); D. Hannay's *Life of Blake* (1886); *The First Dutch War* (Navy Records Society, 1899-1900).

him to abandon his course at the University of North Carolina, and he entered the navy as midshipman in 1800. Blakely commanded the *Wasp* in the War of 1812, and received a gold medal from Congress for his capture of the British brig *Reindeer* in May, 1814. After taking several other prizes Blakely and the *Wasp* disappeared in October of the same year, and the vessel is presumed to have foundered.

**Blanc, MONT**, the loftiest mountain (15,782 ft.) in the entire chain of the Alps. It rises towards the s.w. end of the chain to which it gives its name, to the s. of Chamonix (France) and to the n.w. of Courmayeur (Italy). By the treaty ceding Savoy to France in 1861 it was agreed that the highest summit should become wholly French. It was originally named simply Les Glacières, or the Montagne Maudite, the first certain occurrence of the name Mont Blanc being found in an Italian document of 1694. Great glaciers stream from it on all sides, the Italian slope being by far the steepest and grandest. It was first ascended in 1786 by two Chamonix men—Dr. Paccard and Jacques Balmat. The third ascent (1787) was made by the famous Genevese naturalist, H. B. de Saussure (statue at Chamonix), and a week later the first Englishman, Colonel Beaufoy, achieved the ascent. Now the ascent is frequently made in summer from Chamonix by way of the Grands Mulets (inn) and the Bosses du Dromadaire (shelter hut), the easiest route. The first winter ascent was made by Miss Isabella Straton in January, 1876. Plans have been completed (1909) for a railway connecting Chamonix and Aosta through a tunnel of 8½ m. under Mont Blanc. See Charles Durier's *Le Mont Blanc* (1st ed. 1877; 4th ed. 1897); Charles E. Mathews's *The Annals of Mont Blanc* (1898); P. Güssfeldt's *Der Mont Blanc* (1894)—also in French. The best map (scale 1-50,000) is that by Imfeld and L. Kurz, published in 1896.

THE CHAIN OF MONT BLANC stretches from the Col de Balme (7,221 ft.), on the n.e., to the Col du Bonhomme (8,147 ft.) and the Col de la Seigne (8,242 ft.), on the s.w. and is mainly divided between Italy and France. The chief passes (all glacier) are the Col de la Brenva (14,217 ft.), the Col d'Argentière (11,536 ft.), the Col de Miage (11,077 ft.), the Col du Géant (11,060 ft.), and the Col du Tour (10,762 ft.). See L. Kurz's *Guide de la Chaîne du Mont Blanc* (1892; and in English, same date), and his *Carte de la Chaîne du Mont Blanc* (1896).

**Blanc, JEAN JOSEPH LOUIS** (1811-82), French historian and

revolutionist, was born at Madrid, his father, a Frenchman, being in the service of King Joseph. He was educated at Paris, where in 1839 he founded the *Revue de Progrès*, printing in it his important work on socialism, the *Organisation du Travail*. This

*Brothers*. A pamphlet on *Idées Napoléoniennes* was succeeded in 1841 by Blanc's *Histoire de Dix Ans 1831-40*, which created an immense sensation, and by its revelations shook the throne of Louis Philippe. In 1847 appeared the first two volumes of his *His-*

Chain of Mont Blanc.

treitise, which attracted wide attention, was the first exhaustive manifesto of state socialism as opposed to individualism. About this time Blanc was the victim of a murderous attack, of which his brother had a distinct presentiment, and which suggested to Dumas the plot of the *Corsican*

*toire de la Révolution Française*. Upon the revolution in 1848, Blanc was elected a member of the provisional government. He enjoyed great popularity with the working-classes, and in March, 1848, a procession of 200,000 workmen, organized by Blanquet, offered him the dictatorship,

MONT BLANC FROM SALLANCHES.

which he refused. But his colleagues and the wealthy men of Paris were jealous of his power; and he further suffered considerable obloquy by reason of the lamentable failure of his scheme to institute national workshops. He was falsely charged with complicity in the disturbances of May, June, and August; and being condemned by a large majority, he sought refuge in Britain, where he remained for upwards of twenty years. He was now chiefly engaged on his *Histoire de la Révolution Française* (completed in 1862), his *Histoire de la Révolution de 1848* (1870), and his correspondence to the *Temps*, collected and published as *Dix Années de l'Histoire d'Angleterre* (1879-81). Returning to Paris on the downfall of the empire, he afterward opposed Thiers, and denounced the conclusion of peace with loss of territory. Until his death at Cannes, in 1882, he was a deputy for Paris. Blanc was a sincere political idealist, an eloquent advocate of toleration, and personally a man of estimable character. See Edmund's *Louis Blanc, Celebrities of the Century* (1882), and the *Annual Register* for 1882.

**Blanca Peak**, mt. in Col., 10 m. n. of Fort Garland. It occupies an isolated position, and is one of the most magnificent of the Park Range, and with an altitude of 14,464 ft. is the next highest mt. in the U. S. to Mt. Whitney.

**Blanchard, SAMUEL LAMAN** (1804-45), English author and editor, was born at Great Yarmouth. In 1828 he published his *Lyric Offerings*, with a dedication to Charles Lamb. After his death Bulwer-Lytton collected his prose essays, under the title of *Sketches of Life* (3 vols. 1846), and Blanchard Jerrold did the same for his poetical works (1876). Most of Blanchard's work as an editor was connected with the *True Sun* and the *Courier*. See *Memoir in Sketches from Life*.

**Blanche, DENT**, one of the grandest peaks (14,318 ft.) of the Alps, near Zermatt, to the w. of which it rises, nearly opposite and n. of the slightly higher Matterhorn. This difficult climb was first made in 1862, by T. S. Kennedy and W. Wigram.

**Blanching Vegetables.** By the exclusion of light certain changes take place in the metabolism of plants. This fact is made use of by the gardener in growing certain vegetables which under normal conditions are tough, bitter, and harmful, yet when etiolated or blanched are tender and pleasant. Among the plants treated in this way are celery, seakale, lettuce, cardoons,

and endive. In gardens, seakale may be blanched by placing over each crown when the stalks are 6-8 inches above ground a mound of sand, or, if this is not obtainable, a six-inch flower-pot or drain-pipe, the open end being well covered and the lower end pressed well into the soil. Celery is commonly blanched by successive earthings up, care being taken not to bury the summit of the leaves. Two long boards, with one edge of each resting along the ground, the other meeting its fellow just below the crowns of the plants, are also sometimes used. Cos lettuces are usually tied up with pieces of bast, so that the outer leaves serve to exclude light from the hearts; and a similar method is often adopted with endive.

**Blanco, CAPE**, on the w. coast of Africa, at the w. extremity of the Sahara.

**Blanco y Arenas, RAMON, MARQUIS DE PENA PLATA** (1832-1906), Spanish official, born in San Sebastian, Spain, entered the army in 1855, became governor of Mindanao, Philippine Ids., succeeded Gen. Weyler in command in Cuba, was captain-general there during the Spanish-American war, and returned to Spain before the American occupation.

**Bland, RICHARD PARKS** (1835-99), American legislator, was born near Hartford, Ky., educated himself, studied law, emigrated to the West, and in 1860 was already treasurer of Carson co., Nev. He returned to Missouri after the war, and from 1873 to his death was a member of Congress from that state. He is best remembered for his championship of silver which culminated in the 'Bland bill,' 1878, which provided for the purchase of silver sufficient for the coinage of \$2,000,000 a month in silver dollars which should be legal tender. See Byars's *Life* (1900). See **BIMETALLISM** and **FREE SILVER**.

**Bland, THEODORIC** (1742-90), American patriot, was born in Prince George co., Va., and studied medicine in Edinburgh, Scotland, returning to America about 1764. He practised his profession up to the outbreak of the Revolution, in which he performed high services, calling forth the praise of General Washington. He was a member of the Continental Congress, 1780-3, opposed the constitution in the Virginia convention of 1788, and was elected that year to the first congress of the United States. See the *Bland Papers*, edited by C. Campbell (1840).

**Blankenberge**, seaside resort of Belgium, prov. W. Flanders, 9 m. N.W. of Bruges and 13 m. N.E. of Ostend; has quite recently developed out of a fishing village into a popular summer resort

visited by nearly 30,000 persons annually. Pop. (1900) 5,048.

**Blankenburg.** (1.) Town of the German duchy of Brunswick, on the n. edge of the Harz Mts., 12 m. s.w. of Halberstadt; is a favorite summer resort, has a ducal castle, and grows fruit and vegetables. It stands amidst the fantastic sandstone region of the Teufelsmauer and of Regenstein. Pop. (1900) 10,173. (2.) Town in the principality of Schwarzburg-Rudolstadt, Germany, at the n. foot of the Thüringer Wald, 27 m. s.w. of Jena. Here Froebel opened his first kindergarten school in 1840. Pop. (1900) 2,805.

**Blanket**, a covering for a bed or the bodies of men and animals. The best blankets are wholly composed of wool. Their manufacture is similar to that of other woollen goods, but the soft fluffy matting on the surface is obtained by a process called 'teaseling,' scratching it with teaseling-cards or brushes made of wire. In large manufactories this operation is performed by a machine with a cylinder bristling with teasels, which is made to revolve rapidly while the cloth is drawn over it. With inferior qualities of blankets varying amounts of cotton are used, this material being quite widely employed for the filling. The manufacture of blankets in the U. S. became an important industry after the Civil War, when the fine grades of wool produced in the far West were available for the manufacture. In the East there are numerous factories making grades of blankets at prices ranging from \$2 to \$20 or more. The American Indians of certain tribes, such as the Navahos and Chilkoots, weave blankets with interesting patterns, which are both warm and valuable for decorative purposes.

**Blank Verse**, a term which signifies, etymologically, all verse in which the rhymes are 'blank' or lacking, but which is generally restricted in ordinary usage to the unrhymed iambic decasyllable, the common medium in English of narrative and dramatic poetry. This measure was first used in our language, in the translation of the second and fourth books of the *Aeneid*, by the Earl of Surrey (1516-47), and was almost certainly copied from the *versi sciolti*, or unrhymed verse of eleven syllables of the Italians—Surrey's immediate example being probably F. M. Molza's translation of Virgil, published in Venice (1541). Surrey's metre was used by Nicholas Grimald in two pieces published in Tottel's *Miscellany* (1557), which, while worthless as poetry, show a curious anticipation of some of Milton's most characteristic rhythms. It was

again used by Gascoigne in his satire *The Steele Glas* (1576), but was not employed in any other considerable non-dramatic work until the publication of Milton's *Paradise Lost* in 1667. As a vehicle of dramatic expression it was first used in Sackville and Norton's *Gorboduc* (1561), and continued in 'scholarly' dramas such as Gascoigne's *Jocasta* (1566) and Thomas Hughes's *Misfortunes of Arthur* (1587; new ed. 1874); until, being adopted by Marlowe in his tragedy *Tamburlaine* (1587), it attained such an immediate popular success that dramatists like Peele and Greene, who had previously been writing in rhymed verse, were forced to abandon their own medium and to employ the new measure. Except for a brief period after the restoration, when the couplet and the 'heroic' play reigned supreme, its position as the only suitable dramatic verse has never been disputed; and even Dryden himself, the high priest of the heroic school, reverted to blank verse in his later plays, confessing himself 'grown weary of his long-loved mistress, rhyme.' The special adaptability of the measure for dramatic purposes is generally attributed to the fact that it approaches nearer the language of ordinary speech than any other English form of verse. But this is simply to place the emphasis at the wrong end of the scale; and, as a matter of fact, the measure holds its position principally because the absence of rhyme frees the poet from the necessity, inherent in all forms of rhymed verse, of occasionally inserting lines and phrases merely for the sake of securing metrical balance, and thus leaves him at liberty to employ only the words absolutely necessary for expressing his thought, and to follow without hindrance the most abrupt transitions of passionate feeling. Moreover, the obvious artificiality of rhyme requires the maintenance of a certain height of poetic feeling in order to justify its presence; while blank verse, depending as it generally does for its music on subtle modifications of pause and emphasis, raises no expectations of regularity of movement in the hearer's mind, and may be applied with equal suitability to the loftiest or to the humblest themes. The extreme flexibility of the medium is shown at a glance by the widely varied effects it has produced in the hands of individual dramatists. Nothing can be more unlike than the rhythm of Marlowe—regular, grandiose, and slightly monotonous—and the tripping, unrestrained, and rather undignified movement of Fletcher. In the matter of metrical development these two poets exercised a pre-

ponderating influence on Shakespeare, who in his own person summarizes the history of dramatic blank verse. Shakespeare's earliest manner (after he has once got rid of his fondness for rhyme) is very similar to that of Marlowe. The end of each line is strongly marked, and usually coincides with a grammatical pause; double (or 'feminine') endings are comparatively infrequent; and there is a tendency—more strongly marked, however, in Marlowe—to adapt the blank verse to something resembling the older stanzaic arrangement. In his middle manner, as represented by the *Merchant of Venice*, there is a steady decrease in the number of lines which close with a grammatical pause, the sense is more frequently carried forward from one line to another, and double endings become more common, amounting in this case to some 15 per cent. of the whole. His final manner, of which the *Tempest* may be taken as the type, shows a metrical system largely assimilated to that of Fletcher, a proportion of double endings amounting to 33 per cent. of the whole, the sense carried on into the next line in about a third of the total; while nearly 5 per cent. of his lines have 'weak' or 'light' endings—i.e. endings such as 'his,' 'for,' 'and'—on which the reader can scarcely make any pause.

Dramatic blank verse had quite ceased to be written when Milton produced the first original example of narrative blank verse in his epic *Paradise Lost* (1667). To the second edition of this work Milton, at the request of his publisher, prefixed a brief preface, in which he defended his use of the measure, and pronounced rhyme 'no necessary adjunct or true ornament of poem or good verse, in longer works especially, but the invention of a barbarous age to set off wretched matter and lame metre.' By this declaration Milton links himself with such renaissance scholars as Ascham, who had declaimed against rhyme (see *Schoolmaster*, ed. Mayor, p. 176). But Milton was very far from sharing the scholarly objection to the whole recognized system of accentual verse, as his reference to 'lame metre' would alone suffice to show; and in his preface he goes on to define the chief beauty of verse as lying in 'apt numbers, fit quantity of syllables, the sense variously drawn out from one verse into another.' In other words, he clearly perceived that rhyme was only one method of procuring the measure effect essential to poetry, and that, for narrative poetry at all events, a greater effect, combined with greater ease of manipulation, could be pro-

duced by deliberate variations of cadence alone. This discovery of the poetical value of a studiously varied caesura is of first-rate importance in the history of English prosody; and whatever may be thought of the actual originality of Milton's verse, it can scarcely be denied that he was the first to observe clearly the scientific basis on which the harmonies of blank verse depend. For the rest, his metrical excellences are the result of admirable poetic criticism, and wise selection of devices already exemplified by the dramatists, rather than of actual invention. He availed himself to the full of the dramatic liberty of trochaic, spondaic, and anapaestic substitutions for the normal iambs of the verse, and did not hesitate to employ the most daring of Shakespeare's metrical licenses—viz. following an overflow line by a line containing a caesura after the first syllable. In the matter of double endings he seems to have made a distinction between epic and dramatic verse, using them more freely in the latter than in the former; while his fondness for the device increased with his years. In *Paradise Lost* the double endings amount to between 1 per cent. and 2 per cent. of the whole, and in *Paradise Regained* to between 3 per cent. and 4 per cent. On the other hand, *Comus* and *Samson Agonistes* contain 9 per cent. and 16 per cent. respectively. The double endings that occur in the epics, moreover, are more numerous in the speeches and debates than in the purely narrative parts. Where, however, Milton can best claim an absolute originality is in the paragraph form into which he threw his verse. Without this arrangement blank verse becomes monotonous beyond measure, and it is the absence of such division that makes a great part of Wordsworth so hard to read.

Milton's blank verse was received with little favor by his own generation, his most considerable follower being Lord Roscommon, who published a paraphrase of Horace's *Art of Poetry* in 1684. The blank verse of Lee the dramatist shows also a strong Miltonic influence; and John Philips (1676–1708) wrote a clever and not ill-natured imitation of his manner in his *Splendid Shilling* (new ed. 1808). The measure languished even more while the influence of Pope prevailed, but it revived in Young's *Night Thoughts* (1742) and Thomson's *Seasons* (1726–30), and was continued in Akenside's *Pleasures of the Imagination* (1744) and Cowper's *Task* (1785) into the period of romantic revival proper. The gloomy but powerful *Grave* (1743) of Robert Blair is Shakespearean

rather than Miltonic in versification, and abounds in double endings. There are few of the 19th century poets who have not employed blank verse in some of their compositions; but while they may have widened its range of application—as Wordsworth, for example, in his *Lines on Revisiting the Wye* applied it to meditative lyric, or as Tennyson in his *Tears*, *Idle Tears* applied it to the lyric of pure emotion—none of them have innovated to any marked degree in the technique of the metre, and the verse remains substantially the old Miltonic blank verse. Meanwhile, in the dramas that continue to be written, British poets have reverted to the versification of the minor Elizabethans, as one may find exemplified in the influence of Ford on Shelley's *Cenci*, or of Webster on Mr. Swinburne's *Rosamund* (1899). Consult J. Addington Symonds's *Blank Verse*; J. B. Mayor's *Chapters on English Metre*; Guest's *English Rhythms* (ed. Skeat).

**Blanqui**, blān-kē', JÉRÔME ADOLPHE (1798–1854), French political economist, was born in Nice. He studied in Paris under J. B. Say, and in 1830 became director of the School of Commerce, three years later succeeding Say in the chair of political economy at the Conservatory of the Arts and Crafts. From 1846 to 1848 he was a member of the Chamber of Deputies. His chief work is *Histoire de l'Economie Politique en Europe*, first published in 1838.

**Blanqui**, LOUIS AUGUSTE (1805–81), French revolutionist, was born near Nice. He was imprisoned for the illegal manufacture of gunpowder in 1837, and, in 1839, was condemned to death for his activity in organizing extreme revolutionary societies, the sentence, however, being commuted to imprisonment for life. Released by the revolution of 1848, he became the leader of the extreme socialistic party and for his communistic tendencies was sentenced to ten years' imprisonment. He was released in 1859, but was again sentenced two years later to four years. On the downfall of the empire (1870) he resumed his revolutionary propaganda, until arrested by order of Thiers. He was brought to trial in 1872, and was imprisoned at Clairvaux, but was once more released in 1879. The same year he was returned for a division of Bordeaux, but the election was annulled. He is the author of *L'éternité dans les astres* (1872); his political writings were published under the title *Critique Sociale*. Consult Combes' *Portraits Révolutionnaires*; Geoffroy's *L'Enfermé*; Da Costa's *Les Blanquistes*.

**Blantyre**, blan-tīr', town, chief commercial centre of Nyasaland, Africa; 41 miles southwest of Zomba. It has a Chamber of Commerce, an Anglican Church, Blantyre Church (Church of Scotland), and a White Fathers' Mission. The chief exports are cotton, coffee, fibre, rubber, tobacco and tea. Blantyre was founded in 1876, being named for Livingstone's native town in Scotland. Pop. (white) about 250.

**Blantyre**, parish and town, Lanarkshire county, Scotland; 3 miles northwest of Hamilton. The town, which is known as High Blantyre, has coal and iron mines. The village, known as Blantyre Works, is the centre of an extensive colliery district, and is the birthplace of Livingstone, the African explorer. Pop. (parish, 1921) 18,153.

**Blar'ney**, village, county of Cork, Ireland; 4 miles northwest of Cork. It contains an old castle, which occupies the site of a still older stronghold erected in 1446 by Cormac M'Carthy. The famous Blarney stone, built into the castle some twenty feet from the top, is supposed to confer wonderful powers of persuasion upon those who kiss it.

**Blasco Ibañez**, bläs-kō ē-bā-nyāth, VICENTE (1867– ), Spanish novelist, was born of Aragonese parents. He was destined for the legal profession but soon abandoned it as un congenial to his revolutionary spirit. He was frequently imprisoned in his youth for political offences, became leader of the Republican party in Spain, representing a radical constituency in the Cortes, and undertook the editorship of a revolutionary journal *El Pueblo*. His writings reflect his militant zeal in behalf of justice and brotherhood. They include *The Shadow of the Cathedral*, *Arroz y Tarhana*, *The Argonauts*, *The Four Noxemen of the Apocalypse*, *Make Nostrum*, *Blood and Sand*, *The Intruder*, *The Horde*, *Woman Triumphant*, *The Enemies of Woman*, *Sonnica*, *The Fruit of the Vine*, *The Cabin*, *The Mayflower*.

**Blash'field**, EDWIN HOWLAND (1848– ), American painter, was born in New York City, and studied in Paris under Bonnat and Gérôme, and at the Royal Academy, London. On his return to the United States (1881), he became known for his mural work, examples of which may be seen on the great central dome of the library of Congress, in the Minnesota, Iowa, Wisconsin, and South Dakota State capitols, in the court houses of Baltimore, Newark, N. J., and Youngstown, Ohio, in the New York Appellate Court, the chapel of the College

of the City of New York, and in a number of private houses. He is a member of the National Institute of Arts and Letters, and was its president, 1915–16. Among his canvases are *The Angel with the Flaming Sword* and *Christmas Bells*. He wrote, in conjunction with his wife, *Italian Cities* (1900), and an English edition of Vasari's *Lives of the Painters* (1897).

**Blasius**, blā'zi-us, St., bishop of Sebaste, Cappadocia, martyred by Agricola in 316. He was considered a guardian saint against throat diseases, for relief from which his blessing is still invoked on his day (Feb. 3). The stories of his life and works are purely legendary.

**Blas'phemy**, in English and American law, the criminal offence of maliciously and publicly contemning God, Christ, the Bible or the Christian religion. Although formerly denial of the accepted doctrines of Christianity was punishable as blasphemy, the offence to-day comprises only those expressions designed to wound the feelings of mankind, to excite contempt and hatred against religion or the church, or to promote immorality. Even in this restricted form, blasphemy is seldom punished, unless it results in public disturbance or a breach of the peace. In some of the United States blasphemy is no longer punishable as a separate offence.

**Blass**, bläs, FRIEDRICH (1843–1907), German classical scholar, was born in Osnabrück, Hanover. He studied at Göttingen and Bonn, taught in the University of Königsburg, and was professor of classical philology at Kiel (1876–92). In 1892 he became professor of philology at Halle, which position he retained until his death. He published or revised the text of all the important Greek orators. His other works include *Die Attische Beredsamkeit* (3 vols. 1868–80; new ed. 1887–92); *Die Griechische Beredsamkeit in dem Zeitraum von Alexander bis auf Augustus* (1865); *The Republic of the Athenians* (1892); *Philology of the Gospels* (1898); *Bacchylid's Carmina* (1904).

**Blasting**, the method of shattering masses of solid matter by means of explosives. Before the discovery or invention of gunpowder early in the fourteenth century, two methods of quarrying or of extracting minerals were employed: splitting the stone by means of a hammer, chisel, or wedge; and the breaking up of solid rock by the expansive power of heat. Gunpowder was first adapted to mining in Germany about 1613 and was introduced into England toward the end of that

century. Invention of new methods of blasting proceeded slowly, and not until 1846 were the high explosives, such as guncotton and nitroglycerin, discovered. Blasting is now widely adapted to such operations as mining and quarrying (qq. v.) and tunnelling (see TUNNELS AND TUNNELLING).

The principal explosives in ordinary use are black powder; dynamite; blasting gelatin, composed of guncotton and nitrostarch dissolved in nitroglycerin; trojan powder; rackrock; and mercury fulminate, an extremely sensitive and dangerous compound made by dissolving mercury in nitric acid and immersing this solution in common alcohol. (See EXPLOSIVES.)

Three methods of blasting are practicable: (1) the small-shot system; (2) the mine system; (3) surface blasts. In the small-shot system holes of small diameter are bored deep into the solid rock; the charge is placed deep in the holes, which are tamped or closed with sand or clay; and the blast is fired by use of a time-fuse.

Large blasts or mines are resorted to when great masses of rock must be removed, or when a great supply of irregularly broken stone is required. Such mines are of two kinds: shafts sunk from the top of the rock; and headings or galleries driven from the face. In a shaft mine the charge of powder is placed in a chamber cut at one side of the shaft, so that the tamping may not be in the direct line of fire, the charge being usually exploded by electricity.

Surface blasts are produced by firing the explosive in contact with or near the substance to be shattered. When fired with a detonator, such compounds as nitro-glycerin and guncotton operate downward, producing great shattering effects.

**Blasting Gelatin.** See BLASTING.

**Blas'toids**, a class of Echinodermata comprising small calcareous fossils occurring, for the most part, in the Carboniferous limestone. Blastoids are characterized by the presence of the hydrospires—five convoluted calcareous tubes communicating with the exterior and carrying a current of water to aerate the blood. The commonest genus is the pentremites (q. v.).

**Blastomycosis**, a suppurative and granulomatous process affecting chiefly the skin and sometimes also the deeper structures, due to infection with one or more closely allied species of fungi. The cutaneous lesions may take the form of papules, pustules, nodes, abscesses or ulcers. The condition is usually chronic and may cover a period of years. Po-

tassium iodide internally, X-ray treatment, and excision of the lesions are among the therapeutic measures employed.

**Blavatsky**, blä-vät'ski, HELENA PETROVNA HAHN-HAHN (1831-91), theosophist leader, was born in Ekaterinoslav, Russia. Following her unhappy marriage to General Blavatsky in 1848, she spent much of her life in travel, visiting practically every point of the globe. In 1871 she founded in Egypt a short-lived society for the purpose of investigating spiritualistic phenomena. In 1873 she arrived in New York City where, with the assistance of W. Q. Judge (q. v.) and others, she founded the Theosophical Society in 1875. She again travelled in the East and in Europe, spending the last years of her life in London. Her works include *Isis Unveiled* (1877); *The Secret Doctrine* (1888); *The Key to Theosophy* and *The Voice of the Silence* (1889). See THEOSOPHY; THEOSOPHICAL SOCIETY.

**Blay'don**, town, Durham, England, on the river Tyne; connected by bridge with Newcastle. Coal mining is carried on, and there are manufactures of bricks, bottles, and chemical manure. Pop. (1921) 33,064.

**Blaz'on**, BLAZONRY, BLAZONING, the art of describing a coat of arms by defining in technical language its component figures, their positions, and their tinctures. See HERALDRY.

**Bleaching**, the art of removing the natural color of vegetable and animal products in such a way as not to injure them and to have them as white as possible.

The process of bleaching by chemical methods is of comparatively modern date, the methods employed in earlier times having been dependent principally upon the action of light and air. In Ireland, alkaline liquors, obtained from the ashes of sea-weed, were used for steeping and boiling linens, and in Holland, which was the centre of the industry in the eighteenth century, the fabric was steeped first in a weak lye, then in a hot potash lye, then given a thorough washing and steeped in buttermilk for several days, before exposure on the grass. In 1785 the bleaching properties of chlorine were discovered, and the fact that lime-water saturated with chlorine gas made a most effective bleaching solution revolutionized the industry.

The 'American Process,' which consists of singeing, washing, boiling with lime, souring with weak acid, boiling under pressure with alkali and resin soap, steeping in a solution of bleaching powder, souring again with

weak acid, washing, and drying, came into vogue about 1837, and, with improvements, is still in general use. There are three kinds of bleach: the madder bleach, the market bleach and the Turkey-red bleach.

In the madder bleach, which is the most thorough calico bleach, the fabric is first singed, to remove loose hairy fibres projecting from the surface. This process is carried out in three ways—by gas, by plate, and by revolving rollers. In gas singeing the cloth is passed rapidly through Bunsen burners. For plate and roller singeing, the pieces are stitched end to end, and drawn over red-hot copper plates or a hollow cylinder.

After singeing, the fabric is thoroughly washed in a washing-machine, and is then allowed to steep or lie in a heap all night so that a fermentation may set in, which acts upon certain insoluble substances; or this step, known as gray wash, may be omitted and the goods may go directly to the lime-boil in which they are submitted to the action of lime-water, generally at a high temperature, and under pressure. After the lime-boil the fabric is washed in water and run through sulphuric or hydrochloric acid at 1° to 2° Tw. (Twaddell hydrometer), and then through water, in order to prevent its being made tender by the acid. It is then boiled under pressure from three to five hours, first with soda ash and resin, and then with soda ash alone. In the first lye-boil about 5 to 6 per cent. (by weight) of soda ash and 1 to 2 per cent. resin are used; in the second, 1 to 2 per cent. soda ash. After the lye-boils the goods are again washed in water.

**Bleaching**, or 'chemicking', which consists in passing the goods through a clear solution of bleaching powder at ½° to 2° Tw. is the next step, followed by the 'white sour' which decomposes any bleaching powder remaining on the fibre. The goods are then washed again and dried over copper cylinders.

The object of the lime-boil is to decompose the fatty, resinous, and waxy impurities, by converting them into lime soaps, which, still being insoluble, stick to the fibre, but are easily removed. Caustic alkalis would bring about a similar reaction, and at the same time soluble decomposition products would be formed; but lime is cheaper, and attacks the resinous matter more vigorously. In the souring, the acid decomposes the lime soaps with the formation of the lime salt of the acid used, and of the free fatty acids, in an insoluble form. These fatty acids are converted into sodium soaps

in the lye-boils, which, now being soluble in water, are easily removed in the washing operations. A special feature of this method of bleaching, called the 'madder bleach,' is the use of resin soap; but the part it plays has not been satisfactorily explained. Practical experience has shown that, better than any other substance, resin soap removes certain impurities which cause uneven results in dyeing.

*Market Bleach* is used principally for goods which are to be sold in the white state; the essential difference between this and the madder bleach is the absence of resin soap in the lye-boil.

*Turkey-red Bleach* is a bleach used for goods which are to be dyed Turkey-red. It consists usually of one or two lye-boils in caustic soda, then souring with weak sulphuric acid, and finally washing and drying. Alizarin, a synthetic dye, is now used almost exclusively for Turkey-red dyeing.

*Linen Bleaching.*—Linen is bleached in a similar way to cotton, but the process is slower. It is, however, assisted by the exposure of the moist fabric to the action of light and air on the grass—fermentation and the formation of traces of hydrogen peroxide probably being the active agencies in this operation.

*Wool Bleaching.*—The natural impurities of raw wool are much greater than those of cotton, and may amount to from 30 to 80 per cent. They are of four kinds—(1) fatty and waxlike bodies soluble in benzine, petroleum, ether, or the like, to which the name 'yolk' or 'wool-fat' is given; (2) dried perspiration, soluble in water, known as 'suint'; (3) dirt, removable by water; (4) vegetable débris, removable by carbonization. The removal of these impurities takes place in the scouring; if this be neglected, the wool appears uneven or stripy when dyed. The scouring of wool is generally done in one of three ways: by saponification and washing out with water the soluble soap produced; by emulsification; or by solution in an organic solvent. The emulsification process is the one most generally employed. For the finest qualities of wool a good neutral soap is used; but for coarser and poorer qualities the soap is mixed with a small quantity of sodium carbonate or ammonia, though, owing to the ease with which wool is destroyed by alkalis, great care must be exercised in their use. The temperature of the scouring bath varies from 35° to 40° c. In many plants the waste scouring liquors are collected and used for the manufacture of lanolin.

A number of experiments have been tried to substitute for soap certain volatile liquids, which

have a solvent action on the fatty and waxy bodies of the raw material. Of all substances carbon disulphide has been most successfully applied, but owing to mechanical difficulties, and the risk of fire and explosion, it has not thus far been extensively used in the industry. In order to remove the faint yellow tint of the wool after scouring, it is bleached, the agent usually employed being sulphur dioxide, sulphurous acid, or hydrogen peroxide. There are two methods of bleaching—*e.g.* gas and liquid bleaching. In the former, the wool, in the wet state, is placed in specially designed brick chambers and submitted to the action of sulphur dioxide, which is produced by burning the necessary amount of sulphur in an iron pot in one corner of the chamber. In liquid bleaching the material is steeped for several hours in a solution of sulphurous acid or a solution of sodium bisulphite, to which the requisite amount of hydrochloric acid has been added. The best results, however, are obtained by the use of hydrogen peroxide or sodium peroxide, and this agent is used in the higher class goods.

*Silk Bleaching.*—Silk consists principally of two substances—fibroin, the fibre proper and a gumlike body, sericin. The latter is removed in the scouring operation, which consists in working the silk in a solution of soap at 90° to 95° c., and afterward in hot water which contains a small amount of sodium carbonate. The waste soapy liquors, containing large quantities of sericin, are collected and extensively used in dyeing, under the name of 'boiled off liquor.' After scouring or 'boiling off,' the silk is bleached by means of sulphur dioxide in a manner similar to that described in the case of wool; by hydrogen peroxide, now most generally employed, or by permanganate of potassium. Consult Higgins' *A History of Bleaching* (1924); Trotman's *The Bleaching, Dyeing and Chemical Technology of Textile Fibres* (1925).

*Bleaching Powder*,  $\text{CaOCl}_2$ , a compound formed by passing chlorine gas over cold slaked lime. When freshly made it consists of an oxychloride of calcium, but by the absorption of moisture it is gradually converted into a mixture of chloride and hypochlorite of calcium. It is commonly known as chloride of lime, and is used as a source of chlorine for bleaching purposes, also as a disinfectant.

*Bleak*, a Cyprinid fish allied to the bream. The common bleak (*Alburnus lucidus*) is a small silvery form common in fresh water in the more northern parts of Europe, usually about 5 to 6 inches in length, and with a protracting lower jaw. The scales

are used in the manufacture of artificial pearls.

**Bleeding**, or BLOOD-LETTING, is commonly resorted to in surgical practice for the relief of congestion; and in this sense the term covers many different methods by which blood may be removed from the body—*e.g.* venesection or phlebotomy, cupping, and the use of leeches. Bleeding, after having been terribly misapplied for many generations and then practically abandoned, is now advocated in certain cases of acute inflammation in suitable subjects, or to relieve an overburdened heart. It is by no means the only example of an old practice in medicine or surgery which had been dropped and then taken up again with greater moderation. Practically any form of counter-irritation or depletion even if it does not remove blood, or all the constituents of the blood, from the body, but merely withdraws some of them, or draws the blood away from a definite spot, may be considered as a modified form of bleeding. Hence, dry-cupping, poulticing, blistering, and strong purges are modifications of the same principle. See HÆMORRHAGE; WOUNDS; VENESECTION.

**Bleek**, bläk, FRIEDRICH (1793–1859), German Biblical scholar, was born in Ahrensböök in Holstein. He became professor of theology at Berlin (1823), and at Bonn (1829). His commentary on *Der Brief an die Hebräer* (1828–40) ranks among the foremost exegetical studies. His *Introduction to the Holy Scriptures* (1860–2), of numerous editions, has been translated into English—the Old Testament by Venables (1869), the New Testament by Urwick (1869), and also his *Lectures on the Apocalypse* (1875). His other works include *Synoptische Erklärung der drei ersten Evangelien* (1862), *Vorles. über die Briefe an die Kolosser*, etc. (1865), and *Der Hebräerbrief erklärt* (1868).

**Bleek**, WILHELM HEINRICH IMMANUEL (1827–75) German philologist, son of Friederich Bleek, was born in Berlin. He took part (1854) in Blaikie's Niger expedition, and (1855–6) spent eighteen months in the interior of Natal. He became curator of the Grey Library in Cape Town and carried on valuable research work. His published works include *Languages of Mozambique* (1856); *Handbook of African, Australian, and Polynesian Philology* (1858–63); the unfinished but important *Comparative Grammar of South African Languages* (1862–9); *Origin of Language* (1869), in which the Darwinian theory is applied; and *Reynard the Fox in South Africa* (1864).

**Bleiberg**, bli'berch, village,

Austria, in Carinthia, 9 miles west of Villach. It has valuable lead mines, the most extensive in Austria. Pop. 5,000.

**Bleibtreu**, blip'troi, GEORG (1828-92), German painter of battle scenes, was born in Xanten, on the Rhine. He was the pupil of Hildebrandt and in 1849 attracted much attention by *The Battle of Bau, in Schleswig*. Afterward he painted a series of pictures drawn from episodes in the war of independence (1813-15), of which the most celebrated are *The Attack on the Grimma Gate at Leipzig* and *The Battle at Waterloo* (1858). From 1864 he painted incidents of the Prusso-Danish and Austro-Prussian Wars, the best being *The Passage of the Prussians to Alsen* and *The Battle of Königgrätz*, both in the National Gallery at Berlin. Later he painted episodes of the Franco-German War, such as *The Capitulation of Sedan, The Bavarians under General von Hartmann before Paris, King Wilhelm after the Battle at Gravelotte, and Napoleon retiring after Waterloo*. His paintings are vigorous and powerful, and his coloring brilliant.

**Bleibtreu**, KARL (1859- ), German man of letters, was born in Berlin. He was engaged in editorial work for a few years and later devoted himself to a varied field of literature. His published works include somewhat turbulent descriptions of battles (*Dies Irae . . . Sedan*, 5th ed. 1902); *Cromwell bei Marston Moor* (1889); *Waterloo* (1902); books about Napoleon (1888, 1891); Frederick the Great (1888, 1892); Byron (1886, 1897); English literature (1887-8); *England's Waterlooage* (1915); *Stegemanns Weltkrieg und die Marneschlacht* (1916).

**Blekinge**, blā'king-e, county, in Southern Sweden, with an area of 1,173 square miles, 35 per cent. of which is forest. The salmon fishery, especially in the River Morrum, is considerable. For practically eight centuries it belonged to Denmark, but was ceded to Sweden in 1658 by the peace of Roskilde. The chief town is Carlscrona. Pop. (1920) 147,098.

**Blemmyes**, blem'i-ēz, ancient people of Hamitic origin, who lived in the south of Egypt.

**Blende**, a name given to sphalerite or zincblende by the early miners. It is still very generally used by miners and prospectors.

**Blenheim**, blen'im, or BLINDHEIM, village, Germany, in Bavaria, near the left bank of the Danube, 23 miles northwest of Augsburg. Near here, at Höchstädt, on Aug. 13, 1704, the Duke of Marlborough and Prince Eugene, commanding the combined armies of the allies (England,

Germany, Holland, and Denmark), defeated the French and Bavarians under Tallard, Marsin, and the elector of Bavaria. The battle has been celebrated in verse by Southey (1798) and Dennis (1705).

**Blenheim Park**, parish, England, near Woodstock, Oxfordshire, on the Glyme River. The name of the park was changed when Queen Anne granted it to John Churchill, Duke of Marlborough, for his famous victory at Blenheim in 1704. Parliament made a grant of about £500,000 for a palace, designed by Sir John Vanbrugh.

**Blenk**, JAMES HUBERT (1856-1917), American Roman Catholic prelate, was born in Neustadt, Bavaria. He studied theology in France and Ireland and in 1885 was ordained priest. He was president of Jefferson College Convent (La.) in 1890-96, became bishop of Porto Rico in 1899, and archbishop of New Orleans in 1906.

**Blenker**, LOUIS (1812-63), German-American soldier, was born in Worms, Hesse-Darmstadt, Germany. He served in the Bavarian legion which accompanied Prince Otho to Greece, 1833-7; engaged in the wine business at Worms, joined the revolutionary party in that city, and was obliged to retire to Switzerland, emigrating to the United States the same year (1849). He entered business in New York City and organized the 8th regiment of New York Volunteers, leading it to the front as colonel. Blenker's regiment was a part of the division which covered the retreat at the first battle of Bull Run, and he was promoted brigadier general, commanding a division in the Army of the Potomac during the remainder of his service. He died from injuries received from a fall from his horse.

**Blenkinsop**, JOHN (1783-1831), inventor of what may be considered the first commercially successful locomotive steam-engine, a cog-wheeled engine which was employed on Hunslet Moor, near Leeds, to draw coal up to a load of thirty tons (1812 *et seq.*). George Stephenson saw Blenkinsop's engine at work before building his famous *Rocket*.

**Blennerhasset**, blen-er-has'-et, HARMAN (1765-1831), English immigrant of Irish descent in America, remembered for his connection with the Aaron Burr Conspiracy. He was born in Hampshire, Eng., emigrated to America, and, about 1798, built a fine residence on what has become known as 'Blennerhasset' Island, a small island in the Ohio River about two miles below Parkersburg, Va. (now W. Va.). There he devoted himself to science and to music, until, in the summer of 1806, he came under the influence

of Aaron Burr, who presented to him a project for a great land speculation in Louisiana and an invasion of Mexico, when the war between the United States and Spain, which then seemed inevitable, should break out. The island became a centre of preparations for the Burr expedition, and in December, 1806, it was seized by a force of Ohio militia. Subsequently Blennerhasset was arrested and in June, 1807, was indicted, with Burr, for misdemeanor and treason, but on Burr's acquittal he was released, and, his island having been sold to pay his debts, he passed the last years of his life in poverty.

**Blenorrhœa**. See GONORRHEA.

**Blenny**, a name given to the members of the family Blenniidae, which includes a large number of small littoral fishes, all having the ventral fin formed of less than five rays, and jugular in position, as in the cod family. In many cases these ventral fins are reduced to rods, which are used by the fish in travelling over the sea bottom. For examples, see articles SHANNY; WOLF-FISH.

**Bleph'aritis**, a chronic inflammation of the eyelids.

**Bleriot**, blē'ri-ō, LOUIS (1872- ), French aeronaut, was born in Nantes. He was graduated from the Central School of Arts and Manufactures in Paris in 1895. In 1900 he turned his attention to flying machines, and constructed an artificial bird with flapping wings, run by a motor. He also experimented with biplanes and the Langley type of aeroplane. The monoplane called by his name grew out of the last-named machine, and is notable for its simplicity, stability, and lifting power. On July 25, 1909, he flew across the English Channel from Baraques to Dover in 37 minutes.

**Blessington**, MARGUERITE, COUNTESS OF (1789-1849), Irish novelist and writer, was born in Knockbrit, Tipperary. She was an intimate friend of Lord Byron; held a little court for many years at Gore House, Kensington; but her equivocal connection with Count d'Orsay who was the husband of her stepdaughter, cut her off from society and overwhelmed her with debt. The couple were obliged to flee to Paris (1849), where Lady Blessington died in poverty. She is the author of *The Idler in France* (1841), *The Idler in Italy* (1841), and *Conversations with Lord Byron* (1834). She also wrote a number of novels, the best known of which are *Grace Cassidy*, or *The Repealers* (1833), *The Victims of Society* (1837), *The Follies of Fashion* and *The Confessions of an Elderly Lady* (1838).

**Blewfields**. See BLUEFIELDS.  
**Blicher**, STEEN STEENSEN

(1782–1848), Danish novelist and poet, was born in Vium, a village of Viborg. From 1819 he led the life of a poor parson, till his growing needs forced him to produce those works which have made him one of the favorite novelists of the Danish nation. Beginning with *En Landsbydegn's Dagbog* (1824), he wrote a whole series of masterly tales of Danish, especially Jutish, peasant life, culminating in *E Bindstouw* (1842), written in the Jutland dialect, and incomparably his best work. What Hardy has done for Wessex, Blicher has done for Jutland, but in a spirit of bright and pleasant humor. Consult his own *Autobiography*, prefixed to his *Samlede Noveller*; Kristensen and Lund's *Blicher's Liv og Gjærning*.

**Blickling Homilies.** The unique ms. of the Blickling Homilies is at Blickling Hall, near Aylsham, in Norfolk, England. They belong to the time between Alfred and Ælfric; they are not homogeneous in character, and may cover a wide period of time. The date 971 occurs in one passage. These homilies, full of legendary, apocryphal, unscriptural matter, form a striking contrast to those of Ælfric (q.v.), who, as is clear from several passages, intended some of his own homilies as a corrective to them.

**Blida**, fortified town, Algeria, 23 miles southwest of Algiers, at the foot of the Atlas Mountains. It is famous for its orange groves. There is also some trade in copper, lead, and cotton. Pop. (1911) 35,461 (11,219 Europeans).

**Bligh**, WILLIAM (1754–1817), English admiral, was born in Cornwall. He entered the navy, and sailed under Captain Cook in his second voyage round the world (1772–4). As a lieutenant he took part in the action off the Dogger Bank (1781), and in Howe's relief of Gibraltar (1782). In 1787 he was sent by the British government, as commander of the *Bounty*, to Tahiti. During their six months' stay on the island his men became completely demoralized, and mutinied. On April 28, 1789, Bligh, with eighteen men, was cast adrift in an open boat, while the mutineers turned back to Tahiti, and ultimately settled on Pitcairn's Island. After almost incredible hardship, Bligh arrived at the island of Timor, near Java, on June 14, having sailed 3,618 miles. (See BOUNTY, MUTINY OF THE.) In 1805 he was governor of New South Wales, but was so harsh as to cause universal dissatisfaction; and in 1808 the civil and military officers of the colony arrested him. He was

kept in prison by the colonists for two years. The officer who arrested him was tried in England and cashiered. After Bligh's return to England he was raised (1811) to the rank of admiral.

**Bligh Islands**, a portion of the Fiji Archipelago, in nearly 180° long.

**Blight**, a diseased state of cultivated plants, especially cereals and grasses. The term has been vaguely and variously used, having, in fact, been applied by agriculturists to almost every disease of plants in turn, however caused, especially when the plant dies before reaching maturity. See PLANTS, Diseases.

**Blight, American**, the name given to a disease that attacks apple and pear trees throughout North America east of the Rocky Mountains. The disease affects the bark, which falls off, and thus causes the death of the tree. It is due to one of the aphids (q.v.), sometimes called the 'woolly aphid,' from the white protective material, like cotton wool, with which it covers itself. Eggs are laid in minute crevices of the bark by oviparous females in autumn, thus spreading the pest. The bark splits open, canker begins, and the tree, if not killed, becomes of little value. No part of the tree is safe from attack. Washing, spraying, or painting with paraffin and soft soap or an insecticide two or three times in the spring and early summer is one of the most effective remedies. This is best applied after the sun has gone down, in order not to injure the foliage. Spraying in winter with a solution of caustic soda and pearl ash is also recommended. Firs and larches are also subject to the blight. Consult the publications of the U. S. Department of Agriculture.

**Blimbing**, or BILIMBI, a pulpy, yellowish, acid fruit, about the size of a hen's egg, and found on the cucumber tree (*Averrhoa bilimbi*) of the order Oxalidaceae. The acidity is due to an oxalate of potassium. It is eaten by natives of India and the East Indies, and is also used in the form of pickles.

**Blind.** See BLINDNESS.

**Blind, KARL** (1826–1907), German author and revolutionist, was born in Mannheim. Condemned, for taking part in the revolution of 1848, to eight years' imprisonment, he was freed by the people and soldiery. A member of the embassy of Baden and Bavaria to Paris, he was there imprisoned, on the charge of participating in Ledru-Rollin's rising, and then banished from France. He went in 1852 to Lon-

don, and there formed intimate relations with the leaders of European democracy—Mazzini, Garibaldi, Louis Blanc, etc. He furthered the Schleswig-Holstein movement, and fought in the war of 1870–71. His writings range over Germanic history, literature, and folklore, as well as politics.

**Blind Fish.** In situations where light is absent, blind animals are commonly found. The absence of the normal stimulus has necessitated cessation of function and various degrees of degeneration in structure. In most cases rudimentary traces of eyes prove the fact of degeneration; and that the latter is largely the direct effect of the absence of the stimulus preserving the health of the eye is allowed by most. The blind fish of the Kentucky caves (*Amblyopsis*) has degenerate hidden remnants of eyes; *Lucifuga dentata*, a very different form, found in the subterranean caves of Cuba (though member of a marine family), is also blind; the hag fish (*Myxine glutinosa*), though perhaps hardly a fish in the technical sense, has also virtually lost its eyes in association with its habit of spending much of its life buried in the mud, or parasitically within cods and haddock; the primitive vertebrate, the lancelet (*Amphioxus*), is in the same state.

**Blind Harry.** See HENRY THE MINTREL.

**Blindness.** In medical terminology the expression 'blindness' means absolute sightlessness; what is popularly termed 'partial blindness' is known medically as Amaurosis or Amblyopia. (See AMBLYOPIA.) Blindness cannot always be accounted for. In general, it may be said to arise from inflammatory or degenerative changes in some part of the path between the cornea without and the visual centre (or that part of the gray matter of the brain especially concerned in sight) within. The eye is so delicate an organ that inflammation of any part may easily spread to the others, and skilled assistance should be called in whenever its safety is concerned.

Blindness is either congenital or acquired. Acquired blindness is due to pus infections (particularly gonorrhœa), syphilis, sympathetic inflammation, accidents (especially industrial accidents), progressive near-sightedness, and various inflammatory conditions. It may also be due to poisoning by lead, tobacco, or wood alcohol, the last used extensively as an adulterant in liquors.

The various forms of eye disease, such as Cataract, Keratitis, Iritis, and Retinitis (qq.v.), are

treated under their several headings. One, however—*viz.*, *Ophthalmia Neonatorum* (sore eyes of the new-born)—is particularly mentioned here because of its special importance. The disease starts with superficial inflammation of the eyes, caused by contagion during birth. It leads to ulceration and rapid destruction of the eyes, and is extremely contagious, being readily transmitted from the child to any one having to do with it. In nearly every instance the disease may be prevented from developing by the instillation of a weak solution of nitrate of silver in the eyes of the new-born child; it may be cured by the same method, if treatment is not too long delayed.

One-tenth of all cases of blindness may be said to be due to this disease. The number of cases of preventable blindness is so great, and the education and maintenance of the blind so costly, that the matter is not alone of importance from a medical point of view, but has become a serious economic problem. Many States have legislative measures requiring that all cases of inflammation or swelling of the eyes of new-born children be reported to the local health officer, either by the nurse in charge of the infant or by the physician. In addition, some States furnish physicians with prophylactic outfits.

Children are sometimes several months old before it is discovered that they are blind. By the third month the healthy child shows signs of recognition on seeing a familiar face; but even after a few weeks it will take pleasure in a bright light, and its perception of it can be tested by moving a candle before the eyes and noting whether they follow it. When over two months old the child with normal sight will blink if an object is suddenly thrust near its eyes. See BLIND, TRAINING OF.

**Blindness, Color.** See COLOR BLINDNESS.

**Blind Spot IN THE EYE,** that part of the retina which is pierced by the optic nerve, and which is insensible to light. If, having closed one eye, a person fixes the other on a black spot on a white ground, any small black object, gradually drawn away sideways from that spot, will at one point disappear, but will presently reappear after having been further removed. The limits of the blind spot can be found by performing the same experiment in different directions. The blind spot is unnoticed in looking at objects in the ordinary way for at least

three reasons. It lies outside the field of distinct vision—*i.e.*, it is always at a point remote from that on which the eyes are fixed. Again, the same point of any object does not fall on the blind spots of both eyes at the same time. Lastly, the blind spot causes blankness, and not a perceptible darkness, which can only be distinguished by those parts which can also distinguish *light*.

**Blindstory,** in architecture, the middle story of a large church, over the pier arches and under the clerestory windows. The technical name is 'triforium,' as the gallery or open space between the vaulting of the nave and the roof of the aisles generally opens on the nave by triple apertures. The ornamental arrangement of the triforium varies considerably. In the Norman style it is often formed of a single complete arch, or of an arch subdivided into smaller ones, supported on diminutive shafts. In the Early English style a range of small arches is not uncommon, and sometimes two or more larger arches subdivided are used. In the Decorated and Perpendicular styles the space occupied by the triforium is often much reduced. In ancient times the triforium was appropriated to the use of females.

**Blind Tom (1849–1908),** musical genius, was born near Columbus, Ga., the son of negro slaves. He was born nearly blind and half idiotic, but possessed the faculty of playing music by ear, after hearing the air. He made his first appearance in New York, at Hope Chapel, in 1861, and subsequently gave concerts all over the United States and in many parts of Europe. He was said to have memorized 5,000 pieces of music, including the most elaborate works of the great composers.

**Blind, Training of the.** Although there were occasional illustrious blind people—notably Nicholas Saunderson, Maria von Paradis, Ziska, John Metcalf, Dr. Blacklock, and Huber—before the latter part of the eighteenth century, the first effort to ameliorate the condition of the blind in general was begun at this time. Previous to that period they were a helpless class, for whom there was little resource but begging. The degraded state of the masses of the blind in France is shown by the following incident: In 1771, at an annual fair in Paris, an innkeeper had a group of blind men attired in a grotesque manner, wearing long, pointed hats and pasteboard spectacles. Their leader was decorated with a peacock's tail and the headdress of

Midas. In this condition they gave a burlesque concert for the profit of their employer.

Among those who gazed at this outrage to humanity was the philanthropist Valentin Haüy (1745–1822). After he had gathered all the information possible respecting the blind, he began teaching a blind boy who had earned his living by begging at a church door. Encouraged by the success of his pupil, Haüy collected other blind persons, and in 1784 founded in Paris the first school for the blind, the Institution Nationale des Jeunes Aveugles, and commenced the first printing in raised characters. In 1786 he exhibited before Louis XVI. and his court at Versailles the attainments of his pupils, and published an account of his methods, entitled *Essai sur l'Éducation des Aveugles*. As the novelty wore off, contributions almost came to an end, and the school for the blind might have ceased to exist had it not been taken under the protection of the state in 1791.

The work of Haüy, the great apostle of the blind, was taken up by Klein of Vienna, by Zeune of Berlin, and by others on the Continent; in Britain especially by Gall of Edinburgh and Alston of Glasgow. Later, every country in Europe came to support one or more residential schools for the blind. Comparatively little has yet been done in Asia and Africa.

In the United States, citizens of Boston, New York, and Philadelphia started our three pioneer schools. In 1829 Dr. John D. Fisher founded the first of these, in Boston. He had visited the Paris school, but the one he established soon surpassed those of Europe. State aid was secured from the start; private interest was aroused and maintained; and Dr. S. G. Howe, the Philhellene, became director, and remained during his long life the leader in this branch of education. A wealthy merchant, Col. T. H. Perkins, gave the enterprise a mansion, valued at \$30,000—hence the name Perkins Institution; and the new school was opened in 1831. Dr. Howe's instruction of Laura Bridgman (q.v.) began in 1837, and his success commanded attention throughout the whole world. The New York institution was also opened in 1831, actually a few months before that in Boston, under Dr. John D. Russ, another Philhellene. The Philadelphia Institution, founded in 1833 by the Society of Friends, secured as its first principal Julius Friedlander, who had had European experience.

These three schools began as

TRAINING OF THE BLIND.

1. Illustration of point prints. 2. Illustration of music in points. 3. Game of checkers. 4. Piano tuning. 5. Desk outline map in points. 6. Pencil writing. 7. Rush seating. 8. Brass plate making on stereotypewriter. 9. Kindergarten occupations. 10. Geometry diagram.

private corporations, and remain so to this day. Through exhibitions of their pupils public interest was aroused in other States, and public State institutions were organized in quick succession—Ohio in 1837, Virginia in 1839, Kentucky in 1842, and so on. In some cases, departments for the blind were added to existing institutions for the deaf; but wherever possible this undesirable association has been terminated. M. Anagnos, the second director of Perkins Institution, opened in 1887 the first Kindergarten for the Blind; and Mrs. Emily W. Foster, in 1893, started the first Nursery for Blind Babies, at Hartford, Conn. In 1900, through the influence of Frank H. Hall, then superintendent of the Illinois Institution, the public schools of Chicago opened a class for blind children. A number of other cities have followed. In 1912 there were reported to the U. S. Bureau of Education 60 residential schools and day schools, having a total of 4,992 pupils and 652 instructors.

There is no better or more thorough elementary schooling given blind children anywhere than in Germany and Austria. But as a rule this ends at the age of fourteen, after which the instruction is purely vocational—and that, handicraft, with some little piano tuning. The general assumption on the Continent is that the blind cannot make a living in the world, and ought not to be expected to do so. This conviction has provided efficient shop schools, followed by employment in shop or at home, resulting in a practically complete paternal care of the blind from cradle to grave. The original Paris school has always been more optimistic in aim, having taught music vocationally, together with piano tuning.

Since 1872, Dr. (later Sir) Francis Campbell, an American and blind, has conducted in London, England, the Royal Normal College and Academy of Music for the Blind, a residential school furnishing unexcelled vocational opportunities in school teaching, music, and piano tuning; and the remarkable success of its graduates has powerfully affected the aims of the other schools of Great Britain and Ireland.

According to the views of Sir Francis Campbell, besides regular gymnastic training we should endeavor to give young blind children that spontaneous activity and love of play which is the universal impulse of all healthy seeing children. The first requisite is a suitable playground, specially adapted to meet the wants of the

blind. Besides a free space where they can run and play, it should have a supply of swings, springboards, stilts, bowling alleys, etc. The pupils should be encouraged to enter various competitions, as walking, running, jumping, leapfrog, sack racing, shot putting, and tug-of-war. Cycling, rowing, swimming, skating, and coasting are also beneficial.

The school curriculum should also be varied according to the age and capacity of the pupils, while the teacher's object should be to develop the powers of observation, train the reasoning faculties, strengthen the memory, cultivate clear and concise expression, and stimulate a love of reading and literature. All children of average intelligence should be taught typewriting. From the earliest years manual dexterity should be cultivated by kindergarten work, modelling, sewing, knitting, and sloyd.

Sir Francis' scheme of education makes music in its various branches, when properly taught, the best and most lucrative employment for the blind. The musical instruction, in its several branches of harmony, pianoforte, organ, and vocal culture, should be addressed to the *mind*, not merely to the *ear*. If the mental faculties have not been developed and thoroughly disciplined, the blind musician, however well he may play or sing, will be a failure as a teacher. The musical instruction must be more thorough, more analytical, more comprehensive than corresponding instruction given to seeing persons.

Piano tuning is another excellent form of employment for the blind. Many can be trained to become successful piano tuners when they have reached an age that renders training for the profession of music impossible. The seeing who excel in the business go through a long apprenticeship, and one must give the blind even more careful preparation.

In America not a few have coupled piano tuning with piano selling, and have succeeded well. The businesslike have often done better in some commercial pursuit than by following an institutionally taught occupation. For girls and young women, teaching and a capacity for housework, developed at school, have proved most effective. Indeed, a cultivated blind girl who is so agreeable and efficient at home that she is not only welcome but needed should be considered self-sustaining.

Because blind children are comparatively few, and these live scattered in city and country, and

because their proper training requires not only special apparatus but different departments of study, with wide opportunities for a rich and full life during youth, most of their schools are residential, the pupils going home for the vacations. Nevertheless, in large cities, where the will has created the necessary machinery, day-school centres for the blind are made to thrive, as for many years in London and Berlin, and more recently in Chicago, Milwaukee, Cincinnati, New York, and a few other American cities. Except in Berlin, where the instruction corresponds in spirit and aim with that of the local institutions, and in London, where it is the ambition of the brighter pupils to gain as soon as possible a scholarship at some residential school like the Royal Normal College, this day-school plan is dictated mainly by a conviction that even handicapped children will be the better assisted in life by going to school with other children with whom they will have to live and compete in the world. This view is promising for the blind in proportion as the instruction is balanced and comprehensive enough to develop the pupil in several lines, and to the utmost; in other words, when it considers the child rather than the curriculum, and the fitting of him into the public school system. But all this involves an expenditure for physical, manual, domestic, and musical training beyond what is usually required for the seeing child. Until this is provided, private agencies must offer opportunities in the various practical and inspirational activities of the times—as in the case of the New York Association for the Blind.

The American aim in the education of the blind is to provide the best and most comprehensive schooling obtainable, to graduate the greatest possible number with high-school diploma and with vocational training in one or more pursuits, and to expect these to make good in the world. The plan is essentially optimistic, and has had good results, especially where the school stands back of the graduate. It has often been lessened in result by changes in superintendents for political reasons, and by the inevitable weakening effect upon the pupils' minds of receiving much for nothing.

TYPES AND PRINTING.—To Haüy belongs the honor of being the first to emboss paper (1784) as a means of reading for the blind. His books were embossed in large and small italics, from

movable type set by his pupils. In 1827 James Gall of Edinburgh embossed some elementary works; his plan was to use serrated lines and replace curves by angles. In 1832 the Edinburgh Society of Arts offered a gold medal for the best method of printing for the blind, and it was awarded (1837) to Dr. Edmond Fry of London, whose alphabet consisted of ordinary capital letters without their small strokes. In 1836 Rev. W. Taylor of York and John Alston of Glasgow began to print with Fry's type.

In 1833 printing for the blind was commenced almost simultaneously in Boston and Philadelphia. Howe, in Boston, used small English letters without capitals, angles being employed instead of curves; while Friedlander, in Philadelphia, used only Roman capitals. About 1838 Lucas of Bristol, England, a shorthand writer, and Frere of London both introduced alphabets of simpler forms, and based their systems on stenography. In 1847 Moon of Brighton brought out a system which partially retains the outline of Roman letters. The preceding systems are all known as line types. These do not lend themselves to tangible writing, and have been superseded by point type systems.

In 1829, Louis Braille, one of the greatest benefactors of the blind, a blind music teacher in the Institution des Jeunes Aveugles, Paris, devised an alphabet in which the characters are formed by an arrangement of dots. The signs of the *Braille Alphabet* are purely arbitrary, and consist of varying combinations of six points

placed in an oblong, thus: . . of  
. .  
. .

which there are sixty-three possible combinations. Such a point type has the double advantage of superior tangibility and superior writability; and it further supplies a complete mode of expression for words, music, and mathematics. This alphabet, with modifications, prevails in most countries. In the United States, two such modifications have been in use—the New York point, in which the characters are not more than two points high and four long, and the American Braille, whose characters are made in the original base. In 1916 the Halifax convention of the American Association of Instructors for the Blind voted to discard the New York point and American Braille in favor of the style of type used in England, known as Revised Braille, Grades 1 and 2.

**Appliances.**—For writing the point alphabets, simple and ingenious slates have been constructed. Two American super-

intendents, Hall of Illinois, in 1892, and Wait of New York, in 1893, brought out the first practical point typewriters, the Braillewriter and the Kleidograph. Similar but heavier machines by the same inventors, the Stereotypemaker, in 1893, and the Stereograph, in 1894, by which embossed metal plates can be rapidly made ready for an indefinite number of paper impressions, have greatly cheapened and facilitated the means of printing for the blind.

Many devices have been contrived to enable the blind to keep the lines apart when writing with lead or fluid pencil. Different ciphering boards have also been constructed, of which one of the simplest and best is the Taylor octagonal board, with star-shaped openings for the insertion of a square type or pin, bearing on one end a ridge, on the other two points. Eight different positions for each end furnish sixteen characters; only a single kind of type is therefore required for arithmetic, and two kinds for algebra. Still another single-type slate is the French *cubarithme*, having shallow square sockets for the reception of cubes bearing Braille point characters, which in the different positions of the cube supply the figures for arithmetic. For geometry, books are prepared with raised diagrams lettered in point. Geography is taught by means of paper desk maps outlined in relief, of wooden dissected maps, or of relief globes. A slight modification of the common table games renders them usable by the blind.

#### *Instruction and Occupations.*—

In 1882 William Moon planted in Philadelphia, and John P. Rhoads later kept alive, the English institution of teaching the adult blind in their homes. Since 1900 other such home-teaching agencies have sprung up in various States, teaching chiefly reading and simple handicrafts, and giving inspirational advice and suggestion. Before then, except in a few working homes, little had been systematically done in aid of the adult. Since 1900 a wave of interest in their behalf has spread over the United States, however, and we find private associations and public commissions both training and employing numbers of men and women and assisting them to self-support. Perhaps the best known to-day are the New York Association, which teaches and employs men and women and conducts all manner of ameliorating and quickening agencies, and the Massachusetts Commission, which with its chain of small shops without dormitory attachment, bureau of statistical information, campaign for the preven-

tion of blindness, and investigation into the condition of those not blind but having defective vision, is especially efficient. There is no better illustration of an effective agency of this kind, conducted with a minimum of outlay in money, than the Exchange and Salesroom of the Pennsylvania Institution for the Instruction of the Blind at Philadelphia.

In America the handicrafts usually taught to boys and young men are the reseating of chairs with cane, splint, or rush, corn-broom making, and mattress renovating. Basket making, carpet and rug weaving, netting and mop making are locally taught. The occupations taught girls and young women are hand and machine sewing, knitting and crocheting, fancy weaving, reed basketry and chair caning; also domestic science and simple housework.

No special provision has yet been made in the United States for those blind who are also feeble-minded.

**Publications.**—Since 1879 the United States government has subsidized with \$10,000 annually the American Printing House for the Blind at Louisville, Ky. From this institution every school in the country has been able to draw embossed books, without expense, in proportion to the number of its pupils. Since 1903 individual schools have installed small printing plants, and have printed books, maps, examination papers, and other matter, as their school departments required. Practically all the State libraries, over 30 free public city libraries, and nearly 50 school libraries maintain departments of embossed books, which furnish abundant instruction and relaxation to many thousands of readers.

Eight periodicals in raised type are published—the *Matilda Ziegler Magazine* alone issuing 7,000 copies every month. The mails carry such books free of postage. America issues a splendid quarterly in common print, *The Outlook for the Blind*, begun in 1907, which serves as an organ of intercommunication and inspiration, and is a means of uniting all activities for and by the blind.

There has existed since 1853 an organization which meets biennially, called the American Association of Instructors of the Blind; and another, since 1895, meeting every three years, the American Association of Workers for the Blind.

At the Perkins Institution, Watertown, Mass., may be consulted a special library about blindness and the blind; also an historical museum of objects and

appliances, used for their convenience, instruction, and amusement.

**Statistics.**—According to the Federal Census of 1910, 62 out of every 100,000 persons in the United States were blind; and in that year the total blind in the country numbered 57,272 persons. The total number of blind persons in the world was estimated at 2,390,000; but this number has since been greatly increased by the effects of the present war. Indians suffer much more than other races; blindness is more prevalent among negroes than among whites, and among men than women. Approximately one-half—49.4 per cent.—of the blind population reported in 1910 were sixty years of age and over. Among children under five years only 5 in every 100,000 were blind; among persons eighty-five years of age and over, 2,575 in 100,000 were blind. Comparisons with earlier censuses indicate that there has been a decrease in the prevalence of blindness among the younger classes of the population. Of the 7,976 blind males gainfully employed, 1,768 were farmers, 665 broom makers, 646 musicians and music teachers.

**Bibliography.**—Consult catalogue of Special Library of Books Relating to the Blind, Perkins Institution for the Blind; Anagnos' *Education of the Blind*; Allen's *Education of Defectives and Tangible Writing of the Blind*; Mell's *Encyclopädisches Handbuch des Blindenwesens*; *Reports of the Massachusetts Commission for the Blind*; *Proceedings of the National Education Association*; *Outlook for the Blind* (quarterly); Javal's *On Becoming Blind*; La Sizeranne's *Blind as Seen through Blind Eyes and Blind Sisters of St. Paul* (1907); Baker's *Sightless Athlete. How the Blind are Taught to Take Exercise* (1908); Richards' *Servant of Humanity*; S. G. Howe (1909); Illingworth's *History of the Education of the Blind* (1910); Winnie's *History and Handbook of Day Schools for the Deaf and Blind* (1912); *American Encyclopædia and Dictionary of Ophthalmology* (vols. i, and ii., 1913); Helen Keller's *Story of My Life and Out of the Dark* (1913).

**Blindworm, or SLOW WORM** (*Anguis fragilis*), a limbless lizard found throughout Europe, and in North Africa and Western Asia. Related species occur also in the warmer parts of America. In form it is worm-like, and only internal traces of limbs are present; the nostril is situated in a shield; the eyes are small but serviceable, the eyelids scaly and movable; the teeth are long, pointed, and directed backwards;

the scales are smooth, and those of the head very distinctive. The young are whitish above with a median black stripe, black on the sides and below; the adults are brownish above and black below, often relieved by longitudinal lines. The full size is about a foot, about half of which is the tail. Blindworms give a feeble bite, but are harmless. They become rigid when caught, and in this state an attempt to bend the greatly contracted muscles results in breakage.

*Blindworm, or Slow Worm.*

The name Blindworm or Blind Snake is also bestowed on *Ophisaurus ventralis*, a harmless 'glass snake' found throughout the United States from Florida to Illinois.

**Bliss, CORNELIUS NEWTON** (1833-1911), American public official, was born in Fall River, Mass. In 1848 he removed to Boston, where in 1866 he became a member of a commission firm, which he subsequently represented in New York City. In 1881 the New York house took the name of Bliss, Fabyan & Co., and became one of the leading dry goods commission houses of the United States. Bliss filled numerous honorary positions in Republican State and national politics, and was treasurer of the National Committee from 1892 to 1908. He served as Secretary of the Interior from 1897 to 1899.

**Bliss, FREDERICK JONES** (1859), American archaeologist, was born at Mount Lebanon, Syria, and was graduated from Amherst College in 1880. From 1890 to 1900 he was explorer of the Palestine Exploration Fund, chiefly at Tell-el-Hesi and at Jerusalem, where he made important discoveries. In 1911 he became dean for men at the University of Rochester. He has written: *A Mound of Many Cities* (1894); *Excavations at Jerusalem, 1894-7* (1898); *Excavations in Palestine* (1898-1900); *The Development of Palestine Exploration* (1906); *The Religions of Modern Syria and Palestine* (1912).

**Bliss, PHILIP PAUL** (1838-76), American evangelist, was born in Clearfield, Pa. He early developed a taste for music, and was a composer of songs and hymns, and a singing evangelist. Many of his hymns—e.g., *Hallelujah! 'tis Done, Pull for the Shore, Hold*

*the Fort*—became quite popular. He was killed in a railroad wreck at Ashtabula, O.

**Bliss, PORTER CORNELIUS** (1838-85), American journalist, the son of a missionary to the Indians, was born in Erie county, N. Y., and in 1861 accompanied James Watson Webb, minister to Brazil, to that country as secretary. He explored the Gran Chaco in Paraguay for the Argentine government, and assisted in writing a history thereof (1871, 2 vols.). A notable incident in his life was his arrest as a Brazilian spy during the war between that country and Paraguay. His release was demanded by the United States government. In 1870 he was secretary of legation in Mexico; and in 1874 he engaged in encyclopædia work in New York, and edited *The Library Table*, a weekly publication. He was the author of a history of the Russo-Turkish War of 1877.

**Bliss, TASKER H.** (1853), American soldier, was born in Lewisburg, Pa.; was graduated from the U. S. Military Academy in 1875; and was commissioned a second lieutenant in the artillery. He served as professor of military science at the Naval War College (1885-8); inspector of rifle practice (1888-95); chief of staff to Major-Gen. J. H. Wilson in the Porto Rican campaign (1898); and collector of customs, port of Havana (1898-1902), where he was instrumental in rehabilitating the customs service. He was a special commissioner to Cuba after the war, and arranged the treaty of reciprocity between that country and the United States.

In 1902 Bliss was appointed a brigadier-general, and was made a member of the Army War College Board. From 1905 to 1909 he was stationed in the Philippines as commander of various departments. In 1909 he became a member of the General Staff, and president of the Army War College; in 1910-11 commander of the Department of California, in 1911-13 of the Department of the East, and in 1913-15 of the Southern Department. In 1915 he was appointed assistant chief of staff, and the same year became a major-general. Shortly after the American declaration of war (April, 1917) General Bliss became Acting Chief of Staff; in September succeeded Gen. H. L. Scott as Chief of Staff; and one month later, when the grade of general was revived, was appointed to that grade with General Pershing. In January, 1918, it was announced that he had been appointed to represent the United States on the Supreme War Council of the Allies.

**Blister**, a vesicle caused by a deposition of serous fluid beneath the skin, in consequence of a burn, the application of a vesicant, or disease, or friction. The same name is given to the therapeutic medium by which the blister is produced. The color of a blister shows the nature of its contents, amber color indicating serum, opalescence pus, and red an admixture of blood. The treatment in general is to puncture, so as to allow the contents of the vesicle to escape slowly, and then to cover with boracic lint. Vesicants, or substances which cause blistering, are cantharides (q.v.), glacial acetic acid, liquor ammonia, liquor epispasticus or blistering fluid, and the cautery.

*Blistering* is the application of a vesicant near an inflamed part; it should not be directly over it, nor where the skin is loose, nor over any prominence of bone. The cantharidine of a blister may be absorbed and affect the kidneys injuriously, but this should be prevented by sprinkling powdered camphor over the blister before applying it to the skin. A blister left on too long may produce dangerous sloughing; six or eight hours are generally sufficient, when it should be replaced by a warm dressing or poultice. A blister should be opened by pricking the most dependent parts with a disinfected needle. The part should then be dressed with sterilized cotton wool or boracic lint. In the case of children, blisters must be used with special caution, being kept on only for an hour or until the skin is reddened, and then replaced by an aseptic poultice.

A blister first acts as a local stimulant; if kept on long enough it causes a large discharge of serum, and so acts as a depletive and depressing agent. A blister over the heart will stimulate its action. Blisters are of service in many brain affections that are attended with congestion, in pleurisy with effusion, in pericarditis, and in effusion in joints. In the acid vomiting of gouty patients a blister over the epigastrium may give relief, and some forms of neuralgia will yield to a vesicant over the seat of pain.

**Blister Beetle**, a popular name for a number of beetles in two distinct families, Meloidæ and Cantharidæ. The name refers to the vesicating or blister-raising properties of their body juice. The Spanish Fly and the Oil Beetle are familiar illustrations. As to the zoological characters of the family, the antennæ are usually eleven-jointed, the head depressed with a narrow neck, the front

shield narrower than the flexible wing covers, the claws split into two usually unequal portions, the abdomen with six to seven free rings. The life history is often remarkable. The larvæ live parasitically on bees, on grasshopper or locust eggs, etc., and seem to pass through an unusual number of changes, to which the name 'hyper-metamorphosis' has been applied. It is not merely that the larvæ begin life lean, horny, and six-footed, and soon become fat, soft, and footless, but that before passing into the pupa stage they pass through a series of preparatory changes. The important genera are: (1) *Lytta* or *Cantharis*, (2) *Mylabris*, (3) *Cercocoma*, (4) *Meloë*. See CANTHARIDES.

**Blitzing**. See BILLITON.

**Blizzard**, a fierce and blinding snow storm accompanied by high north winds and a rapid fall of temperature. The gale drives before it a fine, dry, icy snow, the flakes being virtually ice dust about one-twentieth of an inch in diameter. In severe blizzards the wind will blow at the rate of fifty miles an hour, with the thermometer at 62° below freezing point; and it has been known to blow for 100 consecutive hours at the rate of over forty miles an hour. No one can live in these winds for any length of time; the painful effect of the blast loaded with ice needles rouses a kind of frenzy, and many of those who have died from exposure have lost their senses completely before they have perished. Blizzards are most common in the Western States and Canada, but may extend as far east as New York and as far south as Texas.

In some districts blizzards are looked for three or four times in a winter; but really disastrous ones are rare—those of 1836, of December, 1863, January, 1866, and January, 1873, being, until 1888, the severest on record. In the blizzard which visited the Dakotas, Montana, Minnesota, Nebraska, Kansas, and Texas in January, 1888, the thermometer fell within twenty-four hours from 74° above zero to 28° below in some places, and in South Dakota went down to 40° below zero. In fine clear weather, with little or no warning, the sky darkened and was filled with snow or ice dust as fine as flour, driven before a wind so furious and roaring that men's voices were inaudible at a distance of six feet. Objects became invisible a few yards off. Farmers died in the fields before they could reach their houses, and children on their way from school; some of those who died having been suffocated, from the impossibility of

breathing. Some 235 persons lost their lives.

In March, 1888, a severe blizzard afflicted the North Atlantic States, when snow fell to the depth of more than three feet, and was piled into drifts as high as twenty feet, causing a general suspension of traffic, and inflicting many hardships in the larger cities. The last mentioned is frequently alluded to as 'The Blizzard.'

The most recent blizzard occurred in November, 1913, when a fierce storm visited the region of the Great Lakes, the scene of greatest violence being Central Ohio and Lake Huron. For several days the city of Cleveland was brought to a practical standstill, traffic being interrupted by the snowfall, and most business suspended; while 250 lives and 10 ships were lost on Lake Huron.

The word, which seems to be akin to *blast*, *bluster*, first became usual throughout the United States during the severe winter of 1880-81, but was in colloquial use in the West early in the century. The U. S. Weather Bureau predicts and traces these storms. See STORM.

**Bloch**, CARL HENRIK (1834-90), a leading modern representative of Danish national painting. He studied at the Copenhagen Academy (of which he was appointed professor in 1871), and painted Zealand and Jutland peasant life—e.g., *The Dinner*, *The Fishermen's Home*—between 1854 and 1859. In Rome (1859-65) this many-sided artist painted the humorous side of monastic life, and became a historical painter. His chief works (e.g., *Christian II. a Prisoner in the Castle of Sonderburg*, and *Samson and the Philistines*) are in the gallery of the Royal Palace of Christiansborg at Copenhagen; while a fine piece, *The Deliverance of Prometheus*, went to Athens. He was also a fine etcher.

**Bloch**, JEAN DE (1836-1902), Polish banker and author, was born of Jewish parents, and was educated in Warsaw. He wrote, in Russian, *Influence of Railways on the Economic Condition of Russia* (5 vols.), *The Finances of Russia* (4 vols.), and in 1898 *The War of the Future* (6 vols.), of which part has been translated into English under the title *Is War Now Impossible?* (1899). The thesis of the last work, which has provoked considerable discussion, is that war between the great powers is no longer possible as the arbiter of international disputes. After analyzing present conditions of armament and defence he

deduces that modern wars will be long wars, and must necessarily result in economic exhaustion, entailing starvation and the dislocation of the social fabric. At best they will result in a 'kind of stalemate,' with no decisive issue. Norman Angell develops the same theme, though on different grounds, in his *Great Illusion*. Bloch's pamphlet, *Lord Roberts' Campaign and Its Consequences*, suggested the blockhouse scheme which ultimately brought about the reduction of South Africa district by district.

**Block**, in the rigging of a ship, is part of the apparatus for raising sails and yards, tightening ropes, etc. The block comprises both the frame or shell, and the pulley or pulleys—usually termed 'sheaves'—contained within it. In nautical and mechanical language a *tackle* includes the rope as well as the block through which it works. A single block contains only one sheave, a double block, two; a treble block, three; and so on; while the term 'purchase block' is generally applied to all blocks having more than two sheaves. All the blocks on board ship have distinctive names—*e.g.*, *cat block*, *cheek block*, *clew garnet block*, *clew line block*, *boat block*, *snatch block*, etc. Ships' blocks are usually made of elm, and the sheaves of lignum vitæ. Blocks made wholly of iron are used about the decks of ships, but are ill adapted for use in ships' rigging, on account of the chafing and fraying entailed. See PULLEY.

**Blockade**, in a military sense, is an operation for capturing an enemy's town or fortress, often without a bombardment or regular siege. The attacking party throws up works on the neighboring heights and roads, so as to guard every exit from the town. The rest of the besieging force remains under cover, ready to repel any sortie. Fortresses on steep eminences, difficult to conquer by assault, may be reduced by blockade. Towns situated on a plain are less easily invested. The blockade of Paris by the Germans in 1870-71 is the most notable example of such an operation that has ever been known. It was of itself completely successful, and the bombardment which was thought necessary might have been dispensed with. At Metz, in the same campaign, a large and well-appointed army was compelled to surrender by a blockade without bombardment. (See SIEGE.)

Blockade, in a naval sense, is the prevention of the entrance or exit of the enemy's ships at a particular port, or at all the ports on a

stretch of coast, excluding also neutrals. For a valid blockade it is necessary that a state of war should exist; that the blockade be really effective—that is to say, it must be maintained by a force sufficient to prevent access to the enemy's port; and neutral nations must be informed by the blockading power. Effective blockade is the principle laid down in the Declaration of Paris (1856), but this is construed more rigidly by Continental nations than by England or the United States. Riga was effectively blockaded during the Crimean war at a distance of 120 miles. The blockading force may seize any vessel with its cargo trying to trade with the port, and send it home for condemnation; and if the vessel succeed in breaking the blockade, it may be pursued and captured by a belligerent, until it has reached its port of destination. That breach of blockade involves confiscation of the ship is admitted by all civilized nations. The cargo is not forfeited unless its owner is the owner of the ship, or was cognizant of the intended violation.

There are various rules in regard to blockade that have been adopted by common consent for convenience. A ship, for instance, is not liable to capture if, on arriving at the scene of blockade, her papers show that she began her voyage in ignorance of it, and was directed to make inquiry, and to proceed, if necessary, to an alternative destination. A vessel, further, for the sake of humanity, is allowed, if in danger or distress, to enter a blockaded port. If a neutral ship be in port when a blockade begins, she is given fifteen days for clearing. Mail steamers, on condition that no contraband of war is carried, are allowed in and out of a blockaded port. In the Mexican War, British mail boats ran in and out of Vera Cruz. Neutral men-of-war are by consent and custom, but not by right, allowed ingress and egress.

Napoleon's Berlin decree of 1806 declared the British Isles in a state of blockade (see CONTINENTAL SYSTEM). The most memorable of recent blockades is that of the ports of the Southern States by the Federal Government during the American Civil War. The blockade was begun in April, 1861. It extended from the Potomac to the Rio Grande, along the Atlantic Coast, and over the Gulf of Mexico, for a distance of 3,000 miles, and lasted four years. Considerable trade was carried on, however, by swift steamers through such blockaded ports as

Charleston (the harbor of which was obstructed by sinking old ships and stones to assist the blockaders) and Wilmington. See CONTRABAND OF WAR; NEUTRALITY; PRIZE OF WAR. Consult Hobart Pasha's *Sketches from My Life*; T. S. Taylor's *Running the Blockade*; and as to the law, Twiss, Hall, Phillimore, Hazlitt, and Roche for England; Wheaton for the United States; Hautefeuille, Heffter, Gessner, and Bluntschli for the Continent of Europe.

**Block Books**, books printed from engraved wooden blocks, one block generally serving for an entire page. A large number of these were produced in Central Europe, chiefly in Germany, also in Holland, during the years that immediately preceded (say 1435 onward) the invention of typography, or printing from small movable types. Some of them consisted wholly of pictures; others contained explanatory text. It is not known with certainty whether a rude kind of press was used, or whether they were produced by rubbing the back of the paper as it lay on the block. Only one side of the paper was printed, two blank sides being afterward pasted together. See BIBLIA PAUPERUM.

**Blockhouse**, originally a detached fort blocking or covering the access to a landing, a narrow channel, a mountain pass, a bridge, or other strategical point. It may be constructed of timber, stone, or metal, and is loopholed and embrasured for rifle firing. In the later guerrilla stages of the South African War (1901-2) extensive use was made of a series of blockhouses by Lord Kitchener. Nearly 5,000 of them were built, from 2,000 to 3,000 yards apart, totally enclosing a large extent of country. They were constructed of sheets of corrugated iron 4 inches apart, filled in with stone ballast, and surrounded and connected by barbed wire.

**Blocking Course**, in masonry, a course of stones laid above a projecting cornice, in order that its weight may prevent the latter from falling, where the centre of gravity of the cornice is rather far forward.

**Block Island** (formerly MANISEES), an island forming part of Newport county and the town of New Shoreham (whose pop. in 1910 was 1,314), 10 miles south of the mainland of Rhode Island, some 8 miles in length, and varying from 2 to 5 miles in width. It is a popular summer resort. There is a small light on the northern extremity, and on the southeast a light of the first order

visible for twenty miles. It was first visited by Adrian Block in 1614, and has afforded poets and romancers a fertile theme of wreck and piracy.

**Blocksberg.** See BROCKEN.

**Block Signal System.** See RAILROADS, *Block System*.

**Blodget, LORIN** (1823-1901), American physicist and statistician, was born near Jamestown, N. Y., and was graduated from Geneva (now Hobart) College. He joined the staff of the Smithsonian Institution in 1851, and was in the Government service until his resignation in 1877, with the exception of four years as editor of the *Philadelphia North American* (1859-63). His early papers on climatology had much to do with the establishment of that science in the United States. He published *Climatology of the United States and of the Temperate Latitudes of the North American Continent*, which received the commendation of Humboldt; also a number of volumes on finance and industry.

**Bloemfontein**, blōm'fon-tin, capital of the Orange Free State, South African Union; 750 miles by rail northeast of Cape Town. It is pleasantly situated in the open veld at an elevation of 4,518 feet, and has a dry, healthy climate, which has given it some reputation as a health resort. The streets are well laid out; several stone bridges cross the Bloemspruit, which runs through the town. There are a number of fine buildings, notably the Raadzaal, former meeting place of the republican government, now occupied by the provincial council; the post and telegraph office, public library, museum, and Dutch Reformed and Anglican Churches. At a short distance from the town is Grey University College (1906-8).

Bloemfontein is the commercial centre of the province, and has a large trade in wool. During the South African War it was occupied by the British under Lord Roberts. Pop. (1911) 26,925, of whom 14,720 were white.

**Blois**, blwä, town, France, capital of the department of Loir-et-Cher, is situated on the right bank of the River Loire; 35 miles by rail southwest of Orleans. It is the seat of the famous chateau of the family of Orleans, a splendid Renaissance structure finely restored since 1845, which has been the scene of many interesting historical events. Louis XII. was born in it; under its roof Charles, Duc d'Alençon, and Margaret of Anjou, and Henry IV. and Margaret of Valois, were married; and here the Duc de Guise and his brother, the Cardinal, were murdered by order of Henry III. in 1588. The town is

also the seat of the old abbey Church of St. Nicholas (1138-1210) and of the Cathedral of St. Louis, rebuilt after 1678. Vinegar, chocolate, earthenware, shoes, and furniture are manufactured, and there is trade in grain, wines, timber, and live stock. Pop. (1901) 23,785; (1911) 23,955.

**Blok, PETRUS JOHANNES** (1855), Dutch historian, born at Helder. He was made professor of history at Groningen (1884) and at Leyden (1894); and has written: *Geschiedenis van het Nederlandsche Volk* (8 vols. 1891-1907; Eng. trans.).

**Blomfield, CHARLES JAMES** (1786-1857), bishop of London, was born at Bury St. Edmunds. He had a brilliant career at Trinity College, Cambridge, of which he was elected a fellow. Between 1810 and 1815 he published editions of several of the plays of Æschylus, an edition of Callimachus, and (in conjunction with Dr. Monk) the *Posthumous Tracts of Porson* (1812) and the *Adversaria Porsoni* (1814). Blomfield became rector of St. Botolph's, Bishopsgate (London), in 1819, bishop of Chester in 1824, and then bishop of London (1828-56). During his London episcopate more than two hundred churches were built, and he was also mainly instrumental in establishing the Colonial Bishops Fund. Consult his *Memoirs*.

**Blommaert, PHILIP** (1808-71), Flemish author, born at Ghent. One of the chief revivers of the Flemish idiom, he edited its poetry of the twelfth to the fourteenth century, including *Theophilus* (1836; new ed. 1858), which bears some resemblance to *Faust*, and *Oudvlaemsche Gedichten* (1838-51). He also translated the *Nibelungenlied* into Flemish. *Aleoude Geschiedenis der Belgen* (1849) is marked by anti-French sentiment.

**Blondel**, famous minstrel of the twelfth century, a native of Nesle in Picardy; was the friend of his fellow minstrel, Richard Cœur de Lion, king of England. Richard, returning from the Holy Land, was captured by Leopold, duke of Austria, and thrown into the dungeon of Dürrenstein, where he was discovered by Blondel, whose song was answered by Richard from the tower. Speeding to England, Blondel arranged for the payment of the ransom which set Richard free. The earliest trace of this legend occurs in the *Chronicle of Rheims* (thirteenth century); no mention of it is found in Blondel's (Blondain's) acknowledged poems.

**Blondin, CHARLES** (1824-97), acrobat and tight-rope walker, whose real name was JEAN

FRANÇOIS GRAVELET, was born at St. Omer. He engaged in a tour through the United States; crossed the Niagara Falls many times on a tight rope, once blindfolded, once trundling a wheelbarrow, once carrying a man on his back. He settled in England during the last thirty years of his life. He considered his most difficult feat was walking from the main-mast to the mizzen on the steamship *Poonah* while on a voyage to Australia.

**Blood**, the red fluid which circulates through the heart, arteries, capillaries, and veins, supplying nutrition to all parts of the body, and conveying waste substances from the tissues to those organs by which they are excreted. In man and in all other mammals, with the single exception of the camel in which the shape is elliptical, the red corpuscles are minute circular discs, biconcave and entirely devoid of any central kernel or nucleus. In all other vertebrate animals, including birds, reptiles, amphibians, and fishes, the red corpuscles are oval in shape, and contain a large central oval body.

Human blood is bright red in the arteries, dark in the veins, of an average specific gravity of 1.055, of a salt taste, faint odor, an alkaline reaction, and a temperature of 100° F. in the interior of the body, but lower in the extremities and on the surface. It holds in suspension large numbers of cells or corpuscles. The fluid itself is called the *plasma* or *liquor sanguinis*. The corpuscles

*Blood Corpuscles.*

a, Red corpuscle; b, the same in profile; c, red corpuscles in rouleaux; d, crenate red corpuscles; e, finely granular colorless corpuscle; f, coarsely granular; g, amoeboid corpuscle.

are of two kinds—red and white. In a cubic millimetre of normal human blood there are five million red and ten thousand white corpuscles. The red give the color to normal blood; they contain a pigment, hæmoglobin, a complex proteid substance containing about 0.4 per cent. of iron. The red corpuscles are round discs  $\frac{3}{250}$  of an inch in diameter and  $\frac{1}{250}$  of an inch thick, and are of a light yellowish tint when seen under the microscope.

When freshly drawn blood is examined under the microscope, the red corpuscles are seen to run together, forming 'rouleaux.' The form of these red cells may be altered by various diseases — e.g., pernicious anæmia; and another alteration due to disease is the appearance of nucleated forms of different size. The number of the red cells may also vary; the term *polycythæmia* is applied to those conditions in which the number of red cells is higher than normal, as contrasted with *oligocythæmia*, which means a decrease in number. The former condition arises when an animal is taken from a low to a high altitude; the latter is present in all forms of anæmia.

The white corpuscles, or *leucocytes*, though much less numerous than the red ones, have important functions. They are derived from lymph corpuscles, the cells of lymphatic glands, spleen, and pancreas; some of them, termed *phagocytes*, devour bacteria, dead or degenerate tissue, the products of inflammation, etc., and so have been called 'blood scavengers.' But they not only destroy what is effete; their normal secretions, especially those of the granular forms (for there are several kinds of leucocytes), have been shown to be essential to the economy of the body.

Other solid elements in the blood are *blood plates*, round bodies less than half the diameter of red corpuscles. They do not, as a rule, contain hæmoglobin, but are rich in phosphates and glyco-gen, and are supposed to aid in coagulation. Granular bodies also are found in blood: they are small, round, and highly refractive; seem to be derived from leucocytes, degenerating red cells and blood plates; and form precipitates in the blood plasma.

**Chemical Composition.**—In the red cells the main constituents are hæmoglobin (a globulin which coagulates at 167° F.), lecithin, cholesterin, and salts of potassium, sodium, iron, calcium, and magnesium. The most important salts are the chlorides and phosphates. There is about 70 per cent. of water. The *hæmoglobin*, which takes up oxygen in the lungs and carries it to all the tissues, is by far the most important constituent. The leucocytes are rich in a proteid 'nucleo-histin'; and the large proportionate quantity of phosphorus in the cells depends mainly on this substance and on lecithin. The number of leucocytes increases after a meal, and is proportionately larger in the pregnant, the newly born, and in those suffering from certain diseases. (See LEUCOCYTHÆMIA.)

**Plasma and Serum.**—While blood corpuscles and plasma form normal blood, clotted blood consists of clot and serum. The plasma is alkaline, yellowish in tint, of sp. gr. 1.026–1.029; 100 parts of plasma contain water 90.3, and solids 9.7. The characteristic proteids of serum are serum globulin, serum albumin, and fibrin ferment; those of the plasma are fibrinogen, serum globulin, and serum albumin. The gases of plasma and serum are small quantities of oxygen, nitrogen, and carbon dioxide.

The coagulation of blood may be observed in blood which has been drawn into an open vessel. In two or three minutes the surface of the fluid becomes semi-solid or jelly like, and this change extends in eight or nine minutes throughout the mass. It is supposed that when blood is in the body it contains a globulin 'fibrinogen,' and that when it is shed the fibrinogen molecule is split up into a globulin which remains in solution, and 'fibrin ferment,' which does not exist in healthy blood, but is a product of the disintegration of the white corpuscles and blood plates produced when the blood leaves the vessels or comes in contact with foreign matter. Methods have been devised for estimating the total quantity of blood, the volume of the corpuscles and plasma, the specific gravity, and the alkalinity. The quantity of hæmoglobin is estimated by color tests, and the number of red corpuscles within a given volume is counted under the microscope in the hæmocytometer. The bacteriological examination of blood has yielded valuable results, as, for example, in 'Widal's reaction,' which is valuable in the diagnosis of typhoid fever. The recently discovered test of the opsonic index of the blood is an important aid in diagnosis and treatment.

See ANÆMIA; BLOOD] PRESSURE; BLOOD VESSELS; CIRCULATION OF THE BLOOD; CHLOROSIS; OPSONIC INDEX; SERUM THERAPY.

Consult Cabot's *Clinical Examination of the Blood*; Ewing's *Clinical Pathology of the Blood*.

**Blood, AVENGER OF** (Hebrew *goël haddam*), a title given to one who pursued a manslayer to avenge the death of his kinsman. Hebrew law stands between primitive custom, which puts the duty of avenging murder on the kindred of the murdered, and modern law, which puts it on the state. Thus it is the kinsman, not the state, who executes justice (Deut. xix. 12); but the manslayer can flee to the altar or the cities of refuge, and there lay his case before the elders (Josh. xx. 4 f.); in Num. xxxv.

24 f. the congregation decides between him and the *goël*. In this way a certain check was given to the blood feud. It is noteworthy that Hebrew law forbade compensation for murder (Num. xxxv. 31 f.), which the Koran allows.

**Blood, CORRUPTION OF.** See ATTAINDER.

**Blood, THOMAS** (c. 1618–80), English adventurer, usually styled 'Colonel' Blood. For his military services on the Parliamentary side he was rewarded with Irish estates, which he lost at the Restoration, but received again from Charles II. His most notorious exploits were the plot to surprise Dublin Castle and seize the lord-lieutenant, in 1663; the rescue of his friend Captain Mason from a guard of eight troopers near Doncaster; the attempt to abduct and hang the Duke of Ormonde, in 1670; and the theft of the crown jewels.

On May 9, 1671, Blood, disguised as a clergyman, with three accomplices entered the Tower to carry off the regalia. He actually succeeded in getting off with the crown under his cloak, while one of his associates bore away the orb. They were, however, overtaken, and imprisoned. King Charles visited the adventurer in prison, and, believing that there were hundreds of Blood's associates banded together by oath to avenge the death of any of the fraternity, pardoned him, took him to court, and restored him his estate of \$2,500 a year. Consult Abbott's *Col. Thomas Blood* (1911).

**Blood Feud**, the right of private vengeance. In primitive society the protection and enforcement of one's rights are largely left to the individual or to the family or clan to which he belongs, and the first step toward the reign of law consists in the legal regulation of this self-help. Murder and other crimes of violence were accordingly punished with the sanction of the law by the family of the victim, but under certain guarantees of fair dealing and with some consideration for the rights of the criminal. In course of time a pecuniary composition, known as *blood money*, could be made for such a crime, the amount of the payment due depending upon the degree of the injured person and the nature of the crime. See VENDETTA.

**Blood Flower** (*Hemanthus*), a genus of Amaryllidaceæ, mostly natives of South Africa, some of which are common in greenhouses. They take their name from the usual color of their flowers, which form a fine head or crowded umbel. The species seem generally to possess poison-

ous properties. The inspissated juice of *H. toxicarius* is used in South Africa for poisoning arrows.

**Bloodhound**, an ancient breed of dog, remarkable for its exquisite powers of scent, and for the eagerness with which it tracks a bleeding animal. It is able to select a freshly wounded deer from among a herd, and follow its trail; and from this faculty it derives its name. The bloodhound was formerly common and much in use in Great Britain and on the continent of Europe for hunting purposes, being in the possession of most noble families, who vied with one another in the purity and excellence of their different strains. Bloodhounds were also much used to track escaped prisoners, and are mentioned in the poetical histor-

*Bloodhound.*

ies of Bruce and Wallace as being used by their enemies to discover them; and in later days they were resorted to by slave owners in America in the pursuit of fugitive slaves.

The bloodhound is a large tan-colored dog, with an exceedingly handsome and noble head expressing dignity and strength. The head should be long and narrow, with a dome-shaped skull, the occipital bone forming a peculiar peak on the back of the skull; the eyes distinctly showing the third eyelid or 'haw,' which gives the eye a bloodshot and rather fierce look; the ears long enough to meet in front of the nose, but falling down close on either side of the face; color, a rich tan with a dark saddle, showing no white if possible.

The bloodhound is rather unmanageable when thoroughly roused, on account of his courage and strength, but when properly treated is generally docile, and makes a capital watchdog. In recent years attempts have been frequently made by the police to track murderers by means of bloodhounds.

The *Cuban Bloodhound*, notorious as having been employed in the pursuit of felons and fugitive

slaves in Cuba and the Southern States, differs largely from the true bloodhound, and is really the descendant of mastiffs with a bulldog cross, inferior to the real bloodhound in scent and all but ferocity.

**Bloodletting.** See BLEEDING.

**Blood Poisoning** is a name loosely used of septicæmia, pyæmia, and allied diseases (see SEPTICÆMIA; PYÆMIA). It is also used popularly in a wider sense for the results on the human system of poison germs from malaria, bad drains, etc.

**Blood Pressure.** The blood (see BLOOD) is under a certain degree of pressure which varies in different parts of the circulatory system. The heart propels the blood into the arteries. From the aorta, the main artery leaving the heart, branches go to all parts of the body. These branches break up into smaller and smaller divisions until they are of microscopic size, when they are called capillaries (q.v.). These join one another to constitute a new system of vessels, the veins (q.v.), which become progressively larger, and in them the blood is returned to the heart. The capillaries with their narrow lumina offer the maximal resistance to the flow of blood from the heart. As the result of these two forces, propulsion on the one hand, resistance on the other, the blood is under considerable pressure. It is the *arterial* blood pressure—that is, the tension of the blood between the heart and the capillaries—that is ordinarily indicated when we speak of 'blood pressure.' After the blood has passed through the capillaries into the veins, the pressure, known as the *venous* pressure, is considerably lower.

The earliest blood pressure observations were made in 1733 by the Rev. Dr. Stephen Hale. This scientist made his studies in a very simple manner. He connected various blood vessels with an upright glass tube. It was found that the blood from the arteries rose 8 feet and 3 inches in the tube, while that from the veins attained a height of only 12 inches. It is obvious that if blood pressure observations are to be made in routine physical examinations on human beings, other methods must be applied. The instruments in use to-day are very compact and simple. A rubber bag shaped like a cuff is strapped or banded loosely about the upper arm; by means of rubber tubing this bag is connected with a rubber bulb and an indicator. The rubber bulb, when compressed, pumps air into this closed circuit. The indicator is one of two types: either a pressure gauge much like that used on steam en-

gines, or an upright glass tube whose lower end is connected with a small reservoir of mercury. When air is pumped into this system of tubes and the pressure within it rises, the needle of the gauge or the height attained by the column of mercury indicates the extent of the rise. When the arm band causes sufficient compression to result in a disappearance of the pulse at the wrist, the blood pressure reading is taken. It may also be found by listening over the arteries at the elbow with the aid of a stethoscope (q.v.), and observing the point at which a thumping sound disappears as the pressure in the cuff is raised and again reappears as it is lowered. Inasmuch as mercury is 13.5 times as heavy as blood, it has been used as a practical, compact standard for measuring the blood pressure. It has been found convenient to think of blood pressure in terms of millimetres of mercury, instead of the height of a column of blood in feet and inches.

In normal individuals, the blood pressure varies somewhat with age, increasing slightly with advancing years. According to J. W. Fisher's statistics, from 19,339 accepted candidates for life insurance, it appears that between the ages of 15 and 20 years the average blood pressure is 120 millimetres of mercury, while from 56 to 60 it is 135. The intervening ages show corresponding gradations. The blood pressure is not constant in healthy individuals, but has a tendency to rise moderately with physical exercise or marked nervous tension, and to fall with rest or sleep.

Certain diseases are characterized by an increase in blood pressure. These are notably two: Bright's disease (or nephritis) and essential hypertension (a morbid condition characterized in its early stages by increased blood pressure and no other changes). The cause of the increased blood pressure or hypertension in these conditions is a debated matter. The most plausible theory advanced heretofore is that the body elaborates some chemical substance which stimulates the muscular walls of the arteries to contract. When their calibre is reduced, they offer an increased resistance to the flow of blood, and hypertension results. No one has yet succeeded in isolating this hypothetical chemical substance.

The heightened blood pressure is likely to cause certain secondary changes in the heart and blood vessels that may entail serious consequences. However, by moderation in physical and mental efforts, these effects may in large part be held in abeyance.

Thus, Sir Clifford Allbutt reports a case of hypertension lasting for eighteen years, the patient finally succumbing to old age. A diminished blood pressure, hypotension, has up to the present time been found of very little significance in clinical medicine.

**Blood Rain**, which doubtless has its origin in the uprushing currents of waterspouts and whirlwinds, has frequently fallen in Italy and Southern Europe, and has been repeatedly traced to microscopic dust, of a brick-red color, borne high into the air from the sandy deserts of North Africa adjoining. Similar rains have fallen in the Canaries, and they may be likewise ascribed to the African desert to the eastward. In these cases the origin is the rainless whirlwinds, which are locally called 'devils.'

**Bloodroot** (*Sanguinaria canadensis*), a perennial herb of the poppy family (Papaveraceæ), native to Eastern North America, where it is found in colonies in rich, open woods on low, rocky hillsides. It blossoms in early spring, bearing a single white star-like flower at the end of a naked scape, enfolded while in bud in a single large, lobed leaf. The blossom is from one to one and a half inches across, has from eight to twelve petals, and two sepals, which fall as soon as the flower unfolds. The horizontal root stock is thick and fleshy,

*Bloodroot*  
(*Sanguinaria canadensis*).

and both root stock and stem, when bruised, exude a blood red sap in copious quantities. This sap was used by the aborigines as a paint for their flesh and as a scarlet dye, whence the plant is also known as Red Indian Paint and Red Puccoon.

Various species of the Hamorodaceæ (q.v.) are also known as bloodroot.

**Blood Stains** include both discolorations due to the contact of

blood with an absorbent material, as linen and other fabrics, and the residue of blood left after evaporation on non-absorbent surfaces, as polished wood and metals. They vary in color with age, the nature of the material stained, and the degree of exposure to the air. The detection of blood stains is of the utmost importance in medico-legal investigations. The methods of determining the origin of suspected stains are of four types—chemical, spectroscopic, microscopic, and biological or serological.

**Chemical Tests.**—The chemical reactions of blood are very definite. In the first place, all blood stains are soluble, making possible at once the exclusion of insoluble stains, as paint and iron mould. In the second place, ammonia produces no change of color in blood, but turns to a greenish tint certain other soluble stains, as those due to fruits and vegetables.

In addition to these negative tests there are a number of positive chemical tests having to do chiefly with the presence of hæmoglobin, the principal component of the red blood corpuscles, and the one to which they owe their color. For *Teichmann's test* a bit of the stained fabric is moistened with a drop of water containing a minute crystal of common salt, and evaporated to dryness. The residue is treated with glacial acetic acid, reheated, cooled, and examined microscopically for crystals of hæmin, the occurrence of which is a sure proof of the presence of blood.

Where the suspected stain has been partially obliterated by washing, the *sodium tungstate test* is valuable. A solution of the stain is filtered, and the filtrate acidified with acetic acid and treated with a saturated solution of tungstate of sodium similarly acidified. On heating, dense chocolate-colored masses are produced, which may then be subjected to *Teichmann's test*.

In the *guaiacum test* a few drops of a freshly prepared spirituous solution of guaiacum are placed on the stain, and a small proportion of hydrogen peroxide applied. If no color change occurs, the stain is not due to blood. If blood is present a sapphire blue is produced. As a similar change takes place with certain other substances, the test is most valuable when it yields a negative reaction.

**Spectroscopic Test.**—The stained portion of cloth or of the suspected blood clot is digested in distilled water, and the resulting liquid placed in a deep nar-

row cell and examined by a spectroscopic eye piece with a low power of the microscope. The spectrum of oxyhæmoglobin is characterized by the presence of two dark absorption bands between the lines D and E. If the blood has passed, by exposure to the air, from the condition of oxyhæmoglobin to methæmoglobin, the spectrum will show in addition two other absorption bands—one in the red orange between C and D, and one to their right faintly defined in the green between E and F. (See SPECTRUM AND SPECTROSCOPE.)

**Microscopic Test.**—In some cases blood corpuscles can be recovered from a stain in a comparatively uninjured condition by soaking or washing the stained material or dissolving a portion of the clotted blood in a normal salt solution. If blood cells thus removed are examined under the microscope, their form and measurements will determine whether they belong to mammalian blood.

The **Biological or Serological Test** makes it possible to distinguish definitely between human blood and that of other animals (except *Simiidae*). It depends upon the fact that if an animal A be inoculated with the blood or serum of a second animal B of another species, and the blood of A be then added to that of an animal of a similar species to B, a definite reaction is set up. In medico-legal practice suspected stains are dissolved, diluted in salt solution, and treated with a certain proportion of humanized rabbit serum.

See BLOOD. Consult Sutherland's *Blood Stains* (1907).

**Bloodstone**, HELIOTROPE, or ST. STEPHEN'S STONE, names given to a variety of chalcedony or plasma, distinguished by the presence of a dark green ground of blood red spots, apparently due to red oxide of iron. It has been much used for rings and brooches, those varieties being most valued in which the red spots are bright, well defined, not too irregularly scattered, and contrast well with the dark green color of the body of the stone. It is found in Iceland, the Hebrides, and in larger quantities in India and Australia.

**Blood Transfusion.** See TRANSFUSION.

**Blood Vessels**, a general term applied to all the canals through which the blood circulates, including the arteries, veins, and capillaries. See ARTERY; BLOOD; CAPILLARIES; CIRCULATION OF THE BLOOD; VEINS.

**Bloodworms** are the aquatic larvæ of gnats, belonging to the genus of Chironomus (see MIDGES). They are long, slender,

worm-like creatures, which contain the red blood pigment hæmoglobin, and do not at first possess the ordinary tracheal system of insects. They occur in stagnant water.

**Bloody Assize**, name given to the treason trials conducted by Lord Chief Justice Jeffreys of England after Monmouth's rebellion in 1685. See JEFFREYS OF WEM.

**Bloody Mary**. See MARY I.

**Bloomer**, AMELIA JENKS (1818-94), American reformer, was born in Homer, N. Y. She taught school from 1837 to 1840, when she was married to Dexter C. Bloomer of Seneca Falls, N. Y., a lawyer and newspaper man of that place. From 1849 to 1855 she published *The Lily*, a semi-monthly periodical devoted to temperance and woman's rights. The particular costume for women associated with her name was first advocated by her in this paper in 1851. It consisted of a jacket with close sleeves, a skirt falling a little below the knee, and a pair of Turkish trousers. The fashion was adopted by a few women at the time, but was ridiculed and soon discarded.

**Bloomer Costume**. See BLOOMER, A. J.

**Bloom'ery**, BLOOMARY, the first forge through which iron passes after it has been melted from the ore, and where it is made into blooms. See IRON.

**Bloom field**, town, Indiana, county seat of Greene county, on the West Fork of White River, and on the Illinois Central, and the Chicago, Indianapolis and Louisville Railroads; 44 miles southeast of Terre Haute. It has flour and lumber mills, and manufactures of steel, iron, wood, and clay articles. There is trade in coal, lumber, live-stock, and agricultural products. Pop. (1900) 1,588; (1910) 2,069; (1920) 1,872.

**Bloomfield**, city, Iowa, county seat of Davis county, on the Chicago, Burlington and Quincy, and the Wabash Railroads; 70 miles northwest of Keokuk. Public buildings include a new \$180,000 high school. Trade in grain and live-stock is carried on. Pop. (1900) 2,105; (1910) 2,028; (1920) 2,064.

**Bloomfield**, town, New Jersey, Essex county, on the Erie, and the Delaware, Lackawanna, and Western Railroads; 12 miles northwest of New York. It is the seat of the German Theological Seminary, Jarvie Memorial Library, and the Job Haines Home for Aged People. The First Presbyterian Church was built in 1797. According to the Federal Census of Manufactures for 1919, Bloomfield has 59

industrial establishments, with \$23,962,713 capital, and products valued at \$25,245,436. Woolen and rubber goods, safety pins, electric elevators, hats, paper, cream separators, cod liver oil, and incandescent lamps are manufactured. Settled between 1670 and 1675, Bloomfield was a part of Newark until its incorporation as a township in 1812. Pop. (1900) 9,668; (1910) 15,070; (1920) 22,019.

**Bloomfield**, MAURICE (1855- ), American philologist and Orientalist, was born in Bielitz, Austria, and was brought as a child to the United States. He studied at the University of Chicago (1871-4), was graduated from Furman University, S. C. (1877), and studied Sanskrit and comparative philology with Professor Whitney at Yale, and at Johns Hopkins University (PH.D., 1879), completing his education at Berlin and Leipzig. He has been professor of Sanskrit and comparative philology at Johns Hopkins since 1881. He is a fellow of the American Academy of Arts and Sciences, and in 1908 received the Hardy Prize from the Royal Academy of Sciences at Munich.

Professor Bloomfield's translations and editions of Sanskrit writings and his contributions to philological literature are numerous and important. He edited for the first time from original manuscript the *Sûtra* of Kauçika and the *Grihyasamgraha* of Gobhila-putra, and translated the *Atharva Veda*. He has written: *The Atharva Veda* (1899); *Cerberus, the Dog of Hades* (1905); *A Vedic Concordance* (1906); *The Religion of the Veda* (1908); *Rig-Veda Repetitions* (2 vols., 1916).

**Bloomfield**, ROBERT (1766-1823), English poet, was born in Suffolk, was first an agricultural laborer, and then a shoemaker in London. During a short residence in the country in 1786 he conceived the idea of his poem *The Farmer's Boy*, written under melancholy circumstances in a London garret, and published in 1800. It is an estimable though much overpraised work, and was so successful that nearly 26,000 copies were sold in three years. He died in poverty and mental darkness.

**Bloomfield-Zeisler**, blööm'fêld-tsîs'ler, FANNY (1866- ), American pianist, was born in Bielitz, Austria, and was brought in infancy to the United States, where she made her home in Chicago. She received her instruction chiefly under Leschetizky in Vienna, and began playing in public in 1883. Two years later she was married to Sigmund Zeisler, a prominent lawyer of Chicago, Ill. She has

played in all the principal American cities, and has toured in Germany, England, Austria, and France.

**Bloom'ington**, city, Illinois, county seat of McLean county, on the Illinois Central, the Lake Erie and Western, the Chicago and Alton, the Cleveland, Cincinnati, Chicago, and St. Louis, and the Illinois Central Railroads; 60 miles northeast of Springfield. It has a number of fine public buildings, including the Court House of Illinois marble, City Hall, and public library, several hospitals and sanitariums, and a Soldiers' Monument. The Illinois Wesleyan University is situated here, and the State Normal University is two miles away, at Normal (q. v.).

Bloomington is an important railroad centre, and is the seat of the car works and repair shops of the Chicago and Alton Railroad. Its pork packing and canning industries are important; stoves, machine shop and foundry products, brick and tiles, flour, and agricultural machinery are manufactured. In 1919 there were 83 industrial establishments, with \$7,830,947 capital, and products valued at \$11,519,580. Coal is mined. The town was settled in 1831. Pop. (1900) 23,280; (1910) 25,768; (1920) 28,725.

**Bloom'ington**, city, Indiana, county seat of Monroe county, on the Chicago, Indianapolis and Louisville, and the Illinois Central Railroads; 50 miles southwest of Indianapolis. It is the seat of Indiana University (q. v.), with grounds and buildings valued at \$1,300,000. Manufactures include furniture, flour, harness, gloves, baskets, furniture polish, wax products, and mirror plating. Limestone is quarried near by. Pop. (1900) 6,460; (1910) 8,838; (1920) 11,595.

**Blooms'burg**, town, Pennsylvania, county seat of Columbia county, on the North Branch of the Susquehanna River, and on the Delaware, Lackawanna and Western, the Philadelphia and Reading, and the Bloomsburg and Sullivan Railroads; 40 miles southwest of Wilkes-Barre. It is the seat of the Bloomsburg State Normal School. It is located in a rich coal and iron district, and has blast furnaces, foundries, car works, and manufactures of furniture, carpets, woollen goods, silk, flour, fountain pens, matches and carriages. Pop. (1910) 7,413; (1920) 7,819.

**Blossburg**, borough, Pennsylvania, Tioga county, on the Tioga River and the Erie Railroad; 70 miles northwest of Wilkes-Barre. It is on Williamson Road, a direct highway from Harrisville to Buffalo, New

York. There are coal mines and quantities of undeveloped highest clay for bricks in the vicinity. Pop. (1900) 2,423; (1910) 2,303; (1920) 2,033.

**Blossom, HENRY MARTYN, JR.** (1866-1919), American writer, was born in St. Louis, Mo. He was educated at the Stoddard School and Washington University, St. Louis, and engaged for some time in the insurance business. He is the author of several novels—*The Documents in Evi-*

born in Macon, Ga. He became a lawyer; served in the Confederate army during the Civil War; and was a member of Congress from 1872 to 1893. When in 1893 the Hawaiian monarchy was overthrown and an American protectorate established by U. S. Minister Stevens without authority, Blount was appointed by President Cleveland his paramount commissioner to investigate the affair. On the conclusion of his task he was for a short

Tennessee to the Union was elected U. S. Senator (1796). In 1797, having been accused of implication in a conspiracy to seize the Spanish possessions of New Orleans and the Floridas, and transfer them to Great Britain, he was expelled from the Senate. At his trial (1799), however, the court dismissed the impeachment on the ground of lack of jurisdiction, Blount being no longer a Senator. He was subsequently elected to the State senate of Tennessee, of which he became speaker.

**Blouse**, blouz, primarily a loose, sack-like outer garment such as is worn by the French workman, the Russian peasant, and the British farm laborer (see SMOCK); by an extension of meaning any loosely fitting upper garment, as a shirtwaist or midy-blouse.

**Blow, JOHN** (1678-1708), English composer, was probably born in Nottinghamshire. He was appointed successively organist of Westminster Abbey (1669); master of the children (1674) and organist (1676) at the Chapel Royal; composer in ordinary to James II. (1685); almoner and master of choristers at St. Paul's (1687); and composer at the Chapel Royal (1699). He wrote numerous odes, anthems, and services, and published a collection of songs under the title *Amphion Anglicus*.

**Blow, SUSAN ELIZABETH** (1843-1916), American educator, was born in St. Louis, Mo. She went to Germany and studied the kindergartens there, and returned to the United States a staunch disciple of Froebel. In 1873 she offered her services to the St. Louis Board of Education, undertaking to pay all the expenses and provide the equipment of a kindergarten school if the city would permit her the use of a school-room for one year. The experiment was markedly successful, and the training school later organized under her direction became the centre of influence in the new movement. She published: *Symbolic Education* (1894); *The Mottoes and Commentaries of Friedrich Froebel's Mother Play* (1896); *Letters to a Mother on the Philosophy of Froebel* (1899); *Educational Issues in the Kindergarten* (1908).

**Blow-fly**. See BLUE-BOTTLE.  
**Blow-gun**, a weapon employed by certain tribes of North American Indians, consisting of a long hollow tube of cane or wood from which slender darts are expelled by blowing with the mouth. Blowguns are also used by certain natives of South America and by the East Indian Malays.

**Blowing Machines**, mechanical contrivances for the produc-

dence, *Checkers, A Hard Luck Story, and The Brother of Chuck McGann*; and of the following plays and musical comedies: *Checkers; The Yankee Consul; Mlle. Modiste; The Prima Donna; The Red Mill; Miss Philura; The Slim Princess; All for the Ladies; The Man from Cook's; The Only Girl; The Princess Pat; Eileen*.

**Blouet, PAUL**. See MAX O'RELL.

**Blount, blunt, JAMES H.** (1837-1903), American legislator, was

time American minister at Honolulu.

**Blount, WILLIAM** (1749-1800); American public official, was born in Bertie county, N. C. He served in the North Carolina legislature, was a delegate to the Continental Congress in 1783-4 and 1786-7, and a member of the convention which framed the Federal Constitution in 1787. In 1790 he became governor of 'The Territory of the United States South of the Ohio,' and upon the admission of

tion of a current of compressed air. Their use is as varied as their form, but they are chiefly employed to produce the blast for metallurgical and forced draught for boiler furnaces, to displace vitiated air in close and foul places, to supply warmed, cooled, or purified air to public buildings, and to furnish a drying current of air to lumber, grain, fabrics, brick and other articles, or to remove steam, dust, and refuse from factories. The most elementary blowing machine is the common bellows of domestic use, which was also used from time immemorial for metallurgy, until the blowing cylinder with reciprocating piston was devised.

A modern blowing cylinder (Fig. 1) is fitted with a piston usually coupled direct to the reciprocating piston of the steam-engine. Both horizontal and vertical types are used. Air is drawn into one end of the cylinder through a flap-valve in the cylinder cover while the piston makes its out-stroke, and at the same time the air at the other side of the piston, drawn in at the previous in-stroke, is expelled under pressure through a flap-valve at the other end of the cylinder into the blast main. Blowing cylinders worked by direct-acting steam-engines are now in general use to produce a blast in furnaces. Blowing engines, as they are called, pump large quantities of air against comparatively low pressures; in blast furnace practice 15 to 30 lbs. per square inch is common, and in Bessemer steel work 25 to 30 lbs. per square inch.

They are equally well adapted for supplying large amounts of air or gas under pressure for other purposes, such as is required by chemical works and smelting furnaces, and for pumping and compressing natural and artificial gases. For low pressures and large volumes of air, fans and rotary blowers are preferred.

The centrifugal fan or fan blower, as an apparatus for producing draft for ventilation, dates back to the sixteenth century, but the application of the fan to accelerate combustion is much more recent. Two types of fans exist: The first, known as the disc or propeller wheel, is constructed on the order of the screw propeller and moves the air in lines parallel to its axis, the blades acting upon the principle of the inclined plane. The second, or fan blower proper, consists in its simplest form of a number of blades extending radially from the axis and presenting practically flat surfaces. By the action of the wheel the air is drawn in axially at the centre and delivered from the tips in a tangential direction. This type is designated as a centrifugal fan, or, more

properly, as a peripheral discharge fan. The propeller or disc fan, which is available for ventilating purposes, when it acts against slight resistances is practically useless as a means of draft production. This can be secured by the use of the peripheral discharge type, which is usually enclosed in a case of such shape as to provide free movement for the air as it escapes at the periphery and an outlet through which it is all delivered. Figs. 2 and 3 illustrate a Green Matteawan Steel Plate Fan of this type.

Fans are known as blowers or exhausters, owing to the duty which they perform. The normal use of a blower being to force air into a given space while the exhauster is employed to remove air

**Blowitz, HENRI GEORGES STEPHEN ADOLPHE OPPER DE** (1825-1903), who won a European reputation as Paris correspondent of the *Times* during a period of thirty years, was born at the château of Blowsky, in Bohemia, and baptized a Catholic. He was at first a teacher, but later took to politics. On the establishment of the republic in 1870 he obtained letters of naturalization. He supplied Thiers with information which enabled him to crush the commune in the south of France. As a reward he was nominated for the post of consul at Riga. He was appointed chief correspondent of the *Times* in 1873, and on Dec. 31 he telegraphed particulars of the *coup d'état* in Spain, which he had

*Green Mechanical Draft Fan.*

Installed to take gases from a Green Fuel Economizer. The gases are discharged to the chimney through a horizontal flue under the Economizer.

from an enclosure. For convenience of adjustment of pipe connections an exhauster is provided with an inlet on one side only, while a blower being exempt from these requirements is provided with two inlets, one upon either side. When pressures exceeding six inches of water are required, Roots's rotary blower (Figs. 4, 5) may be employed. It consists of a casing in which two 'rollers,' shaped like the figure 8, are centred on parallel axes, and are driven by a pair of equal spur-wheels in opposite directions at about 300 revolutions per minute. The rollers and casing have very little clearance, and the air is really scraped out of the casing on one side and delivered on the other.

obtained by actually interviewing in Paris the newly-proclaimed king, Alfonso XII. Two years later he exposed the designs of the military party in Germany for a fresh attack on France, and war was averted. He obtained a copy of the treaty agreed to at the Berlin Congress in 1878, and telegraphed its preamble and sixty-four articles to the *Times* before it was actually signed. The name of the plenipotentiary who gave him the treaty has never been divulged. It was Blowitz who first announced that the Russians were going to Merv. The news was contradicted by the Russian government, but the prophecy was realized within six months. During his connection with the *Times* he interviewed

Bismarck, King Humbert, Pope Leo XIII., the Sultan of Turkey, and the Shah of Persia, among many notabilities. His *Memoirs* were published in 1903.

**Blowpipe**, an instrument used by glass-blowers, in analytical chemistry, and in the soldering of metals, for directing and increasing the rapidity of combustion of a flame. In its simplest form it consists of a tapered metal tube fitted with a mouthpiece; from the side projects a narrow tube provided with a nozzle of brass or platinum. By holding the point of the side tube into a candle, alcohol lamp or gas flame, and blowing a gentle current of air from the mouth, the flame is deflected, and an intensely hot, pointed jet is obtained. Larger blowpipes are made in various patterns, the air being supplied from a foot bellows, and the supply of gas and air regulated by taps. See Cornwall, *Manual of Blowpipe Analysis* (1891); C. F. Plattner's *Blowpipe Analysis* (1875); W. A. Shenstone's *Methods of Glass-blowing* (2nd ed. 1888).

**Bloxwich**, eccles. par. and vil., Staffordshire, England, 3 m. N.W. of Walsall. In the vicinity are coal and ironstone mines and blast-furnaces. Pop. of par. (1911) 23,190.

**Blücher**, GEBHARD LEBERECHE VON (1742-1819), field-marshal of Prussia, was born at Rostock, and entered first the Swedish service, then the Prussian (1760). In 1772 he left the army and farmed his own lands until the accession of William II. (1787). After being present in many actions (e.g. Kaiserslautern) against the French, he commanded the cavalry at Auerstädt in 1806, and was compelled to surrender after the fall of Lübeck (1806), but was soon after exchanged for the French general Victor. In 1813 Blücher received the chief command in Silesia, operating against the French at the battles of Lützen, Bautzen, and Haynau. He defeated Marshal Macdonald at the Katzbach in Aug., 1813, Marmont at Möckern (Oct. 16), and three days later made his victorious entry into Leipzig and was raised to the rank of field-marshal. In Jan., 1814, he crossed the Rhine and won the battle of La Rothière, but was soon afterward defeated by Napoleon. This reverse, however, was quickly wiped out by his victory over Napoleon at Laon on March 9; and after again inflicting a severe defeat on the French at Montmartre, he marched in triumph into Paris. He was made Prince of Wahlstadt by Frederick William III. for his victory at Katzbach. After Napoleon's return from Elba in 1815, Blücher was appointed commander-in-chief of the Prussian

army. At Ligny, on June 16, he was defeated after a stubborn action; but he rallied his scattered troops, and moved to the assistance of Wellington at Waterloo. This impending flank attack on the French contributed greatly to the completeness of Wellington's victory, and Blücher was in time to participate in the pursuit. On the second taking of Paris, Wellington had great difficulty in preventing Blücher from sacking the capital, which the latter held to be a justifiable retaliation for the sacking of other capitals by the French. In Blücher's honor Frederick William III. created the order of the Iron Cross; and Rauch's noble statue of the veteran was erected (1820) at Breslau. Blücher's intrepidity and warlike fervor gained him the appellation of 'Marshal Vorwärts' (Go ahead), but he was not a great military strategist or tactician. He was characterized by patriotism, loyalty, and integrity, and by uncompromising hostility to Napoleon. Although rough in manner, he was idolized by his troops. He died at his estate in Silesia. See *Lives*, by Förster (1821; new ed. 1887), Scherr (1865), Varnhagen von Ense (in vol. iii. of *Biographische Denkmale*, 1872); also the various histories of the Waterloo campaign, and Chesney, *Waterloo Lectures* (1874).

**Blue**. The blue pigments and dyes in most general use are ultramarine, cobalt blue, indigo, and Prussian blue, in addition to the large number of compounds made from coal-tar products. Laundry blue is made of ultramarine, 60 parts; bicarbonate of soda, 40 parts; glucose, 12 parts. Grind the two first together, mix in the glucose, and press in moulds. Liquid laundry blue may be made as follows:—Indigo or Prussian blue, 8 lbs.; oxalic acid, 1 lb.; water, 32 gallons.

**Blueback**, the salmon of the Fraser River and its neighborhood (*Oncorhynchus nerka*), one of the most valuable of the Pacific salmon (q.v.). Its upper part is in spring distinctly bluish.

**Bluebeard**, hero of the fairy tale, and type of savage husbands. The English version is a rendering of Perrault's *Barbe-Bleue* (in his *Contes*, 1697). Bluebeard is the subject of an *opéra bouffe* by Offenbach (1866). See Wilson's *Bluebeard: A Contribution to History and Folklore* (1899).

**Bluebell**, a name applied to various plants—the wild hyacinth (*Scilla nutans*), which flowers in European woods in spring; to the several species of Campanula having nodding flowers, and particularly to the harebell (*Campanula rotundifolia*), which flowers during summer on hills. The latter is the 'bluebell of Scotland.'

**Bluebird** (*Sialia Wilsoni*), a common N. American bird belonging to the thrush family, and beloved of every one as a 'harbinger of spring.' It is prevailing sky-blue above, with a brownish breast; but in western species the breast is white. It comes familiarly into gardens and orchards, nests in holes in trees, or often in boxes placed in trees and the like for its accommodation, and lays 5 white eggs. It is migratory, arriving early in the spring, and saluting us with a soft and melodious warble. It is the nearest American approach to the English robin-redbreast. The name is also applied to the Indian *Irena puella*, a member of the family Pycnonotidae. See John Burroughs's *Wake Robin* (1871).

**Blue Books**, official reports of the British Parliament and the Privy Council, usually bound in blue paper covers, containing the votes and proceedings of the house, bills at their successive stages, annual estimates for the public service, accounts of the expenditure of the previous year's votes, documents tabled by the ministry voluntarily or on demand of the house, reports of government commissions, annual reports of governors of colonies and consuls, etc. The printing of the proceedings of the house dates from 1681, and the selling of its blue books from 1836. In imitation of the blue book, Germany has established its gray or white book, first communicated (1854) to the Imperial Parliament. In France, the corresponding color is yellow; in Spain and Austria, red; in Italy, green; and in the United States both blue and red.

**Blue-bottle**, BLOW-FLY OR FLESH-FLY (*Calliphora Erythrocephala*), an insect nearly related to the common house fly, but differing in its larger size, its bright blue abdomen, and its deep humming note. The eggs are laid in meat, especially if putrefaction has commenced—the flies being strongly attracted by decomposing matter of any kind—and hatch into maggots, which pass through the life-history usual for flies. Its maggots are called 'gentles' by anglers, and used as bait. The species mentioned has become almost cosmopolitan, but several others more local exist in various parts of the world. See Osborn's *Insects Affecting Domestic Animals* (1896).

**Blue-coat School**. See CHRIST'S HOSPITAL.

**Blue Earth City**, tn., Minn., co. seat of Faribault co., 46 m. s. by w. of Mankato, on the Blue Earth R. and on the Chi., St. Paul, Minn. and Omaha R. R. It has lumber and flour mills. Pop. (1910) 2,319.

**Bluefields**, or **BLEWFIELDS**, riv. and tn., Nicaragua, Central America. The river has a course of about 100 m., and is navigable for 60 m. The harbor of bluefields is one of the finest in Central America. Pop. about 5,000.

**Blue-fish** (*Temnodon saltator*), also called 'skip-jack,' is a widely-distributed fish belonging to the family of the horse-mackerels. It is especially common on the coasts of N. America, where it is much used as food, and in summer, when it appears close inshore, feeding upon menhaden, mackerel and other fishes; it offers excellent sport with rod and reel, or by trolling from a boat. It may attain a length of three feet, but is usually less, and is a most rapacious fish. Its flesh is highly prized as delicate food.

**Blue-gowns**, or **KING'S BEDESMEN**, public almsmen in Scotland to whom the kings distributed bounty, in return for which they were expected to pray for the welfare of king and state. The appointment of blue-gowns ceased in 1833, and the last allowance to a blue-gown was made in 1863. See Introduction to Scott's *Antiquary*.

**Blue Grass**. Certain species of the genus of grasses Poa, having bluish-green foliage, and panicles of bloom. The famous Kentucky blue-grass (*Poa pratensis*), which has given its name to the 'blue-grass' region of Kentucky, notable for its horses, is a favorite grass for pasture and lawn, and is widely cultivated for hay. It is known also as June-grass, and smooth-stalked meadow grass, and is found in Europe and Asia.

**Blue Island**, city, Cook co., Ill., a suburb S. of Chicago, on the Calumet R., and on the Chi., R. I. and Pac., the Ill. Cent. and other R. Rs. It has smelters, brickyards, quarries, etc. Pop. (1910) 8,043.

**Blue Laws**, any laws, especially sumptuary, characterized by extreme rigor and severity; particularly, in popular usage, the laws which were supposed to have been in force in the colony of New Haven, a collection of which was published by Samuel Peters in his *General History of Connecticut* (1781). It was long believed that this code was fabricated by Peters and that no such laws were ever really enacted, but it is now known that most of them did appear at one time or another in the statute books of some one or more of the colonies of New England, or were taken from an earlier writer, Neal. Several of the laws, however, and the most extreme and puritanical of the collection seem to have been invented by Peters. At all events the code was not what it purported to be, a collection of the laws of the New Haven Colony. See a

monograph 'Examination of Peters's Blue Laws' by Prince in *Annual Report of the American Historical Association* for 1898 (1899), and Trumbull, *Blue Laws of Connecticut and New Haven*; and *The False Blue Laws invented by Samuel Peters* (1876).

**Blue Mountains**. (1.) Well-wooded (chiefly with eucalyptus) range in New South Wales, extending from the Warragong Mts. (Australian Alps) on the s.w. to the Liverpool Range on the n., approaching to within 40 m. of the coast. A few spurs run down to the shore. Average alt. 3,000 ft. (2.) Mountain group in Oregon, trending nearly n. and s., in the e. part of the state; alt. from 6,000 to 9,000 ft. It is chiefly composed of lava, with granite in the higher portions. (3.) Mountain range in E. of Jamaica, running from E. to W. and culminating at 7,423 ft. (4.) **BLUE MTS.**, Pa. See **KITTATINNY**.

**Blue Mountain Lake**, a lake at the ft. of Blue Mt. (3,759 ft.), an Adirondack peak of Hamilton co., N. Y. The village is a summer resort. Pop. about 400.

**Blue Nile**. See **NILE**.

**Blue Peter**, a blue flag with white square in the centre, denoting the letter O in the international signal code; hoisted to show that a ship is about to put to sea. This practice is followed on the British navy, but a flag called the cornet is used on American men-of-war as a sailing signal.

**Blue Pill**, or *Pilula hydrargyri* contains free mercury in the proportion of one part in three with liquorice and confection of roses. It is a common purgative, acting probably by irritation of the intestinal mucous membrane, and resulting in peristalsis and a watery exudation. It hastens the evacuation of bile, but does not increase the amount secreted by the liver. Its action is commonly aided by the after-use of some saline draught.

**Blue Ridge**, a range of the Appalachian Mts., lying nearest to the Atlantic coast. It is highest in Virginia and North Carolina and is traced from the comparatively low headlands of West Point, N. Y., into Alabama. It should not be confused with the Kittatinny or Blue Mts. of Pennsylvania, which lie behind to the w. forming the other side of the Great Valley. The highest summits of the Appalachians occur in the Black Mt. group in North Carolina.

**Blue Shark** (*Carcharias glaucus*), a common shark, which sometimes reaches a length of 25 ft., though from 12 to 15 ft. is the usual size. Most abundant in tropical seas, its range extends northwards into the North Atlantic.

**Bluestocking**, a term applied contemptuously to a female pedant. It originated in connection with certain reunions held in London about 1780 by Johnson's friend, Mrs. Montagu, and other ladies. Hannah More addressed to them her poem of *Bas-Bleu, or Conversation* (2nd ed. 1787).

**Bluthroat** (*Cyanecula suecica*), a beautiful bird allied to the redstart, also called 'Swedish nightingale' and 'bluebreast;' which breeds in N. Europe, Siberia, Alaska, etc., winters in Abyssinia and India, and is seen in Europe in spring and fall.

**Bluffton**, city, Ind., co. seat of Wells co., 22 m. s. of Fort Wayne, on the Wabash R., and on the Cin., Bluffton and Chi., the Lake Erie and West. and the Toledo, St. Louis and West R. Rs. It has a foundry, machine shops, engine works, manufactures barrel-staves, etc., and is the shipping centre of an extensive trade in lumber and grain. Pop. (1910) 4,987.

**Blum**, **HANS** (1841), German jurist and historian, born at Leipzig. He was a member of the North German Parliament from 1867-70, and has written several works on jurisprudence and on the contemporary history of Germany, as *Auf dem Wege zur Deutschen Einheit* (2 vols. 1893), *Das Deutsche Reich zur Zeit Bismarcks* (1893), *Fürst Bismarck und seine Zeit* (6 vols. 1894-5), *Persönliche Erinnerungen an den Fürsten Bismarck* (2nd ed. 1900).

**Blum**, **ROBERT** (1807-48), German politician, born at Cologne. He helped to found (1840) at Leipzig the *Schiller Society*, and (1847) a publishing house from which he issued his *Staatslexikon*. Democratic leader in the revolution of 1848, he represented Leipzig in the Frankfort Parliament. Sent by the Left with a congratulatory address to the insurgents of Vienna, he led them at the barricades, but was taken prisoner and shot (Nov. 9) for having assumed arms against the imperial troops. The news excited the liveliest indignation throughout Germany, where \$30,000 was raised for his widow and children. See his *Life*, by H. Blum (1878).

**Blum**, **ROBERT FREDERICK** (1857-1903), American painter, was born in Cincinnati, O., received a public school education, and was apprenticed to a lithographer at the age of sixteen. Subsequently he abandoned this work to study drawing and painting, and studied for a time at the Pennsylvania Academy of Fine Arts at Philadelphia. In 1879 he went to New York, where he received the helpful encouragement of Alexander W. Drake, the art editor. He made yearly trips abroad, and was elected a full member of the

National Academy of Design in 1892. His mural decorations of Mendelssohn Hall, New York, were his principal achievement in decorative work. In 1890-3 Mr. Blum visited Japan for the purpose of making his illustrations of Sir Edwin Arnold's *Japonica*.

**Blumenbach**, JOHANN FRIEDRICH (1752-1840), German naturalist, born at Gotha. Appointed (1778) professor at Göttingen, he lectured there for nearly sixty years on natural history, anatomy, and medicine. In 1785, before Cuvier, he discerned that the true basis of zoological study is comparative anatomy, a science which he elaborated in *Handbuch d. vergleichenden Anatomie u. Physiologie* (1804; new ed. 1824). Devoting himself particularly to the history of man, he advocated the unity of the race, and made a collection of human skulls, supplying data for his *Collectio Craniorum Diversarum Gentium* (1790-1828). Original observations are also embodied in his *Ueber den Bildungstrieb* (1781), *Institutiones Physiologicae* (1787; new ed. 1821), and other publications.

**Blumenthal**, JACQUES, musical composer, was born at Hamburg (1829) and educated in Vienna and Paris, but is now a naturalized British subject, having lived in England since 1848. He is best known as a song-writer, his *Message*, *Requital*, *My Queen*, etc., having had considerable popularity.

**Blumenthal**, LEONHARD, COUNT VON (1810-1900), Prussian general. Appointed on the general staff in 1848, he distinguished himself in Denmark in 1849; took part as chief of the staff in the campaign against Denmark (1863-4); served as chief of the staff to the Crown Prince of Prussia in the Austrian campaign of 1866; and in the war with France (1870-1) he again acted as chief of the staff to the Crown Prince Frederick, and took part in the surrender at Sedan and in the siege of Paris. Created a field-marshal by the Emperor Frederick in 1888. He was one of the ablest strategists in the German army.

**Blumenthal**, OSKAR (1852), German dramatist, founder and manager of the Lessing Theatre (1888-97) in Berlin, and author of a number of light and popular comedies, such as *Der Probenheil* (1882), *Die Grosse Glocke* (1887), *Im weissen Rössl* (1898). He has also written light satirical works, as *Allerhand Ungezogenheiten* (1874; 5th ed. 1877), *Gemische Gesellschaft* (1877), and *Aus heiterm Himmel* (1882).

**Blunderbuss**, a short gun, unrifled, and with a large bore, widening towards the muzzle, firing many balls or slugs, which

scatter when fired, and can do execution within a limited range without exact aim being taken. The blunderbuss has long been obsolete.

**Blunt**, JAMES G. (1826-81), American soldier, born in Hancock co., Me. He practised medicine in Ohio; became a free-state leader in Kansas, whither he removed in 1856; and during the Civil War served in the Federal army, rising to the rank of major-general of volunteers (commissioned Nov., 1862), commanding the Department of Kansas (1862-3), and being conspicuous in the border warfare of Kansas and Missouri. He was mustered out of service in July, 1865.

**Blunt**, JOHN HENRY (1823-84), English writer of theological and ecclesiastical books. Taking orders in 1852, he was presented with the crown living of Beverstone, in Gloucestershire, in 1873. He published *Annotated Book of Common Prayer* (1866), *Hist. of the Reformation* (1868), *Dict. of Theology* (1870), *Dict. of Sects and Heresies* (1874), and *Cyclopædia of Religion* (1884).

**Blunt**, JOHN JAMES (1794-1855), professor of divinity in Cambridge from 1839, is best known by his *Sermons*, and by his apologetic works, reissued as *Undesigned Coincidences in the Writings both of the Old and the New Testament* (1847). His *Hist. of the Christian Church during the First Three Centuries* (1856), and his lectures *On the Right Use of the Early Fathers*, were published after his death.

**Blunt**, WILFRID SCAWEN (1840), English poet, born at Petworth House, Sussex; served in the British diplomatic service from 1858 to 1870. Blunt upheld the cause of Arabi Pasha in Egypt in 1882, and in 1887-8 took part in the anti-coercion movement in Ireland, for which he suffered imprisonment. He is a poet of a high order, except when political questions are the subject. His works include *Love Sonnets of Proteus* (1880); *The Future of Islam* (1882); *The Wind and the Whirlwind* (1883); *Ideas about India* (1885); *In Vinculis* (1889); *A New Pilgrimage* (1889); *Esther* (1892); *Griselda* (1893); *Satan Absolved* (1899). A useful selection of his *Poems* was made by W. E. Henley and G. Wyndham in 1898.

**Bluntschli**, JOHANN KASPAR (1808-81), Swiss jurist, born at Zürich. Professor at Zürich (1833), he published (1838-9) *Staats- und Rechtsgeschichte der Stadt u. Landschaft Zürich*, the tenor of which conforms with the principles of the historic school. In 1848 he was called to a law chair at Munich. His *Allgemeines Staatsrecht* (1852; 5th ed. 1875-6), translated into English (1885;

2nd ed. 1892) and French (1877), established his authority as a jurist. From 1861 professor at Heidelberg, and at the front of liberal movements, he cooperated in the foundation of the German House of Representatives (1862), and induced (1865) the upper house to voluntarily submit to reform. No less zealous for religious freedom, he was one of the most active members of the German Protestant Union. Bluntschli wrote several other books on German and Swiss law, politics, and history (e.g. *Geschichte der Republik Zürich*, 1847-56). His *Selbstbiographie* (3 vols.) appeared in 1884. His library is now the property of Johns Hopkins University, Baltimore.

**Blushing** is a reflex dilatation of the blood-vessels of the face and neck, due to vasomotor paralysis through the cervical sympathetic nerve, acted upon by the higher cerebral nerve centres, their action being initiated by the emotions of shame, bashfulness, timidity, and the like. The process is not fully understood. See Darwin's *Expressions of Emotions in Man and Animals* (1872).

**Boa**, a genus of very large snakes, confined to tropical America, and without poison fangs. Their great size (10 to 11 ft.) and strength enable them to crush their prey to death by coiling the pliant body round the victim. The habit has long been rendered familiar by descriptions of the boa constrictor. The process of digestion is long and laborious, and is aided by a copious discharge of saliva. Together with the anacondas (*Eunectes*), the boas form the family Boidae, closely allied to the pythons of the tropics of the Old World. The anaconda is an aquatic boa, said to reach 30 ft. in length.

**Boabdil**, more correctly ABU ABDALLAH, last Moorish king of Granada. Rebellious against his father (1481), and then warring against his uncle, he so reduced the strength of the Moors that he had to surrender Granada to Ferdinand of Aragon (1492). Crossing (1493) to Africa, he fell fighting in the service of the king of Fez.

**Boadicea**, queen of the Iceni in Britain, who inhabited Suffolk and Norfolk. The outrages of the Romans (60 A.D.)—two of her own daughters having been ravished—caused her to head an insurrection during the absence of Suetonius Paulinus, the Roman governor, in Anglessey. She succeeded so far as to capture the towns of Camulodunum (Colchester) and Londinium, killing 70,000 Romans and their allies. But Suetonius, on his return, defeated the Britons with great slaughter, and the queen put an

end to her life (62 A.D.). This victory secured the Roman dominion in Britain. See Tennyson's *Boadicea*, and Cowper's ode with the same title.

**Boanerges**, a name given by Jesus, in Mark 3:17, to the disciples James and John, the sons of Zebedee, and interpreted by the sacred writer as 'sons of thunder,' hence sometimes applied to a man of strong and vehement character.

**Boar**, or **WILD BOAR** (*Sus scrofa*), a mammal still found in many parts of Europe, Asia Minor, India, and N. Africa. It is believed to be the original of the domestic pig, from which it differs in certain minor points. The body is covered with long, stiff bristles, beneath which there is a softer curling undercoat, which is uniform in tint in the adult, while the young are striped. In the swamps which it usually haunts the boar is prevented from sinking in the mire by the broad spreading feet; on dry land it uses only the two median toes in walking, the lateral ones being too short to reach the ground. As is indicated by the generalized character of the teeth, the boar is practically omnivorous, though it depends largely upon roots, bulbs, and tubers, which are dug up by the sensitive snout with the help of the tusks. In the male the canines or dog-teeth are greatly developed, and make the animal a dangerous adversary when at bay. Zoologically the boar is of great interest, as being one of the most generalized of living even-toed ungulates, and as retaining the marshy habitat of the ancestral ungulates. Its unspecialized nature is shown especially in the number (44) and structure of the teeth, in the number (4) of the complete toes and the structure of the limbs, and in the simple nature of the stomach (contrast sheep and cow). It is the object of India's foremost sport, 'pig-sticking,' i.e. the chase of boars on horseback, and spearing them as they run. See also Pig.

**Boarding-House**. A private house maintained for furnishing table-board, usually with lodging. The private character of the house is what distinguishes it from an inn or hotel. The boarding-house keeper is not, like the innkeeper, bound to receive any proper person who seeks accommodation, nor is he subject to the extraordinary common law liability of the innkeeper for the goods of his guest, but only for reasonable care. On the other hand the boarding-house keeper has not, in the absence of statute, the right to detain the baggage of his guest to secure an unpaid board bill, though the statutes of some states give him a lien similar

to the innkeeper's common law lien. See INNKEEPER; LIEN.

**Boardman**, GEORGE DANA (1828-1903), American clergyman, the son of a Baptist missionary, was born at Tavoy, Burma, and graduated (1852) at Brown University. He was installed pastor of a Baptist church in South Carolina, 1855, but resigned on account of a difference of views with his parishioners on the slavery question. Dr. Boardman was pastor of the First Baptist church of Philadelphia from 1864 to 1894, when he retired as pastor emeritus. He was active in movements for international arbitration, and lectured on this subject. Some of his books are *The Creative Work* (1878), *The Divine Man* (1889), and *The Problem of Jesus* (1891).

**Board of Trade and Plantations**. An English governmental board, established in 1696 to exercise general jurisdiction over colonial affairs, examine and pass on colonial laws, suggest legislation concerning the colonies, and have to do especially with their colonial affairs. Previously various temporary boards had discharged the same or very similar functions; for instance Charles II. established a 'Council of Trade' and a 'Council for Foreign Plantations' in 1660, and the two were combined in 1672 as the 'Council for Trade and Plantations,' which went out of existence in 1688. The importance of the Board greatly decreased after 1762, when a Secretaryship of State for the Colonies was established, and both the Board and the Secretaryship were abolished in 1782. The Board's full title was the 'Board of Commissioners for Trade and Plantations,' and its members were known as the 'Lords Commissioners for Trade and Plantations.'

**Board of War**, the name of two boards, or committees, appointed by the Continental Congress during the American Revolution to look after the raising and equipping of troops. The first, created on June 12, 1776, was known as the Board of War and Ordnance, and consisted of five members of Congress: John Adams (chairman), Roger Sherman, James Wilson, Edward Rutledge, and Benjamin Harrison, with Richard Peters as Secretary. On Oct. 17, 1777, a new board, known simply as the Board of War, was created, and the members of this board, first three and subsequently five in number, were not members of Congress. Gen. Horatio Gates became the chairman. The board was abolished in 1781.

**Boar-fish**, a name applied to two distinct fish—(1) to an Australian food-fish (*Histioglossus*

*recurvirostris*) belonging to the perch family, and (2) to the Mediterranean *Capros aper*, one of the horse-mackerels, which is caught for market.

**Boas**, FRANZ (1858), German-American anthropologist, was educated at German universities and, as early as 1883-4, made a voyage to the Arctic and explored Cumberland Sound, returning to New York city. Two years later he entered upon a study of the Indians of British Columbia by the British Association, and subsequently for the N. Y. Museum of Natural History. In 1898 he was appointed professor of anthropology at Columbia University, and in 1901 curator of the department of anthropology at the American Museum of Natural History, and he was also made philologist in the Smithsonian Institution. Author of *Baffin Land* (1885) and a number of works on the customs and languages of the N. A. Indians and Eskimos.

**Boat**, a term now indiscriminately used for sea and river vessels of all kinds, but more properly applied to a vessel that can be hauled up on or launched from a beach. It may be propelled by oars, sails, steam, or other motive power. From the earliest ages men have used buoyant contrivances to float them across streams and lakes. The primitive log or number of logs lashed together to form a raft, or bundles of brushwood or reeds used for the same purpose, early developed into the parent of modern boats, the dug-out, which has been found in association with Stone Age remains and in Swiss lake dwellings. Bark canoes and wickerwork frames covered with skins, such as the coracle of the ancient Britons, are a further development. The catamaran clearly exhibits its connection with the raft, so modified as to afford less resistance to the water. Modern boats are of many kinds according to the purpose for which they are intended and the character of the waters on which they are to sail. They are usually classed for racing purposes as open, half-decked, and decked boats. The canoe, punt, skiff, gondola, dingy, and outrigger are used on smooth water for pleasure and racing. The boats used by watermen vary greatly, according to the locality. Whale-boats are sharp at both ends, and may be steered with an oar or ordinary rudder. Life-boats (see LIFE-SAVING APPARATUS) are provided with air chambers, which render them self-righting or self-bailing, or both combined. The following boats are used in the U. S. navy for rowing and sailing: barge, cutter, whale-boat, gig, and dingy. Steam launches and cutters are

also employed. Every sea-going ship is by law required to carry a specified number of boats, according to the tonnage. Sea-going ships carrying passengers must carry life-boats, and have sufficient boat accommodation for all the passengers carried.

**Boatbill** (*Cancroma cochlearia*), a S. American night-heron, remarkable for its broad head ending in the peculiar flattened and keeled bill to which it owes its name. The birds occur especially in the woods bordering the rivers of Brazil, and feed upon worms and other aquatic organisms. See HERON.

**Boat-fly, or WATER-BOATMAN** (*Notonecta*), a carnivorous bug living entirely in the water. It is peculiar in that it always swims

Boat-fly, or Water-boatman.

back downwards, and is exceedingly common in ponds, where it may be seen rising to the surface to breathe.

**Boat Race.** See ROWING.

**Boatswain**, a warrant-officer in the U. S. navy. The term is derived from 'boat's swain,' or husband. According to Sir Harris Nicolas's account of the 'buscarles,' every ship was anciently in charge of a 'batsuen,' who commanded her crew in action, and acted at all times as master pilot or steersman. The office of boatswain, although long in use, in the British Navy received recognition for the first time when the navy was increased in the 16th century. When the U. S. navy was formed, the practice of the British navy was in this, as in most other respects, followed quite closely. A boatswain has charge, under the supervision of the executive officer, of the rigging, anchors, cables, boats, and other equipment. Assisted by his mates, he summons the crew at all general

drills and evolutions and acts as assistant to the executive officer in carrying on the work of the ship. For the purpose of attracting attention as a preliminary to passing orders he sounds his 'call' on his 'pipe' or whistle, and this, both for him and for his mates, is a sort of badge of office. When a boatswain has served 6 years in that grade he is advanced to the grade of chief boatswain and commissioned with the rank of ensign. Vacancies in the grade of boatswain are filled by the appointment of competent petty officers. The pay of a boatswain when at sea is \$1,200 per annum with an increase of \$200 for each period of three years service until the maximum of \$1,800 is reached. Chief boatswains receive the same pay as ensigns. There are at present 66 chief boatswains and 81 boatswains.

**Bobadilla**, FRANCISCO DE (?-1502), Spanish magistrate in Hispaniola, or Santo Domingo, a knight commander of the Order of Calatrava. In 1500 he was sent to Hispaniola, with plenary powers in civil and criminal matters, by Ferdinand and Isabella, to investigate the numerous charges which had been brought against Columbus, and to take such action as might seem necessary. He appears to have been unscrupulous and overbearing, and on reaching the island seized the public and private papers and certain property of Columbus, put Columbus in irons and grossly maltreated him, and soon sent him, still manacled, to Spain. After a short period of mismanagement, Bobadilla was superseded (1502) by Nicholas de Ovando, and lost his life at sea (probably in July, 1502), while being sent back to Spain.

**Bobbins**, wooden rollers with axial perforation by which to place them on a spindle, and flanged at each end. It is on bobbins that yarn is wound. In throstle-spinning the bobbins receive the threads of wool, cotton, etc., from the drawing rollers. The largest bobbins are used for the slubbing frames, where, from the lap shape in which it comes from the carder, the cotton passes into a loose strand. The most familiar form of bobbin is the pirn or spool of sewing-thread. Metal bobbins are used for lace-making. Paper tubes are now largely taking the place of bobbins.

**Bobbio**, tn. and epis. see, prov. Pavia, Italy, on the Trebbia, 26 m. s.w. of Piacenza. Near it, in 612, St. Columbanus founded an abbey, which possessed a famous collection of historical MSS., now for the most part in the Vatican. There is an old cathedral. Pop.(1901)4,876.

**Bobbeat**. The name of the smaller and more southerly species

or varieties of the North American lynx (q.v.), distinguishing them from the larger northern 'Canada lynx.' It refers to the brevity of the tail, and is coming into general use in scientific as well as popular books.

**Bobolink, or RICE-BUNTING** (*Dolichonyx oryzivorus*), a N. American bird, famous for its song, powers of flight, and especially for the flavor of its flesh. It is related both to the buntings and to the family Icteridæ. The male in summer (breeding plumage) has a gay dress of black and white with yellow markings, while the female and young are in conspicuous yellowish brown. Bobolinks breed in the North-eastern states, nesting in the grass

Length 7 in.

Bobolink.

or among grain; and at this season the males fly about the fields uttering a gay, rollicking song, while tumbling and fluttering in the air. In the early autumn they moult, and the succeeding (winter) plumage of both sexes is plain brown. They migrate southward in flocks, crowd into the marshy districts of the coast of the middle states, and are shot for market in great numbers as 'reed-birds,'—a delicacy of the season. The survivors move on to the rice plantations of the Gulf states, or farther, and in the late winter greatly damage the rice-crops. They are known there as 'rice-birds,' and are slaughtered mercilessly as a nuisance. The result is their growing scarcity in the North and elsewhere.

**Bobrinets**, tn. of Kherson gov., 120 m. N. of Kherson city, on the Bobrinets, affluent of the Bûg. Tobacco manufacture. Pop.(1897) 14,352.

**Bobruisk**, tn., Minsk gov., cap. of a dist., with strong fortress (besieged by the French in 1812), on Berezina, 103 m. by rail s.e. of Minsk. Pop. (1897) 35,177.

**Bobwhite**. A sportsman's name, taken from its cry, of the quail or partridge (*Colinus Virginianus*) of the Eastern U. S.

**Bocas del Toro**, seapt., Panama, on island of same name, at entrance to Bay of Chiriqui. Pop. 5,300.

**Boca del Drago**, TIGRE, TORO. See CHIRIQUI.

**Bocauae**, pueb., Bulacán prov., Luzon, P. I., 15 m. n.w. of Manila, on one of the mouths of the

TYPES OF BOATS BELONGING TO VARIOUS TIMES AND PLACES.

Wm. H. Sullivan

Grande de Pampanga and on the Manila and Dagupan R. R. It has a city hall, 2,000 stone and many other well-built houses. It has an important trade on the river and with Manila. Pop. (1903) 8,438.

**Boccaccio**, GIOVANNI (1313-75), great Italian writer and humanist, was born at Paris, the natural son of a Florentine merchant. In 1334 (or 1338) he fell in love with Maria d'Aquino, a natural daughter of King Robert of Naples. This passion directly or indirectly inspired the poet to the composition of a number of works—the *Rime*, *Filocolo*, *Filostrato*, *Teseide*, *Amorosa Visione*, and *Fiammetta*. In 1340 he was recalled to Florence by his father. From 1345 to 1347 he dwelt in the Romagna, till, in 1349, his father's death compelled him again to return to Florence. In 1350 he entertained as his guest Petrarch, with whom he formed a close friendship. In 1359 Petrarch endeavored to work on Boccaccio's religious feelings, and three years later a priest, Gioacchino Ciani, effected a complete change in his moral views and conduct. In 1363 he withdrew to Certaldo (near Florence), where he passed the remainder of his life, except for embassies to Avignon (1365) and to Rome (1367), a visit to Petrarch (1368), and the Dante lectures which he delivered at Florence in 1373 and 1374.

The list of his works in verse is headed by the *Rime*, mostly composed between 1334 and 1348 (a good ed. by Baldelli, Leghorn, 1802). The *Amorosa Visione* (c. 1342; 1st ed. Milan, 1521) is outwardly, in metre and framework, imitated from the *Commedia*. In *Filostrato* (c. 1338; 1st ed. Venice, 1480), in the *Teseide* (c. 1341; 1st ed. Ferrara, 1475), and in the *Ninfaie Fiesolano* (date uncertain; 1st ed. Venice, 1477; a good reprint in Torra's *Poemetti Mitologici dei Sec. xiv., xv., xvi.*, Leghorn, 1888), Boccaccio employed, for the first time in narrative poetry, the octave stanza, which was afterward so prominent in Italian literature.

The series of prose works opens with the prolix *Filocolo* (1338-40; 1st ed. Florence, 1472; Eng. trans. by H. G., London, 1567). This was succeeded by the *Ameto* (1341-2; 1st ed. Rome, 1478); *Fiammetta* (before 1343; 1st ed. Padua, 1472), the heroine of which stands for Maria d'Aquino, and the hero, Pamfilo, for Boccaccio himself; the *Corbaccio*, or *Liberino d'Amore* (1354; 1st ed. Florence, 1487); and the *Vita di Dante* (c. 1364; best ed. that of Macri-Leone, Florence, 1888; Eng. versions by Wicksteed, Hull, 1888, and Carpenter, New York, 1900;

the former is restricted to the purely biographical sections), a sequel to which was his *Comento sopra la Commedia* (1373-5; ed. by Ciccarelli, Naples, 1723; better by Milanese, Florence, 1863). The best collective edition of the minor works is still Moutier's *Opere Volgari di G. B. Corrette su i Testi a Penna* (Florence, 1827-34, vols. v.-xvii.).

The *Decamerone*, the book on which rests Boccaccio's chief claim to immortality, was composed for the most part between the years 1348 and 1353. The framework of the tales describes how, while the plague is raging at Florence in 1348, seven maidens and three youths of noble birth repair to a villa near the city, and, to while away the time, tell each a tale on ten successive days, making one hundred stories in all. The tales go back to the most vari-

Boccaccio.

ous sources—Eastern, classical and French stories, contemporary events, anecdotes, and scandals. (See Landau, *Die Quellen des Dekameron*, 2nd ed. Stuttgart, 1884.) Though the majority of the themes are undoubtedly immoral, Boccaccio's treatment is never obscene. His tales mark an enormous improvement on those that had gone before. The novel becomes in his hands a vehicle for dramatic development and psychological analysis; and many are the great writers who have borrowed from him—Chaucer, Shakespeare, Dryden, Lope de Vega, Molière, La Fontaine, Musset, Hans Sachs, and Lessing, to name but a few. The first edition is that of Venice (1470), and specially important among the early ones is that of

Giunti (Florence, 1573). Good modern editions are those of P. Dal Rio (Florence, 1841-4) and P. Fanfani (*ib.* 1857). Hitherto the ms. Mannetti (1384) of the Laurenziana (diplomatic reprint, Lucca, 1761) was considered the best; now the claims of the Berlin Hamilton ms. are being advanced. (See the treatise by Tobler, 1887, and by Hecker, 1892.) English versions: Anonymous, 1620 (vol. i. only); anonymous, 1702; Dryden's *Fables* (a small selection in verse), 1713; Balmgyl 1741; Dubois, 1804; Kelly, 1855; Wright, 1874; Payne, 1886; unexpurgated trans. (1874).

His Latin works consist of:—(a) *De Genealogiis Deorum Gentilium* (1350-60; 1st ed. Venice, 1472; Ital. trans. Venice, 1547). (b) *De Claris Mulieribus* (1352-62; 1st ed. Ulm, 1473; by Albanzani, 3rd ed. Bologna, 1875). (c) *De Casibus Virorum* (c. 1363; Italian version, Venice, 1545; English paraphrase by Lydgate, *Falls of Princes*, 1st ed. 1494). (d) *De Montibus, Silvis, Fontibus, Lacubus, Fluminibus, Stagnis et Paludibus, et de Nominibus Maris* (1st ed. Venice, 1472; Italian version, Venice, 1520). The few Latin letters are distinguished in neither form nor matter (edited, together with some Italian ones, by Corazzini, Florence, 1877). More interesting, as throwing light on contemporary events, are the eclogues of the *Bucolicon* (Florence, 1504).

For a full account of all the editions, see *Serie delle Edizioni delle Opere di G. B.* (Bologna, 1875). Biographers, Manni (1742) and Baldelli (1806). Landau (Stuttgart, 1877; Italian version by Traversi, much enlarged, Naples, 1881) and Veselovsky (St. Petersburg, 1893-4) deserve careful study. See, too, J. A. Symonds, *Boccaccio as Man and Author* (London, 1895); and W. P. Ker, *Boccaccio* (Oxford, 1900).

**Bocage**, MARIE ANNE FIGUET DU (1710-1802), French poet, born at Rouen. Emulating Milton, she wrote *Paradis Terrestre* (1748); the poem *Columbiade* (1756), which brought her into notice; and *Letters concerning England* (1770). She was highly praised by Voltaire.

**Boccalini**, TRAJANO (1556-1613), Italian satirist, born at Loreto; became governor of several cities under the papal see (1608-11). In 1612-13 appeared his *Ragguagli di Parnaso*, a work full of brilliant satire against contemporary politics and literature. An unfinished sequel, *La Pietra del Paragone Politico*, was completed by Girolamo Briani (1615). An English version of these works, *Advertisements from Parnassus, together with the Politick Touchstone*, by Henry, Earl of Mon-

mouth (London, 1656), reached the 3rd edition in 1674. Boccalini's *Commentarii sopra Cornelio Tacito* (Geneva, 1669) is couched in the same vein as the *Ragguagli*. See G. Mestica, *T. B. e la Letteratura Critica e Politica del Seicento* (Florence, 1878); G. Silingardi, *La Vita, i Tempi e le Opere di T. B.* (Modena, 1883).

**Bocca Tigris**, or **BOGUE FORTS**, at mouth of Canton K., China; taken by British in 1841, and again in 1856.

**Boccherini, LUIGI** (1743-1805), Italian musical composer and 'cellist, born at Lucca; studied at Rome, and spent the greater part of his life (from 1768) at Madrid as court composer. His instrumental works—mostly quintets, quartets, and trios—number 366; but of these 74 are unpublished. Of his vocal works, only the *Stabat Mater* is published. His best works are still much appreciated for their originality, dignity of style, and melodiousness. See *Life*, in German, by Schletterer.

**Boechus**, king of Mauritania in Africa, father-in-law of Jugurtha, with whom he fought for a time against the Romans, but, changing sides, betrayed him to Sulla in 106 B.C. See Mommsen's *Hist. of Rome*.

**Bochart, SAMUEL** (1599-1667), born at Rouen. As pastor in Caen, he publicly defended (1629) Protestantism in a public discussion with Véron, a Jesuit. His immense learning was exhibited in his *Geographia Sacra* (1646; later editions in 1651, 1674, 1681), on early Scripture history. After a brief visit (1662) to Stockholm, he published (1663) his greatest work, *Hierozoicon* (1675, 1793-6), mainly on the natural history of Scripture, but also on fabulous animals in other literatures. See Haag's *La France Protestante*, vol. ii. (1846-59); *History of Rationalism*, by Hurst (9th ed. 1882); and *German Rationalism* (trans. 1865), by Hagenbach.

**Bochold**, vil., prov. Rhineland, dist. Düsseldorf, Prussia, 3 m. N.W. of Essen. Pop. (1900) 21,278.

**Bocholt**, tn., prov. Westphalia, dist. Münster, Prussia, 13 m. by rail N. of Wesel, with cotton industries. Pop. (1900) 21,278.

**Bochum**, tn., prov. Westphalia, Prussia, 10 m. E.N.E. of Essen by rail; one of the chief centres of the Westphalian iron, steel, and coal industries, with coal mines, tin-smelting, brickworks, etc. Pop. (1900) 65,551.

**Böcking, EDUARD** (1802-70), German lawyer, born at Trarbach, on the Mosel; in 1835 became professor of jurisprudence as Bonn. He published valuable editions of classic works of law, as *Notitia Dignitatum* (5 vols. 1839-50); *Institutionen, or Pandekten des Römischen Privat-*

*rechts* (2 vols., 2nd ed., 1853 and 1855). He also edited the complete works of Ulrich von Hutten (5 vols. 1859-62).

**Böcklin, ARNOLD** (1827-1901), Swiss painter, a native of Basel. After studying (1845-50) in Düsseldorf, Antwerp, Brussels, and Paris, he settled in Rome, but in 1856 moved to Munich. Here he found a much-needed patron in Baron von Schack. Then he acted as art teacher at Weimar (1860-63), painted in Basel (1866-71), in Munich again (1871-4), and lived at Florence (1874-85), Zürich (1885-92) and Fiesole (1892-1901). One of the most notable painters of modern Teutonic art, he makes the figures and the backgrounds of the old (classic) myths live again before our eyes. He has besides a decided leaning to the weird and the grotesque. Among his more remarkable works are *Pan amongst the Reeds*, *Pirates Plundering a Castle*, *Island of the Dead* (1883), *Panic Terror*, *The Sport of the Waves*, *The Stillness of the Sea*, *Tritons and Nereids*, *The Island of the Blessed*, *Battle of the Centaurs*, *Petrarch*, and *The Plague* (these three at Basel), and *Sea Surges and A Recluse Playing the Violin* (at Berlin). See *Life* by Schmid in the portfolio of Böcklin's works (4 vols. 1892-1901); also monographs, in German, by Meissner (1898), Schick (1902), Mendelsohn (1901), and Floerke (1902).

**Bocland** ('book-land'), an Anglo-Saxon tenure (called also CHARTER-LAND, or 'deed-land') conveyed by *boc* (written 'charter') to a private owner, and held by a short and simple deed under certain rents and free services. From the bocland tenure are derived most of the freeholds holden of particular manors, and owing them suit and service. See MANOR; TENURE.

**Boeskey, STEPHEN** (1556-1606), prince of Transylvania from 1604 to 1606. In 1604 the brutal conduct of Basta in Transylvania, and the attempts of Rudolf II. of Austria to destroy religious liberty in Hungary, led to an insurrection in Transylvania and in Hungary, the leader of which was Boeskey, who was proclaimed prince of Transylvania.

**Bode, JOHANN ELERT** (1747-1826), German astronomer, born at Hamburg. Director of the observatory in Berlin (1772-1825), he founded the *Astronomische Jahrbücher* (1776). His *Uranographia* (1801; new ed. 1819) comprises some 12,000 stars more than the earlier maps. His *Représentation des Astres* (1782), in 34 sheets, contains all the stars above the horizon, visible to the naked eye from Berlin, as also the most important telescopic stars. An empirical formula de-

noting the relative distances of the planets is called 'Bode's Law.' Place a row of fours under the names of the planets ranged in a line according to their distances. Then under this row 0, 3, 6, 12, and so on. Add the two columns: the result shows the relative distances of the planets. The real relative distances, the earth's distance being reckoned as 10, are:—

3.9	7.2	10	15	27.5
	52	95	192	300

Bode also wrote *Anleitung zur Kenntniss des gestirnten Himmels* (1768; 11th ed. 1858) and other books.

**Bodensee**. See CONSTANCE, L.  
**Bodenstedt, FRIEDRICH MARTIN VON** (1819-92), German poet and dramatist; taught in Russia (1841-7), and became (1854) professor of Slavonic languages and (1858) of Old English literature at Munich. From 1867-73 he was connected with the famous Court Theatre at Meiningen, and from 1879-82 he was in the U. S., where he lectured, publishing a description of his travels in 1832 under the title 'From the Atlantic to the Pacific Ocean.' He was a prolific original writer and translator. With Paul Heyse, Wilbrandt, Herwegh, Gildemeister, and others, he issued a German translation of Shakespeare's plays (9 vols. 1866-72) and sonnets (1862), and wrote useful books on Shakespeare's contemporaries (1862), female characters (1875), and so forth. He also wrote on Russian subjects; published original plays, such as *Kaiser Paul* (1876); various volumes of verse, including *Epische Dichtungen* (1863), and tales. See his *Ausgewählte Dichtungen* (1864) and *Gesammelte Schriften* (12 vols. 1865-69). From a certain easy philosophy, exemplified in his most celebrated poetic work, *Lieder des Mirza Schaffy* (1851; 145th ed. 1893; Eng. trans. 1880), Bodenstedt has been called *Der Horaz der deutschen Bourgeois*. The man and his egoistic *Erinnerungen aus meinem Leben* (1892), and in an interesting series of letters edited by G. Schenck (1893).

**Bodin, JEAN** (1530-96), French political philosopher; born in Angers, and studied at Toulouse. In 1561 he went to Paris as an advocate, and in 1566 he published a treatise on the method of studying history, which evoked the wrath of the great jurist Cujas. In spite of his Protestantism, Bodin began to rise in the official world. Though he had opposed Charles IX., and narrowly escaped the massacre of St. Bartholomew (1572), he was made king's advocate at Laon. In 1580 he published his treatise on political philosophy, *La République*

(Latin trans. 1586; English, 1606), in which he builds upon the family as the basis of settled government, the supreme embodiment of which is the sovereign. The Catholic League, however, became so strong that in 1589 Bodin felt compelled to join its ranks. By this time he was *procureur général*, and a marked man. In 1593, after the victories of Henry IV., Bodin once more ventured to break openly with the League. His *Héptaplomères* (first published in 1857) is a plea for religious toleration; though in his chief work, and in *Démonomanie* (1580), he shows himself a believer in the superstitions of his age. See Boudrillart's *Bodin et son Temps* (1853), and Sir F. Pollock's *Science of Politics* (new ed. 1902).

**Bodleian Library**, Oxford, named after Sir Thomas Bodley, who, after the complete destruction (before 1556) of the university library of Oxford, dating from 1409, restored it (1598) by a gift of books collected by himself at a cost of £10,000. The library was opened (1603) with upwards of 2,000 vols. Later contributors include the Earl of Pembroke, with 250 vols. of Greek MSS.; Kenelm Digby, 238 MSS.; Archbishop Laud, 1,300 MSS. in more than twenty languages; and Robert Burton. Of John Selden's library the Bodleian received over 8,000 vols. General Fairfax enriched it with many MSS., including Dodsworth's 160 vols. in English history. Bishop Rawlinson's bequest (1755) included some 1,900 printed books and over 4,800 MSS. Nineteenth century donations comprise Richard Gough's collection (1809), numbering 3,700 vols. on Saxon and Northern literature; Edward Malone's collection of English drama and early poetry; Francis Douce's collection (1834); and Robert Mason's bequest (1841) of £36,000, the interest to be expended on books. The library now has nearly half a million volumes. It is entitled to a copy of every book printed in the United Kingdom. The first catalogue of its printed books was published in 1605, by its first librarian; the last in 1843, in 3 vols., by its eleventh librarian.

**Bodley, Sir Thomas** (1545-1613), English diplomatist and scholar. In 1585 he began his diplomatic career with a mission to Denmark. In 1589 he became the queen's representative in the United Provinces, where he acted as a member of the council of state until 1596. The rest of his life was devoted to the foundation and development of the Bodleian Library at Oxford. See his own autobiographical *Reliquiæ Bodleianæ* (1703); Wood's *Athenæ Oxon* (1813-20); Macray's *Annals of the Bodleian Library* (1868).

**Bodmer, Johann Jakob** (1698-1783), one of the chief pioneers in the regeneration of German literature in the 18th century; was a native of Zürich, where (1725-75) he was professor of Swiss history. With Breitinger and others he founded a weekly critical periodical (1721-3), *Die Diskurse der Maler*, the object of which was to emancipate literature from the trammels of pedantic rule. The new 'Swiss' school won its way slowly, until its principles were adopted by Lessing and others. Bodmer also drew attention to the old German epics, particularly the *Nibelungenlied*, of which he edited part in 1757. He greatly admired Milton, and translated the *Paradise Lost* into German. For life and bibliography, see J. Baechtold's *Geschichte der Deutschen Literatur in der Schweiz* (1887-92).

**Bodoni, Giambattista** (1740-1813), Italian printer. During his early manhood he worked (from 1758) in the printing-house of the Propaganda in Rome, and afterward (1768) became superintendent of the Duke of Parma's press. In 1788 he published *Manuale Tipografico*, a collection of 178 different types, increased in the 2nd ed. (1818) to 250. Between 1791 and 1813 he issued many beautiful editions of the classics, notably a *Homer* in 1808; but they are more distinguished for typographic beauty than for accuracy.

**Body of Liberties**, a well-known code of laws and 'bill of rights,' drafted by Rev. Nathaniel Ward, and adopted in Dec., 1641, by the General Court of the colony of Mass.; much of it was subsequently embodied in the formal laws of the colony, and it was thus the foundation of the Mass. legal code. It was, for the time, an enlightened code in many respects, establishing equal justice for all and security of person and property under the law. The text of the Body of Liberties may be found in MacDonald's *Select Charters and Other Documents illustrative of American History*, 1606-1775 (1899).

**Body's Island**, long sandy island off coast of N. Carolina. A lighthouse, having a fixed white light of the first order at a height of 156 ft. above mean high water, stands 2 m. from its S. extremity.

**Body-Snatching**. The criminal offence of taking and carrying away a dead human body without authority from those having the legal custody thereof. The law vests in the family or next of kin, or, in some instances, in the county or state authorities, the right to direct the burial, cremation, or other disposition of the body of a dead person. The taking of such a body by any one else and

without an order of the courts, either before or after burial, whether for purposes of dissection or otherwise, is a misdemeanor, punishable by fine or imprisonment.

**Boece, or Boethius, Hector** (c. 1465-1536), Scottish historian, was probably the son of Alexander Boyis, a burgess of Dundee. He studied in Paris, became a professor in the college of Montaigu in 1492, and made the acquaintance of Erasmus. He returned to Scotland about 1498, and became principal in 1505 of the University of Aberdeen. In 1522 he published the *Lives* of the bishops of Mortlach and Aberdeen (new ed. Bannatyne Club, 1875), at the press of Jodocus Badius in Paris; and in 1527 the *Historia Gentis Scotorum*, his most famous work, which was translated (1533) into Scottish prose at the request of James V., and into English for Holinshed's *Chronicles* in 1577.

**Boeckh, Philipp August** (1785-1867), classical philologist, born at Karlsruhe. Having since 1803 studied under Wolf, he became professor of philology in 1807 in Heidelberg, and in 1811 in Berlin, where he acted also from 1812 as director of the philological, and from 1820 of the pedagogical, seminary. His *Public Economy of Athens* (1817; enlarged 1840), of which there is an excellent translation by A. Lamb (1857), presents a complete and minute picture of classic Athens from every point of view. His edition of Pindar (1811-21) establishes the present basis of metre. His great work, *Corpus Inscriptionum Græcarum*, was continued by Franz, Curtius, Kirchhoff, and Röhl (1828-77). His minor writings appeared in 7 vols. (1858-74).

**Boehler, Peter** (1712-75), Moravian bishop, was born in Frankfort-on-the-Main, Germany, graduated at Jena, and in 1737 was ordained a Moravian minister by the founder of the brotherhood. He was sent as a missionary to the negro population of Carolina and Georgia, 1737, and, meeting with the Wesleys in England on his way, is recorded as having been the instrument for converting John Wesley. Boehler's mission in the South was broken up by the war with Spain in 1740, and he removed to Pennsylvania and there established the Moravian settlement at Bethlehem. He visited Europe in 1741 and 1745, and in 1748 was made bishop of England, Ireland, Wales and America. He resided in Germany after 1764, having been made one of the directors of his order. See Lockwood's *Life* (1868).

**Boehm, Sir Joseph Edgar** (1834-90), British sculptor, born

SIR JOSEPH EDGAR BOEHM'S STATUE OF QUEEN VICTORIA IN WINDSOR CASTLE.  
VOL. II.—11

in Vienna, and studied in Italy, France, and in England, where he settled in 1862, and was elected A.R.A. (1878) and R.A. (1882). His chief works are: Statue of Queen Victoria (1869) in Windsor Castle, of Carlyle at Chelsea, and of Wellington at Hyde Park Corner; the Duke of Kent Monument in St. George's Chapel, and the Stanley Sarcophagus in Westminster Abbey. Boehm was appointed sculptor-in-ordinary to Queen Victoria (1881), and created baronet (1889).

**Boehme**, or **BOEHM** (called also in England **BEHMEN**), **JAKOB** (1575–1624), German philosopher and mystic, was born at Altseidenberg, near the town of Görlitz. As a boy he conceived a profound mystic sense of God in nature, which seemed an intimate revelation; and this emotional temperament grew into a consuming passion for truth. Boehme's books were limited to the Bible, in which he was deeply versed, and to a few theosophical and alchemistic writings, such as those of Paracelsus; and the task before his illiterate genius was to shadow forth, in those obscure symbols, natural images, and poetic suggestions which were his only instruments, philosophical conceptions which were new to his age, and which later were not easily expressed by Hegel. For Boehme, God is the One from whom all creation proceeds by His self-differentiation into a negation of Himself. Spirit cannot be, except it distinguishes that which is not itself from itself; and this inner difference, beginning in God, and reproducing itself in all consciousness, is the principle by which the whole world is evolved. This negation of self, by which self arises, is variously identified with evil; and, again, the doctrine of the Trinity is never far from Boehme's meaning when he writes of the divine self-destruction. His earliest work, *Aurora* (1612), was denounced from the pulpit, and he was forbidden by the magistrates of Görlitz to write any more. This injunction Boehme obeyed for some years, but finally broke through it. Boehme's collected works were published in Amsterdam in 1675, and again in 1730, and in Leipzig in 1831–46. They were translated into English shortly after his death.

**Bœhmeria**, a genus of plants of the order Urticaceæ, noted for the production of strong fibres which are made into ropes and sailcloth. *Bœhmeria nivea*, the China Grass, is cultivated in Asia and the warmer parts of Europe and the Americas. It is a shrubby plant, with two forms, one being more robust, and known as rhea or ramie. The fibre is extracted from the stalk by hand-stripping,

boiling, or machinery, and is of all fibres least affected by moisture. It is very strong, and can be separated into filaments almost as fine and lustrous as silk; it takes dyes well, and can be

*Bœhmeria nivea*.

1, Female flower; 2, male flower.

woven in fine and beautiful textiles, such as the Chinese grass cloth which resembles linen. It is often used for nets, fishlines, and cordage, and furnishes a superior quality of paper pulp.

**Boehm von Bawerk**, **EUGEN** (1851), Austrian political economist, was born in Brünn, Moravia, and studied at the universities of Vienna, Heidelberg, Leipzig, and Jena. He lectured at the universities of Vienna and Innsbruck, and was three times Austrian Minister of Finance. His theory of value is set forth in his book *Kapital und Kapitalzins* (1884–89; Eng. trans. by Smart, *Capital and Interest*, 1890). He considers land and labor as the only actual sources of production, and capital as the only true means of production.

**Bœotia**, a district of ancient Greece, bounded on the E. by the Eubœan Sea; S. by Attica, Megaris, and the Corinthian Gulf. Its inhabitants were said to be slow and heavy-witted. In the earliest times Bœotia was occupied by a race called the Minyæ, whose chief city was Orchomenus. The Bœotian cities were united in a league, and the history of Bœotia turns chiefly on the attempts made by Thebes to dominate this league. It was only after the battle of Leuctra, in 371 B.C., that the Thebans gained their aim; in 364 they destroyed Orchomenus. The Bœotians bore the brunt of the Greek resistance to Philip at Chæronea in 338 B.C.; and in 335 Thebes revolted against Alexander, and was destroyed, and Orchomenus was rebuilt. Henceforward, Bœotian history is unimportant. See

W. Rhys Roberts's *The Ancient Bœotians* (1895).

**Boerhaave**, **HERMANN** (1668–1738), a Dutch physician, born at Voorhout, near Leyden. Lecturer (1701), he became (1709) professor of medicine and botany, and (1714–36) rector of the University of Leyden, filling also, from 1718, the chair of chemistry. He was a pioneer in clinical medical instruction. His *Institutiones Medicæ* (1708) had great influence. Of equal merit are his *Elementa Chæmiæ* (1724). Boerhaave was the first to lecture in Holland on diseases of the eye. See Burton's *Account of Boerhaave's Life and Writings* (1743), and Johnson's *Life* (1834).

**Boers** (Dut. *boer*, a 'peasant or husbandman'; connected with Ger. *bauer*, 'peasant'), the farmers in S. Africa descended from the Dutch who founded Cape Colony in 1650. See **TRANSVAAL**, **SOUTH AFRICA**.

**Boer Wars**. See **SOUTH AFRICA**.

**Boëthius**, or **BOËTHIUS** (c. 470–524), 'the last of the Romans whom Cato or Tully could have acknowledged for their countrymen' (Gibbon). His full name was ANICIUS MANLIUS SEVERINUS BOËTIUS. He became famous for his learning and knowledge of Greek philosophy and was consul in 510, also chief of the senate. Theodoric, king of the Ostrogoths, made him one of his most powerful ministers. But his protests against the excesses committed by the Gothic officers, and especially his defence of Albinus, who with Symmachus was accused of seeking to liberate Rome, brought him into disfavor with Theodoric. He was accused of treason, sentenced to death untried, and imprisoned in the tower of Pavia, where he produced his great work, the *Consolation of Philosophy*. He was executed in 525. He wrote many works on arithmetic, geometry, logic, and music, which are extant, and translated the principal works of Aristotle. These were the chief source for the knowledge which the middle ages had of Aristotle. A defence of the Christian faith is incorrectly assigned to him. His *Consolation of Philosophy* was translated by Alfred the Great (ed. Fox, 1864) and Chaucer (pub. 1480), and more recently by James (1897). It is a dialogue between the author and Philosophy, in prose and verse. Complete works eds. of Basel (1570), Paris (1860); Peiper, *Consolatio* (1871); Friedlein, *De Institutione Arithmetica et Musica* (1867); Meister, *Commentaria in Aristotelem* (1877–80). See **Gibbon's Decline and Fall**; Bury's *Later Roman Empire* (1889); H. F. Stewart's *Boëthius* (1891).

**Bog** is spongy land containing considerable accumulations of decayed or decaying vegetable matter (peat). Bogs are most abundant in flat-lying countries, high latitudes, and near the sea, as high rainfall, cold climate, and insufficient evaporation favor their formation. There are many different ways in which they have originated. Some are old lakes which have become partly filled up; others lie in hollows in the surface of the boulder clay, left after the melting of the ice sheets of the Glacial period; others are found in the deserted loops of river channels, or in the half obliterated courses frequent in river deltas. A few are due to subsidence of the surface, owing to removal of underground materials (coal, salt, etc.). Vegetation of a peculiar type is usually abundant—rushes, sedges, grasses, mosses, algae, and other plants adapted for aquatic conditions. The economic importance of bogs is not great; peat, bog iron ore (q. v.), and bog oak (q. v.) are their most valuable products. When reclaimed by drainage they may yield most fertile soils. See PEAT; BOG PLANTS; CHAT MOSS.

**Bogardus, ANNEKE.** See JANS, ANNEKE.

**Bogardus, bō-gār'dus, EVERARDUS** (?-1647), New Amsterdam clergyman, was born in Holland, and was the second minister of New Amsterdam, where he arrived in 1633. He was almost constantly in trouble with Governors Wouter Van Twiller and Kieft, whom he publicly denounced for corrupt practices and intemperance. Both governors made counter charges, and Bogardus was returning to defend himself before the classis in Amsterdam when he was shipwrecked and drowned in the Bristol Channel. His wife was ANNETJE JANSEN, or ANNEKE JANS (see JANS, ANNEKE).

**Bogardus, JAMES** (1800-74), American inventor, was born in Catskill, N. Y. Of his various inventions the best known are the ring flyer for spinning cotton, the dry gas meter (1833), a medal-engraving machine (1836), and instruments used in rubber manufacture and in deep-sea sounding. In 1839 he gained the prize offered by the British government for the best machine for the manufacture of postage stamps.

**Bog Asphodel.** See ASPHODEL, BOG.

**Bog Bean.** See BUCK BEAN.

**Bog Butter** (BUTYRITE or BUTYRELITE of mineralogists), a peculiar substance, found in some of the bogs of Ireland commonly supposed to have been formed by the decomposition of the peat amidst which it is found, but more probably of

animal origin. In composition and qualities it exhibits a general agreement with bitumen, asphalt, amber, and the other mineral resins.

**Bogdanovich, bog'da-nō' vech, IPPOLYT FEDOROVICH** (1743-1803), Russian poet, famous for his mock-heroic *Dushenka* (1778), based on the story of Psyche. His works were collected in 6 vols. (1810).

**Bogert, GEORGE H.** (1864), American artist, was born in New York. He studied under Thomas Eakins, and later on in France under Puvis de Chavannes and Aimé Morot, receiving the Webb prize in 1898. He also obtained (1899) the Hallgarten prize at the National Academy of Design, and the bronze medal, Paris Exposition, 1900. His work includes both landscapes and marines.

**Boggs, FRANK MYERS** (1855), American artist, best known for his marine scenes, was born in Springfield, O., and studied art in the Ecole des Beaux-Arts, and under Gérôme in Paris. The French government (1882) bought for the Luxembourg Museum his *Place de la Bastille*, and (1883) *Isigny* for Niort museum. Other specimens of his work are to be seen in notable French collections, and in museums at Havre, Nantes, and Dieppe. His *A Rough Day, Hon-fleur*, is in the Boston Museum.

**Boghaz-Keui, bō-gāz'kū'i**, or **BOGHAZ-KOI** (ancient *Pteria*), village, province of Angora, Asia Minor; 90 miles east of Angora. It has remains of an extensive ruined city which is now proved to have been one of the great centres of Hittite civilization. In 1905-7 the ruins were scientifically explored by Winckler and Puchstein, and yielded numerous tablets of great historic interest.

**Boghead Coal.** See TORBANITE.

**Bogie, bō'gi**, the small truck forming the front part of a locomotive engine (see LOCOMOTIVE). Bogies are also usually placed under each end of other railway cars.

**Bog Iron Ore**, a spongy and porous form of limonite (q. v.), frequently found in meadows and bogs. In such situations the water absorbs much carbonic acid from decomposing vegetation, and is thus able to dissolve out oxide of iron from the rocks through which it passes. On emerging to the surface the iron is precipitated in a brown pulverulent mass which may collect in such quantities as to be used as an iron ore. The beds of clay ironstone in the Carboniferous formation have probably been formed in a similar manner. It occurs in Northern Europe and in North America, but is not

worked commercially in the United States.

**Bog Mosses.** See SPHAGNUM.

**Bog Myrtle.** See SWEET GALE.

**Bogner, bog'ner**, watering place, Sussex, England; 9 miles southeast of Chichester. It has an iron pier and an esplanade. Pop. (1911) 8,142.

**Bogo, bō'gō**, seaport, Cébu, Philippines, on Bogo Bay; 56 miles north of Cébu city; with a good harbor. Pop. 15,000.

**Bog Oak**, portions of oak trees frequently found in peat bogs, showing that a forest formerly grew where mosses and other marshy plants which form peat have supervened. The wood, though preserving its original structure and grain, is usually black, dense, and difficult to work. It is valued for ornamental purposes; and furniture and ornaments are made from it. Much so-called bog oak, however, owes its dark color to artificial treatment. Remains of birch, hazel, and beech trees are similarly found.

**Bogodukhov, bog-o-dōō'kof**, or **BOHODUKHOV**, town, Kharkov government, Russia; 34 miles by rail northwest of Kharkov. It has tanneries. Pop. 12,000.

**Bogomiles, bog'ō-milz**, or **BOGOMILI** (from Slavonic words meaning 'friends of God'), a religious sect of the twelfth century, whose chief seats were in Thrace, Macedonia, and Bulgaria, spreading over Servia, Bosnia, Dalmatia, and Croatia, where its adherents were called *Patarenes*. The teachings of the Bogomiles included the origin of evil in declension from God, salvation through Christ's teaching, the rejection of the sacraments, the use of images in worship, and the rejection of the books of the Old Testament except the Psalms and the Prophets. Severe asceticism was practiced. Basil, one of the leaders, was burned at the stake by the Emperor Alexius Comnenus in 1118, but in spite of much persecution, the sect survived until the Turkish conquest in the sixteenth century.

**Bogorodsk, bog-o-rodsk'**, or **BOHORODSK**, town, Moscow government, Russia, on an affluent of the Volga; 50 miles by rail northeast of Moscow. Silk, wool, and cotton fabrics and liquors are manufactured. Pop. 12,000.

**Bogoslov, bog'o-slōv**, or **BOGOLOF**, a group of volcanic islets in the Aleutian Islands, Alaska. Sea lions are found.

**Bogoslovsk, bog-o-slofsk'**, township, Perm government; 170 miles northeast of Perm city, Russia. It has a meteorological observatory, and important copper mines and gold workings in the vicinity. Pop. 9,000.

**Bogotá**, *bō-go-ta'*, or **SANTA FÉ DE BOGOTÁ**, the capital of the republic of Colombia, and one of the foremost cities of South America, is situated on an elevated plateau (alt. 8,670 feet) in the department of Cundinamarca, at the base of the Guadalupe and Monserrata Mountains, in the eastern range of the Cordilleras; 4° 35' N. and 74° 13' W. The climate is mild and agreeable, the temperature ranging between 57° and 61° F.; there are two rainy seasons. The city is separated into four parts by the San Francisco and San Augustin Rivers, crossed by numerous bridges. In general, the streets are regularly and handsomely built, and there are numerous imposing buildings. Grouped around the Plaza de la Constitución (Bolívar Park), which contains a bronze statue of Bolívar, are the government buildings (including the Capitol) and the Cathedral, a beautiful edifice of the Corinthian order, erected in 1563. In the Independence Park are located the pavilions of textile products, of machinery and mechanics, and of *belles artes*, wherein are exhibited the products and arts of the country. The city is noted for its culture and education, its institutions, including the University of Bogotá (founded 1572), with faculties of letters and philosophy, jurisprudence and political sciences, medicine and natural sciences, mathematics and engineering; National Academy, National Museum, three state endowed colleges, National Library (50,000 volumes), National Observatory, School of Chemistry and Mineralogy, and Botanical Gardens. Other public buildings are the old San Carlos Palace; the new Palace of the High Road, the residence of the president of the republic, the Mint, and two theatres. The city is the seat of an archbishop, and has churches and convents, with paintings by Murillo, Ribera, and others.

Bogotá has railway connection with several neighboring towns, including Soacho (7 miles), Facativivá (25 miles), Zipaquirá (37 miles), and Girardot, on the River Magdalena (52 miles). Rich mineral deposits occur in the district on the north and east, including iron, coal, salt, limestone, fire clay, manganese, and precious stones. The government salt mines at Zipaquirá are an important source of revenue. The principal manufactures are textiles, pottery, glass, cordage, matches, brewing, flour, and shoes. There are large electric lighting plants and electric railways.

Founded in 1538 by Quesada, the town was called Santa Fé,

VOL. II.—Oct. '19

and in 1598 became the capital of the Spanish viceroyalty of New Granada. Pop. (1912) 121,257.

**Bog Plants.** The extensive areas, especially in the colder regions of the Northern Hemisphere, which are covered by bogs and marshes have a highly characteristic flora that is distinct from the fully aquatic plants on the one hand, and from the ordinary terrestrial flora on the other. The most important and widely distributed of bog plants are the bog mosses (see SPHAGNUM); but higher cryptogamic plants also occur, notably the horsetails (see EUISETUM), and occasionally also rarer forms like pilularia. Many sedges and rushes, reeds and grasses, are also highly characteristic, while heaths constantly struggle for possession of the drier and denser spots. The bog myrtle (see SWEET GALE) often overspreads vast areas with its low, scanty brushwood, above which rise only occasional tufts of willow, or at most here and there an alder. The insectivorous plants are perhaps the most characteristic minor denizens, sundews and butterworts being thickly strewn, while the rarer blossoms of the bladderwort rise golden from their stagnant pools.

**Bog Spavin,** a fluctuating swelling on the inner and front part of the hock of a horse, arising from a distention of the joint capsule with synovial fluid. See HORSE, *Diseases*.

**Bogue, VIRGIL GAY** (1846-1916), American civil engineer, was born in Norfolk, N. Y. He was graduated from Rensselaer Polytechnic Institute with the degree of C.E. in 1868, was assistant engineer of Prospect Park, Brooklyn (1868-9) and assistant engineer of the Oroya Railway and manager of the Trujillo Railway Company, in Peru. In 1880 he became assistant engineer of the Northern Pacific and during his services in that capacity discovered Stampede Pass, through which he constructed a famous two-mile tunnel. Six years later he became chief engineer for the Union Pacific, and from 1891 until his death was in independent practice. He was a member of the commission appointed by President Harrison to investigate methods for improving the Columbia River and consulting engineer for the Government of New Zealand on the railroad across South Island.

**Bogue Forts.** See CANTON RIVER.

**Boguslav, bō'gu-sláf'**, ancient town, Kiev government, Russia, 70 miles southeast of Kiev. It has cloth manufacture and trade in wool, leather, and sheep skins. Pop. 9,000.

**Bogutschutz, bō'gōot-shüts,** town, province Silesia, Prussia, immediately northeast of Kattowitz, with coal mines and zinc furnaces. Pop. (1910), 22,923.

**Bohain, bō-ah'**, town, department Aisne, France; 13 miles northeast of St. Quentin. It has brewing, tanning and dyeing industries. During the World War (1914-19) it was occupied by the Germans, who used it as a centre for detaining troops and stores, and who left it in ruins in their retreat before the Allied advance that ended the war. Pop. (1911) 6,877.

**Bohemia** (Bohemian *Chekky* or *Cechy*; German *Böhmen*), formerly a kingdom of the Austrian Empire, forming since 1918 a constituent part of the new Czechoslovak Republic (q.v.). It is bounded by Saxony on the north, Bavaria on the west, Silesia on the northeast, Moravia on the east, and Upper Austria on the south. Its area is about 20,065 square miles.

Bohemia is fenced in by lofty mountain ranges—the Bohemian Forest on the southwest, the Fichtelgebirge and Erzgebirge on the northwest, and the Isargebirge, Riesengebirge, Adlergebirge, and other chains of the Sudetic system on the northeast. A broad but relatively low hilly region, constituting the watershed between the Elbe and the March, marks it off from Moravia; and the determining feature of the interior is the River Elbe. From the Bohemian Forest the surface slopes toward the Elbe in a series of terraces and hilly plateaus trenched by the Moldau and its tributaries. The only level tracts are the small expansions of the river valleys—e.g., at Prague, Pilsen, and Budweis. The climate resembles that of the interior of Germany, but is more severe in the mountainous parts on the borders than in the low-lying Elbe valley. The mountain peaks are snow-covered most of the year. The annual mean temperature is 46½° F.

With a fertile soil, an industrious population, and abundant mineral deposits, Bohemia's resources are extensive. Forests cover 29 per cent. of the surface; the remainder is under cultivation or under grass. Cereals thrive in the lower northern districts, potatoes and oats in the higher grounds. Beet root is extensively grown for sugar. Cattle raising is carried on extensively, and in the South geese are an important source of wealth. The most important minerals are coal and lignite, silver, iron, and graphite, with lead, tin, antimony, and gold. The lignite mines stretch along the foot of the Erzgebirge from Aussig to Eger, and produce annually

some 18,000,000 tons; while the bituminous coal mines, most of them around Kladno (west of Prague) and Pilsen, yield over 7,000,000 tons. Iron ore is mined near Prague, Pilsen, and Falke- nau, to the extent of 700,000 tons per annum; of this, some 300,000 tons of pig iron are smelted at Prague and Pilsen. The mining of gold was revived in 1903, the principal mines being at Mount Roudny and at Krasna Hora. Along the northwest border are the well-known mineral springs of Karlsbad, Marienbad, Franzensbad, Teplitz, Bilin, Johan- nisbad, and Sedlitz.

The most important industry is sugar manufacturing; over 500,000 tons of raw sugar being

The Bohemians, or Czechs (Chekhs), are mostly of Slav stock, and have been settled in the country since the fifth century. About 37 per cent. of the population is of German descent, mostly town dwellers, and between them and the Czechs—mainly the peasants and aristocracy—there exists a bitter race enmity. About 96 per cent. of the entire population is Roman Catholic; 1½ per cent. is Jewish. At the end of the Thirty Years' War (1648) Bohemia had barely 800,000 inhabitants; in 1772 she had 2,314,795; in 1857, 4,705,527; in 1910, 6,774, 309, and in 1913, 6,820,610 (est.), giving 338 to each square mile over the total area of 20,052

the great monarch of Moravia. Little is actually known of their history, however, till the time of Wenceslaus I. (Vaclaw), who was crowned king in 1230. His son, Premysl Ottokar II (1253-78), undertook an expedition against the heathen Prussians, many of whom were converted. He defeated the Hungarians with great slaughter in 1260, and was himself eventually defeated and slain (1278) by Rudolph of Hapsburg, near Marchfeld. He was succeeded by his son Wenceslaus II. (1283-1305), who died suddenly in the midst of preparations to invade Austria; and he by his son Wenceslaus III., whose assassination at Olmütz a year later ended the male

John Bartholomew & Co.

produced yearly. Cloth and other woollen goods are manufactured at Reichenberg, Aussig, Friedland, and Asch; cotton goods at Prague, and generally from Reichenberg westward to Brüx; carpets at Reichenberg and Eger; linens at Trautenau, Schönberg, and Hohenelbe; beer at Pilsen, Budweis, and Eger; glass at Prague, Eger, Pilsen, Gablonz, and Karlsbad. About 200,000,000 gallons of beer are brewed annually, that of Pilsen and Budweis having a world-wide reputation, and the glass trade has been in a flourishing condition since its introduction from Venice in the thirteenth century, Bohemian glass being universally known for its beauty. Of less importance are distilling, engineering, paper making, and printing. Bohemia is the centre of an active trade, and the Elbe is of the greatest importance as a means of communication.

square miles. The capital is Prague (q.v.), the seat of the oldest of the German universities, founded in 1348. Other large towns are Pilsen, Budweis, and Aussig.

**History.** — When Bohemia (with which we here include Moravia) is first mentioned in history we find it occupied by the Boii, a Celtic tribe; hence the name Böhmen (German *heim*, or home, of the Boii). The Boii were overcome (first century B.C.) by the Marcomanni; and when the latter had been crushed by other tribes, the Slavonic Czechs made their appearance (about 450 A.D.), and have since occupied the country.

The Bohemians are supposed to have been tributary to Charlemagne. Christianity was introduced among them by Cyril and Methodius in the ninth century, and for a period they fell under the dominion of Svatopluk,

line of the dynasty of Premysl.

After the very short and fruitless reigns of another Rudolph of Hapsburg and Henry of Carinthia, the choice of the Bohemians fell upon the only son of the German Emperor Henry VII., John of Luxemburg, who was succeeded by his son Charles IV. (1346-78), a great lover of the Bohemian language, and the founder (1348) of the University of Prague. Charles was followed by his son Wenceslaus IV. (1378-1419), whose reign is notable for the beginning of the religious movement led by John Huss (q.v.), which, strongly leavened with nationalist aspirations, resulted in the Hussite War (See HUSSITES, WAR OF), and continued to agitate the country for nearly a hundred years. In 1419 Wenceslaus was succeeded by his brother Sigismund, who, like his two predecessors was also Emperor of

Germany. The reformers led by John Ziska (q.v.) refused to recognize the new sovereign, but a compromise was eventually reached and he entered Prague in 1436.

Albert, Duke of Austria, Sigismund's successor, reigned for only two years (1437-9), and upon the death of his posthumous son Ladislaus, George Podiebrad (q.v.), who had proved himself an excellent regent, was unanimously chosen (1458) king by the Bohemian Estates. He was regarded with the greatest abhorrence by Pope Paul II.; and was engaged in continuous fighting with Matthias Corvinus, the vigorous king of Hungary, whom he succeeded in driving completely out of Moravia. His successor, the Polish prince Ladislaus (1471-1516), was elected (1490) to the throne of Hungary, and removed the royal residence to Ofen, where his son and successor, Louis (1516-26), also resided. After the death of the latter in the battle against the Turks, led by Sultan Solyman at Mohacz, Bohemia and Hungary passed into the hands of Ferdinand I. of Austria, who had married Louis' sister.

From this time forward the history of Bohemia merges in that of Austria. In 1547 Ferdinand crushed a movement for the restoration of certain ecclesiastical and political liberties which had been usurped by the king, and in 1556 he introduced the Jesuits, who had a great reactionary influence upon the country. He died in 1564, and was succeeded by his son Maximilian (Emperor Maximilian II.), who had a short but troubled reign. Maximilian was succeeded by his son Rudolph, who also became German Emperor (Rudolph II.) and king of Hungary, with his residence at Prague, which thus practically became the capital of the Austrian dominions. Rudolph ultimately was compelled by his subjects to grant (1609) the celebrated Letter of Majesty, which ensured religious toleration, and this was confirmed by his successor Matthias, and later by Ferdinand II., whose election to the Bohemian throne Matthias had secured. Ferdinand's toleration of Protestantism, however, was mere pretence; the religious struggle was soon renewed; and on May 23, 1618, occurred the so-called defenestration whereby Slawata and Martinitz, Ferdinand's representatives at Prague, were seized by the patriotic Protestant party and flung out of the windows of the palace, an event which precipitated the war that was to desolate Bohemia and all

Germany for thirty years. (See THIRTY YEARS' WAR.)

In 1619 Ferdinand was formally deposed by the Bohemian Estates, and Frederick, the Protestant Elector Palatine, was chosen in his stead. The new king, however, was unequal to the task that confronted him, and after the Battle of White Mountain fled, leaving his followers to their fate. Many of the leading Protestants were executed, others were driven into exile, and their lands confiscated; the political and religious liberties of Bohemia were destroyed, and even the national language began to decay. Over a hundred and fifty years later religious freedom was restored by the Edict of Toleration in the reign of Joseph II. (1780-90).

Revolutionary movements agitated the country in 1848; and the ensuing years were marked by increasing rivalry between the Czechs and Germans and by almost continuous agitation by the young Czech party for political autonomy. The Great War (q. v.) brought these dissensions to a climax. The reluctance of the Bohemians to fight for the Central Powers led to serious repressive measures, and on Oct. 28, 1918, revolutionists seized Prague. In the meantime Czech and Slovak emigrants had organized (1916) a Provisional Government abroad, with headquarters at Paris. The two movements combined, and Bohemia became thereby a part of the new Czechoslovak State (See CZECHOSLOVAK REPUBLIC).

Consult Monroe's *Bohemia and the Czechs* (1910); Capek's *Bohemia under Hapsburg Misrule* (1915); Nosek's *Independent Bohemia* (1918).

**Bohemia: Language and Literature.**—The Bohemian language belongs to the western branch of the Slavonic languages, and is closely connected with Slovakish, which is spoken in the northern parts of Hungary. Bohemian literature may be divided into three leading periods—(1) from the beginning till the Hussite wars (1410); (2) from the time of Huss to the latter part of the eighteenth century; (3) from the renaissance of the literature to the present day.

The earliest productions are religious in character. The Greek Church is represented by a Glagolitic fragment (c. 900), the Latin by a fragment of St. John's Gospel, with an interlinear Bohemian translation of somewhat later date. The greater part of the Bible was translated by the end of the thirteenth century, and in the fourteenth the whole was complete. The Latin *Alexandriensis* was freely translated into Bohemian between 1240 and

1250, and legends of Christ and several saints were current towards the close of the century. To the fourteenth century belongs the chronicle called after Dalimil, although the real name of the author is unknown. It is in verse. Some clever satires were written by Smil of Pardubitz, surnamed Flaska, who was killed in 1403. To this period also belong *The Book of the Old Lord of Rosenberg* (*Kniha Stareho Pana Rozenberka*), one of the earliest specimens of Bohemian prose; and the *Exposition of the Law*, by Andrew of Duba. Pulkava, a priest, who died in 1380, wrote another prose chronicle; and here must be mentioned the *Weaver* (*Tkadlecck*), in which the anonymous author celebrates the beauty of a certain Adelicka. Thomas of Stitny, who writes on religious and moral topics, is the great Bohemian author of the fourteenth century. His prose is remarkable for the period.

The second period begins with the name of Huss, who did a great deal to settle Bohemian orthography, and to develop Czech literature. Some of his writings are in Latin, but he left a fair number in Bohemian. Peter Chelický (1390-1460), a pupil of Huss, wrote a celebrated work, the *Net of Faith* (*Sit Viry*). In 1487 the first regular printing press was set up at Prague, and the Bible was printed there in the following year. Some interesting volumes of travels were published. Gelenius and Velslavin (1546-99) worked as humanists, and did much to spread the Renaissance in Bohemia. Hajek (1495-1553) wrote a curious chronicle, *Kronyka CzeKa*, with which he incorporated all the early Bohemian legends, so that his history is more amusing than reliable. Harant published his travels in the Holy Land, and we have the narrative by Wenceslaus Vratislav of Mitrovitz and his captivity at Constantinople. John Amos Komensky (more familiar to Englishmen in the Latin form of his name, Comenius) composed his valuable works on education, in exile. He died in Holland in 1670 (born in 1592).

It was not until nearly the close of the eighteenth century that a revival of Bohemian literature took place. It began with Joseph Dobrovsky (1753-1829), who wrote a grammar of Czech and an epoch-making work on Old Slavonic (Vienna, 1822). Jungmann (1773-1847) compiled a valuable dictionary, and Kolár (1793-1852) and Celakovsky (1799 - 1852) gained reputation as poets. In our own

days Bohemian literature has been greatly developed. Palacky (q. v.) was the author of the great national history completed in German in 1867 and in Bohemian in 1876. His literary labors were carried on by Tomek and Gindely (q. v.). Other historians of note are Joseph Kalousek, Constantine Joseph Jirecek, author of a history of Bulgaria, Dr. Resek, Cenek Zibrť, Josef Emler, J. Pekar, and Karel Erben.

Among the most celebrated poets are Jan Vrchlicky (1853-1912), a voluminous writer, Sladek (1845-1912), Halek (1835-74), Zeyer (1841-1901), Henrietta Pech, whose works appear under the name of Eliska Krasnohorska; Svatopluk Cech (1846-1908), one of the greatest of modern epic poets; Josef Machar (1864); Frantisek Svoboda (1860); Neruda (1834-91); Sova (1864); Pězruc (1867), and Brezina (1868), the three last being authors also of admirable works in prose.

The first to collect the folk-tales of the country was Bozena Nemcova (1820-62), while Scharfík (1795-1861) was the first to treat scientifically the ethnology of the Slavonic races. His book is familiar to most students in the German translation *Slavische Alterthümer* (1837). Other prose writers of note are Karolina Svetla (1830-99), Rais (1859), Sezima (1876), Klostermann (1848), Simacek (1860), Saldá (1867), Capek (1890), and Srámek (1877).

**Bohemian Brethren.** See MORAVIANS.

**Bohemian Forest** (Ger. *Böhmerwald*), a mountain range separating Bavaria from Bohemia, stretches from the Fichtelgebirge south to the Danube, some 150 miles, reaching its maximum elevation in Great Arber (4,785 ft.) and Rachel (4,770 ft.), though the average altitudes lie between 2,500 and 4,500 feet. With the exception of the highest summits, the range is covered with dense forest. It is crossed, at altitudes varying from 1,600 to 3,400 feet, by three railways and four roads, the best known being the 'golden ladder' from Passau to Strakonitz. The German and Czech inhabitants engage chiefly in agriculture and the pasturage of live-stock, made profitable by the abundant rainfall.

**Bohemond I.**, bō'hē-mond (c. 1056-1111), prince of Antioch, was the eldest son of Robert Guiscard (q. v.), under whom he served with distinction in the war (1081-5) against Alexius Comnenus, emperor of Byzantium. He took a distinguished part in the first crusade (1096), captured Antioch (1098), of which he became prince, but was him-

self captured (1100) by the Turks and imprisoned for three years, during which his cousin Tancred (q. v.) looked after his interests in Antioch. He married a daughter of Philip of France, and with a French army renewed unsuccessfully the war (1107-8) against Alexius. He died at Canossa, in Apulia. In the sovereignty of Antioch he was succeeded by six princes of his name, the principality being destroyed by the Mamelukes in 1268.

**Bohlen**, bō'len, PETER VON (1796-1840), German Orientalist, was born in Oldenburg. In 1822-4 he attended A. W. von Schlegel's lectures on Sanskrit at Bonn, and in 1828 became professor of Oriental languages in the University of Königsberg. Among his principal works are *Das alle Indien* (2 vols., 1830); *Ueber den Ursprung der Zendsprache* (1831); and translations of two Sanskrit poems in the original metre—*Bhartriharis Sententia* (1833), and *Ritusanharā, sive Tempestatum Cyclus, Carmen Kalidasi* (1840). Consult his *Autobiographie* (1841).

**Böhme.** See BOEHME, JAKOB.

**Böhmen.** See BOHEMIA.

**Böhmer**, bō'mer, EDUARD (1827-1907), German philologist and theologian, was born in Stettin. He became professor of Romance philology at Halle in 1868, and at Strassburg in 1872. His publications include an edition of Spinoza's *Tractatus de Deo et Homine* (1852); *Ueber die Apokalypse* (1855); *Das erste Buch der Thora* (1862); *Ueber die Provenzalische Poesie der Gegenwart* (1870); an edition of the poem of Roland under the title *Rencesval* (1872); *Pindar's Sizi-lische Oden mit Prosiübersetzung* (1892). He edited also the review *Romanische Studien* (5 vols. 1871-80).

**Böhmerwald**, bō'mer-vält. See BOHEMIAN FOREST.

**Böhmisch-Leipa**, bō'mish-lē'pa, town, Czechoslovakia; 40 miles northeast of Prague. It has railway work shops, calico printing, and other industries. Pop. (1921) 11,753.

**Böhmisch-Trubau**, trū'bow, town, Czechoslovakia; 32 miles southeast of Pardubitz. It has textile industries. Pop. (1921) 8,389.

**Bohn**, bōn, HENRY GEORGE (1796-1884), English publisher and author, was born in London, the son of a Westphalian book-binder. In 1841 he issued his famous 'guinea catalogue' of books, containing 23,208 items, and in 1846 he began the cheap issue of notable books with which his name is chiefly associated. Besides the *Origin and Progress of Printing* (1857), and the *Biography and Bibliography of Shakespeare* (1863), which he wrote for the Philobiblon Society, Bohn compiled several works for

his 'Libraries,' edited Lowndes' *Bibliographer's Manual* (1857-64), and published his own translations of Goethe, Schiller, Humboldt, and Petrarch.

**Bohol**, bō-hōl', island, of the Visayan group, Philippine Islands, lies between the southern end of Leyte and Cebú Islands, 70 miles north of Mindanao Island, in latitude 9° 50' N., and longitude 124° 15' E. It is a coral island, about 55 miles long, by 30 miles wide, with an area of approximately 1,441 square miles. There are no good harbors, and the north and east coasts are rendered difficult of approach by dangerous reefs.

The island has no marked elevations. In the south there are hills, but in the north the surface is either level or undulating, in few places exceeding 1,000 feet. There are four or five large rivers navigable by the native cargo boats, and some smaller streams which are often dry after the end of the rainy season (May to January). The heaviest rains occur from August to November.

Agriculture is the chief occupation, 175,000 acres of the great plateau of the interior being under cultivation. The principal products are rice, corn, sugar and copra. The weaving of cloth and blankets is an important industry; mats, raffia and nito hats, and baskets are made. With its outlying islands, Bohol constitutes the *Province of Bohol*. Area 1,511 square miles. Pop. (1918) 358,387. See PHILIPPINE ISLANDS.

**Bohr**, NIELS (1885- ), Danish scientist, was born in Copenhagen. He was educated at the University of Copenhagen, where he became professor of physics in 1916, and in 1920 director of the institute of theoretical physics. In 1922 he received the Nobel Prize in physics for his theory of the structure of the atom, which he likens to the solar system (see ATOM). In 1923 Professor Bohr lectured at various universities in the United States.

**Böhtlingk**, bet'link, OTTO (1815-1904), Russian Sanskrit scholar, was born in St. Petersburg, Russia. From 1835 to 1842 he studied oriental languages, especially Sanskrit, at Berlin and Bonn; and, after twenty-six years in his native city, settled in 1868 at Jena, and in 1885 at Leipzig. Among his works are the first European edition of the Indian grammarian Panini (1839); a Sanskrit Chrestomathy (1845; 2nd ed. 1877); and a Sanskrit dictionary (7 vols. 1855-75), in collaboration with Professor Rudolph Roth.

**Bolardo**, bō-yār'dō, MATEO MARIA (1434-94), COUNT OF SCANDIANO, Italian poet, was born in Scandiano, and educated

at the University of Ferrara. He was appointed governor of Reggio in 1478, of Modena in 1481, and again of Reggio in 1487, retaining that position until his death. His fame as a poet rests chiefly upon the *Orlando Innamorato*, a long narrative poem in which the romances of the Carolingian cycle are recast in octave stanzas. He also showed himself a worthy follower of Petrarch in his *Amorum Libri Tres* (1499), and in five allegorical eclogues written in 1471-2. He further translated from Herodotus, Xenophon, Apuleius, and Cornelius Nepos, and dramatized Lucian's *Timon* (1500). The first two parts of the *Orlando* appeared at Venice in 1486; the three parts complete at Scandiano in 1495. Ariosto (q. v.) continued the story of Boiardo's masterpiece in his *Orlando Furioso*.

**Boieldieu**, bō-yel-dyū', FRANÇOIS ADRIEN (1775-1834), master of the French school of comic opera, was born in Rouen. He studied under Cherubini in Paris, where he was appointed to a professorship in the Conservatoire, and spent most of his life in the French capital, though he was in St. Petersburg from 1803 to 1810. Of his numerous works the most popular are *Le Calife de Bagdad* (1799), *Jean de Paris* (1812), and *La dame blanche* (1825), his *chef-d'œuvre*. He possessed a charming gift of melody, and his instrumentation, though light, is always full of grace and refinement. Consult Ferris' *Great Musical Composers*.

**Boii**, bō'i-i, a Gallic tribe which at an early date crossed the Alps, and settled partly in Italy, between the Po and the Apennines, and partly in Germany, in Bohemia (which derives its name from them), and between the Danube and the Tyrol. After many wars the Romans finally subdued the Italian Boii in 191 B.C.; the German Boii were expelled, at the end of the first century B.C., by the Marcomanni.

**Boil**, a circumscribed suppurative inflammation of the skin, or of subcutaneous connective tissue, or of a gland, with the formation of a core of dead tissue. It usually begins as a small hard point of a dusky red color, which is hot, painful, and throbbing. This point extends, and the symptoms increase in severity till sooner or later, when the boil ceases to enlarge, it is of a conical form, with a broad firm base, and on the apex a whitish blister, containing a little pus. This opens, and after a few days the core is discharged, and the small cavity heals rapidly, leaving a white depressed scar. Boils sometimes subside without any breach in the skin, or any discharge. These are known as *blind boils*.

Boils are probably always caused by some abnormal condition of the blood or the nutrition of the body, though they often occur in people who appear to be in good health. They are most common in spring; are rare in young children and most frequent in older children and young adults. They often occur also during recovery from exhausting diseases. The micro-organism *Staphylococcus pyogenes* is often present.

The best application for a boil in the early stages is collodion, frequently repeated, which often prevents its further development. Later, when the pain is severe, frequent bathing with hot water, or the application of small hot poultices, will give relief and hasten the progress of the case. Incision is sometimes advisable if the patient's suffering is great. The constitutional condition must always receive attention, and any error in diet or habits corrected. Obstinate cases have been successfully treated by vaccine therapy (q. v.).

**Boileau-Despréaux**, bwā-lō'-dā-prā-ō', NICOLAS (1636-1711), French poet and critic, was born in Paris. He published his satirical *Adieux d'un Poète à la Ville de Paris* in 1660, and in 1663 he was united with Molière, La Fontaine, and Racine, in the famous 'society of four.' Boileau gained the favor of the king, who in 1677 appointed him, along with Racine, royal historiographer. *L'Art poétique* was published in 1674, with four

Through the influence of Boileau more than any other, French prose became clear, precise, and polished composition, but lost its old pith, color, and flexibility. Boileau's influence has thus been both beneficial and hurtful to French letters. For more than a hundred years he was accepted by his countrymen as the infallible 'lawgiver of Parnassus.' His authority has been reduced to a closer conformity with his deserts since the rise of the French Romantic school.

Consult Fournier's edition of Boileau; also the edition by Gidel, and Laverdet's *Correspondence de Boileau*.

**Boiler**. A steam boiler is the combination of a furnace in which fuel is burned and a closed vessel in which steam is generated. The combustion of the fuel—solid, liquid, or gaseous—in the furnace produces hot gases that act as carriers of heat to the various parts of the heating surface through which the heat is transmitted to the water by conduction. It is essential that the furnace should have sufficient volume to allow thorough mixing of the air and the combustible gases to the end that combustion may be completed before the resulting gaseous products of combustion are brought in contact with the heating surfaces of the boiler. If this precaution is not observed, the combustion is incomplete, there is waste of fuel, and probably the formation of soot and smoke. Much of the heat absorbed by the water is

FIG. 1.—Atlas Return-Tubular Boiler

cantos of the *Lutrin*, a clever serio-comic description of an ecclesiastical squabble over a reading-desk. Two cantos, concluding the poem, appeared in 1681. Between 1669 and 1677 Boileau published nine epistles, written, like his satires, on the Horatian model. His works include several critical dissertations in prose, a collection of epigrams, a translation of Longinus, *On the Sublime*, a *Dialogue des héros de roman*, and a series of letters, a number of which are addressed to Racine, extending from 1672 to 1710.

transmitted by radiation from the incandescent fuel and the highly heated furnace walls to those parts of the heating surface directly surrounding the furnace. The area of heating surface should be ample to absorb the heat so that the products of combustion may be rejected at as low a temperature as practically possible, which of course must be higher than the temperature of the water in the boiler. The heating surface comprises those portions of the boiler which are in contact with the hot gases on one side and with water on the other.

**Return-Tubular Boiler.**—The most common type of boiler in use in the United States is the horizontal return-tubular boiler, one form of which is shown in Fig. 1. Such a boiler consists of a cylindrical shell, the length of which is four or five times the diameter, with flat heads supported by stays and connected by a large number of tubes of diameters varying from 3 to 6 inches in different makes of boilers. The boiler is supported in a horizontal position by a brick setting, which also supports the grate under one end of

heat transfer and laminations in the sheet.

**Vertical Boilers.**—Vertical boilers may be of either the fire-tube or the water-tube type. An example of the fire-tube type is shown in Fig. 3. The furnace is located inside the shell and is surrounded by water except at the bottom. The annular space between the walls of the furnace and the outside shell is known as the water leg. Tubes lead from the furnace vertically upward to the smoke-box and the hot gases produced by combustion rise through these tubes and escape

but boilers of this type can be built for higher pressures.

**Locomotive Type.**—This boiler, as shown in Fig. 4, consists of a rectangular fire-box attached to a cylindrical shell called the barrel, which extends horizontally from the fire-box to the front part or smoke-box end of the boiler; the fire-box is connected to the smoke-box by a number of tubes, through which the products of combustion pass on their way to the chimney. The fire-box is enclosed completely within the body of the boiler, and consequently the four sides, and also the top or crown, are available as heating surface, which is greatly augmented by the tubes traversing the water space in the barrel. The sides and top of the fire-box, being flat, would quickly collapse under the pressure of the steam, unless special provision, in the shape of stays, was made to stiffen and support them. The tubes, in addition to acting as flues and heating surface, fulfil also the function of stays to the flat end of the barrel of the boiler, and to the portion of the fire-box opposite to it.

This type of boiler is widely used for portable power plants on construction work and in the oil fields. It also finds wide application in apartment house heating, in which event it is usually supplied with a down-draft grate, so that smokeless operation is possible.

FIG. 2.—Bigelow Horizontal Return-Tubular Boiler

the boiler, as shown in Fig. 2. The gases of combustion are caused to travel along the under surface of the boiler over its entire length and then return through the internal tubes, escaping through a breeching placed vertically above the fire-door. In this way about one-half of the surface of the shell and all of the tubes are useful in transmitting heat. The merits of this type of boiler are cheapness and simplicity. Its disadvantages are the difficulty of cleaning scale and other deposits from the interior and great destructiveness in case of explosion.

As long as the amount of steam to be obtained per square foot of boiler heating surface is low the horizontal return tubular boiler is to be preferred, as it is easy to handle and the efficiency is equal to that of the other boilers. But when the output of a single boiler gives over 7,000 lbs. per hour, the water tube type is the favorite, as it gives a high capacity, per unit of space occupied and per square foot of furnace volume.

The return-tubular boiler is seldom built for pressures over 175 lbs. since high pressures entail thick shell plates which are liable to blister due to poor

from the smoke-box to the chimney. Heat is transmitted to the water by radiation to the furnace walls, and by conduction through these walls and through the tubes. The steam space of this type of boiler surrounds the upper ends of the tubes. The parts of the tubes extending through the steam space form superheating surfaces. But if the boiler is steaming at a fair rate the ebullition at the water surface is so violent that the steam filling the upper part of the shell is more or less wet. Consequently superheating does not occur, but the exposed tube ends dry out the wet steam.

Vertical fire-tube boilers are usually built in small sizes of from 4 to 50 horsepower, although the Manning type fire-tube boiler is built up to 300 hp, and for years was largely used in textile mills. They are completely self-contained, require no brick setting, and may be shipped ready for use. Fire engines are of this type, but the vertical fire-tube boiler is also extensively used to furnish steam for small engines and for operating steam hoists such as those employed by contractors. The pressure carried is usually less than 100 lbs. per square inch,

FIG. 4.—Locomotive Portable Boiler, Erie City Iron Works

**Marine Boilers.**—The Scotch marine boiler is extensively used in marine practice. It is a horizontal, internally fired, fire-tube type of boiler, consisting of a cylindrical shell from 6 to 16 feet in diameter and of approximately equal length. Inside the shell are placed the corrugated furnace flues, which may be from one to four in number. If furnaces are placed in both ends of the boiler, it is said to be double-ended. At the rear end the furnace flue opens into a vertical combustion chamber, whose sides are stayed to the outer shell for support. From the upper end of the combustion chamber a nest of tubes leads forward to the front head of the boiler. The hot gases from the fire on a grate in the front end of the furnace flue pass to the rear into the combustion chamber and then back to the front through the tubes, escaping at the front into a suitable breeching by which they are led to the stack.

The dry-back Scotch marine

boiler, is shown in Fig. 5. The boiler pictured has the back of the combustion chamber 'dry,' or not surrounded by water.

FIG. 5.—Section of Dry-back Scotch Marine Boiler

Many Scotch boilers have a 'wet' back. The main difference lies in the fact that in the former the combustion chamber at the rear of the furnace flue is lined with firebrick at the back, laid up against a flat head riveted to an extension of the main shell. Thus, the combustion chamber is not surrounded by water, whence the name given to the boiler.

**Water-tube Boilers.**—

In boilers of this type the steam is generated from water contained in thin tubes of small diameter, by heat applied to the outside of the tubes. Circulation in water-tube boilers is mainly produced by the difference in density of the ascending and descending currents of water. In this type of boiler a small quantity of water covers a large area of heating surface, and a rapid circulation is necessary to carry off the heat absorbed by the generating tubes,

which should be arranged to facilitate the free escape of the steam.

There are many forms of water-tube boilers, some with vertical tubes and some with inclined tubes.

The inclined-tube boilers make use of either a series of sinuous headers that nest together to form the main front and rear headers, Fig. 6, or the front and rear headers may be of one-piece plate construction, the 'box' type Fig. 7.

The Babcock & Wilcox boiler, one form of which is shown in Fig. 6, belongs to the inclined-tube class. The tubes are straight and are expanded at their ends into forged steel boxes known as headers. The combination of a front and a rear header and their connecting tubes forms a section. A number of these sections are set side by side, with the tubes inclined downward from front to rear, and

the headers are joined by pipes to an overhead horizontal drum. The headers are not straight, but are of a zigzag shape, and the tubes in a single section are

FIG. 6.—Babcock & Wilcox Water-tube Boiler

FIG. 7.—Heine Box-header Boiler

staggered instead of lying in the same vertical plane. Thus, when the sections are placed side by side, the tubes in each horizontal

row are directly over the spaces between the tubes in the row directly below.

The drum and the sections connected to it by pipes are suspended from a steel framework by stirrups that pass beneath the drum near the ends, and the whole is enclosed in a brick setting so as to form a furnace chamber and passages for the hot gases. The brickwork immediately surrounding the furnace and combustion spaces is

the tubes. The grate bars are supported by transverse bearer bars, and at the rear of the grate is a brick pier called a bridge wall, the purpose of which is to prevent the fuel from falling off the rear end of the grate, as well as to force the hot gases to rise through the tubes at the front. Baffles, consisting of firebrick partitions built transversely across the tubes above the bridge wall and at a point midway between the bridge wall and the

these holes are closed by hand-hole plates that are held in place by clamps and bolts.

It will be noticed that the drums in both Fig. 6 and 7 are placed longitudinally. The water rises up the header over the furnace, and the entrained steam bubbles are released in the water space immediately above the header opening. The water then flows back to the rear header, down the header and forward through the tubes where it picks

FIG. 8.—Babcock & Wilcox Marine Water-tube Boiler. U.S.S. 'Cincinnati's' Boiler. Section Showing Path of Gases

made of refractory materials so as to withstand successfully the high temperatures produced.

The box-type inclined-tube boiler Fig. 7 is in general principles identical with Fig. 6, but as has been stated the front and rear headers are made of steel plates, box-like in form. The plate toward the tubes is dilled to receive the tube ends, which are expanded, or rolled, in place. Opposite each tube or pair of tube ends, an opening is cut in the outside plate of the header to afford access to the tube.

The fuel is burned on a grate situated below the front ends of

rear end, compel the hot gases to take a circuitous path in traveling from the furnace to the chimney. In this particular case the gases are forced to pass across the tubes three times.

The tubes are inclined in order to provide rapid circulation of the water. Since the water in the tubes has a higher temperature than that in the drum above, and therefore weighs less per cubic foot, the lighter water tends to rise and the heavier to descend.

Opposite the ends of the tubes in the headers are openings through which the tubes may be cleaned. Under normal operation

up heat from the combustion gases, and as a mass of water mixed with steam bubbles, enters the front header.

It will be seen that the surface when the steam bubbles disengage from the water is equal approximately to the cross section area of the opening between the front header and the drum. At high rates of evaporation the stream of steam and water from the front header 'geysers' into the header, and water is carried along with the steam into the steam main. This is a serious objection, especially in large boilers.

**Cross-Drum Boilers.**—To eliminate the objectionable 'geysering,' especially on shipboard where boilers are usually forced to maximum capacity, the cross-drum boiler was developed by several firms. The Alert type as developed by Babcock & Wilcox for marine service is shown in Fig. 8. The longitudinal drum of Fig. 6 is here replaced by a cross-drum, usually 42 to 48 inches in diameter. The sinuous headers are retained, and each set is connected to the drum by tubes as shown. As the headers connections enter along the entire length of the lower side of the drum, the disengaging surface is great.

**Vertical Water-tube Boilers.**—When the tubes have a slope of over 45 degrees, it is usual to class them as being of the vertical type. There are then included in the vertical horizontal-drum class two distinct types, one a boiler made up of an upper and a lower drum placed with the cylinder axis horizontally connected together by straight tubes. This type includes the Erie City vertical (Fig. 9), the Milne and the Ladd designs. As long as this type was used for medium capacities, the number of tubes possible to place in the drum shell was sufficient. But when capacities went over 24,000 lbs.

FIG. 9.—Erie City Vertical Boiler

per hour, it was necessary to employ three or more drums, which in turn forced the employment of tubes with ends bent to enter the drum radially.

**Inclined Tube Horizontal-drum Water-tube Boiler.**—The Stirling boiler was the first of

this design to be manufactured but during recent years many modifications have been introduced by various boiler manufacturers.

In the Stirling boiler (Fig. 10) the heating surface is almost wholly supplied by water tubes. The main tubes connect three steam drums above with the water drum below. The sides and back and front of the boiler are composed of brickwork, in which suitable doors are provided for cleaning, etc. In addition to the main tubes there are short curved tubes, which connect the three steam drums with one another. Above the middle steam drum is a dome with an anti-priming pipe, through which the steam is taken from the boiler. There are no brickwork supports under the lower drum, which hangs from the upper drums by the tubes, so that the whole boiler is free to expand without disturbing the brickwork. The feed-water is introduced below the water level in the backmost top drum; it then finds its way down the bank of tubes to the lower water drum. The water then passes, by means of the inclined tubes, to the upper drums. By means of suitable baffles, the furnace gases are compelled to pass up and down the various banks of tubes until they reach the flue. On account of the very large combustion chamber, the walls of which are made of firebrick, and are maintained at a very high temperature, the combustion of the fuel is exceptionally good.

The tubes are curved at their ends in order that they may enter the drums in a radial direction. This makes it a simple matter to expand the ends of the tubes tightly into the holes in the drums; whereas, if the tubes were straight and entered the drum shells at a sharp angle, it would be difficult to make water-tight joints. Manholes are provided in the ends of the drums, so that workmen may enter the drums to clean them internally.

The original Stirling boiler had three upper and one lower drum. Modern tendencies are toward two upper and one lower drum for all but the largest boilers. When capacities go to over 100,000 lbs. of steam per hour, some designers use two upper and one lower drum for the boiler but add a second section of an upper and a lower drum, with connecting tubes as an in-

FIG. 10.—Stirling Boiler

tegral economizer. This extra heating surface permits a reduction in the flue-gas temperatures.

**High Steam Pressure Boilers.**—There are two methods by which the efficiency of a power plant can be increased to any extent, either through an increase in boiler pressure or in the temperature of the steam. For metallurgical reasons a temperature of much over 750° F. is impractical, so there has been a steady increase in the boiler pressure. Also an increase in pressure reduces the amount of boiler heating surface per kilowatt of turbine output. This is due to the reduced steam consumption of the turbine with an increase in pressure. For example, with steam of 200 lbs. pressure each kilowatt capacity of the turbine would require about 1.75 sq. ft. of boiler heating surface; for 400 lbs. about 1.37 sq. ft. is needed and for 1,200 lbs., only 0.34 sq. ft. is needed. This offsets the natural increase in cost of high-pressure boilers per square foot of heating surface.

High-pressure plants, to generate cheap and dependable power, cannot be designed simply as replicas of low-pressure plants, with boilers, turbines and auxiliaries modified for safe and efficient operation under new and radically changed conditions. While the experience gained with low-pressure equipment should, of course, be utilized as far as possible at every step, the design must be worked out from the ground up. Only in this way can full advantage be taken of the fuel-saving possibilities of higher pressures without sacrificing reliability or incurring undue fixed charges.

At one time (1926-1929) it seemed that the next logical increase in pressure above 450

lbs. should be 600 lbs. However the first 600-lb. plants installed revealed that this was not correct, for the additional cost of the boilers was too high for the increase in efficiency. This difficulty was due to the problem of reheating the steam. If the boiler pressure is 450 lbs., the steam is not unduly wet until it reaches the exhaust end of the turbine; on the other hand with 600 lbs. steam, expansion to, say, 350 lbs., causes the steam to be so wet as to erode the blades in the lower end of the turbine unless the steam is reheated back to about 700° F. This reheating is accomplished by taking the steam from the turbine at about 300 lbs. pressure and passing it through a boiler or nest of tubes in a boiler setting, where the steam is reheated to 700° and is again returned to the turbine, to be expanded in the lower stages of the turbine. The thermal gain is more than offset by the cost of the reheating boiler and pipe lines. But with 1,200 lbs. boiler pressure, the thermal gain justifies reheating. Consequently modern boiler designs jump from 450 lbs. to 1,200 lbs. pressure.

There is little difference in design between a 400- and a 1,200-lb. boiler. The high-pressure boiler designers have here followed the designs at lower pressures, and where the drums were too thick for plate and rivet construction, they have been made of forgings. The machinery used during the war for making cannons has been put to good use manufacturing boiler drums, oil stills and high-pressure vessels for other purposes.

Both the vertical and the horizontal types of boilers have been used. In general it may be said that the horizontal type is somewhat cheaper on account of the cost of forged drums, but there may be cases where the space limitations in old buildings are such as to make the vertical or semi-vertical type the best choice. The arrangement of superheater, reheater and type of firing will often affect the type of boiler to be chosen. This same selection of boilers is often used abroad; although the lower cost of forged drums in Europe has caused favoring the semi-vertical boiler, and the largest installations there are of this construction.

The construction of the drums has been a most difficult one. For 1,200-lbs. pressure a 42-inch diameter drum must be about 8 inches thick. It is of course impossible to roll and rivet plates for such a drum, so forged drums are employed exclusively. These are generally a solid billet, pierced and hollow forged. The

ends are then drawn down by forging. No single method of calculation of the necessary wall thickness is acceptable to all designers.

For ordinary rolled and pressed drums the inner radius of the vessel multiplied by the pressure and divided by the allowed stress of the material used determines the thickness of the shell when increased by the seam efficiency of the tubelignament efficiency, whichever gives the thicker shell. This applies to shells up to 2 or 2 3/8 inches thick for the usual diameters used for boiler drums. The limit in pressure for this class of work is 600 lbs. to 700 lbs. pressure.

For thicker drums the problem becomes more complicated. Lame for hydraulic work adopts the formula:

$$S = P \frac{r_2^2 - r_1^2}{r_1^2 - r_2^2}$$

The A. S. M. E. code has endeavored to take care of thick cylinders by saying that 'if the thickness exceeds 10 per cent. of the radius, the outside radius must be taken in figuring the thickness' in the following formula:

$$S = \frac{r^1 \times P}{t}$$

A comparison of three proposed formulas is shown in the following table calculated for drums of 50 inches outside diameter, pressure as shown and plates 3 and 4 inches thick.

Pressure	Stress, t = 3 in.			Stress, t = 4 in.		
	Clark	Lame	A.S.M.E.	Clark	Lame	A.S.M.E.
800	6,750	6,320	6,666	4,840	4,624	5,000
1,200	10,150	9,790	10,000	7,220	6,936	7,500
1,600	13,500	12,640	13,333	9,650	9,248	10,000
2,000	17,000	15,800	16,666	12,150	11,560	12,500

At the present time this disparity does not make a great deal of difference in the usual run of cases except where a little more thickness requires the next size ingot or throws the ingot into larger furnaces and lathes.

When it comes to establishing the safe stress to use, there is a much wider discrepancy. The A. S. M. E. code provides for a factor of safety of five based on the tensile strength. Nothing is said about the temperature at which the tensile strength is to be measured, and at the lower pressures this makes no difference. There seems to be a tendency on the part of other engineers to reduce the factor of safety on the thicker drums but others feel that this is a wrong move until more

information is available on creep and other undetermined stresses.

A few tests are available on creep stresses of some steels. These tests number in the hundreds, while they must be in the thousands before definite figures are available. Tests are now made in laboratories on small samples that may represent minimum, average or maximum conditions, and, furthermore, stresses are encountered in actual boiler operation that cannot be duplicated in laboratory work, although these tests give the trend of what may be expected.

The tubes do not offer any serious problems and while tubes with 1/2 inch walls are employed, there is reason to feel that thinner tubes will be used in the future. Thick tubes must experience stress due to differences in expansion between the inner and outer wall, which would be avoided by thinner walls.

**Boiler Plate Failure.**—With the advent of high pressures and high rates of evaporation, there have been many cases of plate fracture in boilers, especially along the riveted point. Investigation has revealed that such trouble as has been experienced has occurred in boilers that used a zeolite feed water treatment; this is a caustic treatment, and it is claimed by many that the caustic soda has caused embrittlement. But this theory does not give a plausible explanation for all plate failures, for in some cases there has been no caustic condition of the feed water.

The metal fails due to progressive cracking, but the structure of the metal adjacent to the crack does not become any more brittle than it was before. The condition of the water or other corroding media in contact with the metal while under stress, however, does have a material effect upon the acceleration of the cracking. To this extent the idea of maintaining a non-destructive condition of boiler water has a sound basis. However, this is not embrittlement, but probably an action on the part of certain ingredients in the water that destroys the protective film which otherwise would form on the bare surfaces of the pit or crack that is the initial starting point of the failure. To what

extent various waters accelerate corrosion fatigue, pitting and cracking under boiler conditions has not been adequately investigated.

Any condition which produces unrelieved or locked-up stress in the boiler plate is a potential cause for eventual failure. These initial internal stresses are often not well understood, but suitable annealing will often avoid such failures. Some mysterious failures have their origin in locked-up or unrelieved stresses. Usually, however, a thorough examination of a fatigue crack will disclose that the part was subjected to repeated excess

perature for each pressure. If steam is still further heated in the absence of water, its temperature may be raised above that of saturated steam for the same pressure, and it is then called superheated steam.

The advantages of superheated steam for use in steam engines or turbines arise from the facts that it carries no moisture in suspension, has a greater heat content for the same weight, permits the attainment of higher steam temperatures, and therefore higher engine efficiency without a correspondingly higher steam pressure, and if sufficiently superheated does not condense while

heater used in connection with the Babcock & Wilcox boiler is shown in Fig. 12. It consists of a series of U-shaped tubes, the ends of which are expanded into two headers or manifolds, the whole being located between the steam drums and the upper rows of tubes, where it is in contact with the hot gases between the first and second passes. The steam enters one of the headers from the steam drums, flows through the tubes of the superheater into the other header, and thence to the outlet from the boiler. The tubes are held only at their ends and are therefore free to expand and contract under variation of

FIG. 11.—Two Tubes of Foster Superheater

stress of sufficient frequency and magnitude to account for the failure during its period of service.

It has been found by experiments in corrosion fatigue carried on at the Engineering Experiment Station, Annapolis, Md., under the direction of Dr. D. J. McAdam, Jr., that failure will be initiated under conditions of cyclic stress when the metal is exposed to a corroding medium at stress much below the elastic limit and well below the ordinary endurance limit.

There are numerous boilers in service where certain parts, due to the design, construction and operating condition, are subject to repeated loads which produce a localized fiber stress considerably in excess of 10,000 lbs. per square inch. Such boilers are likely to fail some time without regard to condition of feed water. If feed water is unfavorable, such as sea water or water high in certain salts, the fatigue failure will be accelerated. Hence while proper conditioning of feed water does have a considerable effect in retarding failure, bad water, of itself, is not the fundamental cause of fatigue cracks.

**Superheated Steam.**—Water when boiled produces saturated steam, which has a definite tem-

perature. Its effect in improving steam economy has been most marked in the case of the steam turbine, the steam consumption of which is reduced about one pound per horsepower hour for each 60° F. superheat.

The Foster superheater, illustrated in Fig. 11, consists of a series of straight, seamless steel tubes expanded into headers at the ends and having strung close together upon them rings of cast iron which serve the dual purpose of reinforcing the steel tubes and of presenting a larger surface for the abstraction of heat from the hot gases. Such a superheater may be placed in various positions in the furnaces of nearly all kinds of boilers, or it may be heated by an independent furnace of its own. It is more usual, however, to heat it by gases which have been partly cooled by contact with boiler surfaces. A superheater may also be used for heating air or other gases.

The form of super-

temperature. The headers are provided with handholes, covered by suitable fittings, through which access may be had to the ends of the superheated tubes.

**Mechanical Stokers** are used mainly for three reasons: first, to reduce the cost of boiler-room attendance by reducing the number of men required; second, to insure a more uniform and economical firing; and, third, to secure more perfect combustion and decrease the amount of smoke. The first end is especially important in large boiler plants.

FIG. 12.—Babcock and Wilcox Superheater

but in small plants which could be tended by one man there is little or no saving. The stokers on the market may be divided into three classes; under-feed stokers in which the fuel is forced continually up into, the

the ash pit and force in a blast of air by means of a blower. Stokers of the under-feed type are sometimes referred to as coking stokers, since the coal is first coked by the driving off of the volatile constituents. The

up of a series of short links joined together to form an endless belt or chain, which passes over drums at the front and at the rear and is prevented from sagging along the upper side by a series of rollers carried by the frame. The endless chain is given a continuous motion by suitable driving mechanism at the front of the boiler and the flat top of the chain travels slowly from the front of the furnace to the rear. The fuel is fed on to the grate at the front end, from a coking plate just inside the coal hopper. On this plate the coal is subjected to the reflected heat from the arch over the furnace and all volatile matter is rapidly distilled from it. It then drops on the grate, the speed of which is so timed that the coal is completely burned when it reaches the rear end of the grate, where it falls into the ash pit. The entire mechanism of this stoker is carried by a heavy frame mounted on rollers, so that it may be withdrawn from the furnace when repairs become necessary.

FIG. 13.—Riley Underfeed Stoker

fire bed from beneath; over-feed stokers in which the fuel is pushed onto the upper end of an inclined grate, the bars of which may or may not have a rocking motion; and a third class known as chain-grate stokers.

The Riley stoker, illustrated in Fig. 13, is of the under-feed type. A reciprocating plunger, driven by a small steam engine or a motor, receives coal from a hopper at the front of the boiler and forces it into the furnace and under the fuel bed, where it is gradually forced upward into the zone of combustion and spreads out sideways over the edges of the sloping retorts. These retorts form the supports for the fuel bed and are provided with air openings or tuyères, through which air is admitted to the furnace through the fuel bed. The green coal is forced in at the front of the furnace, and gradually works down the inclined retorts to the back of the furnace, where the ashes are dropped into the ash pit over a dump plate. The movement of the burning fuel is aided by the reciprocating motion transmitted to the sides of the retorts. As the freshly fed coal becomes heated, the volatile matter it contains is driven off and forced to rise through the incandescent fuel bed above, where it is either consumed by contact with oxygen or at least broken down into simpler gases which will not give rise to smoke. This form of furnace is thus especially suitable for burning bituminous or soft coal. In stokers of this general type it is customary to enclose

burning of anthracite or hard coal requires no such action as this and is therefore suitable for burning on stokers of the end-feed or chain-grate types.

The end-feed type of stoker is known as the Roney, consists of a series of bars placed crosswise of the furnace and forming a stepped inclined grate. The bars are pivoted and are connected to a driving mechanism at the front of the boiler, by which they are given a slight rocking motion. The coal is fed on to the upper end of the grate from the hopper along the boiler front, and the rocking of the bars carries it down to the

**Stokers for Small Boilers.**—

Stokers by reason of their high cost are seldom used on small boilers. Of late, however, several stokers of low first cost have been designed for application to small boilers, especially of the heating type. While one or two chain-grate stokers are available the usual small-boiler stoker is of the underfeed type. One of these, built by Leffel & Co., is shown in Fig. 15. The new unit is made in sizes suitable for boilers ranging from 150 to 2,000 sq. ft. of heating surface, and can be readily applied to existing as well as to new installations.

Referring to the illustration, it will be seen that the various

FIG. 14.—Green Chain-Gate Stoker

rear, where the ashes are dumped into the ash pit.

The Green chain-grate stoker is shown in Fig. 14, half of the grate being removed from one side to indicate the method of support. The grate itself is made

parts of the stoker are combined to form a complete assembly, which is placed in front of, and made to rest on, the same level as the boiler itself. The forced-draft fan is directly connected to the driving motor, with the re-

FIG. 15.—Leffel Stoker for Small Boilers

duction gear for the stoker ram drive in the centre. The crank driving the ram revolves in a horizontal plane instead of the usual vertical plane. By this design the gear reduction has been simplified and the space required between the motor and fan has been reduced. Manual control of the forced draft air is by a damper on the air intake of the fan. Automatic control of the complete unit is effected by a pressure-switch mounted beside the combined starter and safety switch on the boiler smoke-box.

**Pulverized-Coal Burning.**—The idea of finely crushed coal so that upon introduction into the furnace it would burn as freely as natural gas, was proposed a hundred years ago. But the commercial application began as late as 1910. Since then the development of coal grinding and handling apparatus has been exclusive, and at present about one half of the power boilers installed each year is equipped for the burning of pulverized coal.

Two basic methods are used: The central pulverizing and the individual pulverizing systems. Until recently it was the practice to place the coal pulverizers in a building separate from the boiler house. The coal was ground and conveyed to a storage bin and was drawn and conveyed to each boiler. With this system the coal had to be thoroughly dried before storage to prevent clogging of conveyor screens; this was accomplished by separately fired rotary drums or by the boiler fuel gases. This system was ex-

pensive and entailed considerable extra labor.

At present the tendency is toward the use of individual grinders and blowers, as many as

six being used on one boiler. The pulverizer is some type of paddle wheel revolving at high speed, and by impact the coal is finely pulverized (Fig. 16). A blower mounted on the same shaft as the paddle wheel blows the coal dust and part of the air supply through the burner nozzle. The remainder of the air is taken in through openings around the burner. If the coal is bituminous with the usual amount of moisture no drying is necessary. But lignite which may contain 40 per cent. of moisture usually necessitates some drying.

The location of the burners in the furnace influences its combustion efficiencies. One modern arrangement has four burners placed at the corners of a square furnace, with the coal stream issuing in a longitudinal direction. Some designs have the coal entering the furnace from the furnace roof, while in others the burner is placed in the furnace front.

**Furnace Construction.**—Modern high rates of combustion prevent the use of the plain fire brick which was customary ten years ago. Instead some protective wall must be used. The Bailey water wall consists of a series of water tubes in connection with the boiler drum; these

FIG. 16.—Coal Pulverizer with Blower Incorporated

tubes form a complete screen around the furnace and also on the bottom in case of pulverized coal burning.

To prevent damage to the tubes, the sides toward the

FIG. 17.—Cross Section of Boiler showing Water Walls and Under-feed Stoker

furnace heat are covered with a series of cast-iron plates which are faced with carborundum. A boiler with this type of furnace is shown in Fig. 17.

The Murray fin-type boiler furnace has each water tube in the furnace wall provided with two longitudinal fins. The tubes are placed far enough apart that the fins of the adjustment tubes touch and so give a complete metal jacket between the furnace and the outer brick work. These water walls have permitted high furnace temperatures and give high combustion efficiencies. As a result of these developments boilers have been built to deliver over one million pounds of steam per hour.

*Natural or chimney draft* is caused by the difference in weight between the products of combustion in the chimney and an equal volume of cooler air outside; on this account it is necessary that the waste gases should leave the boiler

at a comparatively high temperature (about 600° F.), the height and diameter of the stack having a decided influence on the temperature needed.

*Forced Draft.*—With forced draft the air is not drawn through the furnace as with natural draft, but is made to enter under a small pressure. It is therefore possible to use more heating surface for a given grate area, and the products of combustion can be discharged at a lower temperature, thus increasing the efficiency of the boiler. With a properly arranged system of forced draft, an increase in capacity, as compared with natural draft, will result. In land practice it is usual to add to the heating surface by introducing an economizer, which acts as a feed-water heater by utilizing some of the otherwise wasted heat in the flue gases.

*Induced Draft.*—In modern boiler plants it is usual, where air preheaters are used, to draw the gases from the boiler and discharge them through the air heater. At the same time air is forced through this heater and its temperature raised to about 400° F., the air then passes into the closed ash pit of stokers or into the furnace of a pulverized coal furnace. In this way some of the heat usually lost in the stack gases is recovered.

*Air Preheaters.*—Modern boiler plants are almost all equipped with air preheaters, consisting of sets of tubes or plate partitions through which the flue gases from the boiler, under the influence of an induced draft fan, pass on their way to the chimney. On the outside of these tubes or compartments air for the furnace is drawn by a fan and forced through ducts to the stoker or pulverized-coal furnace.

This arrangement increases the boiler efficiency by decreasing the temperature of the gases entering the stack. The situation might be pictured as one where a certain amount of heat leaves the boiler in the gases of combustion. Part of this heat is short circuited through the air preheater and returned to the furnace. A furnace air of about 400° is as high as safety allows on account of damage to stoker parts or to the furnace. In many instances when the air preheater is installed, the feed water economizer is left out of the design; in others both are employed, though seldom is this justified.

*Feed-water Heaters.*—One of the most important means for the increase of boiler-plant efficiency consists in heating the feed-water as much as possible before its entry into the boiler. This is best done by utilizing some of the heat of the products of combustion which would otherwise escape up the chimney. One of the best known forms of apparatus for this purpose is Green's economizer (Fig. 18), which consists of a number of vertical cast-iron pipes about 4 inches in diameter and 9 feet long, connected at the top and bottom by longitudinal headers, termed boxes. These boxes are connected by top and bottom branch pipes, placed lengthways on opposite sides of the economizer, and on the outside of the brickwork with which it is encased. The feed-water is pumped into the economizer at the lower branch pipe nearest the point of exit of the flue gases, and emerges from the upper branch pipe nearest the point where the flue gases enter. In an economizer the temperature of the water may be brought up nearly

FIG. 18.—Green's Economizer

to the temperature of evaporation, leaving only the work of evaporation to be done by the boiler. Economizer surface is more efficient in transmitting heat than an equal amount of boiler surface on account of the

FIG. 19.—Alberger Vertical Feed-Water Heater

lower temperature of the contained water, and it costs considerably less.

Very often the feed water supplied to the economizer is first sent through an exhaust-steam heater, where its temperature is raised to from 120° to 200° F. After leaving the economizer, the water has a temperature of from 200° to 300° F. The gases that leave the economizer are cooled to a temperature of 350° or less, which is too low to produce sufficient natural draught. It is therefore customary to install some form of mechanical draught apparatus in connection with an economizer.

There are many forms of feed-water heaters in which the feed-water is heated by means of the exhaust steam from engines or pumps. The Alberger feed-water heater (Fig. 19), which may be taken as an example, consists of a large number of helically corrugated copper tubes through which the feed-water flows. Partitions in the heads are so arranged that the water is com-

pelled to flow twice in each direction the full length of the heater. The corrugations cause rapid mixing of the water and increase the rate of heat transfer. The exhaust steam enters the shell at the bottom and surrounds the tubes. Suitable drains and blow-offs are provided at the bottom to remove the condensed steam and any sediment deposited by the water when it has been heated. This type of heater, in which the water and steam do not come in contact, is called a closed heater. Many closed heaters consist of U-shaped or spiral coils of pipe enclosed in cylindrical shells and surrounded by exhaust steam.

The Hoppes feed-water heater (Fig. 20) is of the open type; that is, the exhaust steam is mingled directly with the feed water. To promote the rapid mixture of the steam and water the latter is caused to flow in succession over a series of trays which are removable and serve also as receptacles for the lime and magnesia precipitated from the water by the heat. The water then falls into a settling chamber, from which it is drawn off and pumped to the boiler. The exhaust steam enters through an opening in the front head and strikes the baffle plate of an oil separator, which removes the oil carried along with the exhaust steam. It is important that such a heater be provided with some efficient means of removing the engine cylinder oil present in the exhaust steam, because, if the oil were pumped into the boiler with the feed water, it would collect on the plates and tubes and might lead to overheating, resulting in the formation of bags and blisters.

High-pressure steam generating units, to obtain an approximate

regenerating cycle, almost universally employ from three to five stages of feed-water heating. This is obtained by tapping the turbine at three or more points to draw off steam at different pressures, which supplies are used to raise the temperature of the feed water in successive steps. The high-pressure bleed points are such that the heaters taking steam from these points are located on the pressure side of the boiler-feed pump. Therefore, in stage heaters in the feed cycle of modern high-pressure units, it is not unusual to have pressures from 900 to 1,600 pounds in the hydraulic circuit, and pressures from 125 to 300 pounds in the steam space.

With the advent of these higher pressures it became necessary to discard the conventional heater employing cast iron for both water boxes and shells. Cast-steel water boxes and covers and steel shells were first employed for moderately high pressures, a departure from the conventional design early indicating the necessity for materials other than cast iron. Cast iron is inherently porous and the porosity is often not detected until after the castings have been subjected to the severe pressure and temperature conditions encountered in stage heating service, and is not reliable. The latest heater designs are made entirely of plate steel, with an arrangement to expel the air entering with the steam.

*Feed-Water Treatment.*—Formerly no attempt other than settling of the mud was made to supply boilers with clean non-scaling water. Consequently as soon as the water became heated it threw down its carbonates

FIG. 20.—Hoppes Feed-Water Heater and Purifier

which speedily formed a hard scale in the tubes. Weekly descaling operations were necessary if any degree of boiler efficiency was to be obtained. With the event of high pressures and high rates of evaporating even a thin coat of scale which is a poor heat conductor might cause a burned tube. This condition led to various methods of heating the water to either remove the scale forming material or change its chemical constitution to a point where the mineral matter would remain in suspension and not settle out. Standard water - softening methods introduce six individual sodium salts. Internal treatment with chemicals or boiler compounds introduces additional sodium salts.

The continuous - blow - down method for the removal of a portion of the boiler water to minimize the soluble concentration is faulty in that the individual properties of each sodium salt are overlooked and the soluble concentration is considered as a unit mass.

Sodium sulphate and sodium chloride, contributing to mass concentration, differ from sodium nitrate, which introduces corrosion, and the carbonate, bicarbonate and hydroxide of sodium, which introduce causticity. Except under the most favorable conditions wherein the sulphate of sodium predominates, chemical control is necessary to establish a minimum causticity and to maintain the correct sulphate-alkalinity ratio for the prevention of embrittlement. Soluble concentration, therefore, introduces factors that of necessity require chemical control in contrast to the insoluble concentration which is removable.

The presence of sodium bicarbonate or sodium carbonate in feed-water results in a high concentration of caustic alkalinity in the boiler. Water-softening procedure usually introduces into the feed-water one of these sodium salts, which, under the high temperature in a boiler breaks down to caustic soda. Investigation has disclosed that the presence of uncontrolled caustic in the boiler water leads to embrittlement, or at least plate fractures are more prevalent when the feed is highly caustic. Further, it has been determined that to minimize the effect of caustic in the boiler, a definite ratio between the sulphate content and the alkalinity must be maintained. A safe sulphate ratio has been established for each working pressure, and with increasing pressures proportionately higher sulphate ratios are required. The use of

other salts, such as tannates and phosphates, for the prevention of embrittlement is still in the experimental stage. It is for this reason that the sulphate-alkalinity ratio has been accepted in boiler-water conditioning as the only safe index in the prevention of embrittlement.

It is evident that in allowing a high alkalinity to develop in a boiler, a greater concentration of sodium sulphate will be required. A critical condition is reached with high alkalinity wherein the proper ratio establishes an excessive soluble concentration; or, in the absence of the proper ratio, protection is not provided against embrittlement.

For the proper control of concentrations the initial procedure is to provide the correct means for conditioning the feed-water. Water-softening methods designed to convert scale-forming salts to soluble salts introduce the component elements responsible for high caustic alkalinity. Correct conditioning minimizes the alkalinity, and, in so doing, reduces the soluble concentrations in the boiler, thus facilitating the prevention of embrittlement.

Available means for the control of concentrations in boiler water include deconcentrating equipment and the continuous blowdown system with heat exchanger. Deconcentration involves the definite chemical control of reactions within the boiler to produce the maximum quantity of suspended solids or sludge, and the continuous circulation of a portion of the boiler water to a settling tank where the suspended solids deposit and from which the clarified water returns to the boiler.

Continuous blowdown, with the transfer of heat units to incoming feed-water by means of a heat exchanger, is a dilution method. The dilution process involves the removal of a portion of the boiler water and its replacement with fresh water, whereas deconcentration provides for the separation and removal of impurities without the waste of the purified water.

**Boiler Fittings.**—Every boiler should be provided with one or more safety valves. A safety valve should not permit the pressure of the steam in the boiler to rise above a fixed limit; and when the blowing-off pressure is reached, it should discharge steam so rapidly that little or no increase in the pressure of the steam can take place, however rapidly the steam may be generated. The standard form of safety valve is the spring-loaded safety valve. The lever safety valve is rapidly becoming obsolete.

A reliable gauge to indicate the steam pressure is also a necessary adjunct to a boiler; it should be removed from the boiler at regular intervals and tested, for gauges are liable to get out of order when in constant use, and to give inaccurate indications of pressure. A boiler should have a water gauge to show the height of the water at all times. It is also customary to provide gauge cocks, which are more dependable, although not so convenient as gauge glasses. The bottom portion of the gauge should be fixed so that when the water is in sight in the glass there should be sufficient water above the furnace crown; generally from 4 to 6 inches.

Small boilers are often fed by injectors, but larger boilers usually receive their water supply from centrifugal or direct-acting feed pumps.

**Boiler Rating.**—In the past the capacity of a boiler as a steam generator was commonly expressed in *boiler horsepower*, i.e., the evaporation of 34.5 pounds of water per hour from a temperature of 212° F. into steam at the same temperature; or, as it was usually stated, it is the evaporation of 34.5 pounds of water per hour from and at 212° F. As the evaporation of 1 pound of water from and at 212° F. requires 970.4 British thermal units, a boiler horse-power was equivalent to 33,497 B.t.u. per hour.

The amount of water that can be evaporated per hour in a boiler depends on the rate at which it is possible to produce hot gases and pass them over the heating surfaces; that is, it depends on the rate at which fuel can be burned in the furnace. Consequently the method outlined is of no value and has been replaced by the system of stating the square feet of heating surface the boiler possesses, and the total amount of steam the boiler will generate at a stated efficiency. At present the technical press and technical societies do not speak of boiler horse-power but describe a boiler as having so many *square feet of heating surface* and as having a normal output of so many pounds of steam at the given boiler pressure.

**Boiler Efficiency.**—A well arranged boiler will utilize from 70 to 80 per cent. of the available heat in the fuel; with careful operation the efficiency may be raised to 85 per cent. In case oil is used for fuel, the mixture of oil and air can be made very thorough, and a smaller amount of excess air may be used. With careful firing, as little as 10 per cent. of excess air may be admitted and an efficiency of more than 80 per cent. may be realized

in consequence. Oil fuel for steam boilers is used extensively on the Pacific Coast, in New England, and in marine practice.

difference in temperature between the hot furnace gases and the water. The iron or steel of which a boiler is usually made is

the plates has a far greater effect in hindering the conduction of heat, and thus reducing the evaporative power of a boiler, than the thickness of the plates themselves.

The chief sources of waste in a boiler are: unsuitable proportions of furnace combustion chamber, fire grate, and heating surface; deficiency or excess of air supply; incomplete combustion; radiation; priming; leaky joints, valves, cocks, etc.; scale and soot on heating surface; flue-gas waste; and leakage of air into flues through defective brickwork. All radiating surfaces in boiler and steam-pipes should be properly covered with some efficient non-conducting covering.

**Boiler Laws.**—In the United States, the most comprehensive set of rules covering the construction of steam boilers is the *A. S. M. E. Boiler Code*. This code comprises specifications for the materials to be used in boiler construction and rules for the sizes and proportions of parts, allowable pressures, methods of testing, and location of accessories. In many cases, the specifications for materials are those of the American Society for Testing Materials. The *A. S. M. E. Boiler Code* is the work of a committee appointed by the American Society of Mechanical Engineers to formulate a set of standard specifications for the construction of pressure vessels. The committee called into consultation an advisory committee made up of a large number of engineers intimately identified with the design and manufacture of steam boilers, and each section of the code was adopted only after it had received unanimous approval. It has been adopted as the legal rule governing boiler construction and inspection in a large number of States.

**Bibliography.** — Consult W. Kent's *Steam Boiler Economy*; C. E. Stromeyer's *Marine Boiler Management and Construction*; Haven and Swett's *Design of Steam Boilers* (1915); Gebhardt's *Steam Power Plant Engineering* (1918); Crofts' *Steam Boilers* (1925).

**Boiler Compositions, or COMPOUNDS.** The most objectionable impurities in water to be used for steam raising are the bicarbonates of calcium and magnesium, magnesium chloride, calcium sulphate, and, in sea water, common salt. When water containing the bicarbonates is boiled, carbon dioxide is evolved, and calcium and magnesium carbonates are precipitated. Calcium sulphate is probably the worst impurity. It is soluble in water at nearly all temperatures, and, even if present in but small quan-

FIG. 21.—Cross Section of Modern Boiler showing Air Preheater, Economizer, Draft Fans, Stoker and Superheater

Natural gas has also become a boiler fuel in the West.

The rate at which heat is conducted through the walls of a boiler depends mainly upon the

a good conductor, but the presence of even a very thin layer of scale on the boiler plates greatly impedes the passage of heat through them; in fact, scale on

tities, is deposited, either alone or with the carbonates, as a very hard, coherent scale. Magnesium chloride is decomposed on boiling, with deposition of magnesium hydroxide and liberation of free hydrochloric acid. If carbonates are present, the acid will combine with them, but forms chlorides; if not, it will corrode the steam pipes and the boiler plates above the water line.

In low-pressure boilers on board ship salt water is sometimes used, but as it becomes concentrated the salt is deposited. The degree of saturation is tested by the specific gravity. With high-pressure and tubular boilers salt water cannot be used, and a distilling apparatus or evaporator is necessary. Peaty waters contain organic acids which destroy the boiler plates, usually at the water line. The addition of a small quantity of chalk, or the mixture with a proportion of hard water, obviates this difficulty.

**Preventives.**—The bicarbonates are readily removed by heating the feed water, whereby they are deposited in the heater; or the water may be softened by the addition of lime. Caustic soda is often introduced into boilers; it combines with the carbonic acid of the bicarbonates, giving sodium carbonate, and precipitates the calcium and magnesium carbonates. The sodium carbonate then reacts on the calcium sulphate, forming sulphate of soda and carbonate of lime. If carbonates are not present in the water, washing soda may be used. These substances are, as a rule, very effective if used judiciously; but if added in excess, they cause the boiler to prime. Their presence prevents corrosion of the plates, and produces a deposit with little tendency to adhere.

One of the most successful of anti-incrustators is tri-basic phosphate of soda. It precipitates the calcium and magnesium salts in the water as a slimy mud which does not stick to the plates. Sal ammoniac is sometimes used with success, but its cost is almost prohibitive.

Besides the above saline anti-incrustators, organic substances, such as fats and oils, tannin, and kerosene oil, are used; but with the exception of the last-named substance, which seems to act mechanically, such bodies should be regarded with suspicion. A large number of patented compounds to prevent incrustation are also advertised, the basis of the majority being some form of alkali; they should not be used, however, unless their composition, as well as that of the water, is known.

**Boiling.** The act of boiling consists in the brisk transformation of a liquid into its vapor form. During the process the

heat that is applied to produce the transformation is wholly used up in effecting the change, and the temperature of the liquid remains constant at what is called the *Boiling Point* (q. v.). For boiling of foods, see **COOKERY**.

**Boiling Point,** the temperature at which the vapor tension of any liquid equals the pressure of the surrounding atmosphere, causing boiling or ebullition. The boiling point of any liquid of definite constitution, therefore, will remain constant so long as the pressure does not vary, but will fall as the pressure is decreased, and rise as it is increased. Thus, water, which boils at 100° c. or 212° f. at normal atmospheric pressure, boils at 160° c. (320° f.) when the pressure is 6.12 atmospheres, and at 40° c. (104° f.) when the pressure is .027 atmosphere; and it is even possible to reduce the pressure so low as to bring the boiling point almost to the same value as the freezing point.

The relation of boiling point and pressure finds many practical applications, as in the use of vacuum pans in the manufacture of

sugar (see **SUGAR**), and the preparation of chemical substances which would decompose at the normal boiling point of the mother liquor; in the construction of specially designed boilers for use in high altitudes, where the pressure is low and the boiling point not sufficiently high to insure proper cooking; and in the carrying out of chemical processes where the required reaction occurs at a higher temperature than the boiling point of the solution employed. Another important application is the hypsometric thermometer, which makes it possible with fair accuracy to determine the altitude of any given place by observing the temperature at which water boils (see **LEVELLING**).

When a liquid contains a solid in solution the boiling point is raised. Thus, it is necessary to raise brine to a higher tempera-

ture than 100° c. to make it boil. Furthermore, the boiling point does not remain stationary, as in the case of a pure liquid, but rises as the steam passes off and the

solution becomes more concentrated. It is therefore possible to reach a temperature of 180° by means of a strong solution of calcium chloride. The molecular weight of the dissolved solid also bears a relation to the boiling point of the solution, the difference between the boiling points of a solution and of the pure solvent being inversely proportional to the molecular weight of the substance dissolved.

**Bois-Brûlés**, bwā-brū-lā' (also known as Half Breeds), a race of people in North America, the descendants of Canadian Frenchmen and Indian women. They now number less than 35,000, found chiefly in Canada.

**Bois d'Arc**, the OSAGE ORANGE (q. v.).

**Bois Colombes**, bwā cō-lōnb', commune, department Seine, France, to the northwest of Paris, Pop. 17,500.

**Boise**, boi'-zā, capital and largest city of Idaho, and county seat of Ada county, on the Boise River, and the Oregon Short Line and Intermountain Railroads; 435 miles northwest of Salt Lake City. Here are located the State Capitol, a Federal assay office, reclamation and forestry service headquarters, surveyor-general's office, internal-revenue office, land office, penitentiary, two hospitals, Carnegie library, and several excellent schools. There are a military post and soldiers' home, and a large natatorium supplied by natural hot water, which occurs in abundance in the vicinity. Business houses and residences are heated with this water.

A flourishing agricultural, horticultural, and stock-raising region lies about the city, and rich mines occur in the surrounding mountains. It is also an important trade centre for wool. According to the Federal Census for 1919, industrial establishments number 98, with \$3,453,-398 capital, and products valued at \$3,883,280. The principal manufactures are candy, harness,

cigars, trunks, doors, and sashes. Boise has the commission form of government. It was founded in 1863 as a military post. Pop. (1900) 5,957; (1910) 17,358; (1920) 21,393.

**Boise Project**, an undertaking authorized by the U. S. Government in 1902, to irrigate from the Boise River 353,941 acres nearly all in Idaho, in the counties of Ada, Boise, Canyon, and Elmore. The project provides reservoirs at Deer Flat (completed 1912) and Arrowrock (completed 1915) holding 457,000 acre feet; the Boise River diversion dam (completed 1908), 8 miles above Boise; and a system of canals for distribution of the water to the adjacent lands on both sides of the river. Construction was begun in 1905; 112,000 acres were irrigated and under cultivation in 1922. In addition to the project lands, storage water was served to 131,300 acres of land in the vicinity under Warren Act contracts by which crops to the value of \$4,596,000 were raised in 1922. The net cost to that date was \$12,731,410.

**Boisgobey**, bwā-gō-bā', FORTUNÉ DU (1824-91), French novelist, was born in Granville, Normandy. For some time paymaster in the Algerian army, he devoted himself after 1868 to the writing of sensational detective novels. A close follower of Emile Gaboriau (q. v.), he has all his master's vigor and ingenuity; he lacks Gaboriau's sense of dramatic fitness, but his stories are at least always readable. Among the best are: *L'Homme sans nom* (1872); *Le Colonel Forcat* (1872); *L'As de cœur* (1875); *Les mystères de Nouveau Paris* (1876); *Le crime de l'Opera* (1880); *Le secret de Berthe* (1884).

**Bois-le-Duc**, bwā-le-dük'. See HERTOGENBOSCH.

**Boisserée**, bwā-s,rā', Ger. pron. boi-se-rā', SULPICE (1783-1854), German writer on art, was born in Cologne. In 1838 he became professor of archæology at Bonn. With his brother MELCHIOR (1786-1851) he formed (1803-19) at Stuttgart a collection of over two hundred old German pictures, all but forty of them now in the Pinakothek at Munich. His chief works are: *Geschichte des Doms von Köln* (1823-32); *Die Denkmale der Baukunst vom 7 bis 13 Jahrhundert am Niederrhein* (1831-3).

**Boissier**, bwā'syā', MARIE LOUIS GASTON (1823-1908), French writer, was born in Nîmes. He was professor of rhetoric at Angoulême (1846), at Nîmes (1847-57), and at the Lycée Charlemagne, Paris (1857-61), and of Latin eloquence and subsequently of the history of Latin literature in the Collège de France (1861-1906). He was elected to the French Academy in 1876

(secretary 1895-1908), and to the Academy of Inscriptions and Belles-Lettres in 1886. His works, distinguished for clearness, vividness, accuracy, and charm of style, include: *Etude sur Terentius Varron* (1859); *Cicéron et ses amis* (1865; 12th ed. 1902); *L'Opposition sous les Césars* (1875; 4th ed. 1900); *La religion romaine d'Auguste aux Antonins* (1874; 5th ed. 1901); *Promenades archeologiques: Rome et Pompéi* (1880, 1896); *L'Afrique Romaine* (1895); and biographies of Madame de Sévigné and Saint-Simon.

**Boissieu**, bwā'sye, JEAN JACQUES DE (1736-1810), French painter and engraver, was born in Lyons, and studied there under Lombard and J. C. Frontier. His 140 etchings, most of them after original designs, are regarded as the best work of the kind of that period. Among his paintings are: *Italian Landscape, with Women Washing* (Paris); *Hilly River Landscape* (Berlin).

**Boissonade**, bwā-sō-nād', JEAN FRANÇOIS (1774-1857), French classicist, was born in Paris. He became professor of Greek in the University of Paris (1812), and in the Collège de France (1828). His more important works are: *Philostrati Heroica* (1806); *Marini Vita Procli* (1814); *Tiberius Rhetor de Figuris* (1815); *Sylloge Poëtarum Græcorum* (1826); *Babrii Fabulæ* (1844).

**Boissy d'Anglas**, bwā-sē' dāng-lās', FRANÇOIS ANTOINE, COMTE DE (1756-1826), French statesman, was born at St. Jean le Chambre, in Ardèche. He was elected a deputy of the States-General; became a member of the Convention; opposed the execution of Louis XVI.; and helped to overthrow Robespierre in 1794. In the same year he became secretary to the National Convention, and was afterward a member of the Committee of Public Safety, and president of the Council of Five Hundred. He was created a senator by Napoleon (1805) and was made a peer by Louis XVIII. He wrote *Recherches sur la vie de Malesherbes* (1819-21); *Etudes littéraires et poétiques d'un vieillard* (1826).

**Boito**, bō-ē'tō, ARRIGO (1842-1918), Italian composer and poet, was born in Padua. He received a musical education at Milan, and composed, with Faccio, a cantata, *Le Sorelle d'Italia* (1862), which achieved considerable success. His opera *Mefistofele*, produced in Milan in 1868, was a failure, but Boito remodelled the piece, and it was successfully produced in Bologna (1875) and other cities of Europe. While never achieving great popularity, *Mefistofele* is to be ranked among the most important operas of the nineteenth century, as it marks the transition to the new Italian

dramatic school. It was sung in New York in 1883, 1896, and 1900. Three later operas, *Ero e Leandro*, *Nerone*, and *Orestide* have never been produced. Besides writing his own librettos, Boito performed the same office for other composers (*Gioconda* for Ponchielli, *Otello* and *Falstaff* for Verdi, *Amleto* for Faccio). As a poet he used the *nom de plume* TOBIA GORRIO.

**Bojador**, Cape, boj-a-dōr'; Port. pron., bō-zhā-dōr', a headland on the west coast of Africa, in 26° 7' N. lat., 14° 29' W. long. The Portuguese doubled this cape in 1432.

**Bojano**, bō-yā'nō, city and episcopal see, province of Campobasso, Italy; 18 miles southwest of Campobasso. It has a cathedral, a seminary, and several churches. It was the Samnite *Bovianum*, and there are ruins of a Roman theatre, a temple, and the ancient city walls. Pop. (1911) 6,439.

**Bojer**, bō'yēr, JOHAN (1872- ), Norwegian author, was born in Orkedalsoren, near Trondhjem. His first books *En Moder* ('A Mother') and *Helga*, published in 1894-5, were well received, and from that time he devoted himself to authorship. From 1899 to 1907 he lived in France, Italy, Denmark, Germany, and England, but returned to Norway to make his home. Among his writings are: *Paa Kirkeveer* ('At the Churchyard Gate,' 1897); *Rosfloiterne* ('The Wind in the Reeds,' 1898); *Et Folketoz* (1896); *Moder Lea* (1900); *Troens Magh* ('The Power of a Lie,' 1903; Eng. trans. 1920); *Liv* ('Life,' 1911; Eng. trans. 1920); *Den Store* ('Hunger,' 1917; Eng. trans. 1919); *Kjaelighetens Öine* ('The Eyes of Love,' 1909; Eng. trans. 1919); *Verdens Ansigt* ('The Face of the World,' Eng. trans. 1919); *Dijrendal* ('God and Women,' 1919; Eng. trans. 1921); *Den siste viking* (1921).

**Bok**, EDWARD WILLIAM (1863- ), American editor, was born in Helder, Netherlands, and removed to the United States with his parents in 1869. He was educated in the Brooklyn (N. Y.) public schools, became editor of *The Brooklyn Magazine* (1882); founder and manager of the Bok Syndicate Press (1886-91); and editor of *The Beecher Memorial* (1887). He was editor-in-chief of *The Ladies' Home Journal* (1889-1919) and after 1891 was vice-president of the Curtis Publishing Company, Philadelphia. In July, 1923, he offered a prize of \$100,000 for a practical plan to enable the United States to co-operate with the nations of the world in keeping world peace. His *Americanization of Edward Bok*, published in 1920, was awarded the Pulitzer Prize, as the best biography of that year.

## The Bok Peace Award

On July 2, 1923, Edward W. Bok announced an offer of a prize, thereafter known as the American Peace Award, of \$100,000 to the American who should conceive the most practicable plan by which the United States might co-operate with other nations to preserve world peace. To determine the conditions of award and to name a jury to select the winning plan, a policy committee was appointed, consisting of:

John W. Davis  
Learned Hand  
William H. Johnston  
Esther Everett Lape  
Nathan L. Miller  
Mrs. Gifford Pinchot  
Mrs. Ogden Reid  
Mrs. Franklin D. Roosevelt  
Henry L. Stimson  
Melville Stone  
Mrs. Frank A. Vanderlip  
Cornelius N. Bliss, Jr.

By the conditions of the contest, announced July 23, it was specifically provided that the winning plan must furnish a practical means whereby the United States might take its place and do its share toward preserving world peace, while not making compulsory its participation in European wars, if any such should, in the future, be found unpreventable. It was further stated that the plan might be based on the Covenant of the League of Nations (q. v.), or might be entirely apart from that instrument. The contest was open to every citizen of the United States, by birth or by naturalization, as well as to national, State, and local organizations.

Since the purpose was not only to produce a plan but also to insure, so far as might be, that it would be put into operation, it was specified that the award would be made in two payments—\$50,000 upon the selection of the plan by the jury of award, and an additional \$50,000 when the plan should be approved by the U. S. Senate or when the jury of award should decide that an adequate degree of popular support had been demonstrated for the winning plan (to be secured by popular referendum).

In order that there might be no question of the award being

made solely upon the basis of merit, no plan was to bear any evidence of the identity of its author, whose name and address were to be attached to the manuscript in a sealed envelope.

The Jury of Award consisted of:

Elihu Root, Chairman  
James Guthrie Harbord  
Edward M. House  
Ellen Fitz Pendleton  
Roscoe Pound  
William Allen White  
Brand Whitlock

The contest closed at midnight Nov. 15, 1923, and the prize-winning plan, one of 22,165 submitted, was announced Jan. 7, 1923. It proposed immediate adherence, on the part of the United States, to the Permanent Court of International Justice, and full co-operation with the League of Nations under certain important conditions, without, at present, assuming full membership.

Beginning with the significant statement that 'five-sixths of all nations, including about four-fifths of mankind, have already created a world organization, the purpose of which is "to promote international co-operation and to achieve international peace and security," the plan sets forth the proposition that 'the only possible path to co-operation in which the United States can take an increasing share is that which leads toward some form of agreement' with this organization. It then proceeds to review the part already taken by the United States in the operations of the League of Nations.

'The United States Government accredited its representatives to sit as members "in an unofficial and consulting capacity" upon four of the most important social welfare commissions of the League, viz.: Health, Opium, Traffic in Women and Children, and Anthrax (Industrial Hygiene).

'Our Government is a full member of the International Hydrographic Bureau, an organ of the League. Our Government was represented by an "unofficial" observer in the Brussels Conference (Finance and Economic Commission) in 1920. It sent Hon. Stephen G. Porter and

Bishop Brent to represent it at the meeting of the Opium Commission last May.

'Our Public Health Service has taken part in the Serological Congresses of the Epidemics Commission and has helped in the experimental work for the standardization of serums.

'Our Government collaborates with the League Health Organization through the international Office of Public Health at Paris, and with the Agriculture Committee of the League Labor Organization through the International Institute of Agriculture at Rome. . . .

'Unofficial co-operation from the United States with the work of the League includes membership in five of the social welfare commissions or committees of the League, in one on economic reconstruction, and in one (Aaland Islands) which averted a war. American women serve as expert Assessors upon the Opium and Traffic in Women Commissions.'

The question remaining then is one of *increasing co-operation* between the United States and the organized world for the promotion of peace and security, in some form acceptable to the people of the United States and 'hopefully practicable.' A number of suggestions are offered:

(1) An expression on the part of the United States of its willingness to 'co-operate similarly with the other reconstructive agencies of the League.'

(2) Extension of the same kind of co-operation, when this is requested, to 'include participation in the work of the commissions and technical committees of the Labor Organization' whose purpose it is to collect and study information on which may be based subsequent recommendations for national legislation. In this connection it is pointed out that all conventions and resolutions recommended by the first three congresses of the International Labor Organization have already been laid before the Senate of the United States and, without objection, referred to the appropriate committee. No different procedure would have been followed if the United States were a member of the Labor Organization of the League.

(3) Approval by the Senate of the proposal that the United States adhere to the Permanent Court of International Justice, for the reasons and under the conditions stated by Secretary Hughes and President Harding in February, 1923.

'These three suggestions for increasing co-operation with the family of nations are in harmony with policies already adopted by our Government, and in the last case with a policy so old and well recognized that it may now be called traditional.

'They do not involve a question of membership in the League of Nations as now constituted, but it cannot be denied that they lead to the threshold of that question. Any further step toward co-operation must confront the problem of direct relations between the United States and the Assembly and Council of fifty-four nations in the league.'

At this point the plan presents a brief review of the actual operation of the League of Nations since its inception, showing how most of the scruples and fears with which the League was regarded by some have been dissipated or disproved by the way in which it has interpreted its authority and directed its activities. This has to do chiefly with articles x. and xvi. (see LEAGUE OF NATIONS). 'Experience in the last three years,' says the plan, 'has demonstrated probably insuperable difficulties in the way of fulfilling in all parts of the world the large promise of Article x. in respect to either its letter or its spirit. No one now expects the League Council to try to summon armies and fleets. . . .

'As to Article xvi., the Council of the League created a Blockade Commission which worked for two years to determine how the "economic weapon" of the League could be efficiently used and uniformly applied. The Commission failed to discover any obligatory procedure that weaker Powers would dare to accept. It was finally agreed that each State must decide for itself whether a breach of the Covenant has been committed.

'The Second Assembly adopted a radically amended form of Article xvi. from which was removed all reference to the possibility of employing military force, and in which the abandonment of uniform obligation was directly provided for.

'Articles x. and xvi., in their original forms, have therefore been practically condemned by the principal organs of the League. . . . The only kind of

compulsion which nations can freely engage to apply to each other in the name of Peace is that which rises from conference, from moral judgment, from full publicity, and from the power of public opinion.'

The plan then points out the unwillingness of the League to intervene in any American controversy, as evidenced by its attitude toward the Panama-Costa Rica dispute in 1921 and in the Chile-Peru-Bolivia difficulties, and its obvious intention to recognize the leadership of the United States in the New World. The present standing of the League and the attitude of the United States, it sums up as follows:

'The operation of the League has therefore evolved a Council widely different from the body imagined by the makers of the Covenant. It can employ no force but that of persuasion and moral influence. Its only actual powers are to confer and advise, to create commissions, to exercise inquisitive, conciliative and arbitral functions, and to help elect judges of the Permanent Court. . . .

'It is common knowledge that public opinion and official policy in the United States have for a long time, without distinction of party, been favorable to international conferences for the common welfare, and to the establishment of conciliative, arbitral and judicial means for settling international disputes.

'There is no reason to believe that the judgment and policy have been changed. Along these same lines the League is now plainly crystallizing, as has been shown, and at the touch of the United States the process can be expedited.

'In no other way can the organized world, from which the United States cannot be economically and spiritually separated, belt the power of public opinion to the new machinery, devised for the pacific settlement of controversies between nations and standing always ready for use.'

Then follows the proposal that the 'United States Government should be authorized to propose co-operation with the League and participation in the work of its Assembly and Council' under certain conditions and reservations. These conditions and reservations we quote in full.

'1. The United States accepts the League of Nations as an instrument of mutual counsel, but it will assume no obligation to interfere with political questions of policy or internal administration of any foreign state.

'In uniting its efforts with those of other states for the preservation of peace and the promotion of the common welfare, the United States does not abandon its traditional attitude concerning American independence of the Old World and does not consent to submit its long-established policy concerning questions regarded by it as purely American to the recommendation or decision of other Powers.

'II. The United States will assume no obligations under Article x. in its present form in the Covenant, unless in any particular case Congress has authorized such action.

'The United States will assume no obligations under Article xvi. in its present form in the Covenant or in its amended form as now proposed, unless in any particular case Congress has authorized such action.

'The United States proposes that Articles x. and xvi. be either dropped altogether or so amended and changed as to eliminate any suggestion of a general agreement to use coercion for obtaining conformity to the pledges of the Covenant.

'III. The United States Government will accept no responsibility and assume no obligation in connection with any duties imposed upon the League by the peace treaties, unless in any particular case Congress has authorized such action.

'IV. The United States Government proposes that Article I. of the Covenant be construed and applied, or, if necessary, re-drafted, so that admission to the League shall be assured to any self-governing State that wishes to join and that receives the favorable vote of two-thirds of the Assembly.

'V. As a further condition of its participation in the work and counsels of the League, the United States asks that the Assembly and Council consent—or obtain authority—to begin collaboration for the revision and development of international law, employing, for this purpose, the aid of a commission of jurists. This commission would be directed to formulate anew existing rules of the law of nations, to reconcile divergent opinions, to consider points hitherto inadequately provided but vital to the maintenance of international justice, and in general to define the social rights and duties of States. The recommendations of the commission would be presented from time to time, in proper form for consideration, to the Assembly as to a recommending if not a law-making body.'

**Boke**, bō'kā, a fortified station of West Africa, in French Guinea, on the Nuñez River, about 50 miles from its mouth, and at the head of navigation when the tide is high.

**Bokelmann**, bō'kel-män, CHRISTIAN LUDWIG (1844-94), German painter, was born in St. Jurgen, near Bremen. After several years spent in business he began his career as an artist, and in 1893 was appointed professor in the Academy at Berlin. His canvases display realistic conception, a fine eye for character, and telling arrangement. Among his best known works are: *In the Pawnshop* (1875, National Gallery, Stuttgart); *An Itinerant Stall Before Christmas* (1878); *The Emigrants* (1882, Museum at

clude the dramas *The Betrothed*, *The Widow's Marriage*, *All the World a Mask*, and the poems *The Lesson of Life* (1847), *Plays and Poems* (1856), *Street Lyrics* (1865), *Königsmark*, and *Other Poems* (1869), *The Book of the Dead* (1882), *Sonnets* (1886).

**Bokhara**, bō-kā'ra, formerly a Russian protectorate of Central Asia, now joined with Khiva to form the Socialist Soviet Republic of Uzbek. It is bounded on the north by the Russian provinces of Syr Daria, Samarkand, and Fergana; on the east by the Pamir region; on the south by Afghanistan; and on the west by the Transcaspian Territory and Khiva. Area, about 79,000 square miles.

The middle and eastern por-

during the summer months, and agriculture is wholly dependent on irrigation. Wheat, barley, rice, durra, lucerne, sesame, millet, cotton, hemp, tobacco, and fruits are raised—especially melons, figs, quinces, peaches, apricots, plums, and pomegranates. The mulberry tree thrives everywhere, and silk culture is an important industry. Sheep, goats, camels, and horses are bred.

Gold occurs in the basins of the Amu Daria and the streams along its upper reaches. Salt deposits are numerous. Alum and sulphur are found in the vicinity of Samarkand, and sal-ammoniac in the mountainous districts. Manufactures consist principally of textile fabrics, made by hand, and the rugs for which the coun-

Dresden); *The Gaming Tables at Monte Carlo* (1884); *The Opening of the Will* (1879, National Gallery, Berlin); *The Arrest* (1881, Museum at Hanover).

**Bo'ker**, GEORGE HENRY (1823-90), American poet and dramatist, was born in Philadelphia. He was graduated from Princeton (1842), and subsequently made a tour of Europe. His tragedy *Calaynos* was successfully produced in London in 1849, and was followed in quick succession by *Anne Boleyn*, *Leonor de Guzman*, and the well known *Francesca da Rimini*. During the Civil War he wrote several patriotic poems which had a wide circulation, and were collected as *Poems of the War* (1864). He served as U. S. Minister to Turkey (1871-5) and to Russia (1875-9). His other works in-

clude the dramas *The Betrothed*, *The Widow's Marriage*, *All the World a Mask*, and the poems *The Lesson of Life* (1847), *Plays and Poems* (1856), *Street Lyrics* (1865), *Königsmark*, and *Other Poems* (1869), *The Book of the Dead* (1882), *Sonnets* (1886).

tions, comprising more than two-thirds of the country, are rugged and mountainous, while the western portion is divided between steppe and desert region. The chief rivers are the Amu Daria (Oxus), which flows through Bokhara in a northwesterly direction to the Sea of Aral, and divides the country from Afghanistan on the south; the Zerafshan, which rises in the mountains of the east, issues into the plain near Samarkand, and waters the western steppes; and the Karshi, which has its source in the highlands, and loses itself in the desert after a course of 60 miles. Numerous smaller streams fed by the mountain snows empty themselves into these three rivers.

The soil in the river valleys and oases is very fertile; but the climate is excessively dry, especially

try is famous. Boots and saddles, weapons, cutlery, and pottery are also manufactured. Trade is carried on chiefly with Russia, India, and Persia, special concessions being enjoyed by Russian traders. Silk, cotton, lambskins, and agricultural products are exported; tea, indigo, muslins, drugs, and manufactured articles are the leading imports. The Amu Daria River, which traverses the southern border, and the Transcaspian Railway, which crosses the country from southwest to northeast, are the chief means of communication; the rest of the country is served by caravan routes.

The population of Bokhara is estimated at about 3,000,000. The two principal races are the Uzbeqs (q. v.), to whom the reigning house formerly belonged,

and the Tajiks (q. v.). The remaining population includes Persians, Hindus, Afghans, Kirghiz, and Turkomans, with an increasing colony of Russians along the line of the Transcaspian Railway. The principal towns are Bokhara (pop. 75,000), Karshi (25,000), Khuzar, Shahr-i-Zabz, Hissar, Charjui, Karakul, and Kerminch.

Bokhara was formerly an absolute monarchy ruled by the *Emir* (Ameer) under the suzerainty of Russia, who represented Bokhara in all foreign relations, but in 1919 the Emir was expelled and a Soviet government was set up. Mohammedanism is the established religion; education is wholly along Mussulman lines. There are about 2,000 primary schools, and many *medreses* or higher schools.

**History.**—Bokhara was conquered in the seventh century by the Arabs, who were dispossessed in 1232 by Jenghiz Khan. It rose to a position of great political and commercial importance under Timur Beg (1336–1405), but in 1505 was taken by the Uzbeks. It came under Russian domination in 1868; and during the invasion of Khiva (1873) the khan assisted the Russians, and was rewarded by a large addition to his territory from the Khivan possessions on the Amu Daria. Under Abd-ul-Ahad (1885–1911), whose mental and physical weakness rendered him anxious to secure the protection of Russia, a Russian political agent was appointed, a Russian bank was established in Bokhara, and the country was practically absorbed into Russian Turkestan, in which the annexation of Merv in 1884 enclosed it. In 1919, after a revolution, a Soviet government was set up and in 1924 Bokhara and Khiva united to form a Soviet Socialist Republic.

Consult Vambéry's *Travels in Central Asia*, *Sketches of Central Asia*, and *History of Bokhara*; Curzon's *Russia in Central Asia*, and *The Pamirs and the Source of the Oxus*; Le Messurier's *From London to Bokhara*; Skrine and Ross' *The Heart of Asia*; O. Olufsen's *The Emir of Bokhara and His Country* (1911).

**Bokhara**, capital of the Soviet Republic of Uzbek, is situated in the lower valley of the Zerafshan, in the midst of trees, gardens, and orchards. It is surrounded by embattled walls of loess, about 24 feet high, pierced by eleven gates. The streets, for the most part unpaved, are narrow and winding, and are intersected by canals, which distribute the waters of the Zerafshan throughout the city. The houses are flat-roofed structures of loess. On an eminence in the centre of the town stands the Emir's old

castle, the 'Ark,' surrounded by a wall 60 or 70 feet high, which encloses as well the harem, state prison, and treasury. There are numerous bazaars, market places, mosques, and *medreses*, or colleges for Mohammedan students. One of the most beautiful mosques is Mashit-i-Kalân, attached to which is the Tower of the Dead, from which criminals were formerly hurled to death.

Commercially, Bokhara is the most important city of Central Asia. Manufacturing is carried on to some extent, but is in the hands of small artisans. Tajiks form three-fourths of the population; Uzbeks, Jews, Hindus, Kalmuks, and Afghans make up the remainder. Bokhara was a centre of Moslem civilization in the ninth and tenth centuries, and became an Asiatic capital under the Uzbek Khans. Pop. 75,000.

About 10 miles to the southeast is NEW BOKHARA, a station on the Transcaspian Railway, where Russian colonists and merchants are settled. Pop. 3,000.

**Boks'burg**, town, Transvaal, South Africa; 15 miles east of Johannesburg. It is an important gold mining centre and has several good public buildings and a fine park. Pop. (1922) 37,979, of whom 12,416 are white.

**Bol**, bōl, FERDINAND (1616–80), Dutch painter, was born in Dordrecht. He studied under Rembrandt, becoming one of his most distinguished pupils. He first painted portraits after Rembrandt, but later came under the influence of the Flemish historical painters. Several of his pictures are at the Hermitage, St. Petersburg (Leningrad). His chief work is *The Regents of the Leprosy Hospital* (1649, Amsterdam). Of his other paintings, Amsterdam possesses a portrait of Admiral de Ruyter; the National Gallery, London, has the *Portrait of an Astronomer*; the Louvre and many other Continental galleries (especially Dresden) have Scriptural and allegorical pictures.

**Bola-Bola**, one of the Society Islands. See BORA-BORA.

**Bolama**, bō-lā'ma, island, West Africa, one of the Bissagos Archipelago, belonging to Portugal. Pop. 4,000. Its largest town, BOLAMA, is the capital of Portuguese Guinea.

**Bolan Pass**, bō-lān', a narrow gorge, hemmed in by steep cliffs, ascending, in a northwest direction, from the plains of Karachi (Kurch Gandawa) across the Hala Mountains to the highlands of Sarawan, Baluchistan. The pass is about 60 miles long, and its summit is 5,900 feet above sea level. It is traversed by a military road that repeatedly crosses the Bolan River; and by the railway between Sibi and Quetta.

**Bolaram**, bō-lā'ram, military

cantonment, India, in Nizam's Dominions, 6 miles north of Secunderabad and now incorporated with it. It is the seat of military headquarters offices, its climate, owing to its elevation (1,900 feet), being salubrious. Pop. 10,000.

**Bol'as**, a weapon and hunting implement used by the Patagonians, Araucanians, and other tribes of the South American pampas. In its older form it consisted of two stone balls, grooved to hold a leather thong by which they were joined; in its modern form it consists of three balls connected by three cords of almost equal length. In use the weapon is whirled about the head and thrown at a running animal, so that the balls wind round its feet and bring it to the ground. The Eskimos of Alaska use small bolas of ivory for catching birds.

**Bolbec**, bōl-bek', town, France, in the department of Seine-Inférieure, 20 miles east of Havre. Industries include cotton and wool spinning, weaving, dyeing and bleaching, paper making, and tanning. Pop. (1921) 10,439.

**Boldini**, bol-dé'nē, GIOVANNI (1845– ), Italian portrait and genre painter, was born in Ferrara, and was educated at the Academy of Florence. He devoted himself to portrait painting in London until 1872, when he removed to Paris, where he has been associated with the modern Parisian school. Among his works are: *The Portrait of a Lady* and *Au Luxembourg* (Paris); *Ladies of the First Empire* and *Des Parisiennes* (New York City); portraits of Menzel (Berlin) and Whistler (Brooklyn); *The Spanish Dancer*; *Repose in the Atelier*; *The Connoisseur*; *Gossip*; *Kitchen Garden*; *Day Dreams*; *Fishing on the Seine*; *Delivering the Despatch*.

**Boldrewood**, bōl'd'r-wōōd, ROLF (1826–1915), the pseudonym of THOMAS ALEXANDER BROWNE, Anglo-Australian novelist, was born in London. In 1844 he settled in Victoria as a squatter and became a police magistrate and warden of the New South Wales gold fields. His first and best work of fiction was *Robbery under Arms* (1888). His other works include: *The Miners' Right* (1890); *The Squatter's Dream* (1895); *Plain Living* (1898); *The Babes in the Bush* (1900). In *Old Melbourne Memories* (1895) he has given a vivid account of his early experiences as a squatter.

**Bole**, an earthy, finely pulverulent mineral, mostly brown, but in some varieties red or yellow, found in the cavities of basaltic igneous rocks. It is employed chiefly as a pigment, and was formerly used in medicine. It is found in the Greek island of

Lemnos, in Sicily, Armenia, Silesia, and South America.

**Bolero**, bō-lā'rō, a Spanish national dance, invented in 1780 by Sebastian Zerezo. It is danced in moderately quick three-quarter time by two persons to the accompaniment of castanets and guitar. The name is also applied to the air to which it is danced. Like the *fandango* (q. v.) it is said to be originally a refinement of an African dance.

**Boletus**, a genus of hymenomycete fungi, including about 100 European species, most of them resembling the common mushroom and other species of *Agaricus*. Instead of gills, however, they have a distinct layer on the under side of the cap, dotted with pores, which are the orifices of hundreds of tiny tubes, containing the spore cases. Many of the species are edible, but a few are poisonous. *B. edulis*, the *ceps ordinaire* of the French markets, grows on the ground in places covered with heath, moss, or grass, and is wholesome and nutritious. Only the flesh of the cap is eaten.

**Boleyn**, bōl'en (BULLEN), ANNE (P. 1503-36), daughter of Thomas, a country gentleman, by Elizabeth, daughter of Thomas Howard, earl of Surrey, and later duke of Norfolk. Helped by the latter's favor, Bullen became a knight, crown officer, and ambassador; by Anne's, earl of Wiltshire and Ormond. He placed Anne at the French court (1514-21), then recalled her to that of Henry VIII. Her sister Mary was already there, married and the king's mistress—more to her father's profit than her own. Anne, a striking and clever brunette, had some futile courtships; but in 1526 she attracted Henry. He was a notoriously brief, stingy and unchivalrous lover, and she shrewdly held out for marriage. Anxious to have a legitimate son, vexed at Catherine's foreign leanings, and galled by her scant personal respect, Henry set about getting rid of her. When Cranmer's near primacy assured this, Anne, for the marquise of Pembroke to herself and children, became in September, 1532, Henry's experimental wife; later he married her (about Jan. 25, 1533). The child was born on Sept. 7, but proved to be a daughter—Elizabeth. Two worse disappointments quenched Henry's hopes.

Though lending himself to Anne's persecutions and menaces of Catherine and Mary, to the extent possibly of compassing Catherine's death, Henry early hated her for her unbridled ill temper, jealousy, and impatient scorn. He therefore thought of divorcing her, but this meant taking back Catherine and re-legitimizing Mary; and after

Catherine's death he chose rather to have his secretary, Thomas Cromwell, find pretext for the death of Anne. The latter was a vain, unqueenly woman, fond of gross flirtations; but much more was needed, and the charges affront human reason and decency: five adulteries, including incest with her brother George, Lord Rochford (amid a swarm of female spies, mostly disliking her, and no breath reaching Henry); with a conspiracy to murder him her sole bulwark against a mass of popular hatred as an enthroned concubine, causing national schism, shame, and hard times from European broils. In his fashion, Henry made the organs of public justice and his victims' families do his ugly work. Only one 'confessed' under torture, perhaps hoping pardon, or preferring the axe to further racking. Anne and Rochford were tried by peers, including their father and uncle (Norfolk), whose struggle would ruin themselves without saving them, and who had enough 'evidence' before them to quiet conscience and qualm. All five of her alleged paramours were executed. Meantime, Jane Seymour had successfully imitated Anne; but Henry, fearing further failure, in order to legitimate his natural son had Cranmer pronounce Anne's marriage invalid (on secret grounds, pretty certainly as marrying her sister's paramour). Anne was beheaded on May 19, 1536, and Henry married Jane the next day. Consult Paul Friedmann's *Anne Boleyn*; Martin Hume's *The Wives of Henry VIII*. (1905); works cited under HENRY VIII.

**Bolgary**, bol-gä'ri, BOLGHAR, or BOLGARA, village, Kazan government, Russia, on the River Volga; 80 miles south of Kazan, on the site of the ancient capital of the old Bulgarians. The town was destroyed by Tamerlane in the fourteenth century. Here, during excavations begun in 1722, many ancient coins and inscriptions were found. The Bulgarians of Bolgary were converted to Islam about 920, and were subsequently visited by Moslem travellers, especially Ibn Batuta, about 1335. During these ages Bolgary was an entrepôt of trade between Scandinavians, Russians, and other Europeans to the west and northwest, and Khazars and Moslems to the south and southeast.

**Bolgrad**, bōl-gräd, town, Bessarabia, government, Russia; 25 miles north of Ismail. It is well built; has manufactures of soap, candles, and pottery. Pop. 15,000.

**Boli**, bō'le, or BOLY, town, vilayet Kastamuni, Turkey; 135 miles east of Constantinople, on the caravan route from that city to Erzerum. It has leather, cot-

ton, and wool industries, and trade in timber. Pop. 11,000.

**Bol'ide** is a name given to a large meteor which explodes and falls in aerolites; a fire-ball. See METEORS.

**Bolingbroke**, bol'ing-brōök, HENRY ST. JOHN, VISCOUNT (1678-1751), English statesman and speculative writer, grandson of Robert Rich, second earl of Warwick, grantor of Connecticut. He was educated at Eton, and in a long foreign tour became steeped in French speech, literature, deism, and morals. Tall, handsome, and brilliant, of extreme charm to both sexes, he prided himself through life on combining the highest powers of intellect and active life with every sensuous indulgence—'a modern Alcibiades or Petronius.' Entering Parliament in 1701 as a Tory, he speedily became a leader from matchless oratory and knowledge of foreign affairs; and in 1704-8 was Secretary for War in Anne's Godolphin ministry, carrying on the War of the Spanish Succession. Quitting office in 1708, he came back in 1710 as Privy Councillor and Secretary of State; in 1711 was made viscount; and in 1712 negotiated the Peace of Utrecht—in itself right, but in manner and many details repugnant to national honor, and never forgotten against him.

For succession to Queen Anne Bolingbroke followed the numerical majority in favoring the Old Pretender against George of Hanover, and was packing the chief posts with Jacobites when Anne's sudden death enabled the Whigs, strongest in the governing classes, to proclaim George I. Doubtless Bolingbroke, who knew the Catholic 'James III.' could not accede without civil war, was only playing for Whig bids; but he was turned out, shortly fled to France, and in 1715 was attainted. He became Secretary of State to the Pretender, but was overridden by fanatical refugees and priests, and after the rising of 1715 (made against his advice) was dismissed. While abroad he wrote *Reflections upon Exile* (1716), and the autobiographic *Letters to Sir William Windham* (1717), his best work.

In 1723 Bolingbroke procured a pardon from George I., and in 1725 his estates were restored. Casually writing to Pope the religious philosophy later versified in the *Essay on Man* (1733), he attempted regaining political primacy through Pulteney's break with Walpole. He assailed the ministry in letters to the *Craftsman* (reprinted 1735 as *Dissertation on Parties*); gained great influence over George II.; and seemed about to replace Walpole when the King died.

In 1735 he retired to France, where he made some vain attempts to regain English position, and wrote much that was posthumously published: *True Use of Retirement, Study and Use of History, Spirit of Patriotism*, and the *Idea of a Patriot King* (1738). The last had a curiously tenacious influence for a century, inspiring Tory politicians from Bute to Disraeli, and George III.; yet a mere impractical vision from conflict with the bases of English government. In truth, Bolingbroke's writings, like his statesmanship, are at bottom little but rhetoric or party weapons, for immediate surface purposes; and his shallow deism has no seed of growth. Selfish opportunism was his life, and is his death. His biography was written by Goldsmith, Thomas Macknight, and Arthur Hassall. John Churton Collins gives a study of brilliancy and over-estimate. Consult also Leslie Stephen's *Religious Thought in the Eighteenth Century* (1876); Walter Bagehot's review of Macknight in his *Works*.

**Bolintineanu**, bō-lēn-tē-ne-än', DIMITRIE (1826-72), Roumanian poet, was born in Bolintin, near Bucharest. He founded the *Dimbovitza* (1861), in which he vigorously sustained the popular cause against the boyars, and was minister of education in 1864, when Prince Cuza introduced his popular reforms. Bolintineanu's works, which include some of the best poetry in the language, are the collections *Cantece si Plangeri*; *Legende Nationale*; *Basmele*; *Florile Bosforului*.

**Bolívar**, bol'i-var; *Span. pron.* bō-lē'vār, department of Colombia, South America, bounded on the north and west by the Caribbean Sea, on the east by the departments of Magdalena and Santander, on the south by Antioquia, and on the southwest by Cauca. The surface is generally low and thickly wooded, and is watered in the east by the Magdalena and Cauca Rivers, and in the west by the Sinu and its tributaries. The climate is tropical, except in the southern highlands. Cattle raising is an industry of first importance, and many cattle are exported. Horses, donkeys, and mules are also bred. Timber, tanning materials, dyewoods, resins, medicinal plants, and some rubber are derived from the forests. Maize, rice, bananas, coffee, cocoa, sugar, tobacco, and cotton are extensively cultivated. Deposits of gold and coal occur. Capital, Cartagena. Area, 22,320 square miles. Pop. (1912) 420,730.

**Bolívar**, largest state of Venezuela, South America, extends along the southern bank of the Orinoco and Apure Rivers, and

is bounded on the west by Colombia, on the south by the territory of Alto Orinoco and Brazil, and on the east by British Guiana. It includes the gold-mining territory of Yuruari. Besides the wooded hills of the gold country, there are vast stretches of savannah, which have proved excellent for cattle breeding. The forests, which cover much of the state, yield copaiba balsam, rubber, and Tonka beans. Tobacco, coffee, and cinchona are produced, and sugar cultivation is an important industry in the eastern districts, where there are many plantations and mills. Capital, Ciudad Bolívar. Area, 90,440 square miles. Pop. 60,000.

**Bolívar**, province of Ecuador, located on the central plateau of that country. It is heavily wooded, and has forestry, agricultural, and pastoral resources. Capital, Guárandá. Area, 1,260 square miles. Pop. 45,000.

**Bolívar**, SIMÓN (1783-1803), South American patriot, known as 'the Liberator,' was born in Carácas, Venezuela, of a noble Spanish family. He was educated in Madrid, and visited Paris in 1801 and 1803, returning by way of the United States in 1809. He early identified himself with the movement for the independence of Venezuela; was appointed lieutenant-colonel of the revolutionary army; and was sent on a diplomatic mission to England, whose aid he invoked on behalf of the patriot cause. Shortly after his return, the declaration of Venezuelan independence was issued (July 5, 1811), and a long struggle for the mastery ensued between Spain and her recalcitrant colonies. Bolívar distinguished himself in a number of successful engagements under General Miranda; but the royalists eventually gained possession of the country, and he fled to Curaçao.

In 1812 Bolívar joined the insurgents in New Granada, and driving the Spaniards back beyond the Magdalena, recrossed the frontier with a force of 500 men, and issued his famous proclamation of war to the death. His army increased with each victory, and in 1813 he entered Carácas, where he was hailed as liberator of his country, and made dictator of Western Venezuela. Fortune deserted the patriots, however; they were routed near Cura, with great losses, and Bolívar retired to Cartagena. After further service in New Granada he went to Kingston, Jamaica, in May, 1814, where an assassin hired by the Spaniards killed his secretary by mistake.

Having visited Haiti, and assembled there the insurgent refugees, Bolívar returned to Venezuela in 1816, setting up a pro-

visional government in Barcelona. The two years following were marked by a series of conflicts in which the scattered parties of patriots were defeated frequently. In 1819 a congress was opened at Angostura, and Bolívar, confirmed in the supreme power, reorganized his troops. Having conducted them over the Cordilleras to New Granada, he entered Tunja, won the victory of Boyacá, and soon afterward declared New Granada united with Venezuela as a republic, under the name of Colombia. But the dissensions of the patriots prevented any concerted action, and it was only in June, 1821, that the victory of Carabobo virtually ended the war in Venezuela; while it was not till July, 1824, that the royalist troops were finally driven out of the country. The constitution of Colombia was adopted on Aug. 30, 1821, with Bolívar as president.

In 1822, after the decisive battle of Pichincha, Bolívar added Ecuador to the republic, and was summoned to help the Peruvians. He was named dictator of Peru, from which the Spaniards were driven, after more than two years' hard fighting. In 1825 Bolívar visited Upper Peru, the name of which was changed in his honor to Bolivia. A constitution prepared by him in 1826 excited alarm, chiefly on account of its proposal to intrust the executive power to a president for life, with power to name his successor. In September he turned over the government of Peru to a council appointed by himself, and returned to quell a disturbance in Venezuela. His personal influence prevailed, and he was re-elected president; but meantime, his famous code had been renounced in Peru, and the Colombian troops had been expelled from Bolivia. His assumption of supreme power in August, 1828, roused the apprehension of the republicans; and the dread of a second Napoleon led to another conspiracy against his life, from which he escaped by dropping from a window and seeking a hiding place beneath a bridge. In November, 1829, Venezuela separated from Colombia, and Bolívar laid down his authority and retired to Cartagena. He died at San Pedro, near Santa Marta.

Bolívar has been designated the 'Washington of South America.' The difficulties of the war of liberation compelled him to assume a dictator's power, but he was sincere in his devotion to liberty; and in the service of his country he gained no wealth, but freely spent his own fortune. Consult Ducoudray-Holstein's *Mémoires* (Eng. trans.); Rojas' *Life*, in Spanish; De Schrij-

ver's *Esquisse de la Vie de S. Bolivar*; Petre's *Bolivar* (1910).

**Bolivia**, a republic of South America, lies approximately between latitudes 9° 44' and 22° 50' s., and longitudes 58° and 70° w., and is bounded on the east and north by Brazil, on the west by Peru and Chile, and on the south by the Argentine Republic. Area, 708,195 square miles.

lampu (24,900 feet) and Sorata or Illimani (24,600 feet). The lowlands or llanos toward the north, east, and southeast constitute two-thirds of the total area.

The rivers of the north empty into the Amazon. Chief among them are the Beni, Mamoré, and Madre de Dios, which unite to form the Madeira, the largest tributary of the Amazon. From

**Flora**.—Nearly three-fourths of Bolivia is covered with forests containing much valuable timber —mahogany, rosewood, cedar, jacaranda, quebracho and other tanning woods, copal and other gum trees, and several dyewoods. Rubber trees are found in large numbers along the rivers; and the cinchona, coca, cinnamon tree, sarsaparilla, and vanilla grow

Bolivia.

**Topography**.—The southwestern part is high and mountainous; the northern and eastern part is made up of low terraces sinking into lowland plains. The mountain system consists of two ranges, the Andes on the west and the Cordillera Real on the east. Between them is the great Bolivian plateau, from 70 to 80 miles in width and over 500 miles long, embracing about 40,000 square miles, at an average elevation of 12,000 feet. The highest peaks of the Andes are Huallatira (21,654 feet) and Sajhama (21,047 feet); of the Cordillera Real, Il-

lampo (24,900 feet) and Sorata or Illimani (24,600 feet). The lowlands or llanos toward the north, east, and southeast constitute two-thirds of the total area.

**Climate**.—The mean annual temperature of the lowlands is 74° F.; of the zone from 2,000 feet to 8,000 feet elevation, 63°; on the high plateaus, 50°. The rainy season is from December to May. On the eastern plains the rainfall is heavy, 74 to 76 inches annually; on the plateaus it is about 24 inches.

wild in abundance. Below the altitude of 6,500 feet the mimosa and bamboo flourish. The high plateau is treeless, vegetation comprising coarse grasses.

**Fauna**.—The wild animal life includes several kinds of monkeys, the guanaco, llama, alpaca, vicuna, puma, jaguar, wildcat, coati, tapir, and sloth. The viscachacha, fox, chinchilla, South American otter, and opossum are among the fur-bearing animals. The spectacled bear, deer, ant-bear, capybara, armadillo, skunk, and ferret are also found. Alligators, lizards, turtles, rattle-

snakes, and boa constrictors are plentiful in the lowland country. Among the larger birds are the condor and stork; water fowl of all kinds are abundant. There are large herds of wild cattle roaming the plains, and wild hogs in the forest lands.

**Mining.**—Bolivia is extremely rich in minerals. Among the metals are tin, silver, gold, copper, iron, lead, zinc, cobalt, platinum, antimony, bismuth, and quicksilver; among the non-metals, alum, arsenic, borax, talc, mica, marble, salt, salt-petre, asphalt, and petroleum. Precious stones include the topaz, turquoise, amethyst, and lapis lazuli. Tin is mined principally in the neighborhood of La Paz and Oruro. The principal mineral exports in 1915 were: tin, \$19,814,000; antimony, \$4,835,000; copper, \$3,929,000.

The silver mines are extremely rich, but are not now worked extensively. The Spaniards, from 1556 to 1651, took \$3,000,000,000 in silver from the famous mines at Potosí. Nearly every stream coming down from the Andes carries gold, and it has been found also in the rivers flowing into the Amazon. The gold produced between 1540 and 1900 was valued at \$2,225,000,000. Copper exists in large deposits.

**Agriculture** is carried on chiefly in the eastern valleys of the Cordilleras. Coffee, cocoa, sugar cane, tobacco, cotton, rice, yucca, manioc, maize, and alfalfa are cultivated; pineapples, oranges, bananas, lemons, peaches, pears, apples and cherries are produced; and there are extensive plantations of cinchona, coca, and other medicinal plants.

Vast stretches of grazing land are devoted to the raising of sheep and goats, also of tame alpacas, llamas, and guanacos, used as beasts of burden as well as for their wool. On the llanos of the north and the pampas of the southeast large herds of cattle are pastured.

**Transportation.**—Bolivia has about 800 miles of railroad in actual operation, and 1,800 additional miles under construction or projected. The principal line runs from the Chilean port of Antofagasta to Oruro, to Viacha, to La Paz (719 miles). The Arica-La Paz Railroad, opened in 1912, gives a third outlet to the sea—the other being *viâ* Lake Titicaca to the Peruvian port of Mollendo. The projected Pan-American Railroad is planned to run from Guaquin to Viacha and thence to the Argentine border *viâ* Uyuni, Tupiza, and La Quiaca.

The navigable streams cover 5,625 miles, and all flow toward the Atlantic by way of the Amazon in the north and the Plata in

the south. Large steamers ply on Lake Titicaca, trans-shipping freight to Mollendo. There are about 3,800 miles of telegraph line, connecting the principal cities.

**Commerce.**—Bolivia has no seaport of its own, but depends on Antofagasta, Arica, Mollendo, and certain river ports. The exports for 1915 were valued at \$33,960,000; the imports, \$7,893,000. The latter have fallen off greatly since the war. The chief exports are rubber, tin, and silver; the chief imports, cottons, woollens, cattle, provisions, and machinery.

The **population** in 1915 was placed at 2,890,000, of which about 50 per cent. are Indian, 25 per cent. mixed Spanish and Indian, and 13 per cent. white. The principal towns are: La Paz (pop. 100,000), Cochabamba (31,000), Potosi (30,000), Sucre, the capital (30,000), Oruro (22,500).

**Primary education** is nominally free and compulsory, and there are over 900 elementary schools. Secondary education is provided by 21 colleges and 5 clerical institutes. For higher education there are 19 institutions with 1,500 students. There are universities at Sucre and La Paz, with schools of law, medicine, and theology; and commercial, military, and normal colleges at La Paz.

The Roman Catholic religion is supported by the state, though other forms of worship are tolerated. The church is governed by an archbishop resident at Sucre. The non-Catholic population numbers less than 50,000.

Military service is compulsory for men between 20 and 50 years of age. The peace strength is about 3,000, with a militia and reserve force of approximately 100,000.

**Government.**—Bolivia is governed by a president elected for four years, a Senate elected for four years, and a Chamber of Deputies elected for four years—all by direct popular vote. There are two vice-presidents, and a Cabinet of six ministers appointed by the president. Suffrage is granted to all male citizens over twenty-one years of age who can read and write, and who have a fixed independent income. The country is divided into 8 departments, 3 territories, and 61 provinces.

**History.**—For two centuries after the Spanish conquest the country formed part of Peru (q. v.). Bolivia proclaimed its independence in 1825, after the overthrow of the Spanish power at Ayacucho (1824). The first constitution was drawn up by Gen. Simon Bolivar (q. v.), and adopted in 1826; the first

president was General Sucre. During the succeeding years, Bolivia suffered frequently from civil wars.

In 1879–84 Chile waged successful war against Bolivia allied with Peru, and deprived Bolivia of the coast province of Atacama, with its valuable nitrate and guano deposits.

The boundary dispute with Brazil as to the territory of Acre was settled in November, 1903, when, in return for Upper Acre, Upper Purus, and Upper Jurua as far as 11° s. (73,720 square miles), Bolivia acquired territory on the frontier of Matto Grosso and the River Madeira (1,221 square miles), together with a money payment of \$10,000,000 and commercial facilities.

On April 13, 1917, Bolivia severed diplomatic relations with Germany.

**Bibliography.**—Consult Pan-American Bureau's *Bolivia*; Blanche's *Diccionario Geográfico de Bolivia*; Marie Wright's *Bolivia* (1907); Peixotto's *Pacific Shores from Panama* (1913); Wall's *Bolivia* (Eng. trans. 1915).

**Bolkhov**, bol-koif', city, Orel government, Russia; 37 miles north of Orel. It manufactures leather, gloves, hosiery, and soap. Pop. 22,000.

**Boll**, the rounded pod or capsule of such plants as flax and cotton (qq. v.).

**Bollandists**, an association of Jesuits by whom the *Acta Sanctorum*, or Lives of the Saints of the Christian Church, were collected and published (1643–1794). They received their name from JOHN BOLLAND (1596–1665), born in the Netherlands, who edited the first five volumes at Antwerp, and associated young men of his order with him in the work. The suppression of the Jesuit order in 1773 caused the removal of the Bollandist Society to Brussels, till the persecutions under Joseph II. brought about its dissolution. In 1789 the Abbey of Tongerlo in Brabant took up the task; but scarcely had the fifty-third volume appeared in May, 1794, when the French occupation, with the destruction of the MS. collections, put an end to the work.

In 1837 a new Bollandist association of Jesuits was formed under the patronage of the Belgian government. Sixty-five volumes, most of which contain more than a thousand closely printed pages in double columns, have appeared, with an index (1892). The calendar from January to October has been covered.

**Bollene**, town, Vaucluse department, France; 25 miles north of Avignon. It has silk industries. Pop. (1911) 6,069.

**Bolles**, bōlz, ALBERT SYDNEY (1846). American economist, was born in Montville, Conn. After being admitted to the Connecticut bar, he became a judge of probate for Norwich (1870); professor of mercantile law and banking at the Wharton School of Finance and Economy; chief of the Bureau of Industrial Statistics; and lecturer on law at Haverford College. He has written: *Banking; Industrial History of the United States; The History of Pennsylvania; The Modern Law of Banking; The Conflict between Labor and Capital; Money, Banking, and Finance*.

**Bolley**, HENRY LUKE (1865), American plant pathologist, was born in Manchester, Ind. He was graduated from Purdue University (1888; M.S. 1889); was instructor and assistant in biology at Purdue and assistant botanist at the Indiana Agricultural Experiment Station (1889-90); and in 1890 became professor of botany and zoology at North Dakota Agricultural College (dean of division of biology since 1909), and botanist and plant pathologist of the Government Experiment Station for North Dakota. He made a special study of plant diseases; discovered the parasitic nature of potato scab, and originated preventive measures to combat that disease; first employed formaldehyde as a disinfectant for seed grain; discovered the cause of so-called flax-sick and wheat-sick soil, and made other discoveries of importance in economic agriculture.

**Bollington**, town, East Cheshire, England; 2 miles northeast of Macclesfield. It has cotton manufactures and calico printing. Pop. (1911) 5,225.

**Boll Rot**. See COTTON: *Diseases*.

**Boll Weevil**, bōl wē'vil, a small grey weevil (*Anthonomus grandis*), about the size of the common housefly, which is the most serious pest of cotton in the United States. The adult weevils puncture the young flower buds and deposit eggs. As grubs from the eggs develop, the buds drop. They also lay eggs later in the year in the young bolls, and when the grubs develop the cotton is ruined. The boll weevil first entered the United States, from Mexico into Southwestern Texas, in 1892. In one year the damage done by the weevil has been estimated at more than \$10,000,000; it has caused a loss in the production of cotton in the United States in excess of 10,000,000 bales; while the loss due to the reduction in cotton planting cannot be estimated.

So far all attempts to destroy

VOL. II.—Oct. '19

the weevil by spraying or poisoning have met with scant success, primarily for the reason that the weevil bores into the plant for his food, while sprays and poisons lie upon the surface. Burning or ploughing under the infested cotton plants in the fall, burning all brush heaps, picking and destroying weevils which appear upon the young cotton, picking and destroying the infested squares during the growing season, rotating crops so that the weevils find no cotton to feed upon when they emerge from their hibernating quarters, are among the remedies which experience has shown to be the most effective. However, the main reliance of the planter still continues to be in sunshine and hot, dry weather, and he also relies upon the assistance of predaceous insects and birds that prey upon the boll weevil. See WEEVIL; COTTON. Consult *Bulletins* of the U. S. Department of Agriculture.

**Bollworm**, a caterpillar (*Heliothis obsoleta* or *armiger*), which bores into flower buds and young bolls, causing them to drop. The bollworm is most destructive in the Southwestern United States, where the annual loss is estimated at \$12,500,000. Paris green kills the worm in its young stages. (See COTTON, *Diseases*.)

In 1916 the Department of Agriculture announced that the PINK BOLLWORM, the most destructive cotton pest known, had appeared for the first time in North America. It was discovered in Northern Mexico, and importation of cottonseed, cottonseed hulls, and seed cotton from Mexico was prohibited.

**Bolo**, a large steel knife with a thick blade, used by the natives of the Philippine Islands both as a tool and a weapon.

**Bologna**, bō-lō'nyā, province, Italy, lying between the middle Apennines and the lower Po. To the south of Via Æmilia, on which stands the capital Bologna, are the slopes and valleys of the Apennines, and north of it is the fertile, well-watered valley of the Po. Wheat and maize are largely grown. Its principal manufactures and industries are those of the city of Bologna (q.v.). Area, 1,448 square miles. Pop. (1901) 527,367; (1911) 577,969.

**Bologna** (ancient *Bononia*), city, capital of the province of Bologna, Italy, and an archiepiscopal see, situated at the foot of the Apennines; 135 miles southeast of Milan by rail, and 82 miles north of Florence. All the railways of that part of Italy converge on Bologna. It is one of the ancient cities of Italy, beautifully situated on a fertile plain at the foot of the lower slopes of the Apennines. It stands on the

ancient Via Æmilia, and in a fortified strategical position.

The streets in the newer parts of the city are spacious and well paved; the older central parts are adorned with many fine palaces of the nobility, rich in fresco paintings by the great masters. Pre-eminent are the Palazzo Pubblico and the Palazzo del Podestà. The former contains some fine frescoed rooms and galleries; the latter is interesting as having been the prison and death scene, in 1272, of Enzo, the son of the Emperor Frederick II.; it also contains the archives of the city.

The religious edifices are remarkable for the beauty of their architecture and for the abundance and splendor of the art treasures they contain. Bologna has more than seventy churches, the most remarkable of which are San Stefano, rich in relics, Madonnas, and Byzantine frescoes of the eleventh and twelfth centuries; San Petronio (1390-1659), which, though unfinished, is the largest church in the city, a noble specimen of Italian Gothic, with a meridian traced on the floor by the astronomer Cassini, and numerous masterpieces in sculpture and in painting; San Domenico, where the founder of the order lived and died, and where his tomb has been richly ornamented by Michelangelo and others; and the Cathedral of St. Peter (founded in 910, rebuilt in 1605), rich in works of art. In the centre of the city are two remarkable leaning towers—Torre Asinelli and Torre Garisenda (see CAMPANILE), belonging to the twelfth century. Outside the city stand the Certosa (1335) and the pilgrimage Church of the Madonna of St. Luke.

The *University of Bologna*, the oldest in Europe, claims to have been founded in 425; it certainly dates as a law school from the eleventh century. Its reputation early became so great, chiefly on account of its school of jurisprudence, that students from all parts of Europe were attracted to it. In 1262 the number receiving instruction is stated to have been 10,000. The students now number 1,600, and the University holds a first rank among Italian educational institutions. The *Academy of Fine Arts* is particularly rich in the works of those native artists who founded the far-famed Bolognese School of Painting—Guido Reni, Domenichino, Francesco Albani, the Carracci, and Guercino (qq. v.)—and it has also some fine specimens of other schools.

Bologna is the birthplace of the painters already named, and of Francia, Galvani, and Rossini. It has given eight popes and more than 200 cardinals to the Church.

The surrounding district is fertile. Trade and manufactures are important, the principal products being hams, sausages, perfumery, soap, lace, artificial flowers, macaroni, liqueurs, preserved fruits, silks, cloth, hemp textiles, glass, tobacco, and hats. Pop. (1901) 147,898; (1911) 172,639; (est. 1915) 189,770.

**History.**—Bologna owes its origin, which is said to be much more remote than that of Rome, to the Etruscans, by whom it was called *Felsina*. It was afterward, as *Bononia*, the chief town of the Boii, from whom it was taken by the Romans and made a colony (189 B. C.). After the fall of the Roman Empire it passed into the hands of the Longobards, from whom it was taken by the Franks. The feuds of the Guelph and Ghibelline factions led in 1506 to the downfall of the republic, and the supremacy of the Papal See. In 1796 Bologna was taken by the French, and was constituted the chief town of the Cisalpine Republic; in 1815 it reverted to the Pope. From the commencement of the Italian campaign of 1859, the Bolognese gave an active sympathy to the national cause; and in 1860 the city became part of the modern kingdom of Italy. Consult Coulson-James' *Bologna* (1909).

**Bologna**, GIOVANNI or GIAN (1524-1608), sculptor of the Italian renaissance, called IL PIAMMINGO, from his birthplace in Flanders. He went early (1551) to Florence to study the work of his contemporary Michelangelo, and worked there for three years under the goldsmith Vecchiotti. His statues are characterized by classic simplicity and nobility of form; the chief are the bronze *Mercury*, in the Bargello at Florence; the *Rape of the Sabines*, in the Loggia dei Lanzi at Florence; and the equestrian statue of Cosimo I. (1594), grand duke of Florence. He also designed the fountain of Neptune at Bologna, and the bronze gates for the Pisa Cathedral (1595).

**Bologna University.** See BOLOGNA.

**Bolometer** ('ray measure'), an instrument invented by S. P. Langley (q. v.) for the measurement of radiant heat. The principle of its construction is the change of electrical resistance which is produced in metallic conductors by variations of temperature. In Langley's improved apparatus, erected at the Smithsonian Astrophysical Observatory in 1892, all the movements are automatic. The sun's rays collected by a large siderostat, are transmitted through a rock-salt prism, and the infra-red part of the spectrum thus formed is made to travel by means of clockwork in front of a bolometric

strip one-twentieth of a millimetre wide and one-thousandth of a millimetre thick. The ensuing electrical effects record themselves through the movements of a speck of light which is thrown from a mirror attached to the galvanometer upon sensitized paper shifted at a steady rate.

The curves traced as the outcome of the process are termed *bolographs*; they show, by their heights and hollows, the alternations of temperature due to absorption. From the materials furnished by them Langley mapped about 750 lines below the red, mostly of telluric origin. His perfected bolometer records differences of temperature not exceeding one ten-millionth of a degree centigrade. See ACTINOMETER.

**Bolondron**, bō'lōn-drōn', town, Matanzas province, Cuba; 35 miles southeast of Matanzas city. Pop. 15,000.

**Bolor-tagh**, bō-lōr' tāg', a mountain range of Central Asia, reaching altitudes of 24,000 to 26,000 feet. See PAMIRS.

**Bolsena Lake of**, bōl-sā'na, about 55 miles northwest of Rome, in the centre of a volcanic district. It is 1,000 feet above sea level, 480 feet deep, 10 miles long, and 8 miles broad.

The town of *Bolsena* stands on the northwest shore of the lake, 9 miles southwest of Orvieto (q. v.). It has remains of the ancient *Volsinii Novi*.

**Bolsheviki.** See BOLSHEVISM.

**Bolshevism** (derived from *Bolshevik*, pronounced bol-she-veh'k; plural *Bolsheviki*, pronounced bol-she-veh'-kē'), a term loosely used to denote: (1) the communist party now in supreme control of what remains of the Russian Empire; (2) the Russian Socialist Federal Soviet Republic; (3) a proposed international world-order to consist of a loose federation of national soviet republics under the control of the workers of the world; (4) any party or movement having the same general aims of conquest of absolute political power by armed revolution of the propertyless working class.

The word, meaning *majority*, was originated in 1903 to designate the *majority* of the Russian Social Democratic Labor Party. During the great revolutionary ferment of 1903-5 a profound cleavage, both as to the ideals and methods of attainment of the Socialist state, developed between the two factions of the party, and the Bolsheviki, no longer the majority faction, became the radical left wing, sharply differentiated from the great majority of Social Democrats in

their program. They sought: (1) The early attainment of socialism, not by evolution but by a *coup d'état* of 'an armed and desperate proletariat'; (2) non-participation in any democratic government or *duma* beyond the appropriation of the *duma* platform for socialist propaganda, and no co-operation with other socialist or democratic groups in the *duma* in problems of actual government; (3) formation of a strong centralized party organization to control the coming revolution; (4) constant propaganda among the workingmen, inciting them to armed revolt against the Czar's government.

Russia was on the verge of a great anti-Czar revolution, when the Great War broke out in August, 1914. With other Russian socialist groups, the Bolsheviki joined in a peace manifesto, branding the war as a crime against the internationale, and refused to vote war credits. The majority of the socialists soon rallied to the patriotic defence of the fatherland. Not so the Bolsheviki. Defeat, even more than a Russian victory, might bring the opportunity for the sudden *coup d'état*. Accordingly, they continued to plan a revolution and initiated a vicious propaganda among the soldiers 'that their weapons should be directed not against their brothers, the hired slaves of other countries, but against the reactionary bourgeois governments.' The government suspected the plot and arrested the leaders, at a Revolutionary conference at Viborg on Nov. 17, 1914. From this time on until after the overthrow of the Czar and the establishment of a provisional government, the Bolsheviki played small part in the history of Russia, their *rôle*, under the brilliant and unscrupulous leadership of Nicholas Lenine, whose real name is Vladimir Oulianov, being limited to seditious propaganda and association with German agents in attempts to sabotage the government of the Czar.

The eventual overthrow of the Czar on March 16, 1917 (see RUSSIA), was effected by two forces, the patriotic group in the *duma*, and the revolutionary force of soldiers and workmen, soon afterward organized into soviets or revolutionary councils. The *duma* group at first assumed complete political power, although the actual strength of the movement lay in the soldiers of the great garrison city, supported by the radical workmen. The soldiers at the front and the sailors of the fleet represented a third group, while a fourth group, powerful, though largely unorganized and remote from the

political centres of activity consisted of the peasants, forming 85 per cent. of the population, and demanding now, as in every crisis of Russian affairs, 'land for the people.'

A constituent assembly to form a permanent form of government was early determined upon by the provisional government. The task of establishing the electoral machinery for a first election on the principle of universal and secret suffrage in a country so huge, so heterogeneous, and so lacking in transport system, however, was immense, and it was found necessary to postpone the date of the election from Sept. 30, to Nov. 25, 1917, though every effort was made to organize a permanent constitutional government at the earliest possible date.

The insurrection of General Korniloff gave the Bolsheviki the opportunity they sought. On Sept. 3, Riga was shamefully surrendered to the Germans, and panic reigned in Petrograd. Korniloff charged Kerensky with collusion with the German general staff under pressure from the Bolsheviki. Kerensky ordered Korniloff's removal, but the General replied by dispatching troops from the front to seize the government at Petrograd.

Now, however, the Bolsheviki raised the cry of counter revolution. The Revolution must be saved from the agents of the Czar. Korniloff to them was the old hated *régime*. The Korniloff forces melted away before Petrograd was reached, but the battle cry 'save the revolution' was turned against the Kerensky government. The provisional government was charged with being the enemy of the Russian people because it had delayed calling the constitutional convention and because it had not given the land to the peasants. A revolution was openly called for, and revolutionary troops (Red Guard) were formed from deserters from the army. A new All-Russian Congress of Soviets had been elected to meet Nov. 7, in which for the first time the Bolsheviki, not without suspicion of intimidation and fraud, had secured a majority. On the night of Nov. 6 the Bolshevik coup took place, and on the seventh most of the members of the government were arrested. Kerensky escaped. Little blood was shed.

A new government was formed under an executive committee called the Council of Peoples' Commissars with Nicolai Lenine as President and Leon Trotzky Commissioner of Foreign Affairs. Lenine was dictator of Russia in the name of the pro-

letariat, and by virtue of the power of the Red Guards. Thus the Russian Socialist Federal Soviet Republic was born.

The constituent convention was generally looked forward to as the salvation of Russia. It was one of the chief issues on which the Bolsheviki gained control. The election of delegates had been set for Nov. 25. One of the first decrees of the Peoples commissars was to confirm the date and order 'fair play at the elections.' The Bolsheviki, in spite of every effort, elected only a minority of the delegates, and forthwith, contrary to their public declaration to hold power only until the convening of the constitutional convention, began to plot its overthrow. Efforts were made to intimidate the early arrivals; delegates were arrested and some were shot. One hundred persons were killed or severely wounded by the Red Guards in the attempt to break up the processions and demonstrations in favor of the convention. When the convention finally met, Jan. 18, 1918, Sverdlov, for the Bolsheviki, presented a 'declaration of rights of the toiling and exploited peoples,' outlining a framework of soviet government, and limiting the power of the convention to the adoption of this plan. While approving the principle of the nationalization of land, mines, forests, and waterways, the convention refused to abdicate to the soviet committee and repudiated the idea of a separate peace with Germany, while favoring the continuance of the armistice. Thereupon the convention was dispersed by the Red Guard sailors from the Baltic fleet. The All-Russian Peasant Congress which met a few days later and supported the Constitutional Convention was similarly dispersed by armed force.

The Lenine-Trotzky Ministry had summoned an extraordinary Congress of Soviets to meet in Petrograd at the same time. This congress approved the declaration of rights, spurned by the constitutional convention, and thus established a permanent soviet government. This provisional constitution was later revised, elaborated, and adopted by the fifth Soviet Congress on July 10, 1918, as the permanent Constitution of Russia.

In the meantime negotiations for peace had been undertaken by Trotzky. An armistice had been signed and negotiations opened at Brest-Litovsk (q. v.) Dec. 22, 1917. Trotzky indignantly repudiated the infamous German peace terms, and counseled resistance by a new Red Army. He was overruled by

the practical Lenine, and the peace terms were formally, if sullenly, accepted by the fourth Soviet Congress.

The history of Russia from this date has been a tragic tale of civil and foreign war. Isolated from the world by an iron ring of self-made enemies, little is known of the details of the economic anarchy and terror that reign within. The self-confessed enemy of all democratic government, the Soviet Republic is described by Lenine himself as the dictatorship of 200,000 members of the Bolshevik party over 50,000,000 Russians.

The economic structure of Russia had broken down even under the Czar's *régime*. The provisional government, with such aid as the Allies could give, was unable to re-establish industry. Under the socialistic experiments of the Bolsheviki, the very elements of economic life seem to have been destroyed. Industry is dead. Transport is almost non-existent. Credit, finance, and business have been reduced to mere barter of commodities.

The strength of the Bolsheviki as an organized government lies largely in its use of the native institution, the soviet, which originated as a revolutionary committee of workmen in 1905. Soviets are of many kinds from the simple 'town-meeting' of the peasants, and the industrial 'union' or 'guild' of the factory to the great national assembly of delegates from all local, provincial, and industrial soviets. The village or factory group is the unit. Central soviets of delegates from local soviets are formed in all townships, districts, provinces, and the national soviet of delegates is called together at least twice a year to exercise supreme legislative power. All delegates are at all times responsible to the group from which they are elected and can be recalled at any time. Executive committees hold the supreme power when soviets are not in session. All soviets are responsible for the enforcement of the *general* laws as well as local ordinances and decrees. This plan of representative government is vitiated by limitations of franchise and inequalities of representation. Only the poorest peasants and the propertyless workers are permitted to vote. The following classes are disenfranchised: (a) All employers of labor including servants. (b) All capitalists, or others receiving interest, rent, dividends, or an income from financial or industrial enterprises. (c) All merchants, traders, and dealers. (d) All clergymen and priests,

and employees of religious bodies. (e) Certain former officials of the Czar's government, criminals, and insane. The professional class (intelligentsia) and those engaged in the management of industry are usually permitted to vote, if not 'counter-revolutionary' or otherwise disqualified.

The Bolshevik revolution was frankly an economic overthrow of the capitalist system. Capitalists, 'bourgeois,' are represented as the real enemies of the people. No mercy, no justice, no compensation is allowed them. Private property was in general promptly confiscated to the state on a large plan. Homes and small personal belongings are alone exempt. Land was nationalized and became the property of the state, as did also all live stock, all agricultural implements, all forests, mines, minerals, and natural resources, all banks and banking institutions, all factories, mills and industrial institutions, all church property, all public meeting places and assembly halls. Insurance has been made a state monopoly as has also the transportation business, the publishing of newspapers, periodicals, and (largely) books, all advertising, all foreign trade. Compulsory labor has been made universal, as has also compulsory military service. All foreign debts and all debts due landlords and capitalists were repudiated. The right of inheritance was abolished and all estates of all decedents confiscated. The right to manage and operate factories is vested in the workers, the right to divide and cultivate the land and enjoy the fruits thereof is vested in the peasants. The right to employ any human being in any capacity is annulled.

Co-operative production and co-operative agriculture are permitted. Rights of assembly and free speech are abridged. Revolutionary tribunals vested with unlimited power of arrest, trial, pronouncing and executing sentence make a travesty of justice.

The war-born Russian soviet republic is recognized by Lenin and the communists (as the Bolsheviks are officially called) as a transitional incomplete Socialist state. The ideal aim of the party is stated in the familiar terms of a communist utopia. 'The complete liberation of the laboring classes from spoliation and oppression' is represented as an international problem, to be accomplished only through the united exertions of workmen of all lands. The Soviet Republic urges the establishment of local soviets as centres of world revolution wherever possible, and extends to all such organizations

an invitation to 'enter as members with equal rights into the fraternal family of the Republic of Soviets. . . to any extent in whatever form they might wish.' This is plainly a veiled invitation to universal revolution, and a covert threat against all organized governments. Local soviets such as exist in most European and American countries are in fact not so much private associations of citizens, as weak members of a Soviet World League under Russian hegemony. The doctrine of class selfishness as a natural and unavoidable basis of human government has challenged the democratic faith in the equality and inherent rights of all men, regardless of class or economic status.

**Bol'sover**, town, Derbyshire, England; 6 miles east of Chesterfield. It has coal mines and limestone quarries. Pop. (1911) 11,225.

**Bolsward**, bōl'svārt, town, province of Friesland, Holland; 6½ miles northwest of Sneek. It has a fine town hall in the renaissance style (1614-18), the church of St. Martin (1446-66), and the so-called Small Church (1280). There is trade in agricultural produce; pottery, tiles, and textiles are manufactured. Pop. (1910) 7,215.

**Bolt**, any metal pin which unites parts of structures or machines. Temporary bolts are fixed to doors, windows, etc., and are operated by a key or the hand. Permanent bolts take various shapes, according to their use; they may be round, square, hook-and-eye, etc. The commonest form of bolt has a head and a screw thread toward the end, and is fastened up with a loose nut.

In shipbuilding, bolts which completely penetrate a structure are *through* bolts, and those which only partly do so are *blunt* bolts. *Eyebolts* have a hole in the projecting end; a ring through this hole turns the eyebolt into a *ring bolt*. The *Lewis bolt* is an eyebolt with a barbed shank fixed into a socket on the deck.

The word is used in firearms for the part of a rifle which sends the firing pin home, and also for an elongated bullet.

**Bolting Cloth**. See GAUZE.

**Bol'ton**, or BOLTON - LE - MOORS, town, Lancashire, England, on the River Croal, which divides the town into Great and Little Bolton; 11 miles northwest of Manchester by rail. The principal buildings are the Public Library, the Town Hall (1873), the Technical School, and the Mechanics' Institute. It is one of the chief centres of the cotton industry, and is noted for fine yarns. There are also manufac-

tures of muslins and fine calicoes, foundries, iron works, bleaching, paper, and saw mills, and chemical works. In the vicinity are extensive coal fields. The town operates its street railways, gas and electric works, and markets.

As early as 1337 the Flemings introduced the woollen trade into Bolton; this was further stimulated by French Huguenots in 1685. The inventions of Arkwright and Crompton, who were natives of the town, played an important part in its development. Pop. (1901) 168,205; (1911) 180,385.

**Bolton**, CHARLES KNOWLES (1867), American author and librarian, was born in Cleveland, Ohio. He was graduated from Harvard (1890), and was successively assistant in the Harvard Library (1890-93), librarian of the Brookline library (1894-8), and librarian of the Boston Athenaeum library (1898- ). He served also as instructor and associate professor at Simmons College, and as a trustee of the Boston Museum of Fine Arts. He edited *Letters of Hugh, Earl Percy* (1902) and the *Athenaeum Centenary* (1907), and wrote: *Saskia, the Wife of Rembrandt* (1893); *On the Wooing of Martha Pitkin* (1894); *The Love Story of Ursula Wolcott* (1895); *Brookline, History of a Favored Town* (1897); *The Private Soldier under Washington* (1902); *Scotch-Irish Pioneers* (1910); *American Library History* (1911); *The Elizabeth Whitman Mystery* (1912); *Christ Church, 1723* (1913); *Portraits of the Founders* (1919).

**Bolton**, HERBERT EUGENE (1870), American educator and historian, was born in Wilton, Wis. He was graduated from the University of Wisconsin (1895) and from the University of Pennsylvania (PH.D. 1899); was professor of history and economics in the Milwaukee State Normal School (1899-1901); instructor (1901-05), adjunct professor (1905-08), and associate professor (1908-09) of history in the University of Texas; and professor of American history at Leland Stanford Jr. University (1909-11) and at the University of California (1911- ). He is known for his researches in the Mexican archives on the history of Spanish America, and of the Southwestern Indians. He published *Guide to Materials for U. S. History in the Archives of Mexico* (1913); *Athanase de Mézières* (1914); and *Texas in the Middle Eighteenth Century* (1915). He edited *With the Makers of Texas* (1904), *Spanish Explorations in the Southwest 1542-1710* (1915), and *Father Kino's Memoirs* (2 vols., 1919).

**Bolton Abbey**, township, England, in West Riding, Yorkshire, on the River Wharfe; 6 miles east of Skipton. A priory for Augustinian canons, founded at Embay about 1121, was moved here in 1251. It is now a picturesque ruin whose nave serves as a parish church.

**Bo'lus**, a soft mass of any kind of medicine, intended to be swallowed at once. It is similar to a pill but is larger.

**Bo'ma**, or M'BOMA, formerly known as EMBOMMA or LOMBI, city, former capital of the Belgian Congo, West Africa, on the right bank of the Congo River; 55 miles from its mouth. The harbor, formed by the Congo and the island of Nkete, is about a mile wide and from 20 to 66 feet deep. Boma was established in the sixteenth century as a station for European traders, and became a well known slave mart. Pop. 6,000.

**Bomarsund**, bō'mār-sōönd', ancient Russian fortress on the east coast of Aland Island, Baltic Sea, at the entrance to the Gulf of Bothnia. On Aug. 16, 1854, after a six days' siege, it was taken by the allied fleets of Britain and France. Russia, by the Treaty of Paris, was forbidden to rebuild it.

**Bomb**, BOMB SHELL, a hollow projectile, usually of cast iron, fired from a piece of ordnance. It is fitted with a time fuse, which causes it to burst at any required instant. The fragments are most destructive, and the flame of the explosion sets fire to anything inflammable with which it comes in contact. Such projectiles were formerly fired from mortars only; but all modern pieces of artillery now use them. See AMMUNITION; EXPLOSIVES; GUNS.

**Bomb**, in geology, a large, round, porous mass of igneous rock often mixed with other varieties of volcanic ash and ejected by active volcanoes. The blocks are often pear shaped or flattened, owing to their having been in rapid rotation while hot and viscous during their journey through the air. They are simply a large form of the *lapilli* of which the ash beds principally consist. Masses nine feet in diameter have been thrown a distance of several miles. When such materials have, in course of time, been compacted into firm rock, they are known as volcanic agglomerate. Bombs are sometimes hollow, owing to the expansion of the steam in the molten igneous rock, aided, no doubt, by centrifugal force.

**Bomba'la**, town, New South Wales, in Wellesley County; 250 miles southwest of Sydney. Pop. of town, 1,000; of district, 4,500.

**Bombard**, a kind of cannon in

use about the fourteenth century, sometimes capable of throwing balls of stone of 200 pounds weight.

**Bombar'dier**, the lowest non-commissioned officer in the British artillery, ranking with corporals in the infantry and cavalry. The name was applied in the seventeenth and eighteenth centuries to a man employed about the mortars and howitzers—ordnance used in bombarding.

**Bombardier Beetle**, a name given to several species of beetles belonging to the family Carabidæ. The name refers to their offensive and defensive habit, when annoyed, of discharging an acrid volatile fluid with explosive force from the abdomen. The discharge has a pungent odor, acid and caustic properties, and evaporates with effervescence in the air. The most common English species is only about a half inch long. When roughly handled, it will make more than a dozen discharges in rapid succession.

**Bombardment**, an attack by artillery upon a fortress or town. In modern warfare attacks from the air are often called bombardments. In modern times a bombardment is generally adopted as an adjunct to a siege, distracting the garrison by an incessant fire from mortars and heavy guns day and night. A bombardment is more frequently a naval than a military operation. History has shown that the effects of bombardment on the civil population is usually small—about one per cent. only being killed. The Brussels Conference of 1874 drew up rules for the restriction of bombardment to fortified places and towns which actively oppose the enemy. The Hague Regulations, formulated at the Hague Peace Convention, also prohibit bombardment of undefended towns or buildings, provide that warning be given the authorities of intention to attack and that all possible steps be taken to spare buildings dedicated to art, science or religion, historic monuments, and hospitals.

The stores required for a vigorous bombardment are immense. Thus, in 1759, Rodney threw 20,000 shells into Havre; in 1792 the duke of Saxe-Teschén threw 36,000 shot and shell into Lille in 140 hours; in 1795 Pichegru threw 8,000 shells into Mannheim in 16 hours; and in 1807 the English threw 11,000 shot and shell into Copenhagen in 3 days. In January, 1871, the Germans, bombarding Paris and its forts, threw 10,000 shells daily into the place, of which 500 fell in the city itself.

One of the most famous bombardments in history is that of Port Arthur during the Russo-

Japanese War, August–December, 1904. Some three hundred guns were trained against the place, and all the infantry assaults were preceded by bombardments. The Japanese used regular siege guns of from 5 to 6 inches calibre, naval guns (4.7 to 6 inches), ordinary field ordnance, and, above all, 11-inch mortars weighing eight tons apiece without the carriage. During heavy bombardments each gun was fired once every eight minutes, and the grand bombardments were kept up about four hours. The mortars had a maximum range of seven or eight miles, but none of them were more than three miles distant from the town. They were fired at angles as great as 60°, 'the huge shells hurtling high into the heavens, passing over two ranges of hills, and falling like thunderbolts out of the blue sky vertically upon the devoted city.' Practically no damage was inflicted on the many large buildings, the attack being directed mainly to the defences, the storehouses, and the warships in the harbor.

In the Great War there were many bombardments from the air, for an account of which, see section *Aerial Warfare* in the article EUROPE, GREAT WAR OF. See FORTIFICATION.

**Bombay**, bom-bā', city, capital of the presidency of Bombay, India, is situated in 18° 55' N. and 72° 54' E., on an island of the same name, which is 11 miles long by about 3½ broad. The city is connected by causeways and breakwaters with Salsette Island and the mainland. Three main lines of railway have terminal stations in Bombay: by two of these the port is in direct communication with Calcutta, either through the Central Provinces or through Rajputana; the third line runs southeast, by way of the Nizam's Dominions, to Madras. Its harbor, studded with islands and crowded with shipping, is one of the finest in the world; the space available for shipping being about 14 miles long by 5 broad. The mails to and from the West for all India are embarked at and disembarked from this port, which is called 'the Gate of India.' For administrative purposes the city constitutes a district by itself, with an area of 22 square miles.

Bombay is the most European in appearance of all the cities of India, and is second only to Calcutta in commercial activity and population. The native town lies to the north. On Kolaba, the narrow southern extremity, is the European garrison. A shallow sheet of water on the farther side of Kolaba, called Back Bay, is encircled on the west by a hilly

promontory (Malabar Hill), terraced with houses—the residential quarter, especially for Europeans. On the esplanade, facing toward Back Bay, are the Secretariat, the University, Senate Hall, High Court, Offices of Public Works, Sailors' Home,

Peninsular Railroad, opened in 1876, is probably the finest building in Bombay. Near by a new General Post Office has been erected.

Recently Bombay has undergone considerable development. Large areas of land have been

Mazagaon Bay, the centre of shipping activity, is at the head of the harbor. Always favorably situated for foreign trade, Bombay has profited largely by being the first important port reached by vessels from Europe, and by being the chief mail line to India by Suez and Aden. All but an insignificant portion of the trade of the presidency passes through the port. Bombay suffered less from the Great War than other Indian ports, although shipping was seriously affected. The chief articles of export are raw cotton, wheat, hides, coffee, pepper, linseed, manganese, gums, opium, ivory, and shawls; the chief imports, piece goods, thread, yarn, silk, wine, beer, tea, iron and steel goods, and coal. There are large cotton mills, tanneries, dye works, and shops for metal working.

Bombay is the headquarters of the government of the presidency, over which a high court exercises supreme jurisdiction. Besides the University, there are the Government Elphinstone College, art colleges, the Grant Medical College, missionary colleges, a technical institute, and a law school. Numerous high schools and orphanages, initiated by the efforts of Christian bodies, have been extended by the native merchant princes; and several hospitals, including one for lepers, are maintained by its citizens. In municipal enterprise Bombay holds its own with the foremost cities of Europe. Since 1897 several visitations of bubonic plague have occurred, but an extensive scheme of sanitary improvement has been instituted.

Hindus and Mohammedans are the most numerous of the inhabitants, and include not only natives of India, but also Afghans, Arabs, Malays, and Africans. The Parsees rank next to the English in position and influence. There are also influential communities of Jews, Europeans, and Americans. Pop. (1911) 972,892. (1921) 1,175,914.

*History.*—In 1509, about a year before the capture of Goa, the Portuguese visited the island; and by 1532 they had made it their own. In 1661 they ceded it to Charles II. of England, as part of the dowry of his bride, the Infanta Catharine. In 1668 that monarch granted it for an annual payment to the East India Company, which in 1685 transferred what was then its principal presidency to Bombay from Surat. Consult Forrest's *Cities of India*.

**Bombay Duck** (*Harpodon nereus*), or BUMMALOTI, marine fish found in abundance on the east coast of India. Salted and dried, it is used to flavor rice, and forms part of all Indian curries.

Bombay, India: The Victoria  
Railway Station, Main Entrance

and statue of Queen Victoria. The Taj Mahal, opened in 1904, is one of the largest and best hotels in India. Opposite the anchorage are the fort and the docks and places of business. In the neighborhood of the fort are the Town Hall, Mint, Cathedral, and Custom House. The Victoria terminus of the Great Indian

reclaimed, South Salsette Island has been developed, the harbor has been improved and its defences remodelled and docks have been built. The European garrison is stationed at Kolaba at the southern extremity of the island. Batteries armed with the newest guns are placed both on the mainland and the islands.

The fish itself, which is caught in vast numbers and exported, is long, and has large fins and a very wide mouth.

the Narbada pursues a westerly course into the Gulf of Cambay. The Tapi flows through Khandesh district, entering the sea

It covers an area of about 8,000 square miles, and is the great source of salt supply for the presidency.

**Bombay Presidency** comprises that portion of India which lies between Baluchistan and the Punjab in the north and Mysore in the south. The Arabian Sea marks its western boundary, and on the east are the native states of Rajputana and the Nizam's Dominions. Its area is nearly 188,800 square miles, of which about 123,000 are British territory.

The coast, line is irregular, broken by the Gulfs of Cambay and Cutch, with several fine natural harbors, Bombay and Karachi (Kurrachee) being the most important. The chief mountain ranges run north and south. In the north are the Kirthar Mountains; in the southeast is the West Aravalli Range; south of the Tapi are the Sahyadri Mountains or Western Ghats, which run almost parallel with the coast; the Satpura Range runs east, and forms the watershed between the Tapi and Narbada.

Sindh is watered and fertilized throughout its whole length by the River Indus, which enters the Arabian Sea in a wide delta; the Submarti and Mati flow through the plains of Northern Guzerat;

above Surat. The Rann of Cutch, in the west of Guzerat, is an inland lake which, when in flood, becomes an arm of the sea.

The country generally is fertile. In Sindh, where there are stretches of sandy desert, irrigation has brought large tracts un-

Bombay Presidency

John Bartholomew & Co

der cultivation. Forests are scattered along the mountain ranges, and cover extensive areas on the banks of the Indus. During the fair weather traffic along the coast line is brisk.

There are few minerals, and no coal; iron is mined at Tagar in Dharvar, and there is gold mixed with the quartz. Good building stone is abundant, with limestone and slate. The principal agricultural products are millet, legumes, rice, wheat, cotton, oil seeds, tobacco, indigo, and cane sugar.

Of late years, manufacturing industries have been extremely active in Bombay. Commanding the richest cotton fields in India, it has improved to the utmost its natural advantages. There is still a large but decreasing import of cotton goods from England; and while the Indian cotton trade has often been greatly depressed, Bombay not only competes with Manchester in the Indian markets, but largely exports its own manufactures. After cotton, the other great staples are wheat, seeds, and opium. Although of recent origin, the wheat trade has assumed large proportions, but the opium trade has fallen off. Other leading exports are sugar, tea, raw wool, woollen shawls, fibres, and drugs; while among the imports are cotton manufactures, metals and ores, machinery, and manufactures of iron and steel. Silk weaving is carried on at Ahmedabad, Surat, Nasik, Yeola, and Poona; carpets are made at Ahmednagar; leather work and pottery in Sindhi; brassware in Bombay city, Nasik, and Poona; cutlery, armor, and gold and silver work in Cutch.

The presidency has more than 3,500 miles of railroad, giving communication with the important towns of India. Three main lines of railway from Bombay tap the Nizam's Dominions, the Central Provinces, and Rajputana; the cotton-growing province of Kathiawar is being covered with a network of lines. A military line from Karachi leads to the northern frontier, and this port is in railway communication with the Punjab and Rajputana. The post office and telegraphs are controlled by the imperial government, both in British territory and in native states. A cable telegraph from Bombay to Aden was laid in 1869.

The executive government is vested in a governor and two councillors. For administrative purposes the presidency proper is divided into nineteen districts. Local self-government is in its infancy, but municipalities have been established in the larger towns; and for legislative pur-

poses the executive government is assisted by a council of Europeans and natives.

Of the territories under native rule the most important is Baroda, which is practically under the direct control of the imperial government. In all the native states the British government is represented by political officers. The chiefs have surrendered the right to manufacture opium, salt, and native intoxicating drinks (*abkari* dues), and the jurisdiction over railway lands. The chiefs of Kolhapur, Cutch, and a few in Kathiawar, possess plenary powers.

The inhabitants comprise numerous races, who profess divers creeds. The majority (75 per cent.) are Hindus—a term used to comprehend pure Brahminism, as well as the worship of Vishnu and Siva under various systems; a small but influential body are Parsees; and the proselytizing faiths are represented by Buddhists, Mohammedans (20 per cent.), and Christians. The languages principally spoken are Marathi (50 per cent.), Gujarati (20 per cent.), and Sindhi (15 per cent.). Pop. (1911) 27,074,570; (1921) British possessions, 19,348,219; Native States, over 4,000,000.

**Bombazine**, bom-ba-zēn', a cloth for dresses, in which the distinguishing characteristic is that the warp is silk and the weft worsted, giving the cloth a somewhat stiff and shiny look. The fabric was extensively made, chiefly at Norwich, England, from about 1816 but it is now little used.

**Bombetoke**, Bay of, bom-betō'ka, inlet on the northwest coast of Madagascar, on which stands the seaport of Majunga (q.v.).

**Bombinator**. See TOAD.

**Bomb Proofs**. See CASE-MATE.

**Bombyx**. See SILK.

**Bom Fim**, bôn fēñ, town, Brazil, in the state of Goyaz, 164 miles southeast of the town of Goyaz. It has gold mines. Pop. 6,000.

**Bommelö**, bom'el-û', island, Norway, off the west coast, between Stavanger and Bergen.

**Bomvanaland**, bom-vā'nā-lānt, native district, Africa, in Tembuland, Cape Colony, lying on the eastern coast between the Bashee and Umtata Rivers.

**Bon**, CAPE, or RAS ADDAR, headland, the northernmost point of Africa; 58 miles northeast of Tunis.

**Bona**, the general term in Roman law for the property of any one, and in the modern system it is used in various connections. A thing is said to be *in bonis* of a person when it is part

of his belongings. *Bona vacantia* in Roman law denoted the property of one who had died intestate and without leaving any legal representative who claimed the inheritance. In English and American law the same term is applied to such things as wrecks, treasure trove, waifs, estrays, etc., which belong not to the finder or occupier, but to the Crown or state. *Bona waviata* denote goods thrown away by a thief through fear of apprehension. At common law these belong to the owner if he prosecutes to conviction; otherwise they go to the Crown or state. *Bona notabilia* are goods of a deceased, the value of which is not so small as to render them negligible, and which must therefore be noted and accounted for by the executor or administrator. *Nulla bona* is the technical description of a return of an execution, where no goods are found to satisfy the claim. In English and American law *bona* includes only personal or movable property, not real property.

**Bona** (French *Bône*), fortified seaport town, Algeria, in the province of Constantine on the Sebous River, 85 miles northeast of Constantine. It has a fine harbor. The exports include phosphates, iron, zinc, lead, copper, cork wood, and briar roots. Bona was occupied by the French in 1832. To the south are the ruins of Hippo Regius, the see of Augustine, who died here in 430. Pop. (1921) 45,171.

**Bona Dea** ('the good goddess'), a Roman divinity, sister, wife, or daughter of Faunus, and variously known as FAUNA, FATUA, or OMA. Her worship was exclusively confined to women, and she was revered as a chaste and prophetic deity. Her sanctuary was a grotto on the Aventine Hill. On May 1 of every year her festival was held in the house of the consul or prætor. The solemnities were performed generally by high-born vestals, no males were allowed to be present, and even portraits of men were veiled.

**Bona Fides** (Latin, 'good faith,' as opposed to *mala fides*, 'bad faith'), a legal term to denote the condition of one who becomes a purchaser of property without notice of equitable claims affecting it in the hands of the vendor. Such a purchaser, if his legal title is good, is protected against the equitable claims of third persons. Any *bona-fide* purchaser will be supported by a court of law. If notice of the rights of a third party has been given to the purchaser, he will only stand in the same position as the person from whom he has purchased the goods in any question as to the legal ownership. This law applies equally

to commercial documents. If any sale or contract can be proved not to have been made in good faith, it can be set aside on the petition of the injured party. In cases of slander and libel, if it can be shown that the statements were made *bona fide* and not maliciously, the action must fail.

**Bonai**, the most southerly of the feudatory states of Chota Nagpur, Bengal, India; consists of a valley, surrounded by the Bonai Hills. Area, 1,349 sq. m.

**Bonaire**. See CURAÇAO.

**Bonald**, LOUIS GABRIEL AMBROISE, VICOMTE DE (1753-1840), French philosopher and statesman, born at Mouna (Aveyron). He retired with other royalist émigrés to Heidelberg in 1791, and there wrote *Théorie du Pouvoir Politique et Religieux dans la Société Civile* (3 vols. 1796). At the restoration he became a member of the Council of Public Instruction, minister of state (1822), and was ennobled (1823). His principal works were *Législation Primitive* (1802), *Recherches Philosophiques* (1818), *Mélanges Littéraires* (1819). His *Œuvres* were collected in 12 vols., 1817-19. See Damiron, *Phil. en France au XIX<sup>e</sup> Siècle* (3rd ed. 1834); and *Ijfe* in French by Bonald's son VICTOR (1853).

**Bonanza** (Lat. *bonus*, through the Spanish), a miner's term for the discovery of a rich vein of ore. The 'Big Bonanza,' one of ten in the Comstock Lode, was struck in 1876. By analogy the term expresses any stroke of good luck.

**Bonanza Creek**, in the Yukon dist., Canada, joins the Klondike R. 2 m. from Dawson. It is rich in deposits of gold.

**Bonaparte**, CHARLES JOSEPH (1851), American lawyer and cabinet officer, was born at Baltimore, Md., a grandson of Jérôme Bonaparte, king of Westphalia. He graduated at Harvard in 1871 and at the Harvard Law School in 1874, and practised in Baltimore. In 1902-4 he was a member of the Board of Indian Commissioners, and he has also served as chairman of the Council of the National Civil Service Reform League, president of the National Municipal League and a member of the National Civic Federation. In 1905 he was appointed Secretary of the Navy, and was Attorney-General from 1906 to 1909.

**Bonaparte**, NAPOLEON. See NAPOLEON I.

**Bonapartes**, THE. The surname Bonaparte or Buonaparte was borne by various Italian families during the middle ages, and it occurs in Corsica in the 10th century. Their name was entered in the 'Golden Book' at Treviso as of noble rank.

**BONAPARTE, CHARLES, or CARLO BUONAPARTE** (1746-85), was a Cor-

sican lawyer, and an adherent of the patriot Paoli. In 1767 he married Maria Letitia Ramolini, a strong-minded and accomplished patrician lady. On the failure (1768) of Paoli's rebellion, Charles Bonaparte accepted the French rule; and in 1773 he was appointed royal counsellor and assessor of the town and province of Ajaccio. In 1793 Napoleon's mother went to Marseilles; but on Napoleon becoming first consul she removed to Paris. She was styled 'Madame Mère' after his coronation in 1804. She accompanied Napoleon to Elba, and after Waterloo she resided with her step-brother, Cardinal Fesch, at Rome, where she died in 1836. See *Madame Mère*, by Larry (1892). Among her children were:—

(1.) **BONAPARTE, JOSEPH** (1768-1844). Expelled from Corsica by the partisans of Paoli, he emigrated to Marseilles; and later, when his illustrious brother rose into power, he was appointed commissary-general, and in 1797 was sent as ambassador to the Pope. In 1800 he was chosen plenipotentiary to the United States to conclude a treaty of friendship between that country and France. He negotiated the treaties of Lunéville (1801) and Amiens (1802). In 1806, much against his will, he accepted the throne of Naples; and in 1808 his brother made him king of Spain. He tried in vain to abdicate; but Wellington's triumph at Vitoria in 1813 at length put an end to his mock sovereignty. On the final fall of his brother he emigrated to the United States, where, under the name of the Count de Survilliers, he lived at Bordentown, N. J., from 1815 until 1832, when he returned to Europe, and died in Florence. See Du Casse's *Mémoires du Roi Joseph* (1856-8).

(2.) **BONAPARTE, NAPOLEON**. See NAPOLEON I.

(3.) **BONAPARTE, LUCIEN** (1775-1840). In 1798 he was elected to the Council of the Five Hundred, where, as president, he rendered great service to Napoleon on the 18th Brumaire. He was subsequently minister of the interior, and in 1800 was sent as ambassador to Spain. Having married Madame Joubertson against the wishes of his brother, he went into retirement in Italy, where he was created Prince of Canino by the Pope. Napoleon's displeasure obliged him in 1810 to leave Rome, and he embarked for the United States, but was captured by the British, who detained him until 1814. Becoming reconciled to his brother, he stood by him during the struggle of the Hundred Days; and it was by his advice that the emperor abdicated in favor of his son. When Louis XVIII. ascended the throne, Lucien

Bonaparte retired with his family to Italy, where he died. See Jung's *Lucien Bonaparte et ses Mémoires* (1882-3).

Prince Lucien Bonaparte left five sons and two daughters. The eldest son, CHARLES LUCIEN JULES LAURENT BONAPARTE (1803-57), married his cousin Zénaïde, the daughter of Joseph Bonaparte, in 1822, and lived in Philadelphia (1822-28) and became known as a naturalist and especially as an ornithologist. His *American Ornithology* (1824-33) was afterward combined with the work of Wilson, as *Wilson and Bonaparte's Ornithology*, a work which is still very valuable. He also published *Illustrations of the Italian Fauna* (in Italian) in 1832-41; *Conspectus Generum Avium*, in 1850-7; besides other books. He succeeded to his father's title in 1840. Returning to Europe, he mingled for a time in politics on the republican side, but in 1849 settled quietly in Paris. One of his sons, Lucien, became (1868) a cardinal in the Church of Rome.—**PAUL MARIE BONAPARTE** (1808-27), second son, took part in the Greek war of liberation, fighting on Lord Cochrane's ship.—**LOUIS LUCIEN BONAPARTE** (1813-91), the third son, became an eminent philologist, and an authority upon the Basque (*Langue Basque*, 1862) and Celtic languages. The catalogue of his works (1858-88) includes no fewer than 222 books written either by himself or under his supervision. He ultimately settled in England, and was awarded a pension of £250 from the British civil list.—**PIERRE NAPOLEON BONAPARTE** (1815-81), the fourth son and the black sheep of the family, spent the early years of his erratic career in Italy, Belgium, and America. Returning to France in 1848, his acts caused great annoyance to his cousin, Napoleon III. In 1870 he shot and killed Victor Noir, the journalist, with whom he was to fight a duel. Brought to trial, he was acquitted of murder, but was ordered to pay a sum of money to the Noir family. His remaining years were spent in England.

(4.) **BONAPARTE MARIE ANNE ELISA** (1777-1820), married (1797) a captain in the French army, named Felice Bacciocchi. She was a clever woman, and when, in 1805, Napoleon erected Lucca and Piombino into a principality, he conferred upon her the government. She became Grand-duchess of Tuscany in 1809. See Turquan's *Les Sœurs de Napoléon* (1896).

(5.) **BONAPARTE, LOUIS** (1778-1846), king of Holland, was in his brother's Italian and Egyptian campaigns. In 1802, in deference to the wishes of Napoleon, he married Hortense (1783-1837), daughter of General Beauharnais by his

wife Josephine, afterward empress of the French. The union was very unhappy, and the pair spent most of their married life apart. In 1806 Louis was made

*sur le Gouvernement de la Hollande* (1821); *Histoire du Parlement Anglais* (1820); *Réponse à Sir W. Scott* (1829); and a critique upon Norvins's *Histoire de*

*Partant pour la Syrie*. The third son of Louis and Hortense Bonaparte was CHARLES LOUIS NAPOLEON. See NAPOLEON III.

(6.) BONAPARTE, MARIE PAULINE (1780-1825), also called CARLOTTA, was Napoleon's favorite sister, and, with her mother, shared his exile at Elba. She was married first (1801) to General Leclerc, afterward (1803) to Prince Borghese. Canova immortalized her beauty as *Venus Victrix*.

(7.) BONAPARTE CAROLINE MARIE ANNONCIATA (1782-1839), married Murat, king of Naples, in 1809, and shared in all his vicissitudes.

(8.) BONAPARTE, JÉROME (1784-1860), king of Westphalia, the youngest brother of Napoleon I., was born at Ajaccio, and served as naval lieutenant in the Hayti expedition (1801). When, two years later, war broke out between France and England, Jérôme, who was in the West Indies, fled for safety to New York, and in December of that year (1803) was married to Elizabeth Patterson of Baltimore. The marriage was annulled by Napoleon in 1805, and Madame Bonaparte was not allowed to enter France in spite of Jérôme's earnest entreaties. A few years later Jérôme, then king of Westphalia, was compelled to marry Catharine of Württemberg.

In 1806 he fought in the war against Prussia, and in 1807 was made king of Westphalia. He took part in the Russian expedition of 1812, commanded a division at Waterloo, and thereafter settled in Florence. On his return to France in 1848 he was appointed governor of the Invalides, and in 1850 was created a marshal of France. His third son by his second wife was NAPOLEON JOSEPH CHARLES PAUL BONAPARTE, known as PRINCE JÉROME NAPOLEON (1822-91) and nicknamed 'Plon-Plon.' He was banished from France in 1845, on account of his republican tendencies. In 1848 he was elected to the National Assembly, and served with the army in the Crimean War. He married, in 1850, Princess Clotilde, daughter of Victor Emmanuel; and their eldest son, PRINCE VICTOR NAPOLEON (1862), is now the head of the Bonaparte family.

See NAPOLFON; Du Casse's *Mémoires et Correspondance du Roi Joseph* (1853-5); Bingham's *Marriages of the Bonapartes* (1881); *Mémoires Secrets de Lucien Bonaparte* (1819); *Mémoires de la Cour de Louis Napoléon*; Wouter's *Les Bonapartes depuis 1815* (1841); Du Casse's *Mémoires du Roi Jérôme* (1861-6); and Martinet's *Jérôme Napoléon, Roi de Westphalie* (1902); Didier's *Life and Letters of Madame Patterson-Bonaparte* (1879), and Williams

The Bonaparte Family.

1. Charles, and 2, Letitia, the father and mother. 3. Napoleon I. 4. Joseph. 5. Lucien. 6. Louis. 7. Jérôme.

king of Holland; but declining to carry out Napoleon's tyrannical policy, he retired in 1810 in favor of his son, and Holland was annexed to France in the same year. He was the author of *Documents Historiques*, etc.,

*Napoléon* (1834). After the final defeat of Napoleon, Hortense Bonaparte settled in Switzerland. She was the authoress of *La Reine Hortense en Italie, en France, et en Angleterre* (1833), and of a number of songs, including the popular

Died May 3, 1906  
1926

and Lester, *The Napoleonic Dynasty* (1860).

**Bonar**, HORATIUS (1808-89), Scottish divine and hymn-writer; born and educated at Edinburgh; appointed minister of Kelso in 1837. He seceded with the Free Church at the Disruption in 1843, and became minister of Chalmers' Memorial Church, Edinburgh, in 1866. He published numerous religious works, notably *Hymns of Faith and Hope* (1857-66; new ed. 1886), eighteen of which are in *Scottish Hymnary*. See *Horatius Bonar, D.D.: a Memorial* (1889).

**Bonaventura**, or BUONAVENTURA, St. (1221-74), scholastic theologian and mystic, surnamed 'the Seraphic Doctor,' was born at Bagnorea in Tuscany. In 1238 he became a Franciscan friar. He received his doctor's degree at Paris after a great controversy, and in 1257 became minister-general of the Franciscans. He accepted the bishopric of Albano, and in 1273 was created a cardinal. He accompanied Gregory X. to the Council of Lyons, during the session of which he died (1274). Dante placed him among the saints in canto xii. of the *Paradiso*; and in 1482 he was canonized by Sixtus IV. His principal works are the *Breviloquium*, the *Itinerarium Mentis in Deum*, *De Reductione Artium ad Theologiam*, and the *Biblia Pauperum*. His works were collected in 8 vols. folio (Rome, 1588-96) and 10 vols. quarto (1882-92). Works upon his life, character, and writings have been written by Hollenberg (1862), Vicenza (1874), Richard (1873), Borgognoni (1874), and De Chévanacé (1899).

**Bonavista**, seapt., Bonavista dist., Newfoundland, 77 m. N.N.W. of St. John's, on cape and bay of Bonavista. The inhabitants are chiefly engaged in fishing and navigation. It is one of the oldest settlements in Newfoundland. The dangers of navigation in the bay are reduced by a lighthouse on Cape Bonavista with a revolving red and white light 150 ft. above sea level. Pop. (1899) 3,550.

**Bonchamp**, CHARLES MELCHIOR ARTHUR, MARQUIS DE (1760-93), Vendéen general, born at Jouverdeil in Anjou. He served in the Revolutionary War in America, and upon his return to France was made a captain. Appointed a leader by the Vendéans, he frequently defeated the republican troops, but was mortally wounded before Cholet in 1793. His last act was to ensure the safety of 5,000 republican prisoners on whom the insurgents were about to wreak their vengeance. See *Life* by Chauveau and Dussieux (1817), and Blachet's *Bonchamp et l'Insurrection Vendéenne* (1902).

VOL. II.—13.

**Bond**. An instrument under seal by which one person, called the obliger, promises to pay another, known as the obligee, a specified sum of money. It is often employed when it is sought to secure under penalty—in a money bond usually double the sum actually due—the performance of something, either the payment of money or the doing of some act; in such cases the obligation is to become void on the happening of the particular event. At common law, on failure of the condition named in the bond, the full penal sum became payable; but the law now only permits the obligee to receive the amount of his actual loss. In many of the United States the debt or money obligation secured by a mortgage on real property is usually in the form of a bond. This is especially the case in the securities issued by railroads and other private corporations. Government securities are usually in the form of bonds, though these are not usually based on mortgages. Though not strictly negotiable instruments, corporate bonds of all kinds are freely transferable and constitute a favorite form of investment of private capital.

**Bond**, a term used in bricklaying and masonry to indicate the arrangement of the bricks or the stones. See BRICKLAYING.

**Bond**, AFRIKANDER. See AFRIKANDER.

**Bond**, SIR EDWARD AUGUSTUS (1815-98), chief librarian of the British Museum, was born at Hanwell, near London, and entered the British Museum as a paleographer in 1838, becoming keeper of the mss. (1866) and chief librarian (1878). With Sir E. Maunde Thompson he founded the Palæographical Society (1870). He was created C.B. (1885) and K.C.B. (1898). He edited *Speeches in the Trial of Warren Hastings* (4 vols. 1859-61), *Chronica Abbatiæ de Melsa* (Rolls Series, 1858), *Statutes of the University of Oxford* (1853), and a complete *Catalogue of the MS. Collections in the British Museum* (1870-5).

**Bond**, SIR ROBERT (1857), premier and colonial secretary of Newfoundland, was born in Newfoundland. Having studied for the bar, he was elected to the Newfoundland Assembly (1880), appointed Speaker (1884), executive councillor and colonial secretary (1889-97), and premier (1900). He was a delegate to England relative to the French treaties question (1890), was mainly instrumental in carrying through the Bond-Blaine convention (1890), and negotiated with Secretary Hay the Hay-Bond treaty which the U. S. Senate refused to ratify. He was also a delegate on the Newfoundland fisheries question (1892), and

chairman of the Ottawa conference (1895).

**Bond**, WILLIAM CRANCH (1789-1859), American astronomer, was born in Portland, Me., and educated himself. He established a private observatory at Dorchester, Mass., and caused some sensation in the astronomical world by his discoveries; was appointed (1838) by the U. S. government to make observations for the use of the Wilkes's exploring expedition to the South Pacific; and became director of the observatory at Harvard University in 1840. He discovered the eighth satellite of Saturn (Sept. 19, 1848), invented the chronograph (1850), and was one of the first (1845) to photograph celestial bodies.

**Bonde** (pl. *bönder*), originally, in the Scandinavian north, a peasant freeholder (odal owner); now, however, synonymous with peasant as ordinarily understood.

**Bonded Warehouse**, a warehouse used for storing bonded goods—i.e., goods subject to internal revenue or customs duty, but on which the duty has not been paid. Such goods are warehoused under government supervision. When removed for sale within the country the duty is paid; when removed for exportation no duty is paid. See WAREHOUSE.

**Bondeno**, tn., prov. Ferrara, Italy, 11 m. by rail N.W. of Ferrara, on the Panaro. Rice and hemp are grown in the neighborhood. Pop. (1901) 15,682.

**Bondi**, CLEMENTE (1742-1821), Italian poet and Jesuit, born at Mezzano in Parma. After the suppression of his order he devoted himself to literature, and became (1797) librarian to the Archduke Ferdinand at Brünn, and in 1815 professor of history and literature at Vienna, where he died. His poems, including his most famous work, *Giornata Villereccia*, as well as French translations of Virgil and Ovid, were published in 3 vols. (1808).

**Bonds**. See STOCKS AND BONDS; STOCK EXCHANGE.

**Bondu**, a native Fulbe kingdom of W. Africa, in the French colony of Senegal, between the middle Gambia and the Faleme; is well watered and fertile, and produces iron and gold, cotton, indigo, tobacco, and the usual W. African products. Pop. 500,000. It became French in 1858.

**Bonduku**, tn., West Africa, in the French colony of the Ivory Coast, close to the w. boundary of Ashanti, and in about 7° 45' N. lat.

**Bone** is one of the hardest structures of the animal body, and possesses also a certain degree of toughness and elasticity. It serves as the framework or skeleton of the body, supporting

Dead  
Mar. 18, 1927

the softer structures, forming the joints, and protecting the viscera. Its color, when fresh, is light pink externally and deep red within. It is composed of earthy and animal matter in the proportion of 67 per cent. of the former and 33 per cent. of the latter. Of the earthy matter 56 per cent. is calcium phosphate, the rest being calcium carbonate, calcium fluoride, and magnesium phosphate. Rickets, mollities, ossium, and caries are associated with deficiency of the earthy matters. The organic substance is chiefly collagen—a substance which is converted into gelatin by boiling. A section of bone is seen to be composed of two kinds of tissue—one external, hard like ivory, a compact and dense tissue; the other internal, a spongy or cancellous tissue resembling a lattice-work. The shaft of a long bone consists of compact bone surrounding a central canal or 'medullary cavity,' so called from its containing the medulla or marrow. Bones are enclosed in a fibrous membrane, the 'periosteum,' by means of which many of the blood-vessels reach the hard tissue. When the periosteum is stripped from the surface of a living bone, the small bleeding points which are seen mark the entrance of the periosteal vessels; the long bones are supplied also by a nutrient artery which enters at the 'nutrient foramen' in the shaft, reaches the medullary cavity, and breaks up into branches, from which small vessels are distributed to the interior of the bone for the supply of the marrow. Veins emerge from the long bones in various places. Examined with a lens of low power, a section of bone is seen to be divided into a number of circular areas, each of which consists of a central hole surrounded by a number of concentric rings. These areas are called Haversian systems. The central hole is a Haversian canal. The average diameter of the Haversian canals is one five-hundredth of an inch; they contain blood-vessels, and minute canaliculi and lacunæ convey the lymph which is exuded from the blood-vessels to the substance of the bone which they traverse. The lacunæ are occupied by branched cells, called bone cells or bone corpuscles, each of which is a little mass of protoplasm, and serves for the nutrition of the bone immediately surrounding it. One lacunar corpuscle communicates with another, with its surrounding area, and with the blood-vessels of the canals, by means of the minute streams of nutrient lymph which occupy the canaliculi. In the shaft of a long bone three distinct sets of

lamellæ can be recognized—circumferential lamellæ, seen best just beneath the periosteum; Haversian lamellæ, round the canals; and interstitial lamellæ, which connect the systems of Haversian lamellæ.

Bone grows in girth by the deposition of layers under the periosteum, like successive rings under the bark of a growing tree. Duhamel placed silver rings round the bones of young pigeons, and when these were killed the rings were found completely covered in by bone; in the animals killed last they were found in the central cavity. John Hunter fed pigs alternately on ordinary food and on food dyed by the red pigment madder. The rings of bone deposited during the madder period were red, and easily distinguished from the others.

Section from Shaft of Humerus  
( $\times 75$ ).

Diseases of bone may be classified as follows: *Bacterial diseases*—pyogenic, tuberculous, syphilitic. *Parasitic diseases*—actinomycosis, mycetoma, hydatid cysts. *Trophic diseases*—rickets, scurvy, osteomalacia, osteitis deformans, fragilitas ossium. *Tumors and cysts*.

Pyogenic disease of bone results from infection with pus-forming organisms, and occurs chiefly before the growth of the skeleton is completed. The *staphylococcus aureus* is the cause of various forms of osteomyelitis and periostitis, of chronic abscess of bone, and of necrosis, with or without suppuration. Other organisms causing bone disease are *pneumococcus* and the typhoid bacillus. Pyogenic diseases of bone also arise from direct infection through a wound or other breach of surface, as in amputations, in compound fractures, and in diseases of adjacent soft parts. Tubercular disease of bone occurs very frequently as the result of the infection of the marrow and periosteum by tubercle bacilli, which have been conveyed to those tissues through the arteries. Syphilitic disease of bone is caused through infection by the syphilitic virus as a consequence of the general disease.

Bones are frequently the seat

of tumors, both primary and secondary. Examples of primary tumors are osteoma, chondroma, sarcoma, and fibroma; and of secondary tumors, carcinoma. For the morphology of bones, see SKELETON.

**Bone, HENRY (1755–1834)**, English painter, was born at Truro. He went to London in 1778, and was employed in enamelling watches and fans, and in enamel painting. His chief works are a series of historical portraits of the time of Elizabeth, *Bacchus and Ariadne*, and the *Cavaliers Distinguished in the Civil War*. He was appointed enamel painter to the king in 1801, and a R.A. in 1811. See Sandby's *Hist. of the Royal Academy* (1862), and Clement's *Painters, Sculptors, Architects, and Engravers* (1899).

**Bone Ash, OR BONE EARTH**, the residue obtained by calcining bones in the presence of air until they are white, consists chiefly of calcium phosphate, together with some carbonate. It is used in the manufacture of cupels for assaying, in the preparation of phosphoric acid and phosphorus, and is the basis of several artificial fertilizers.

**Bone-Black, OR ANIMAL CHARCOAL**, is obtained by heating bones, from which the fat has been removed by a solvent or by boiling, in retorts from which air is excluded. The bone-black contains phosphate and carbonate of lime, with about 10 per cent. of carbon, in a state of very fine division. Its principal use is in sugar-refining, a solution of raw sugar filtered through it being completely decolorized.

**Bone Fertilizers.** The fertilizing value of bones is determined by the phosphoric acid and nitrogen they contain. The proportion of these constituents depends upon the kinds of bones and the treatment to which they have been subjected. Raw or untreated bones consist chiefly of tricalcium phosphate,  $\text{Ca}_3(\text{PO}_4)_2$ , bound together by gelatinous matter rich in nitrogen, and contain when well cleaned as high as 25 per cent. of phosphoric acid and 5 per cent. of nitrogen. When burned, bones yield an earthy residue known as bone ash, which contains from 30 to 35 per cent. of phosphoric acid, when of good quality, but no nitrogen. This material is used to a limited extent in the preparation of superphosphate,  $\text{CaH}_4(\text{PO}_4)_2$ , by treatment with sulphuric acid. Bones are also charred in closed retorts to prepare a product known as bone-black. This is extensively used for clarifying solutions, particularly syrups, as a pigment, and as a fertilizer either directly or after treatment with sulphuric acid to produce what is known as dissolved bone-black or

bone-black superphosphate. Bones are directly treated with sulphuric acid, yielding the so-called dissolved bones, in which the insoluble tricalcin phosphate of the original bones has been converted into the soluble superphosphate by the treatment with acid. This method of treating bones is, however, little used at the present time, superphosphates being more cheaply prepared from the mineral phosphates. The larger part of the bone used for fertilizers is either boiled or steamed at high temperatures. This treatment removes the fat and a part of the gelatinous matter (and hence part of the nitrogen). Steamed bone of good quality contains about 30 per cent. of phosphoric acid and 1½ to 2 per cent. of nitrogen. The mechanical condition of the bone is improved by steaming, and this, as well as the removal of fat, improves its availability when used as a fertilizer. When a considerable amount of meat scraps or other animal refuse is left with the bones a variable product, known as bone tankage, is obtained, which is usually richer in nitrogen and poorer in phosphoric acid than unmixed bones. This product is very extensively used, especially in the preparation of mixed fertilizers.

Bones which have not been treated with acid form a slow-acting fertilizer which is less efficient on calcareous soils than on those less liberally supplied with lime. The fertilizing value of such bones depends to a large extent upon the degree of fineness to which they have been reduced; the finer the bones the quicker their action and the less lasting their effect. Bones give best results on slow-growing crops.

**Boner, CHARLES** (1815-70), English poet and traveller, born at Bath; lived on the Continent from 1840, and was, after 1865, correspondent at Vienna and at other places of the *Daily News*, the *New York Tribune* and other papers. He published *Verse* (1858); *Forest Creatures* (1861)—i.e. the game of Germany; *Transylvania: its Products and its People* (1865). He also translated several of Hans Andersen's fairy tales—*A Danish Story-book* (1846), *Nightingale* (1846), *The Shoes of Fortune* (1883). See *Memoir and Letters of Charles Boner* (2 vols. 1871), and *Memoirs* (2 vols. 1875).

**Boner, ULRICH**, writer of fables, a native of Bern, flourished in the second quarter of the 14th century. He compiled the oldest book of fables in German, his *Edelstein*, to serve as a 'talisman' against the evils and errors of the world. There are a hundred fables, taken from the Latin collections of Avianus and the *Anon-*

*ymus Nevelet*; they are told in simple language, not without grace, and each has its moral, often far-fetched, and in some cases even incongruous. There is a critical edition by Pfeiffer (1844) and modernized selections have been prepared by Oberbreyer (1880) and Pannier (1895).

**Boneset.** A sturdy composite plant (*Eupatorium perfoliatum*) used in domestic medicine. It is a perennial, sending up clusters of tall, hairy stems, with characteristic connate-perfoliate, lanceolate leaves, and massive heads of flowers, which are white and rayless.

**Bo'ness.** See **BORROWSTOUNNESS.**

**Bonfire** ('bone-fire,' 'fire of bones'), probably originating in the funeral pyre. Bonfires were lighted in early times to avert plagues or evil spirits, and became connected with ceremonial observances (cf. the lighting of fires on the eve of St. John's Day or Midsummer Eve). The burning of effigies in such fires may be a relic of propitiatory sacrifices. Firmly rooted in the pagan mind, they were adopted and consecrated by the church: thus, in the Catholic Church the new fire is blessed at Easter, and in the Orthodox Greek Church lighted tapers are carried at that festival. Bonfires are frequently lighted on occasions of public rejoicing, this being especially true of the U. S. The custom of lighting bonfires on Guy Fawkes Day (November 5) still survives in England. See **BEACON**; **BELTANE**; and **Brand's Popular Antiquities**, i. (1849).

**Bonga, tn.**, cap. of Kaffa, 340 m. s.s.w. of Debra Tabor, Abyssinia; trades chiefly with the Galla countries.

*Bongar, or Krait.*

**Bongar**, a name sometimes applied to certain poisonous snakes of the genus *Bungarus*, one of which is the deadly *crait* or *krait* of India. The snakes of this genus are closely allied to the cobra. The krait (*B. candidus*) is dark brown or bluish black above, with bands or spots of white or yellow, and uniform white below. The length does not exceed 4 ft. It is very common in Bengal and S. India, and is said to cause more deaths than any other Indian snake.

**Bongardia**, a genus of the barberry family. One species only

is known; *B. Rawolfii*, a small, stemless plant, found in Greece, Syria, Persia, and Afghanistan, with a tuberous underground root-stock. The Persians roast or boil the tubers for food; the leaves are eaten like sorrel.

**Bon Gaultier Ballads**, parodies of modern poetry written by Professor W. E. Aytoun and Sir Theodore Martin (1840-4). They were reprinted from *Blackwood's Magazine* in thirteen editions between 1855 and 1857. The pseudonym 'Bon Gaultier' was that adopted by Martin when he wrote in *Fraser's Magazine* and *Tait's Edinburgh Magazine*.

**Bonghi, RUGGERO** (1826-95), Italian scholar, political writer, and statesman, was born at Naples, and took an active part in the political events of 1847-9. Between the years 1859-77 he held various chairs of philosophy, classics, and ancient history at Pavia, Turin, Florence, Milan, and Rome. In 1860 he entered Parliament, and was minister of education from 1874-6. Thereafter he devoted himself to literature. His numerous works include *Storia di Roma* (1884-6), *Storia dell' Europa durante la Rivoluzione Francese* (1890-4), various biographies (*Vita di Gesù*, 1890; *Arnaldo da Brescia*, 1884), translations of Plato, Aristotle, etc., and essays on contemporary politics. He was a regular contributor to the *Nuova Antologia*.

**Bongo**, a negro race in the Sudan, between the head-waters of the Bahr-el Ghazal and the Ubangi. They are of middle stature, strongly made, and have a reddish-brown skin. They exhibit some skill in the working of iron. See Schweinfurth's, *The Heart of Africa* (1878).

**Bongo, isl.** Cotabato prov., P. I., 10 m. off E. shore of Illana Bay, S. coast of Mindanao. It is small, densely wooded and reaches an altitude of 300 ft.

**Bonham, tn.**, Tex., co. seat of Fannin co., 75 m. N.N.E. of Dallas, on the Mo., Kan., and Tex. and the Tex. and Pac. R. Rs. It is the seat of Carlton College (Christian) and Bonham Masonic Female institute. There are cotton-seed oil and flour mills, machine shops, cotton and furniture factories. Pop. (1910) 4,844.

**Bonheur, ROSALIE** or **ROSA** (1822-99), French painter of animals, was born at Bordeaux, but early moved (1830) to Paris. Rosa's habit was to study animals not only in their anatomy, but also in their passions. With this object she frequented markets and slaughter-houses. She was eighteen when her first picture was exhibited at the Salon, and in 1848 she painted her famous *Attelage Nivernais*, now in the Luxembourg. After the exhibi-

THE HORSE FAIR. BY ROSA BONHEUR, THE  
FAMOUS ANIMAL PAINTER.

tion of 1855 she rarely exhibited. The *Horse Fair* was painted in 1853; the original is in the Metropolitan Museum in New York City, and a replica in the London National Gallery. Her *Deer in the Forest* is also in the Metropolitan Museum in New York City, and her *Deer Drinking* in the New York Public Library. In 1865 the Cross of the Legion of Honor was conferred on her by the Empress Eugénie, who was at the time acting as Regent. She painted in Spain and Scotland, but her usual residence was near Fontainebleau. Many of her pictures are in England, four in the Wallace collection. Consult Roger-Miles' *Rosa Bonheur*, and Stranahan's *History of French Paintings*.

**Boni**, bō-nē, native state, Celebes, Dutch East Indies, in the southern part of the western peninsula; area about 2,000 square miles. The chief products are cassia, rice, sago, tobacco and cotton. The people, who are mostly Buginese, are skilful workers in gold and iron. The capital is Boni, on the eastern coast. Pop. about 200,000.

**Boniface**, bon'ī-fās, the name of nine Popes. **BONIFACE I.**, bishop of Rome (418-422), was a contemporary of St. Augustine, who dedicated to him his *Quatuor Libri contra Duas Epistolae Pelagianorum*.—**BONIFACE III.**, was consecrated Pope in February, 607, and died in October of the same year. He obtained from the Emperor Phocas recognition of the headship of the church at Rome.—**BONIFACE V.** (619-625) enacted a decree by which churches became places of refuge for criminals. He did much for the Christianizing of England, and four of his letters relative thereto are reproduced in Bede's *Ecclesiastical History*.—**BONIFACE VIII.**, **BENEDICT CAJETAN** (1294-1303), was born in Anagni, a man of great ability. He strongly upheld the temporal as well as the spiritual power of Rome, and was involved in disputes with the Colonnas and Philip the Fair of France, whom he excommunicated. He was proceeding to interdict the whole of France when he was made prisoner at Anagni, and although released almost immediately by the populace, soon died of shock.—**BONIFACE IX.**, **PIETRO TOMACELLI** (1389-1404), quarrelled with Richard of England regarding the collation of benefices. During the reign of Clement VII. he asserted his right to the Papedom, and held his court at Avignon. Consult McKilliam's *A Chronicle of the Popes*.

**Boniface**, Sr. (680-755), the monastic name of Winfried, archbishop, and the great 'Apostle of Germany,' a native of Crediton, Devonshire. Trained in Bene-

dictine monasteries at Exeter and later at Nursling, in 710 he was ordained priest. In 718 he went to Rome, where he was commissioned by Gregory II. to the heathen nations of Germany, and labored as missionary for thirty years. He was consecrated to the bishopric in 723, and founded four cathedrals—Erfurt, Bura-burg (near Fritzlar), Eichstatt, and Würzburg—and established episcopal sees at Freising, Passau, Regensburg, and other cities. Gregory III. appointed Boniface Archbishop and Primate of all Germany; he was chosen archbishop of Mainz in 746, but resigned the see in 754, in order to devote himself more fully to the evangelization of the heathen. During an open-air confirmation service in Friesland in 755, Boniface and his converts were massacred by the heathen. His remains were finally buried in Fulda, where he had founded the celebrated monastery. There is a Life of Boniface by Willibald (in *Monumenta Germaniae Scriptores*, vol. ii. 1829), and his *Letters* have been edited by Giles (1844) and Jaffé (1866).

**Bonifacio**, bō-nē-fā'chō, STRAIT OF, a narrow, rocky passage, difficult of navigation, 7 miles wide, between Corsica and Sardinia.

**Bonington**, **RICHARD PARKES** (1801-28), English artist, was born near Nottingham. His youth was spent in Paris where he became a friend of Delacroix, and was deeply influenced by his great contemporary, Constable. He first exhibited at the Salon in 1822, and later painted in England and in Italy, but his work belongs to the French rather than to the British school. His landscapes (especially in water-color) and his historical paintings are famous for their brilliancy of coloring. He also drew sketches for lithography, and sometimes drew on the stone itself. The National Gallery, London, has one painting; the South Kensington Museum, two landscapes in oil and seven drawings; the Wallace Collection has thirty-four oils and water-colors—a representative series of his historical and landscape work.

**Bonin Islands**, bō-nēn, a group of volcanic islands belonging to Japan. They form a part of the Magellan Archipelago, in the North Pacific, about 24° N. and 140° E., and are divided into four clusters—*vis.*, Coffin Island, Beechey Island (principal, Peel Island, with Port Lloyd, which has a good anchorage), Kater Island and adjacent rocks, and Parry Island. The European and Polynesian half-breeds, and the Japanese colonists who inhabit the group, catch turtle and sharks (for their fins and oil). The Japanese used

them as a penal settlement from 1593 to 1725, and in 1876 took definite possession of them. Pop. about 6,000.

**Bonito**, bō-nē'to (*Thynnus pelamys*), a fish allied to the Mediterranean tunny, found abundantly in temperate and

The Bonito

tropical seas. Like its ally the mackerel, it is an active, predaceous animal, its chief food being flying-fish. It is a fairly good food fish, but is not common in American markets.

**Bonivard**, bō-nē-vār', or **BONNIVARD**, FRANÇOIS DE (1493-1570), the reputed original of Lord Byron's *Prisoner of Chillon*, was born at Seyssel of an ancient Savoyard family, and in 1510 succeeded his uncle as prior of the Cluniac monastery at Geneva. Owing to his hostility to the Duke of Savoy, he was seized in 1530, and spent six years in the castle of Chillon, during four of which he was underground. Released by the Bernese in 1536, when they wrested Vaud from Savoy, he returned to Geneva, and became a Protestant. In 1542 the city commissioned him to compile its history, a task which he completed in 1550. But Calvin found both style and matter wanting, so that the *Chroniques de Geneve* were never printed till 1831 (best ed. 1867, by Revilliod). The work is uncritical, diffuse, and biased.

**Bonjem**, small oasis, in the hinterland of Tripoli, North Africa, on the direct track between that town and Sokna, 150 miles north of Sokna. It contains Roman buildings in an excellent state of preservation.

**Bonn**, city, Germany, in the Rhine province, charmingly situated on the left bank of the Rhine; 21 miles southeast of Cologne by rail. The river is here crossed by a beautiful bridge, and the villas with their lovely gardens on the Rhine make an attractive picture. The most conspicuous building is the Münster, an example of late Romanesque architecture, completely restored since 1875. Other noteworthy structures and institutions are the university (1818), in the lower part of the town; the provincial (Rhenish) museum, built 1889-93 and containing a good collection of antiquities and a picture gallery; the museum of the Academy of Arts; the municipal museum; the castle of Poppelsdorf, which

contains the natural history collections of the university; Beethoven's house, since 1889 a museum; and the house of Arndt. Behind the town rises the hill Kreuzberg (410 feet), crowned by a famous pilgrimage church. In addition to the university, Bonn has an agricultural high school, a

the Treaty of Versailles, from 1918 to 1926 it was occupied first by British, and later by French troops. Pop. (1900) 50,736; (1919) 91,910.

**Bonnat**, bō-nā', LEON JOSEPH FLORENTIN (1833-1922), eminent and powerful French painter was born in Bayonne. He

kept insight. Among his subjects were Victor Hugo, Thiers (Louvre), Puvis de Chevannes, Pasteur, Dumas, Renan, Ferry, Grévy, and Cardinal Lavigerie (Luxembourg). His work is well known in America, as he painted the portraits of a number of Americans, among them a portrait of John Taylor Johnston, a founder of the Metropolitan Museum of Art, New York, in which this painting may be seen. Bonnat's *Italian Girl* and the *Arab Plucking a Thorn from his Foot* are in private collections in New York City.

**Bonner**, EDMUND (?1500-69), bishop of London, who, through the patronage of Cardinal Wolsey, came to be of great service to Henry VIII. in his controversy with the Pope (1532-4). In 1539 he was elected bishop of London. Under Henry he maintained the principle of royal supremacy; but under Edward VI. he resisted the claim of the Privy Council to uncontrolled authority in church and state, and was confined in the Marshalsea prison from 1549 to 1553. On the accession of Queen Mary he was restored to his bishopric. Refusing to take the oath of supremacy (1559) to Elizabeth, he was again sent to the Marshalsea, where he died.

**Bonner**, ROBERT (1824-99), American publisher, was born near Londonderry, Ireland. He went to the United States in 1839, and began work in Hartford, Conn., as an apprentice in the *Courant* office. Removing to New York City in 1844, he became correspondent for out of town papers while working as printer and proof-reader, and in 1851 he bought the *Merchants' Ledger*, a financial paper, to which he added literary material. He changed its name to the *New York Ledger* (1855), engaged popular writers at enormous prices, advertised in extensive and startling ways, and maintained its record as the most popular weekly in the United States until his retirement in 1887. He took great interest in fast horses, of which he acquired a notable list—among them Maud S. and Sunol—owning about fifty at his death.

**Bonnet**, a headdress of women worn out of doors, distinguished from a hat mainly by the want of a brim, and by its covering no part of the forehead. The earliest head gear of the women of Great Britain was a felt or woollen cap called *hat*, worn by the higher class of Anglo-Saxons. This was superseded by a hood or veil, which lasted till the reign of Edward III., when hats first became general; but with the accession of Richard II. they were discarded in favor of colored hoods. Velvet headdresses were

Bonnets

botanical garden and other educational institutions. It is an episcopal see of the Old Catholics.

Bonn is the *Castra Bonniensis* of Tacitus, one of the chief Roman camps on the Rhine. It was almost destroyed by the Elector Frederick III. of Brandenburg in 1689, and was besieged by Marlborough in the war of the Spanish Succession. Its fortifications were demolished in 1717. At the close of the Great War, in accordance with

studied with Madrazo in Madrid and began to exhibit in the Salon in 1857, his genius declaring itself in the *Pilgrims at the Foot of the Statue of St. Peter* (1864). His *Assumption* (1869) is in Bayonne, his *St. Vincent de Paul taking the Place of a Galley Slave* (1866) in St. Nicholas des Champs, his *Christ on the Cross* (1874) in the Palais de Justice, Paris, and his *Martyrdom of St. Denis* in the Pantheon. But his fame rests chiefly on his portraits, remarkable for energy and

usual in the reign of Henry VIII.; French caps were fashionable in the reign of Elizabeth, who introduced the ermine bonnet, which was 'forbidden to all but gentlewomen born.' Since that time there have been as many changes in the style and shape of bonnets as in other articles of wearing apparel. The bonnet, however, has been gradually superseded by the hat in England and America, although there are spasmodic attempts to revive it in its most picturesque forms. The bonnet is still quite generally worn with a veil as a symbol of mourning, especially by widows, and forms a distinctive part of the costume of certain classes, such as the Quakers, and of sisterhoods, as nuns and deaconesses.

The term bonnet is applied

vegetable physiology, followed by *Essai de psychologie* (1755), in which he sought to show the links between the moral and physical world, and *Considerations sur les corps organisés* (1762), Bonnet's teaching is most perfectly summed up in his *Contemplations de la nature* (1764)—of which it has been said that it might have been called the *Esprit de la nature*—and in his *Palingénésie philosophique* (1769-70), dealing with the immortality of all men and animals. He was strongly opposed to Voltaire and Rousseau. Consult *Mémoire* by Trembley (1794), and *Life* by the Duc de Caraman.

**Bonnet Monkey** (*Macacus sinicus*), a species of Old World monkey found in Southern India, so called from a curious crest of hair standing erect on

commission in the Austrian army and fought against his native country (1706-12) and under Prince Eugene against Turkey, (1716-17). For insulting conduct to the Prince he was subsequently sent to the Nether-

Bonnet Piece

lands; there he was again dismissed for insolence and went to Turkey, where he became an officer in the Turkish army under the name of Achmed Pasha. He served successfully in the war against Russia and was made governor of Chios, but again his quarrelsome disposition brought him into disrepute; he was recalled and died in Constantinople.

**Bonneville**, BENJAMIN L. E. (1795-1878), American army officer and explorer, was born in France. He went to New York as a boy, entered the U. S. Military Academy at West Point, and was graduated in 1815. In 1820 he constructed a military road in Mississippi and from 1831 to 1836 was engaged in explorations in the Rocky Mountains and California. He was promoted major in 1845 and fought through the Mexican War, taking part in many important engagements and being brevetted lieutenant-colonel for gallant service. He was made colonel in 1855, commanded the Gila expedition in 1857, and was retired for disability in 1861. During the Civil War he served as superintendent of recruiting in Missouri and in 1865 was brevetted brigadier-general for long and faithful service.

**Bonneville**, LAKE, an extinct glacial lake of the United States, of the Pleistocene period, occupying the northwestern part of the Great Basin known as the Utah Basin. It was formerly about 346 miles long, 145 miles wide, 1050 feet deep and covered an area of 17,500 square miles, but is now a flat plain with the shallow Great Salt Lake resting on its surface.

**Bon'ney**, THOMAS GEORGE (1833-1923), English geologist, was born in Rugeley, and was educated at St. John's College, Cambridge. In 1877 he was made professor of geology at University College, London, a post which he held until 1901, when he was created professor

Bonnet Monkey

also to a headdress for men and boys, usually soft, and distinguished from the hat by the absence of brim. The bonnet has been retained in Scotland, and is represented by three types: the Lowland broad bonnet, the balmoral, and the glengarry. The balmoral and glengarry are worn as a part of the undress uniform of the Scottish regiments.

**Bonnet**, bo-nā', CHARLES DE (1720-93), Swiss naturalist, was the son of a French family settled at Geneva. His first important work was the *Traité d'insectologie* (1745), which was permeated by the philosophical idea, then so powerful at Geneva, of the interdependence of all parts of the universe, physical and moral. In 1754 appeared his *Recherches sur l'usage des feuilles dans les plantes*, a treatise on

the crown of its head. It is very docile and is often kept in captivity as a pet.

**Bonnet Piece**, a gold coin issued in 1539 and 1540, during the reign of James V. of Scotland. The coin is so called because the head of the King is adorned with a bonnet instead of a crown. It weighed 88½ grains and specimens are of great value to the antiquary, having sold as high as £20 10s.

**Bonnet Rouge**, the French liberty cap (q. v.).

**Bonneval**, bon'val', CLAUDE ALEXANDRE, COMTE DE (1675-1747), French soldier and adventurer, was born in Limousin of noble ancestry. After serving with distinction in Italy and the Netherlands, he was court-martialled for insolence and fled to Germany. He obtained a

emeritus. He was president of the Geological Society (1884-5); Hulsean (1884), Boyle (1890-2), and Rede (1892) lecturer in Cambridge University. He served as vice-president of the Royal Society in 1899, and as president of the British Association in 1910-11. Among his works are: *The Alpine Regions* (1868); *The Story of our Planet* (1893); *Charles Lyell and Modern Geology* (1895); *Volcanoes* (1898); *The Building of the Alps* (1912); *The Present Relations of Science and Religion* (1913); *Memories of a Long Life* (1922).

**Bonnie Blue Flag**, a Confederate war song said to have been written by Henry McCarthy, member of a negro minstrel troupe and first sung at the Mississippi Convention which passed the act of secession.

**Bon'ny**, town on the southern coast of the British colony and protectorate of Nigeria, on the west coast of Africa; 80 miles east of the mouth of the Niger. It exports palm oil. Pop. about 7,000.

**Bonny**, river, one of the east mouths of the Niger, falling into the Bight of Biafra; formerly a notorious haunt of slave traders.

**Bonomi**, bō-nō'mi, GIUSEPPE, or JOSEPH (1739-1808), British architect, was born of Italian parents in Rome, and settled in England in 1767. His designs were chiefly in the style of Grecian architecture. His most celebrated buildings are the Italian villa at Roseneath in Dumbartonshire, Langford Hall in Shropshire, and Dale Park in Sussex. He was elected an associate of the Royal Academy in 1789.

**Bonomia**, ancient Latin name of BOLOGNA (q. v.).

**Bonpland**, bōn plān', AIMÉ JACQUES ALEXANDRE (1773-1858), French naturalist, whose real name was GOUJAND, was born in La Rochelle. He travelled with Alexander von Humboldt in America (1799-1804), and was director of the gardens of Josephine at Malmaison (1805-14). Having been appointed professor of natural history at Buenos Aires in 1818, he was seized by Francia, dictator of Paraguay, while engaged in scientific work on the Paraná, and held a prisoner for eight years (1821-9). After his release he devoted himself to agriculture, first in Brazil and later in Argentina. His works include *Plantes equinoxiales* (2 vols. 1805, with 140 plates) and *Monographie des Mélastomacées* (2 vols. 1806, with 120 plates). Consult Brunel's *A. Bonpland*.

**Bon'sal**, STEPHEN (1865- ), American newspaper correspondent, was born in Baltimore, Md. He was educated at St. Paul's

School, Concord, N. H., and in Heidelberg, Bonn, and Vienna. He was special correspondent of the New York *Herald* during the Bulgarian-Servian War, the Macedonian uprising, the Chino-Japanese War, the Cuban insurrection, the Spanish-American War, and the China relief expedition; travelled for that paper in the Balkans, Albania, Macedonia, and Russia, 1904-7; visited South America and the West Indies in 1908; and in 1910-11 went to Mexico for the New York *Times*. From 1891 to 1896 he was in the U. S. diplomatic service in China, Japan, Spain, and Korea; in 1913 was appointed secretary to Governor-General Harrison of the Philippine Islands; in 1914 was commissioner of public utilities in the Philippine Islands; in 1915 was with Hindenburg's army on the east front and in 1918 was with the A. E. F. in France. He is the author of *Morocco as It Is* (1892); *The Real Condition of Cuba* (1897); *The Fight for Santiago* (1899); *The Golden Horse Shoe* (1900); *The American Mediterranean* (1912), and many magazine articles.

**Bonsignori**, bon-sē-nyō'rē, or BUONSIGNORI, FRANCESCO (1455-1519), Italian artist, was born in Verona, and lived there until he was thirty-two, when he went to Mantua and came under the influence of Mantegna. Marchese Gonzaga became his patron and retained him in his service until his death. Bonsignori was especially successful in historical subjects and as a painter of animals. His best works include *St. Louis and St. Bernardino*, in Milan; *March to Calvary*, in Mantua; *Portrait of a Venetian Senator*, in the National Gallery, London; *Christ Carrying the Cross*, in the Doria Gallery, Rome, and *Madonna and Saints*, in Verona.

**Bonstetten**, bon'stet-en, KARL VICTOR VON (1745-1832), Swiss littérateur, a scion of one of the great patrician families of Bern, was profoundly influenced by Rousseau. Later he visited England, and was a friend of the poet Gray. In 1803 he settled at Geneva, where he associated with Madame de Staël and the historians of Switzerland, Johannes von Müller and Zschokke. His most famous work is *L'Homme du Midi et l'Homme du Nord* (1824), one of the earliest treatises on the influence of climate on the characters of various peoples—the south, in his view, being far inferior to the north. Consult his *Souvenirs* (1831) and biographies by Steinlen (in French), Morel (in German), and R. Willy.

**Bon'tebok** (*Bubalis pygargus*), a species of antelope closely allied

to the hartebeest (q. v.), but smaller and characterized by a broad white band down the middle of the face, and by white patches on the hind quarters.

**Bontuku**. See BONDUKU.

**Bonus**, an allowance in addition to that which is formally due. The term is applied to an extra payment of earnings made to holders of corporate shares in addition to the regular dividend, though in the United States this is more frequently called an extra dividend. It usually arises out of the undivided profits of former years, or is occasioned by exceptional transactions involving a large profit. In such cases the directors are unwilling to create a precedent by raising the nominal dividend. Special inducements in the form of money or stock offered security holders to induce them to exchange their securities for others are also called bonuses.

The bonus given by an insurance company is an addition made to the amount insured under a life policy. The amount is determined by the profits of the company as ascertained by periodical valuation. In mutual companies in the United States such a payment, if it accrues annually, is known as a dividend.

In industry the term bonus designates an extra payment made to employees as a reward for increased efficiency and effort, with the object of sharing with the workers the increased results of their industry. Bonuses may be based on economies effected, as in the use of coal, gas, or electricity; on length of service; on the quality or quantity of work produced; and on savings in the cost of production. In cases where neither the production of the individual nor the plant can be measured the bonus may be based on the success of the business as a whole. Such a bonus plan is often adopted by large banking houses, and the bonus is frequently given at the holiday season.

Like profit-sharing (q. v.), the bonus system is not coöperative in character; the establishment of the system and the control of the industry resting entirely with the employer. The chief advantages of the system are that it develops more accurate rewards for actual work done; encourages individual interest and initiative; helps to eliminate errors and waste, and tends to increase production and improve its quality. The disadvantages are chiefly those arising from practical difficulties in operation; carelessly administered bonus schedules give rise to unfairness and dissatisfaction, and interest, at first strong, tends to wane as the bonus becomes an old story.

Labor unions are often suspicious of bonus plans as expedients to outwit them; and occasionally employers use the bonus as a pretext for reducing costs and crowding the workers.

**Bonus, Soldiers'**, compensation granted to ex-soldiers at the conclusion of a war, without regard as to whether or not they incurred any disability. In the United States, ten years after the close of the Civil War, President Grant vetoed a bill to pay a bonus to the troops he had led in battle, and it was not until over forty years after the close of that war that any able-bodied veteran received a bonus or a pension, and not until 1920 did an able-bodied veteran of the Civil War receive a pension or bonus solely on account of having served in the war. (See PENSIONS.)

At the close of the Great War a Federal bonus of \$60 was awarded to every United States soldier upon his discharge from service. About 1920 a determined movement was undertaken for the payment of a further bonus to every man in the United States who had served in the War, the payment to be received under various options, as cash payments, certificate plans, farm, home and land settlements, and vocational training. A bonus bill passed by the House of Representatives and the Senate on Sept. 16, 1922, was vetoed by President Harding (Sept. 19) on the particular ground that it provided no funds for the enormous expenditure involved. On May 3, 1924, a second bonus bill was passed by the House of Representatives and the Senate; it was vetoed by President Coolidge on May 15 on the ground that it was unnecessary and uneconomical, but on May 19 it was passed over the veto by the Senate after having been again passed by the House on May 17. The main features of the bill are as follows: Men who served less than sixty days receive nothing in addition to the \$60 which they received upon discharge. Those who served between 60 and 110 days receive a cash payment of \$1.00 for each day served in excess of 60. Other veterans receive twenty-year endowment insurance policies, the value of the policy being determined by length of service, and whether this was overseas or at home. The average policy amounts to about \$960. All ex-soldiers up to the grade of captain in the army and lieutenant in the navy are eligible, and dependents of dead veterans may receive their bonus. The lowest estimate of the cost to the nation is \$2,000,000,000 spread over a period of twenty years.

A considerable number of the

States also made provision for the payment of bonuses to their ex-service men. In 1924 the following States were paying such a bonus: Illinois, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Missouri, Montana, New Hampshire, New Jersey,

They were based on length and nature of service from Aug. 4, 1914, to the time of discharge. For men who were in overseas service the scale was as follows: Warrant officer 1st class £15, warrant officer 2nd class £12, sergeant £8, corporal £6 and

*Bony Fishes*

1. Hoplopteryx Lewesiensis (fossil). 2. Semiophorus velifer (fossil). 3. Sea-horse. 4. Globe fish. 5. Haddock. 6. Wrasse. 7. Perch. 8. Salmon.

New York, North Dakota, Ohio, Oregon, Rhode Island, South Dakota, Vermont, Washington, and Wisconsin. Colorado and Pennsylvania had voted a bond issue for a bonus, but it had not then been voted on by the people. California, Connecticut, Nevada, Utah, and Wyoming had enacted various measures of relief instead of a cash bonus.

In Great Britain gratuities to non-commissioned officers and men who served in the Great War were paid on demobiliza-

tion. They were based on length and nature of service from Aug. 4, 1914, to the time of discharge. For men who were in overseas service the scale was as follows: Warrant officer 1st class £15, warrant officer 2nd class £12, sergeant £8, corporal £6 and

private £5, for the first year, with 10s. for each succeeding month. For the men in home service the scale was the same for the first year's service, but 5s. instead of 10s. for each additional month. The Canadian government passed a law in December, 1918, establishing a 'war gratuity,' applying to all officers, non-commissioned officers, and men of the Canadian land and naval forces. This act provided for a sliding scale of payment accord-

ing to length and place of service, and based on payment at service rates, as if the man had continued to serve for a minimum period of 31 or a maximum of 183 days after receiving his honorable discharge. There are minimum payment clauses which provide that \$70 is the smallest monthly allowance when a soldier has no dependents and \$100 when he has dependents. The maximum period of payment is six months. Men serving three years, part overseas and in the actual theatre of war, receive a gratuity on the basis of 183 days' extra service; those serving three years in Canadian service, on a basis of 92 days; two years, and less than three, part or all overseas, on a basis of 153 days' extra service; two years' Canadian service, on a basis of 61 days; one year's service and less than two, part or all overseas, on a basis of 122 days' extra service; one year's Canadian service, on a basis of 31 days; those serving less than one year, part or all overseas, on a basis of 92 days' extra service.

Recent estimates of the bonuses paid by the various countries are as follows: Great Britain, \$275,910,000; Canada, \$147,600,000; Australia, \$105,000,000; New Zealand, \$18,290,000; France, \$372,271,000; Belgium, \$10,592,000.

**Bonvalot**, bôn'va'lô', PIERRE GABRIEL (1853- ), French traveller and explorer, was born in Epagne, Aube. He accompanied G. Capus, in 1882, on a trip through Central Asia and Turkestan, followed by a second journey (1885-7) through Persia and the Pamirs. In 1889-90 he went with Prince Henri of Orleans on an expedition from Siberia to Tonkin, and in 1897 he was sent on a government mission to Ethiopia. He made another trip to Central Asia in 1900. His published accounts of his travels include *En Asie Centrale: I. De Moscou en Bactriane* (1884), and *II. Du Kohistan a la Caspienne* (1885); *De Paris au Tonkin* (1892); *L'Asie inconnue* (1896); *Une lourde tâche* (1913).

**Bonvin**, bôn'van', FRANÇOIS SAINT (1817-87), French painter and etcher, was born in Vaugirad. He treated lamplight effects with great success, notably in *A Woman Eating* (1848), *The Etcher* (1873), and in the water-color drawing *The Woman Watching* (1877). His subjects are interiors, still life, and figures, studied with great refinement and realism. Most of his work belongs to private owners, but the museums of Rodez, Niort, and Arras have fine examples; and he is represented in the Luxembourg at Paris by *The Servant at the Fountain* and *The Refectory*.

**Bony Fishes**, or TELEOSTEANS, an important order of fishes, including the vast majority of living forms. Since their first appearance, apparently in Jurassic times, they have increased in numbers until at the close of the secondary epoch they acquired the numerical superiority which they have never since lost. Ganoids and teleosteans are very closely related, and it is believed that the bony pike is the nearest living representative of the stock from which the latter arose. As special teleostean characters, are to be noted the soft scales, the completely bony skeleton, the usually homocercal or even-lobed tail, the swim-bladder, the absence of a spiral valve in the intestine, the existence of an anus instead of a common opening for food-canal and urino-genital organs, together with some less obvious anatomical peculiarities. See illustration on page 191 B.

**Bony Pike**. See GAR-PIKE.

**Bonze**, bonz or bon'ze, a member of a Buddhist fraternity; but the name is generally applied to any Asiatic monk or priest. It comes from a Japanese pronunciation of *fan sung*, which means an ordinary member of the assembly (monastery, etc.).

**Booby**, a name applied to those species of the bird genus

Booby

*Sula* in which the whole of the lower jaw and throat is bare of feathers. They differ from the closely allied gannet in this character, and also in breeding in trees instead of upon rocks, and in being confined to warm climates. They are large birds, from twenty-eight to thirty inches in length, with long pointed wings and a long wedge-shaped tail of twelve to eighteen feathers. Most of the species are white except the wings and tail, which are black or dusky. Their food consists entirely of fish, especially herrings. They owe their common name to their seeming stupidity in allowing themselves to be caught by hand. Common forms are *S. cyanops*,

the Blue-faced Booby, from the South Pacific, which closely resembles a gannet in appearance; the dark brown *S. leucogaster*, found in the tropical parts of the great oceans; and *S. piscator*, the Red-footed Booby.

**Booby Island**, small, rocky island, dangerous to the navigation of Torres Strait, Queensland, Australia.

**Book** (O. E. *bōc*), originally a writing-tablet, or board of beech-wood; then any written document, more especially a charter or legal deed; a treatise or series of treatises written or printed on a number of leaves of paper or other material fastened together at the back and in some kind of binding; by transference, the literary or other contents thus preserved. An unbound book of less than one hundred pages is commonly called a pamphlet. Literary manuscripts of antiquity are spoken of as books when they are written on sheets of paper or vellum, or any substitutes for these, fastened and bound as already described. Previous to the introduction of this book form, literary works written on various materials, as bark, papyrus, parchment, paper, or skins, were put together in any portable form, commonly in rolls made by gluing together pieces of papyrus or vellum, or the separate leaves were strung or hinged together. Specimens of Egyptian papyrus rolls still exist, extending to upwards of 20 and even 40 yards, but the great inconvenience of consulting such enormous scrolls made it more usual to break up any lengthy production into sections, each on a separate roll. These are described under MANUSCRIPTS; see also BOOKBINDING. In ancient Assyria the equivalents of books were the clay tablets inscribed with cuneiform texts, and hardened, for preservation, by baking (see CUNEIFORM).

The earliest printed books were formed of leaves of parchment or of paper laboriously printed from xylographic plates, that is, plates of wood, on which an engraver had cut in relief the letters and figures of the text. The so-called block books were thus printed. Possibly from the occasional necessity of cutting a single letter to correct an error on the block may have sprung the pivotal idea of the art of book-making, the movable character for each letter. The *Biblia Pauperum* and *Ars Moriendi* are among the best specimens of block-books.

The earliest books printed from movable type imitated closely the manuscripts which they quickly superseded; the forms of the types were copied from the Gothic or black-letter characters in which

Bibles, psalters and missals were then written by professional copyists, the arrangement being generally the same. Thus the earliest books have no title page, the place of printing or publication, name of printer or publisher, and date of issue, being either withheld altogether or placed in a colophon or closing paragraph, such as author or copyist had been wont to write at the end of his manuscript. The Latin Bible, known as the Mazarin or Gutenberg Bible, printed at Mainz about 1455, has no colophon; that in the Psalter of 1457 has been translated: 'The present book of Psalms adorned with beauty of capitals, and sufficiently marked out with rubrics, has been thus fashioned by an ingenious invention of printing and stamping, and to the worship of God diligently brought to completion, by Johann Fust, a citizen of Mainz, and Peter Schöffer of Gernsheim, in the year of our Lord, 1457, on the Vigil of the Feast of the Assumption.'

In 1470 Arnold Therhoernen at Cologne printed on a separate leaf a nine-line paragraph containing the title of a Latin sermon and its date; fifteen years later title pages had become common, though the two earliest English examples, that of *A Passing gode lityll boke necessarye and behovefull agenst the Pestilens*, printed by Machlinia, and of *The Chastysynge of Goddes Chyldern*, issued from Caxton's office probably after his death, both date from about 1490-1. For more than a century after this the colophon struggled with the title page for the right of giving the fullest information about the book. Both colophons and (when they came into use) title pages were frequently decorated with the mark or device of the printer, and subsequently of the publisher. The earliest printers' device is the two shields of Fust and Schöffer in the Mainz Bible of 1462; but the use of such devices spread less quickly in Germany than in Italy and France, in both of which countries they attained great beauty, the Italian designs being mostly conventional, while the French often introduce the figure of the printer's patron saint, the arms of the town, or the sign of his house. When not decorated by a device, title pages in the 16th century often displayed a woodcut illustration, and in the 17th the entire title page was frequently engraved on copper.

The writers of mss. made up their books in quires or gatherings of four to six sheets of paper or vellum, folded once and placed one within the other, forming sections of 8 to 12 leaves. These sections correspond to the folded

sheets of the modern book. To aid the binder in arranging they marked the first leaf of the successive sections with the letters of the alphabet, further indicating the order of the leaves in the section by the addition of a number, aii, aiii, aiv, av, avi, on the following first leaf of each included sheet, according as the sections were quaternion (4 sheets), quinternion (5 sheets), or sextern (6 sheets). These letters were called signatures, a name now given to the entire folded sheet. The use of these signatures was introduced into printed books by John Koelhoff at Cologne in 1473, and has continued to the present time—the letters j and v, which had no separate existence in the 15th century, and w, which was not recognized in Roman founts, being still omitted. In early Italian books a summary of these signatures was often given in a register at the end of the book.

In most early books the leaves are left unnumbered, leaf numeration being first used by Arnold Therhoernen at Cologne in 1471, making its way gradually, and being slowly replaced by pagination during the 16th century. The preliminary leaves containing the author's preface or introduction, dedication, etc., were for a long time left unnumbered, and the use of Roman numerals for preliminaries and Arabic for the text is quite modern.

Very elaborate printed capitals in the proper sense of the word—i.e. large initial letters at the beginnings of chapters or sections of a book—were used in Fust and Schöffer's Psalter of 1457; but throughout the 15th century spaces were frequently left blank for them to be filled in by hand, a small letter being sometimes printed to guide the rubricator. The *De Regimine Principum* of Egidius Columna, printed by G. Zainer at Augsburg in 1473, has not only printed capitals, large and small, but also headlines, chapter headings, and paragraph marks, all of which were frequently left to be added by hand in much later books. Decorative capitals became usual about 1490, and held their place in large books for rather over a century. The illustration of books forms the subject of a separate article.

*Size of Books.*—This is determined primarily by the number of times the sheets of paper used in a book are folded, and secondarily by the trade names of the sizes of paper used. In a folio the sheet is folded only once, to form two leaves; in a quarto twice, to form four; in an octavo four times, to form eight. Other recognized fold sizes are duodecimo (12°), sextodecimo (16°),

octodecimo (18°, a French size), vigesimo-quarto (24°), trigesimo-seculo (32°), etc. When handmade papers are used, the true fold of a book, even when cut down in binding, can be told by the position of the wider waterlines—those in folios, octavos, 24mos, and 32mos being perpendicular; those in quartos, 12mos, and 16mos horizontal.

As sheets of paper from different makers varied greatly in dimensions, in order to meet the difficulty of determining the size of books from these fold numbers or symbols, the American Library Association in 1878 adopted the plan of indicating the size by giving the size from actual measurement of the outside height in centimetres. The size is indicated by a letter instead of a number; e.g.

SIZE LETTER	HEIGHT IN CTM.
T	12.5 to 15
S	15 " 17.5
D	17.5 " 20
O	20 " 25
Q	25 " 30
F	30 " 35

corresponding respectively to the fold symbols 24mo, 16mo, 12mo, 8vo, 4to and folio. The simplicity and exactness of this size notation have led to its general adoption in American libraries, and by the *Publishers' Weekly* office for all publications issued therefrom.

*Early Books printed in America.*—The first book printed in the American colonies was the *Bay Psalm Book*, compiled by Richard Mather, Thomas Welde, and John Eliot, the Indian missionary; it was printed in 1640 by Stephen Daye, of Cambridge, Mass. At the same place in 1661-3 was printed by Green and Johnson a still more celebrated book, *Eliot's Indian Bible*, the first Bible published in this country, and in the language of a nation no longer in existence. The credit of printing the first book in America is claimed for Juan Cromberger in Mexico, in 1539, based on a title given in a list published at Madrid in 1577. But a *Doctrina breve* of 1543, the fourth book known to have been printed in Mexico, is the earliest that can be located.

The book has always preserved for us a very exact image of the epoch in which it was written or printed, and a study of the manuscripts or printed books from different countries, showing the development of the caligraphic or typographic arts will also reveal the growth of literary taste during the same periods. It is a fact to be noted that the finest of the earliest books, printed in the blackest of ink on the whitest of vellum, or paper almost equal to vellum, have never been equalled by the modern bookmakers; their

only rivals are the elegant manuscripts which they superseded.

See H. Bouchot's *The Book* (New York, 1889); G. H. Putnam's *Books and their Makers in the Middle Ages* (New York, 1896); E. G. Duff's *Early Printed Books* (London, 1893); *Library Journal* (New York, 1878); F. Saunders's *Story of some Famous Books* (New York, 1887); A. W. Pollard's *Last Words on the Hist. of the Title Page* (London, 1891).

**Bookbinding. HISTORY.**—Binding began when it became necessary to fasten together for preservation the inserted leaves or folded sheets of four, eight, twelve or more leaves of the written manuscripts of the monastic scribes. Threads were passed

one best in Europe. Large panel stamps were subsequently used in France and the Low Countries, and were introduced into England in the 15th century. They are found on numerous books of the time of Henry VIII., some of them bearing the royal arms, others figures of saints or conventional designs. In the 12th and 14th centuries the boards of very valuable books, more especially copies of the gospels for use in church, were covered with carved ivory or metal, and frequently studded with gems. The famous 'Lindau Gospels,' thus ornamented in gold and jewels, belonging to the Earl of Ashburnham, was sold to Mr. J. P. Morgan in 1901 for \$50,000. Towards the end of the 15th cen-

ture, of such exquisite design and workmanship as to command the admiration and imitation of the best workers of all succeeding periods. Contemporary with these we find in France the famous Lyonnaise painted bindings. Later, on the return of Grolier to France under royal patronage, the French school of binding speedily attained excellence by the work of such artists as Nicolas and Clovis Eve (fl. 1560-90), with their elaborate gold-tooled framework interlacings, and compartments filled with laurel and palm branches, and graceful scrolls; Le Gascon (c. 1620), with still more delicate dotted-face gold lines and dentelle or lace-work patterns and borders; Du Seuil, Monnier, and the suc-

*Quadruple Folding Machine, folding a sheet of sixty-four pages (four signatures) of this Encyclopædia.*

through the back folds of each section and around narrow bands of vellum or leather the ends of which were laced into the boards forming the sides of the books. In ordinary binding these boards of hard wood were covered with leather which was protected by metallic bosses, corner plates and other ornaments, and clasps. In the earliest English bindings which have come down to us from about the 10th century, the boards are covered with deer skin or other leather, on which numerous small stamps, from half an inch to an inch in size, containing figures of animals or conventional designs, have been impressed. By arranging these small stamps in circles, rectangles, and other patterns, the binders of Winchester, Durham, Oxford, and London, in the 11th and 12th centuries, produced excellent effects, and the English binders of this period were

through the use of gold leaf in the decoration of bindings was introduced into Venice from the East; and with it an Oriental style of ornamentation showing the Arabic or Saracenic origin of this kind of decoration. Aldus made use of an arabesque ornament of solid face, a style that still bears his name 'Aldine.' Later the tools were crossed or shaded with parallel lines and formed the style called 'azured.' Under the patronage of Jean Grolier (who became treasurer of the duchy of Milan in 1510), Tommaso Maioli, and other wealthy book-lovers, many beautifully-decorated bindings were produced in Italy in the first half of the 16th century, with gold-tooling in lines, straight and curved, worked into the geometrical figures preferred by Grolier, and the elaborate patterns of Maioli, with their azured and openwork arabesque ornamenta-

cessive members of the families of Padeloup and Derôme, and continued pre-eminent till nearly the end of the 18th century. In Germany many good bindings in white pig-skin were executed in the 16th century, blind-stamped by means of small dies representing biblical, mythological, or classical subjects, portraits or purely conventional designs, sometimes dated, and used on books of all kinds without any reference to the fitness of the design to the contents of the book; here gold-tooling arrived late, and never developed any originality. In Holland, Le Gascon found imitators in Poncyn and Magnus of Amsterdam. In England, with the assistance of Italian workmen, Thomas Berthelet, printer and bookbinder to Henry VIII., turned out some excellent bindings; and, under the patronage of Archbishop Parker the workmen of John Day estab-

lished a heavy and dignified English style, well suited to large folio volumes. Under both the Tudor and the Stuart kings various styles of embroidery were applied to bindings, the gaudy little prayer books in embroidered satin of the reign of Charles I. being quite inaccurately associated with the work done in the religious house maintained by John Ferrar and the Collets at Little Gidding. Under Charles II. the royal binder, Samuel Mearne, freely copied Le Gascon, his designs being often excellent. Their general effect is pleasing, especially when the tooling is combined with inlays of different colored leathers. From the frequent use of a design, the top and bottom of which dimly resemble a roof, the bindings of Mearne and his successors are often spoken of as forming the 'cottage' style. In the first half of the 18th century many handsome bindings in red morocco, with a centre ornament in gold tooling, were executed for Robert Hadley, Earl of Oxford, and during this century England took front rank for artistic finishing of books, due largely to the work of Roger Payne, which combined in high degree originality, fine taste, and consummate workmanship. During the 19th century binding all over Europe suffered from the slavish imitation of old designs, but in the latter half of the century, especially since the Paris Exposition of 1867, the binders of England and of France have put forth some excellent work. The workmanship of Hayday and Bedford surpasses that of Roger Payne, and the splendid tooling of Cape and Trautz excels in perfection of finish any of the work of their predecessors. The works of the French binders, Petit, Joly, Lortic, Marius Michel, and the exquisite inlays of Pagnant and Meunier are highly esteemed for originality and delicate finish, even though at times fantastic and bizarre in design.

A collection of the best work done by American binders during the same period would more than hold its own in comparison with foreign work. Examples of finishing by F. Gilson show excellence of design and for perfect accuracy of execution are unexcelled. The highest praise has been given to Otto Zahn, of Memphis, and Stikeman, of New York, but to the late William Matthews must be assigned the first place in the ranks of American bookbinders.

**MODERN INDUSTRY.**—The requirements of modern publishing have made cheaper and speedier methods necessary, and practically every operation may now be performed by machinery. Modern

bookbinders divide their work into two sections—'forwarding,' or preparing the book, and 'finishing,' or decorating the cover.

**Forwarding** includes the operations of folding, gathering, collating, sewing and papering, trimming, gluing, rounding and backing, casemaking and covering. Folding of small quantities is still done by hand. The printed sheets are folded once, twice, thrice, or four times, according to the number of pages in the sheet. The hand folder uses no tool except a small piece of wood or bone, like a paper-knife. Before a fold is made care is taken that the pages are placed exactly opposite each other, or 'in register.' The section of a book folded in each sheet is commonly known as a signature, and the usual signature contains sixteen pages; for thin papers, thirty-two pages. The technical name of each size of book is determined by the number of folds. (See article BOOK above.) Folding machines are now devised to make one fold (for a sheet of four pages), two folds (for eight pages), three folds (for sixteen pages), four folds (for thirty-two pages), and also to do the more unusual folds for twenty-four pages, forty-eight pages, etc. The simplest type of machine for ordinary bookwork makes three folds, and produces a folded signature of sixteen pages. To secure correct 'register,' the sheets are fed by the operator so that the edges are in contact with 'guides' at the front and side, or are 'pointed'—i.e. tiny holes, perforated in the sheet in the process of printing, are placed over steel points on the feeding-board of the folding machine. The feeding is now usually done by an automatic attachment to the folding machine. The most efficient of all bookfolding machines is the quadruple (an American invention), which folds a sheet of sixty-four pages, cutting it into four sections of sixteen pages, each of which is delivered into a separate trough at the rate of from forty to forty-five large sheets per minute.

**Gathering.**—The folded signatures must next be gathered in complete books. This operation is done either by hand or by gathering machines, which have long rows of boxes for the signatures, and moving fingers which take out one signature at a time. They deposit these in proper order on a moving band, and forty complete books can thus be gathered in a minute. Gathered books must next be *collated*—i.e. looked over to see that the sections are in their proper order.

**Stitching.**—Hand-sewing is done in frames across which are stretched, in a vertical position,

the cords or tapes on which the books are to be sewn. Small holes are sawn in the backs of the signatures, and through these the sewer passes the needle in and out round the cords or tapes. It

Book-sewing Machine.

would be impossible to explain or illustrate all classes of book sewing machines, but it will suffice to give two illustrations of those most commonly used. The first is the machine generally used for bookwork. The operator feeds the

Wire-stitching Machine.

signatures on a radial arm which carries them into the machine, where they are firmly sewed. The second machine illustrated is an example of the numerous wire-stitchers which cut off from a reel a small piece of wire, form it into a staple, force it through

the paper, and turn over the ends of the wire. These ingenious machines can wire-stitch a book one inch in thickness.

Guillotine with Two Knives.

**End-papering.**—At the front and back of the book a strong paper, called 'end-paper' or 'waste-paper,' is now fixed. By this the book will afterward be pasted to its cover.

**Trimming.**—After sewing, the books have their edges trimmed (unless bound with uncut edges) on a guillotine. The simplest form of guillotine is a metal table with guides to place the books in proper position, a press (platen) to hold them firmly, and a descending knife to cut the edges. In this form of machine books must be inserted three times to get their 'heads,' 'tails,' and 'fore-edge' cut. Other forms have been devised with either one or two knives in which the books are placed on turn-tables, all three edges being cut consecutively, without moving the books.

**Gluing.**—The trimmed books are now glued on the back with a brush, to harden them and make them more solid.

**Rounding and Backing.**—When the glue is dry, the books are ready for the next two operations—*viz.* rounding the backs, a term which explains itself; and 'backing'—*i.e.* making the little projections at the side against which the cover opens as on a hinge. These operations are done in small binderies by hammering the glued backs roughly into a curve, then fixing them in a vice and passing a roller over the backs. In large binderies the two operations are performed at once by a rounding and backing machine.

**Linings.**—The next operation is the pasting on of mull or paper, or both, to the rounded back to give additional strength to the book. When this is done the book is ready for *casings*.

**Case-making.**—In binding ordinary cloth books, the covers or 'cases' are made before they are attached to the books. The materials required are cotton cloth, straw boards for the sides, and thick paper to stiffen the back. All these are cut to the exact size required. The cloth is glued with a brush, the boards and stiff paper are laid on by gauges, and then the edges of the cloth are turned over, a piece being cut off each corner to prevent a thick fold. Case-making is now done in large binderies by machines, of which the one illustrated is most generally used. The operator feeds the cloth to guides. The machine glues it, places the boards and stiff paper in position, and completes the case.

**Finishing the Case.**—Modern cloth books must receive some ornament on the covers, and this is done either by the hand work already described or by machine-'blocking.' By this latter method metal stamps, on which the design for the back and sides is cut, either emboss the cover or print it with ink or gold. In the gold process, known as 'gold blocking,' leaves of very thin gold are laid on the covers at the spots where a gilt design is required; the design is then stamped in with a hot metal stamp, and the surplus gold leaf not impressed by the stamp is brushed off the cover.

Case-making Machine.

**Casing.**—The book being now ready for its cover, and the cover being prepared for the book, there remains only the operation of pasting the two together. After being pressed for a few hours, the book is ready for delivery.

It would be impossible to describe in detail the progress of many other classes of work which pass through binders' hands. A few words may, however, be added about some distinctive features of other work with which every reader is familiar.

**Edges.**—Ordinary cloth work has plain edges either trimmed, as already described, or 'deckle-

edged'—*i.e.* rough and uncut—when an antique paper has been used. Very often, however, trimmed edges are dyed with red or some other color, or 'sprinkled' with spots of mixed colors. These colored edges, again, may be either dull or 'burnished' by hand.

Many fine books are bound with gilt edges or gilt tops. The books, after trimming, are fastened in a press; the edges are scraped smooth, and sized; gold leaf is then laid on, and when dry is burnished with a tool by hand till it shines brightly. In Bibles, etc., a color is washed over the edges before gilding, producing the beautiful 'red under gold' edges.

**Leather Binding.**—In the finest work, or when great strength is required, a leather cover is not completed separately from, but, as it were, built up round the book, and finished when attached to it. In recent years, however, leather bindings have become so common that most of the leather covers are now made and finished separately like cloth cases. In the old-fashioned way the leather cover adhered to the back of the book, but was made so supple that the book opened freely. In the more modern style of leather binding, as in ordinary cloth work, the back of the book and the back of the cover are not fixed together, and when the book is opened they curve in

opposite directions and a hollow appears between them; hence the expression 'hollow back.' The cheapest leathers in use for book-binding are split sheepskins (commonly known as 'skivers' or French moroccos). Next come sheepskins of the full thickness of the hide; then persians—the skins of Persian goats; and lastly fine moroccos. The persians, moroccos, and other fine leathers have beautiful natural grains, but the same appearance is given to both fine and common leathers by stamping them in a machine by a metal plate. (See LEATHER.)

Leather-bound books may be

roughly divided into (1) full leather or 'bound' books, in which the whole cover is leather; (2) 'half-bound' books, with leather back and corners, the rest of the cover being paper or cloth; and (3) 'limp' books. In the first two classes the basis of the cover is a stiff board; in the third the cover is made as flexible as possible. Bound and half-bound books are generally made with 'hollow backs,' but in limp leather bindings, which have recently become very popular in Dent's Temple Classics, Nelson's New Century Library, etc., the covers are always pasted to the backs of the books.

**Bibles.**—A very large proportion of leather binding is done for Bibles and Prayer Books. For an example of fine leather bindings done in large quantities at cheap prices, nothing is more wonderful than the beautiful flexible Bible work of Eyre and Spottiswoode and other Bible firms. Nearly all Bible work comes under the class of cased work, and the two prevalent styles are known as 'limp' (*i.e.* soft leather covers without flaps) and 'divinity circuit' or 'yapp' (*i.e.* soft covers with a projecting flap turned over to preserve the book). 'Bible work,' and especially Prayer Books, give great scope to the binder for introducing round corners, pretty gold lines, and ornaments both inside and outside the cover, and tasteful linings of paper or leather for the inside of the covers.

**Stationer's Binding,** or the manufacture of account books, etc., is a distinct branch. These books must be specially strong, and the covers are securely fastened to the books at an early stage, and completed while fixed to the books themselves.

A bibliography of works on binding is printed at the end of Miss S. T. Prideaux's *Historical Sketch of Bookbinding* (1893), itself an excellent work. Other good books are W. Matthews's *Modern Bookbinding practically considered* (1889); H. P. Horne's *The Binding of Books* (1894); W. Y. Fletcher's *Bookbinding in England and France* (1896); C. J. Davenport's *Royal English Bookbindings* (1896); and *English Embroidered Bookbinding* (1899). The best collections of colored illustrations of bindings are the *Catalogue of the Exhibition of Bookbindings at the Burlington Fine Arts Club* (1891); *Examples of Bookbindings* (1894); Fletcher's *English Bookbindings in the British Museum* (1895), and *Foreign Bookbindings in the British Museum* (1896). The technical processes of bookbinding are briefly described in Mr. Horne's book quoted above, and more fully in

J. W. Zaehnsdorf's *The Art of Bookbinding* (1890), also in Douglas Cockerell's *Bookbinding and the Care of Books* (1902).

**Book Clubs.** Before the growth of circulating libraries clubs were formed in many country towns and districts for the purchase of the best popular books of the day, and their distribution among the members in rotation. At the end of the year the books purchased were mostly put up at auction at a meeting of the club, and the sum realized carried forward to the next year's purchases. Subscriptions to magazines also were often included and these were circulated among the members. The term is more broadly and generally applied to clubs of two or more persons whose sole purpose it is to publish original matter or reprints of scarce or curious books, for distribution only to members, or among a limited circle of subscribers. Some famous English book clubs (*e.g.* the Roxburge, Maitland, Abbotsford, and Bannatyne), were formed at the beginning of the 19th century.

'The Junto,' founded in Philadelphia by Franklin in 1726, may be called the earliest of American book clubs, though not originally organized as such, since with its encouragement and support Franklin began in 1741 the issue of *The General Magazine, and Historical Chronicle*, the first magazine published in this country, which had no subscribers, the expense of printing being borne by its projectors. 'The Hartford Wits,' and 'The Drone Club' of New York, appear to be the only others organized in the 18th century. The earliest to declare its purpose to be a book club for publishing, as defined above, was 'The Seventy-Six Society' organized in Philadelphia in 1854. Since then some forty or more have come into being, the best known of which are 'The Rowfant Club' of Cleveland, 'The Filson Club' of Louisville, 'The Philobiblon Club' of Philadelphia, and 'The Grollier Club' of New York. For a complete account, see A. Growoll's *American Book Clubs, their Beginnings and History* (1897); see also J. H. Burton's *The Book-Hunter* (1863).

**Book Collecting.** We read of book collecting in the very opening pages of history, as is told elsewhere (see LIBRARIES). The Sphinx had a library at her breast, and the sands of the Great Desert have surrendered some of the most fragile of palæographical treasures. The Greeks had traditions of their book-collecting kings. The Romans collected books among their spoils of war, and Lucullus was a very prince of collectors. Seneca rails at 'Our

idle book-hunters, who,' he says, 'know about nothing but titles and bindings.' St. Jerome declared that he had never seen anything to compare with the library of St. Pamphilus, who collected at Cæsarea 30,000 vols., almost all consisting of the works of the Fathers. The patriarch Photius, a famous book-collector and critic, through writing up the contents of his library for an absent brother, in his *The Myriad of Books* abridged the narrative or doctrine of nearly three hundred authors, and thus preserved many of the most valuable classics.

Benedict Biscop was the first English book-collector, the precursor of many a name famous in the annals of book hunting and preserving. St. Boniface begged his friends to send him books as a refreshment in the wilderness. Alcuin was returning from book-buying at Rome when he met Charlemagne at Parma, and joined him in his great work of reviving learning, and literature. Lanfranc at Canterbury imported a large quantity of books from the Continent, and England in the 12th century has been called the paradise of scholars. Richard de Bury or d'Augerville was a most ardent bibliophile with an ecstasical love for his books, for which he scattered his money with a light heart. He had more books than all the other bishops in England.

Petrarch collected books in many parts of Europe, and through his liberality in lending caused the loss of the only known copy of a treatise by Cicero which was awaiting transcription in his library. Magliabecchi, the jeweller's shop-boy, renowned for his knowledge of books, left 30,000 volumes at his death to the city of Florence, and his name to one of the noblest collections in the world. Matthias Corvinus, king of Hungary, collected the largest and finest library in Europe, afterward nearly all destroyed by the Turks. Bircheimer of Nuremberg had some mss. that 'came to him out of the spoils of Hungary,' in which 'there is to be seen his head graved by Dürer, one of the first examples of sticking or pasting of heads, arms, or cyphers into volumes,' says Oldys. Sir Thomas More was one of England's most learned book-collectors.

The names of royal collectors would fill a volume, but Henri Deux, Catherine de' Medici and Diane de Poitiers constitute a most noteworthy trio. Marguerite de Valois, Anne of Austria, and Queen Marie Leszczinska are to be remembered, the first as queen of *femmes bibliophiles*, Anne for the exquisite bindings done for her by Le Gascon, and Marie for her books bound by Padeloup. Queen

Elizabeth was a collector, and Henry VII. founded the royal collection which later was given to the nation by George II. George III. made another collection which his successor for a large consideration, also gave to his people. Cotton, Harley, Bodley and Ashmole are names immortalized by their famous collections. The same may be said of Grolier and his successors on the Continent, among whom are Petau, De Thou, Pinelli, Peiresc and Libri. Among the more modern European collectors are William Beckford, the Earl of Ashburnham, Henry Huth, Henry Perkins, Henri Bérail, Frederick Locker, and Thomas J. Wise.

**The United States.**—Fascinating and inexhaustible as is the story of book collecting in the Old World, covering, as it does, centuries of time, the success attained by American collectors in less than one hundred years is really remarkable. When the collections made abroad are scattered by sale at auction or otherwise, the choicest of their treasures are generally secured for American collectors who are ever on the alert and ever increasing in number. In consequence of this keen competition the prices of rare books often reach startling figures. Among noted collectors of the United States James Lenox was a pioneer; he secured for his country a copy of the Gutenberg Bible and many first folios of Shakespeare. Other important names in the field of collecting are John Carter Brown and John Nicholas Brown whose splendid collection is owned by Brown University; J. Pierpont Morgan; Henry E. Huntington, whose collection is housed in San Gabriel, Cal.; Robert Hoe; Edward Ayer; Henry C. Folger, famous for his Shakespeareana; and Harry Elkins Widener, with the most complete Stevensoniana in the world.

**Fields of Collecting.**—Each collector has his own hobby and collects generally on special and narrow lines. Books may be rare and yet sell for a low price. Others not so rare sought by many collectors at the same time fetch good prices. Shakespeare and Elizabethan and pre-Elizabethan authors are always a favorite field for collectors. Shelley, Burns, Dickens, Thackeray, Stevenson, Conrad and Kipling occupy high positions, and in the American field Poe, Bret Harte, Mark Twain and Walt Whitman are favorites. Other fields in popular favor are Americana, which includes all works relating to America; first editions of modern authors; books illustrated by such artists as Phiz, Cruikshank, Kate Greenaway,

Hugh Thomson and Beardsley; books on the Civil War; books on the Great War, notably the Hoover collection at Stanford University; and books noted for typographical style and excellence.

Consult Eltons' *Great Book Collectors*; W. T. Fletcher's *English Book Collectors*; Arnold's *Ventures in Book Collecting* (1923); I. A. Williams' *The Elements of Book Collecting* (1927); J. T. Winterich's *A Primer of Book Collecting* (1927); for prices of books see the annual volumes of Slater's *Book Prices Current* (London); L. S. Livingston's annual volumes of *American Book Prices Current* (New York), and the latter's *Auction Prices of Books* (New York).

**Book Illustration.** See ILLUSTRATION OF BOOKS.

**Bookkeeping,** a method of recording business transactions by means of figures. If a business enterprise operated by an individual or group of individuals, is to succeed it must base its future plans and policies on facts. The facts most vital to a given business are: What is our present financial status or condition? How does this condition compare with our condition at some definite date in the past (usually one year ago)? What were the reasons for this change? What was our income and what were its sources? What were our costs of doing business? To answer these questions it will be necessary to have a record of all business transactions for the past period. Furthermore, these records must be summarized and condensed into statements which may easily be interpreted by the business executives. Therefore at the beginning of a business, preparation should be made for compiling this vital information by providing for a bookkeeping system. Another reason for a bookkeeping system is to provide the information required on the Federal and State income tax blanks. The person who makes the records is known as a bookkeeper.

While bookkeeping systems are based on the same fundamental principle which will be explained later, the great variety of types of business makes it necessary to vary the system to meet specific requirements. In other words bookkeeping systems should be 'custom-made,' not 'ready-made.' An expert should be engaged to study the particular business and plan a system of accounts. He should then explain the details to a bookkeeper who will assume the responsibility of recording the business transactions from day to day.

Bookkeeping records are based on the theory that all transactions are dual in character; they affect the business in two ways of equal degree.

At the time the business is started there is an equal exchange—the business receives cash or other assets and in exchange the business owes the proprietors for their investment. Since this investment is permanent and will not have to be repaid as long as the business exists, the obligation is called Capital. At this point the assets equal the capital; which, when expressed as an equation, is ( $A = C$ ). Subsequently the business will purchase other assets, either in exchange for other assets or on a promise to pay in the future. If purchased on a promise for future payment, the business will assume an obligation to pay, which is technically known as a liability. At this point the fundamental bookkeeping equation becomes: Assets equal Liabilities plus Capital ( $A = L + C$ ). Assets originate on the left of the equation and are referred to as debits. Liabilities and Capital originate on the right side and are referred to as credits. The assets, liabilities, and capital have many subdivisions as indicated in the following illustrations, and each of the subdivisions are recorded under their respective headings in a form called an account. An account may have various rulings but in every case it will be arranged with two sides—the left side which is called the debit and the right side the credit. In the following abbreviated forms any of the individual assets, liabilities, or capital could be substituted at the heading, and the rules for increases and decreases would apply.

From the foregoing it is evident that any business transaction will involve either an increase in an asset, a decrease in an asset; an increase in a liability, a decrease in a liability; an increase in capital, or decrease in capital. The bookkeeper must analyze the various business transactions and classify them according to the accounts to be debited and credited. The following illustrates how this analysis is done in a few representative transactions: John Doe invested \$10,000.00 in a business enterprise. The entry—debit cash (asset cash is increased) and credit John Doe (capital increased). Bought store equipment for \$1,500.00. The entry—debit Store Equipment (asset store equipment increased) and credit cash (asset cash decreased). Bought truck for delivery purposes \$1,000.00 paying \$500.00 cash and giving notes for bal-

Dr.	ASSETS (Anything Owned)	Cr.
Always originate as debits. The following are some of the common assets:		Decreases in any asset would be credited to the appropriate asset.
Cash		
Accounts Receivable (oral promises)

ance. The entry—debit Delivery Equipment (asset increased) and credit cash (asset decreased) and credit Notes Payable (liability increased.) Bought merchandise \$125.00 from S. Smith on account (oral promise). The entry—debit purchases (decrease in capital by a cost) and credit S. Smith (increase in liability). Sold merchandise \$165.00 for cash. The entry—debit Cash (increase in asset) and credit Sales (increase in capital by income). Paid employees salaries \$100.00. The entry—debit Salaries (decrease in capital by cost) and credit Cash (decrease in asset).

After the transactions have been analyzed into debits and credits they must be recorded in permanent records. The records have three natural divisions: (1) Books of original entry (those books in which the entry is made at the time of the transaction; (2) Ledger or book of accounts where the information taken from the books of original entry is classified; and (3) The summarizing and interpreting of the results (Trial Balance, Stock Taking, Balance Sheet, and Profit and Loss Statement.)

**General Journalizing.**—There is one fundamental book of original entry, the Journal, in which the bookkeeper records the business transactions according to debits and credits. While it is possible to record any transaction in this book, the detail consumes too much time and space. Therefore as soon as a given

business has a number of transactions of a similar nature, a special journal is devised to reduce the detail to a minimum. The feature of a special journal is the fact that since all entries are of the same type the individual amounts may be totaled and posted in one amount thus saving much time in posting.

Since several of these special journals are to be introduced it becomes necessary to call the original journal the General Journal for the purposes of identification.

**Sales Journal.**—Entries in this journal are usually made from the duplicate of the sales invoice, after which the duplicate is filed away. Some firms arrange the duplicate sales invoices in book form and post direct to the customer's account, thus eliminating the sales journal. The total sales is credited to Sales account thus balancing the individual debits to the customers.

**Purchase Journal.**—Entries are made from the invoices received for the merchandise purchased. The total is posted in one amount to the debit of the Purchase account at the end of the period.

**Cash Receipts Journal.**—This is used for all receipts of cash which include checks, currency, and money orders. Simple forms are ruled similar to the General Journal but special columns may be added. The illustration is an advanced form which provides for cash sales and also for a separate column for receipts from customers such as is necessary when a separate ledger or card file is used for customers' accounts. The individual entries are easy to understand, but the method of footing and labeling the results requires in addition a complete knowledge of bookkeeping theory.

been equal debits and credits posted, it does not prove that the original entries are correct. The trial balance also serves as a convenient summary of the ledger.

**Balance Sheet.**—At the end of the business year the records for the year are used as a basis for determining the present financial condition or capital of the business and the profit or loss for the year. The form which is used for the purpose is called the *balance sheet*. It is based on the fundamental equation Assets = Liabilities + Capital, or expressed in another way A - L = C. Much of this information may be taken from the trial balance. However some of the assets will be valued less than the amounts in the trial balance because of depreciation (lessening in value due to wear and tear). The value of merchandise on hand is not shown in the trial balance but has to be determined by actual count valued at cost price (physical inventory). Some firms keep a proper record of all merchandise which shows the amount on hand at all times (perpetual inventory). There are also certain unrecorded assets and liabilities such as interest accrued on notes receivable, and interest accrued on notes pay-

**Cash Disbursements Journal.**—This is for all disbursements of cash. It may have a simple two-column ruling or additional columns may be added. In small firms these two cash journals are arranged in one book—the receipts on the left page and the disbursements on the right. When arranged as one book it is called a Cash Book. The illustration which follows is ruled as if it were used as the right side of the cash book.

**Posting.**—After the records have been made in the books of original entry the various debits and credits are transferred to their appropriate account in the ledger.

Accounts with customers are often kept on cards or in a separate ledger. It is very important that the balance owed by a customer be available at a glance. This is accomplished by special ruling.

**Trial Balance.**—After all posting has been completed the bookkeeper tests the accuracy of the posting by systematically listing all open accounts in the ledger. (An account is one which has one side larger than the other.) In listing the accounts a two-column form is used. Those with the debit side the larger have the amount extended into the first column, and when the credit side is the larger the amount is extended into the second column. If the posting has been done correctly the two columns will have the same totals which will indicate that

the ledger is in balance, equal debits for equal credits. This form is called a *trial balance*. While it proves that there have

able, and unused costs such as unexpired insurance, etc. The following is a form of balance sheet.

**Profit and Loss Statement.**—After the balance sheet has been prepared, it must be supplemented by another statement which will show in itemized form the sources of income and the nature and amount of the costs.

**Closing the Books.**—At the end of the business, or fiscal year, the

is done by means of journal entries which when posted to the ledger will bring the ledger into agreement with the balance sheet. Proof that this has been accomplished is furnished by taking another trial balance which is technically known as a *Post-Closing Trial Balance*.

**Single-Entry Bookkeeping.**—Single entry is not worthy of being called a system. At best it is nothing but incomplete double entry. It is memorandum

(1) Determine the present capital by preparing a balance sheet ( $A - L = C$ ); (2) Compare the present capital with that of a previous period; (3) If an increase in capital, add any drawings and deduct any additional investments. The result will be the approximate profit.

**History of Bookkeeping.**—In Babylonia as early as 2285 B.C. drafts and checks were used and legal decisions were recorded covering receipts, inventories, sales and accounts. Records were made on tiny sun-baked slabs of clay written on front, back and sometimes on the edges. The early Egyptians kept their accounts on papyrus, while the Greeks required all the public officials to render an account of the funds entrusted to them. These records were engraved on stone and placed in public view. Then as now, publicity was a mighty agency for honesty. In early Rome we have the first evidence of the use of a book of original entry. Family heads, bankers and government officials recorded transactions on a memorandum form and later transferred them to a register.

One of the earliest references to account keeping in England is mentioned in connection with the story of the Domesday Book. Assessments of taxes were recorded on tally sticks which were notched showing amount of taxes owed by each land owner. The same number and kind of notches were made on each end of the stick, after which it was cut into two parts; one to be retained by the treasurer and the other taken to the tax payer by a sheriff.

None of the earlier records were on the double-entry plan. However, in 1494 Luca Paciolo, an Italian monk, published a book entitled *Everything about Arithmetic, Geometry, and Proportion*, a chapter 'Reckonings and Writings' is devoted to double-entry bookkeeping. Paciolo says the object of bookkeeping is to give information about assets and liabilities. His system required three books—a memorial (memorandum book), a journal, and a ledger.

**Modern Methods and Mechanical Aids.**—Present day bookkeeping systems are refinements of Paciolo's theory. Bookkeeping procedure is about the same for the three forms of business organization—Sole Proprietor, Partnership, and Corporation. The essential difference between the records for proprietorship and partnership is that the bookkeeper should keep a separate capital account for each partner, whereas in the corporation there are no accounts with partners, but instead two new accounts

balance sheet will show the condition of the business. Because of the fact that many unrecorded items had to be included in determining present capital it is apparent that the ledger is not in agreement with present condition and must be made so. To accomplish this, the new accounts appearing in the balance sheet must be added to the ledger, and those accounts which do not agree in amounts must be adjusted to the balance sheet figures. Furthermore all the cost and income accounts have served their purpose and they are closed into the capital account of which they are sub-divisions. The necessary adjusting and closing

bookkeeping—keeping book records of only what is of especial interest. Theoretically it is a system which records only the personal accounts (accounts with persons who owe the business and those whom the business owes) which limits its practicability to very small enterprises where the proprietor gives his personal attention to all details. If a firm is large enough to employ a bookkeeper, the books should be kept on the double-entry basis. However, if books have been kept on an incomplete double entry plan or single entry, it is possible to compute the approximate profit or loss, but it cannot be itemized.

are used—Capital Stock, and Surplus.

If a business employs only one bookkeeper, he is a bookkeeper in the old meaning of the word; he does every part of the work. A system which is becoming increasingly popular is one known as the 'Cash-Journal' system. In fact it is the same fundamental system which was outlined in this article, except that *all* the books of original entry are combined in one form or one book of many columns. Leading stationery stores can supply this form. If the business is large enough to require many bookkeepers the bookkeepers become special clerks in certain phases of the work. One will be cashier, another will make out bills, while several will spend their entire time in posting.

When a business has over fifty customers its bookkeeping system should provide for a subsidiary ledger or card file for its customers. The main advantage of such a plan is that the bookkeeping can keep pace with the growth of the business. When the number of customers' accounts becomes too large for one bookkeeper, the accounts may be divided into two ledgers and another ledger clerk hired. This dividing of accounts may go on indefinitely. The summary of all the customers' accounts is recorded in the general ledger under an account 'Accounts Receivable,' which is referred to as a controlling account. A similar plan is usually employed for handling creditors' accounts. To operate a system employing controlling accounts, it is necessary to add special columns to the books of original entry, with a corresponding change in the method of summarizing the footing of the various columns for purposes of posting. The illustration of the cash journals demonstrate the use of special columns for the subsidiary ledgers.

Modern bookkeeping systems make extensive use of mechanical devices. Sales invoices are made out on various kinds of billing machines which are combinations of the typewriter and the calculating machine. Postings to customers' accounts are made with posting machines, which combine the same features of the billing machine but adjusted to posting work. The development of the cash register has been of especial significance to the bookkeeper. The latest development is a combination of the cash register and posting machine which records the receipt on a permanent record, and at the same time prepares a receipt and posts the payment to the customers' account and extends the

balance due. This machine is used extensively in the savings departments of banks and by furniture dealers and installment houses. However, while the use of modern mechanical devices have made it possible to do more work with greater ease, they have in no sense decreased the demand for a knowledge of methods and procedures.

**Bookland.** See BOCLAND.

**Book Lice,** a name applied to the insects of the family *Atropidae*, also called lesser death-watches. They are tiny colorless insects often found inhabiting old books, to which the larvae are often very destructive. They are also found in natural history collections and in strawbeds. See DEATH-WATCH.

**Bookmaker.** See BETTING.

**Book of Common Prayer.** See PRAYER BOOK.

**Bookplates,** pictorial labels used to denote the ownership of books. Their use is said to be nearly as old as the printed book itself, but the earliest bookplate of which we have definite knowledge dates from about 1480. In the 15th century it became common, especially in Italy, to introduce the arms of the owner of a fine book into the illuminated border round the first page of text; and in a few woodcut borders to books printed by Erhard Ratdolt and other printers in Italy blank shields are conspicuous, in which the owner's arms might be inserted. The printing of separate labels to be pasted into a number of volumes began in Germany towards the close of the same century, the example usually quoted as the earliest being that found in the books presented by Hildebrand Brandenburg of Biberach to the Carthusian monastery at Buxheim, in Swabia, about 1480, though the woodcut itself is probably ten or twelve years later. Early in the 16th century the designing of bookplates engaged the attention of many German artists, notably Albrecht Dürer, Lucas Cranach, Jost Amman, and Hans Holbein. In France, Jean Beraud de La Tour-Blanche used a bookplate as early as 1529; but only one other of French ownership in the 16th century has yet been traced.

In England, a woodcut with the donor's arms and a printed inscription was placed in books presented by Sir Nicholas Bacon to the University of Cambridge in 1574; the first English bookplate denoting personal ownership was that of Sir Thomas Tresham, which is dated June 29, 1585. Until the second half of the 17th century the use of bookplates was rare both in France and England, most owners preferring to stamp their arms or names on the leather covers of their books.

Towards the end of the century bookplates increased rapidly in England, and for about a dozen years from 1698 there is a curiously large number of English bookplates bearing the dates of the years in which they were engraved. The styles of English bookplates have been distinguished as 'early armorial,' with no ornament save heavy mantling; the 'Jacobean,' in which the shield mostly rests on a bracket and is surrounded by a frame resembling wood-carving; 'Chippendale,' in which the frame takes the form of a border of open flower- and shell-work of delicate grace and lightness; and 'wreath and ribbon,' whose decoration resembles that of Sheraton furniture.

When bookplates became fashionable, about 1880, armorial designs were largely supplemented by pictorial and emblematic ones. Until about the date just mentioned the collecting of bookplates was hardly known, but it sprang suddenly into favor; some treasure them because of the famous persons for whom they were made; others as the work of distinguished engravers, and for the beauty of their designs; and still others for the aid given by their heraldic designs in tracing family history. The first known collector was a Miss Jenkins, of Bath, England, who began collecting in 1820. The first great collection in England was formed by Sir Wollaston Franks, numbered over 100,000 specimens, and was bequeathed by him to the Print Room of the British Museum.

The earliest bookplates used in America were brought over by some of the colonists or were made to their orders by English engravers. The first American bookplate bearing a date was the work of Nathaniel Hurd, of Boston, executed for Thomas Dering in 1749. Thirty plates signed by him are known, and others are attributed to him. Paul Revere was one of the small coterie of bookplate engravers, but specimens of his work are rare and costly. The early American plates are chiefly ar-

morial in design; many printed labels, some ornamental in composition, were used. The publication of Mr. Warren's book in 1880 aroused a wide interest which culminated in the foundation of the Ex Libris Society, of London, in 1890. Bookplates usually bear inscriptions beginning with the words Ex libris. . . (i.e. One of the books of . . .), and these two words have been adopted as a convenient international name for the plates themselves. The extensive literature on the subject comprises books, monographs, and articles

that history records occurred in the year 221 B.C., when the Emperor Chi Wang-ti, of the Chinese dynasty of Tsin, desiring to destroy the power of tradition, caused to be burned all the books in his empire, except works on divination, agriculture, and medicine. And occasionally in the ancient classic writers mention is made of the burning of obnoxious or inconvenient books; among others, the works of Pythagoras are said to have been burned at Athens. Antiochus Epiphanes ordered all copies of the Jewish Law to be burned. Thus the

Paul's in 1527, followed by the burning of a second edition in 1530. Among other books ordered to be burned were Suarez's *Defensio Catholica Fidei contra Anglicana Secta Errores*, burned by order of James I.; Barker's Bible and Prayer Book (1631), in which the word 'not' was omitted in the seventh commandment; Luther's works, at St. Paul's (1530); Tyndale's *The Wicked Mammon* and *The Obedience of a Christian Man* (1546); Simon Fish's *The Supplication of Beggars* (1546); the anonymous *Revelation of Antichrist* (1546); Simon Fish's translation from the German of *The Summary of Scripture* (1546); and all the works of Frith, Tyndale, Bale, Barnes, Coverdale, Turner, and Tracy.

**Book Scorpion**, a general name given to members of the arachnid order of Pseudoscorpionida, which includes minute insects found in old books, under bark, and in vegetable debris in temperate and tropical countries. They generally resemble scorpions, but lack the long tail and sting.

**Book Trade.** See PUBLISHING.

**Bookworms**, the popular name given to several insects or their larvæ, which feed on the paste used in binding books, and bore holes both through the binding and through the pages of the book itself in order to get it. The commonest and most mischievous of bookworms are the beetles *Sitotroga panicea*, found both in the larval form and as full-grown insects, and the larva of *Attagenus pelloio*. Other troublesome species are the small beetles *Ptinus fur*, *Dermeestes lardarius*, and the larva of *Anthrenus varius*. The insect known as the silverfish (*Lepisma*) is also a pest in damp libraries. Brushing and cleaning, fresh air and use, are the best preservatives against bookworms; but subjection to considerable heat and sprinkling with pure pyrethrum powder are approved remedies.

**Boole, GEORGE** (1815-64), English mathematician and logician, was born in Lincoln, the son of a small tradesman. When a very young man he became assistant in a private school in Doncaster, later established his own school, and in 1849 was appointed professor of mathematics in Queen's College, Cork. He published two important textbooks on *Differential Equations* (1859), and on *Finite Differences* (1860), and contributed many valuable articles to scientific journals—e.g. 'Theory of Analytical Transformations,' in *Cambridge Mathematical Jour.*

Bookplate of Sir Thomas Tresham  
(The first private bookplate in England)

contributed to periodicals. Several important collections exist in the United States, and several expert engravers here and abroad have earned international reputations for their designs and work. Societies have been formed in Germany (1896), France (1894), the United States (1896), and Austria (1903), and periodicals devoted to the subject are issued in London, Paris, and Berlin. Consult H. W. Fincham and J. W. Brown's *A Bibliography of Bookplates*; J. Leicester Warren's *A Guide to the Study of Bookplates*; H. W. Fincham's *Artists and Engravers of British and American Bookplates*; G. W. Fuller's *A Bibliography of Bookplate Literature* (1926).

**Books Burnt by Order.** Probably the most drastic holocaust of books burned by order

burning of heretical books is not of Christian origin. The destruction of Christian books formed part of the heathen persecution of Diocletian, who in A.D. 303 ordered all such writings to be burned.

The introduction of the practice among Christians is ascribed to Osius, bishop of Cordova, who persuaded Constantine to order the writings of Arius to be committed to the flames, while similar treatment was afterward meted out to the writings of Nestorius and Honorius. In 1121 Abélard was condemned to burn his own *Introductio ad Theologiam* because of its false teaching with regard to the Trinity. Book-burning was inaugurated in England by the destruction of copies of the Antwerp edition of Tyndale's New Testament at St.

(1839), and 'General Method in Analysis,' in *Philosophical Transactions* (1844). His most remarkable work, however, was the *Laws of Thought* (1854), in which symbolic language and notation were employed to express purely logical processes.

**Boom**, a spar used to stretch the foot of a fore-and-aft sail. It pivots on the mast and its after-end is controlled by the sheet. (See SHIP; YACHT.) Also any spar projecting abeam to which the boats of a ship at moorings may be made fast, or the supports for the torpedo nets. Also the barrier of timbers, chains, or other material extended across the mouth of a harbor to prevent the entrance of hostile vessels.

**Boom**, bôm, town, Belgium, in the province of Antwerp, 11 miles south of Antwerp. It has brickworks, salt-pans, tanneries, and breweries. Pop. 19,200.

**Boomerang**, a missile weapon of the Australian aborigines, which is a curved piece of hard wood, somewhat resembling a scimitar, about three feet long and three inches wide, flat on one side and slightly rounded on the other, with a sharp

Various Kinds of Boomerangs

edge, but exhibiting variations in shape and dimensions according to locality. It is thrown with the convex or cutting edge pointing towards the object aimed at. Its great characteristic is that, if it encounters no heavy obstacle in its flight, it begins, owing to its peculiar shape, a retrograde motion when its first force is spent, and thus returns to the place from which it has been thrown. A very slight impediment does not check its outward course, for it has been known to slice off the head of a flying bird and yet return to the thrower. It is a keen and deadly weapon, and usually inflicts a fatal wound, whether the object it strikes is a bird in the air, or a man or other animal on the ground. Its

impact with any serious obstacle, of course, absorbs its motion, and it falls to the ground.

**Boondoe**. See BUNDI.

**Boone**, city, Iowa, county seat of Boone County, on the Chicago, Milwaukee, St. Paul and Pacific, the Des Moines and Southern, and the Chicago and North Western Railroads; 47 miles northwest of Des Moines. Features of interest include a State park, a public library, a hospital and a Masonic home. It is a centre for the export of coal and lumber and there are deposits of potter's clay in the vicinity. Large railroad and machine shops are situated here and there are silk mills and foundries. Pop. (1910) 10,347; (1925) 12,812.

**Boone**, DANIEL (1734-1820), famous American pioneer, was born near the site of the present Reading, Pa. With his father he removed about 1752 to the North Carolina frontier, where he became a hunter and trapper, and in 1767 and again in 1769-71 roamed the forests of Kentucky, then an almost unknown region. In 1775 he had an important part in the founding of Boonesboro, Ky. (named in his honor); and for many months in 1778 he was a captive in the hands of the Indians, who adopted him into their tribe. At length he made his escape and immediately after returned to Boonesboro where he assisted in repelling a fierce attack by the Indians which lasted about ten days. He subsequently held several offices among the frontier settlers. About 1799 he received a grant from Spain in what is now Missouri; and until the acquisition of this territory by the United States, through the Louisiana Purchase in 1803, was a Spanish official. Innumerable stories are told to illustrate his prowess and bravery as an Indian fighter and his great skill as a backwoodsman.

**Boonton**, town, New Jersey, in Morris County, on the Rockaway River, and the Delaware, Lackawanna and Western Railroad; 13 miles southwest of Paterson. It is a pleasant residential city and a favorite summer resort. There are iron works, and manufactures of rubber, baking ovens, and silk hosiery. Pop. (1920) 5,372; (1930) 6,766.

**Boonville**, town, Indiana, county seat of Warrick County, on the Southern Railway; 18 miles northeast of Evansville. The surrounding district is rich in timber and contains deposits of coal and potter's clay. There are manufactures of flour, fertilizers, underwear and tobacco. Pop. (1920) 4,451; (1930) 4,204.

**Boonville**, city, Missouri, the county seat of Cooper County,

on the right bank of the Missouri River, and on the Missouri Pacific, and the Missouri, Kansas and Texas Railroads; 169 miles west of St. Louis. It has a fine site overlooking the river from a bluff 100 feet high, and is a residential city. Harley Park includes 35 acres with athletic field and playgrounds. The State Reform School for Boys and Kemper Military School are situated here. Manufactures include boots and shoes, cob pipes, bags, bricks and flour. It was the scene of a Federal victory in June, 1861, when General Lyon routed a numerically stronger body of Confederates, under Col. J. S. Marmaduke. Pop. (1920) 4,665; (1930 est.) 7,000.

**Boorde**, bôrd or BORDE, ANDREW (?1490-1549), English traveller and physician, was born in Sussex. He joined the Carthusians, and about 1521 was made suffragan bishop of Chichester but about 1528 he obtained dispensation from his vow and went to France to study medicine. He made at least four tours on the Continent, one being to report on the state of feeling about Henry VIII. His principal works are *Dyetary* (1542), the *Breviary of Health* (1547), and the *Fyrst Boke of the Introduction of Knowledge* (1547). His *Boke of Berdas* (beards) and his *Itinerary of Europe* are lost.

**Booster**, a form of dynamo for raising the voltage of an outgoing current to compensate for the drop in a long feeder. See ELECTRICITY, DISTRIBUTION OF.

**Boot**, TORTURE OF THE. The boot, used to extort confessions in Scottish judicial proceedings, was an iron or wooden frame in which the leg was enclosed. Wedges were driven between boot and leg with a mallet until the prisoner confessed, or was physically incapable of bearing further torture. It seems to have been in frequent use towards the end of the 16th century, but was discontinued in 1690, though not forbidden by law until 1709.

**Bootan**. See BHUTAN.

**Boot and Shoe Industry**. See SHOES.

**Boötes**, bō-ō'tēz, an ancient constellation, supposed to represent the driver of the Wain, and sometimes called Arctophylax, the 'bear-keeper.' 'Late-setting Boötes' is among the star-groups mentioned in the *Odyssey* (v. 272), and Claudian (*De Raptu Proserpinae*, ii. 190) speaks of 'piger Boötes,' in allusion to the upright position upon the horizon by which its setting is protracted. ε Boötes is an exquisitely tinted double star. Boötes revolves in about a hundred and thirty, 44 Boötes in two hundred and sixty years.

**Booth, AGNES** (1843-1910), American actress, was born (Marion Agnes Rookes) in Sydney, New South Wales. She had already made her first appearance on the stage when she went (1858) to San Francisco, where she acted for several years, and where she was married (1861) to Harry Perry, who died a year later. Her first great success was with Edwin Forrest at Niblo's Theatre, New York, 1865. She was married to Junius Brutus Booth 2d, in 1867, and after his death (in 1883) she bore his name, although married two years later to John B. Schoeffel, a Boston manager. Mrs. Booth made notable successes at Booth's, the Park, and the Madison Square Theatre, New York City, at the last of which she was the original Mrs. Ralston in *Jim the Penman*.

**Booth, BALLINGTON** (1859- ), Anglo-American evangelist, son of William Booth, founder of the Salvation Army, was born in Brighthouse, England, and was sent by his father as commander of the Salvation Army to Australia (1885-7), and to the United States (1887-96). In 1896 he founded, on his own account, the Volunteers of America, a religious and charitable organization, of which he was commander-in-chief from the beginning. He wrote *From Ocean to Ocean* (1890). See SALVATION ARMY; VOLUNTEERS OF AMERICA.

**Booth, BARTON** (1681-1733), English actor, was born in Lancashire. He was destined for the Church but was determined to become an actor and first appeared on the stage in London as Maximus in Fletcher's *Valentinian* (1700). Among his best representations were the Ghost in *Hamlet*, Othello, Henry VIII, and Brutus; but it was as Cato, in Addison's play of that name, that he gained his greatest fame (1713). He wrote a drama, *The Death of Dido* (1716) and several poems.

**Booth, CHARLES** (1840-1916), English sociologist, was born in Liverpool. He devoted his life to the preparation of works of unique value on social questions, notably *Life and Labor of the People in London* (10 vols. 1889-1903), a very able work full of carefully collected facts; *Pauperism, and the Endowment of Old Age* (1892); *The Aged Poor* (1894); *Old Age Pensioners* (1899); *The Religious Influences of London* (1903).

**Booth, EDWIN THOMAS** (1833-93), American actor, fourth son of Junius Brutus Booth (q.v.), was born in Belair, near Baltimore, Md., and received a desultory education, much of his youth being passed with his father on

the latter's professional tours. In this way Edwin early became acquainted with the actor's art. His first appearance was accidental, as substitute in the part of Tressel, in *Richard III.*, at the Boston Museum (1849). His father at first opposed Edwin's following the stage as a profession, but gradually became reconciled to the idea, and the lad played minor parts in his father's company in many Southern and Eastern cities during the two years that followed. By accident or design, Junius Brutus Booth being unable to appear as Richard III. at a benefit in New York, Edwin was called upon to take the part when only seventeen, which he did creditably, at

Edwin Booth

the same time making his first appearance in New York. In 1852 Edwin accompanied his father to San Francisco, where his brother, Junius Brutus, 2d, had preceded them. The father and sons acted successfully at San Francisco, but the venture failing in other places, the elder Booth returned, dying on his way home.

Edwin acted under his brother's and other managements for about a year in San Francisco, for the first time taking several important characters, such as Sir Giles Overreach, Hamlet, and Macbeth. He then went on a tour to the South Sea Islands and Australia with a company including D. C. Anderson and Laura Keane. Returning within a year to San Francisco, he acted in that city and neighborhood with varying success, returning to the East in 1856, and opening at Boston in April, 1857, as Sir Giles Overreach. The next month he appeared in New York, in *Richard III.*, followed by a long list of principal parts, and for the first time establishing himself as a leading actor in that

city. He married Mary Devlin, a charming young actress, in July, 1860, and shortly afterward they sailed for England, where Booth made his first appearances in London and other cities. Returning to New York, he was associated with the Winter Garden Theatre from 1862 until 1867, excepting the periods of retirement caused by the death of his wife and the assassination of Lincoln by his brother, John Wilkes Booth. During this connection he established himself as the leading actor of America, and, among other presentations of the standard drama, achieved a hundred-night run of *Hamlet*—an unprecedented feat at that time (1864). Booth then built his own theatre in New York, bearing his name, and opened it with *Romeo and Juliet* (February, 1869), Miss Mary McVicker, whom he shortly afterward married, playing Juliet to his Romeo.

Booth's theatre was the scene of many dramatic triumphs during his ownership (1869-74) and after. In 1874 he failed in business, but was able, by tours in the Southern States and California (1876), to recoup himself and pay his debts. In 1880 and 1882-3 Booth visited England and Germany, performing with Henry Irving in London, and receiving great honors from the German actors. He played a short engagement with Salvini at New York (1886), and in 1887 formed the combination with Lawrence Barrett that lasted until the latter's death (1891). He founded the club known as 'The Players' in New York, 1888, for the special benefit of actors, and in it are preserved his trophies and many memorabilia of his career. He lived there during the last four years of his life, and there he died in 1893. Consult Winter's *The Life and Art of Edwin Booth*, and Mrs. Grossman's (his daughter's) *Recollections, etc.*; M. J. Moses' *Famous Actor Families in America*.

**Booth, JAMES CURTIS** (1810-88), American chemist, was born in Philadelphia, Pa. He was graduated (1829) from the University of Pennsylvania and from 1832 to 1835 studied chemistry in Germany, Austria and England, in 1836 establishing at Philadelphia the first laboratory in the United States for instruction in analytical chemistry. He was professor of applied chemistry at Franklin Institute, 1836-45, and in 1849 was appointed melter and refiner of the U. S. mint, holding the latter position for the remainder of his life, and being the first to introduce nickel as an alloy in the U.S. coinage. He was editor-in-chief

of *The Encyclopædia of Chemistry* (1850), and author of many scientific reports and papers.

**Booth, JOHN WILKES** (1839-65), American actor, son of Junius Brutus Booth (q. v.) and brother of Edwin Thomas Booth (q. v.). He left the stage in 1863, and devoted himself to secessionist plots, the last of which resulted in his shooting President Lincoln (q. v.) at Ford's Theatre, Washington, on the night of April 14, 1865. He escaped to Virginia, but was surrounded at Bowling Green, where he had taken refuge in a barn, and was shot by Sergeant Boston Corbett.

**Booth, JUNIUS BRUTUS** (1796-1852), American actor, was born in London, England. He adopted the stage as a profession in 1813, appearing for the first time as Campillo in *The Honey-moon* at Deptford. His first London appearance was made at Covent Garden in 1815, in a minor part. Two years later he won success in leading parts, especially Richard III., in the same city. In 1821 he sailed for America, which was thereafter his home. He opened at Richmond, Va., in *Richard III.*, and soon after performed in New York, rapidly winning appreciation from American audiences.

In 1825 Booth visited and acted in London, and in 1828 played a successful season at New Orleans, where he gave performances in French. The remainder of his career was uniformly successful. The death of two of his young sons temporarily unbalanced his reason, however, and he was afterward subject to fits of aberration. In 1852 he visited San Francisco, and there played with his sons, Edwin and Junius Brutus, Jr., to crowded houses. On his return to the East he was taken ill, and died on a steamboat while journeying from New Orleans to Cincinnati. He was thought not to have been excelled in the parts of Richard III. and Sir Giles Overreach; while his renderings of Shylock, Lear, and Iago were beyond any acting in his time. Consult *Clarke's Elder and Younger Booths*.

**Booth, MAUD BALLINGTON** (1865-1943), Anglo-American reformer, was born (Charlesworth) in Limpsfield, England, of wealthy parentage. At the age of 17 she joined Miss Catherine Booth in Salvation Army work in Paris and Switzerland. In 1886 she married Ballington Booth (q. v.) and accompanied him to the United States, where they engaged in reform and relief work in the Salvation Army (1887-96), and after that time in the Volunteers of America (q. v.). Mrs. Booth is best known through her prison work, which she has carried on in all the State prisons of

the United States. During the World War she served with the American Expeditionary Force in France.

**Booth, WILLIAM** (1829-1912), English religious leader and founder of the Salvation Army (q. v.), was born in Nottingham, and received a fair education. Having been attracted by the teachings of the followers of John Wesley, he joined the Methodist Church, and at the age of seventeen began to preach as a layman. At twenty-three he was appointed to the charge of a Methodist Circuit in Lincolnshire. After several years he resigned from the ministry and with his wife settled in London, erected a tent in the Whitechapel district, and there began a series of meetings which eventually resulted in the organization of the body known as the Salvation Army (q. v.).

General Booth's last public appearance was at the Royal Albert Hall, on the occasion of the celebration of his 83d birthday. He became totally blind during the last year of his life, and after a long illness died on Aug. 20, 1912. His death was the occasion of a world-wide tribute of respect, the funeral procession through London being one of the most remarkable ever witnessed there. His published works include, *In Darkest England and the Way Out*, in which he proposed measures to remedy existing conditions of poverty and vice, many of which have been successfully carried out; *Love, Marriage and the Home*; *The Training of Children*; *Religion for Every Day*; *Visions*.

Consult Railton's *The Authoritative Life of General William Booth* (1912); Begbie's *Life of General William Booth* (1920).

**Booth, (WILLIAM) BRAMWELL** (1856- ), general of the Salvation Army (q. v.), was born in Halifax, England, was educated privately, and in 1874 commenced his public work. He is chairman of the Army's Life Assurance Society and its Reliance Bank, and was chief of staff from 1880 to 1912. By his father's nomination he succeeded him as general of the Salvation Army in 1912.

**Boothia Felix**, bōō'thi-a fē'liks (named after Sir Felix Booth), a peninsula (area, 13,100 sq. m.) whose promontory, Murchison Point, is the most northerly part of the mainland of North America. The Gulf of Boothia lies to the east, separating Boothia from Cockburn Island and Melville Peninsula. Sir J. C. Ross, in 1831, fixed the position of the north magnetic pole here, lat. 70°5'17" N. and long. 96°46'45" W.

**Booth-Tucker, EMMA MOSS** (1860-1903), daughter of William

Booth (q. v.), was born in Gateshead, England. She managed the international homes of the Salvation Army from 1880 until her marriage in 1888 to Frederick Tucker. With her husband she went to India, afterward to London, and thence to the United States in 1896. She held the rank of consul in the Salvation Army, and had joint and equal authority with her husband in its direction in the United States. She died from injuries received in a railroad accident.

**Booth-Tucker, FREDERICK ST. GEORGE DE LAUTOUR** (1853- ), Anglo-American evangelist, was born in Monghyr, Bengal, India, and was educated at Cheltenham College. He held several positions in the Indian civil service but resigned in 1881 to join the Salvation Army (q. v.). He established its organization in India (1882), and conducted it there until 1891, when he went to London to take up the work of International Secretary. In 1888 he married Emma Booth, daughter of the founder, adding the name Booth to his own. On the resignation of Ballington Booth, in 1896, he was made commander of The Salvation Army in the United States. In 1904 he returned to England as foreign secretary, and in 1907 was appointed to take charge of The Army's work in India and Ceylon. He was awarded the Kaisar-i-Hind Gold Medal for public services by the Government of India. He returned to England in 1919. His writings include *The Life of Catherine Booth* (1890); *The Life of Consul Emma Booth-Tucker* (1903); *Muktifauj, or Forty Years with the Salvation Army in India and Ceylon* (1923); *Criminocurology, or The Cure of Crime*; *Jesus at His Home in Nazareth*; *Oriental Melodies* (1923); *Daily Mottos* (in verse) for *Soul-Winners and Christ-Seekers* (1924).

**Boo'tle**, county borough, Lancashire, England, continuous with Liverpool (q. v.), of which it is a suburb on the northwest. It has extensive jute factories, engineering works, foundries, lumber yards, and grist mills. The docks comprise some of the finest on the Mersey. Pop. (1921) 76,508.

**Booty**, in a military sense, the plunder taken from a vanquished people by the victorious enemy. Military regulations of civilized nations generally claim all booty to be the property of the sovereign—to be sold, or returned to the conquered, or given to the captors. For naval booty, see PRIZE MONEY.

**Bopp, FRANZ** (1791-1867), German philologist, was born in Mainz. In 1821 he became professor of Oriental literature and philology at Berlin, and in 1822

Died  
July 17,  
1929.

1929  
June 16

a member of the Royal Prussian Academy. In his great work, *Ueber das Conjugationssystem der Sanskritsprache* (1816), he endeavored to trace a common origin for the grammar of Sanskrit and the Aryan family of languages, and thus introduced a new era in linguistic study. He published also an edition, with a Latin translation, of *Nala and Damayanti* (1819), an episode in the *Mahabharata*; *Ausführliches Lehrgebäude der Sanskritsprache* (1828); *Vergleichende Grammatik des Sanskrit, Zend, Griechischen*, etc. (6 parts, 1833-52), a comparative grammar which was translated into both English and French; *Ueber die keltischen Sprachen* (1839). His library was purchased by Cornell University. Consult Lefmann's *Life*.

**Bo'ra**, the sharp, cold, dry northeast wind blowing in fierce gusts (up to 130 miles an hour) along the coast of Dalmatia, from Albania in the south as far north as Trieste. It is due to the great and sudden increase in the barometric pressure in winter over the high plateaus of Central Europe, and to the rapid descent of heavy cold air into the valleys and over the Adriatic Sea.

**Bora**, BOHRA, or BOHREN, KATHARINA VON (1499-1552), wife of Martin Luther (q. v.). The daughter of a German gentleman, she entered a convent at Nimbschen, near Grimma, Saxony, while a young girl. After a perusal of Luther's works, she decided, with eight of her companions, to embrace the principles of the Reformation. With the assistance of the reformer, the nuns made their escape from the convent (1523), and Katharina was placed under the care of the burgo-master of Wittenberg until her marriage with Luther two years later. She survived her husband seven years, and died at Torgau, whither she fled from her home at Wittenberg to escape the plague.

**Bora-Bora**, or BOLA-BOLA, one of the Society Islands (q. v.), 30 miles in circumference; discovered by Cook in 1769. It consists of a volcanic peak surrounded by coral reefs.

**Boracic (Boric) Acid** ( $H_2BO_3$ ), a weak acid obtained chiefly by the action of sulphuric acid on a concentrated solution of borax (q. v.), or by the recrystallization of native boracic acid. The latter occurs in the Tuscan lagoons of Italy, in the neighborhood of Monte Rotondo, Lago Zolfo-ro, Lardello, and Sasso. Around the fissures (*suffoni*) in the rocks of this mountainous region, from which steam impregnated with boracic acid escapes, basins of masonry are built and filled with water; these serve to condense the steam and dissolve the bo-

racic acid. The basins discharge into a central reservoir, where time is allowed for the subsidence of mechanical impurities, after which the solution is concentrated, whereby the boracic acid crystallizes out.

Boracic acid forms transparent, colorless scales which yield a soft white powder of faintly bitter taste, soluble in 18 parts of cold water, 3 parts of boiling water, and 4 parts of glycerin. When neutralized by alkalis, borates are formed. When alcohol (especially wood spirits) is poured over boracic acid and ignited, it burns with a characteristic green-tinged flame. Its aqueous solution turns turmeric paper brown (like alkalis), even when hydrochloric acid is present. When heated to  $100^\circ$  c., metaboric acid ( $HBO_2$ ) is formed; at  $160^\circ$  c., tetra- or pyro-boric acid ( $H_2B_4O_7$ ); and at red heat, boric acid ( $B_2O_3$ ).

Boracic acid is poisonous to lower forms of life; but its antiseptic action is too feeble to be depended on against pathogenic germs. Aqueous solutions are soothing and detergent, free from irritating action, and are used as a local application in inflammatory conditions of the mucous membrane—e. g., conjunctivitis, ulceration of the mouth. In the dry form, powdered boracic acid is frequently used as an antiseptic in dusting-powder (talcum) mixtures. It is also extensively employed in making glazes for earthenware and enamelware.

The use of boracic acid as a food preservative is prohibited in the United States by Federal enactment. Medical authorities differ as to its use in this respect, since it is claimed that fairly large quantities (e. g.,  $7\frac{1}{2}$  grains taken daily) produce no harmful effects. Its long-continued use, however, exerts a harmful influence on the human system. See BORAX.

**Borage**, bur'aj, a genus of plants belonging to the order Boraginaceæ. It is a somewhat coarse annual, hairy in character, with large leaves and beautiful blue flowers. The young leaves are sometimes used as a salad and as a flavoring in the making of beverages. The common borage (*Borago officinalis*) was formerly used in the preparation of cordials for its supposed exhilarating effect and is a favorite bee plant on account of its abundant nectar. It is mucilaginous and slightly febrifuge and is occasionally employed as a domestic remedy.

**Bo'rah**, WILLIAM EDGAR (1865- ), American lawyer, was born in Fairfield, Ill. He was educated in public schools and at the University of Kansas, was admitted to the bar in 1889, prac-

tised law in Lyons, Kans., and in 1890 went to Boise, Ida., where he followed his profession until elected U. S. Senator from Idaho for the term of 1907-13. He was re-elected for the terms 1913-19 and 1919-25. Mr. Borah is rated as a progressive if not actually a radical in politics. He was one of the leading Senators opposed to the entry of the United States into the League of Nations and has been noted for his independence in upholding his convictions.

**Borås**, böö'rös or böö'rös, town, Sweden, in the province of Elfsborg, on the Wiska River; 36 miles east of Gothenburg. Its inhabitants are engaged in cotton spinning and weaving. Pop. (1921) 28,769.

**Bo'rax** (Sodium Pyro- or Tetra-Borate,  $Na_2B_4O_7 \cdot 10 H_2O$ ) is found in a native, impure state (called *Tinca*) in lake beds in Tibet, India, Persia, Peru, Ecuador, California, and Nevada. The South American mineral consists of boro-natro-calcite ( $Na_2B_4O_7 \cdot 2CaB_4O_7 \cdot 18 H_2O$ ), while that from Western North America is chiefly colmanite, a borocalcite ( $CaB_4O_7 \cdot 4 H_2O$ ). The chief sources of supply for the United States are the colmanite deposits in Calico and Death Valley, California, and the deposits in Clark County, Nevada. These latter deposits were discovered in 1921 and constitute the largest known deposit of borax, comprising a hill of pure colmanite 3,000 feet long and from 300 to 500 feet in height. Most of the boracic acid (q. v.) produced in Italy is converted into borax.

Borax forms transparent monoclinic prisms or a white powder, inodorous, of a sweetish, alkaline taste. It effloresces slightly in dry air. It is soluble in 17 parts of cold water, 0.5 part of boiling water, and 1 part of glycerin at  $176^\circ$  F. A solution of borax, when acidified with muriatic acid, turns yellow turmeric paper, after dipping and drying, a brownish red. If a few drops of sulphuric acid are added to a trace of borax or any borate, followed by a little alcohol (especially wood spirit), and ignited, the latter will burn with a green-tinged flame. When heated, borax fuses to a glassy liquid which dissolves metallic oxides, thus serving as a flux in welding and brazing metals by cleansing their surfaces. The solutions of various metallic oxides in borax have characteristic colors; and this peculiarity—known as the 'borax bead' test—is utilized in the analytic identification of certain metals.

Borax is used as a cleansing agent on account of its unequalled detergent properties; also, like boracic acid, in making glazes for pottery, porcelain, and agateware. Medicinally, borax

possesses only moderate anti-septic powers. Without being a bactericide, it arrests putrefaction. It is useful as an anti-septic detergent in the treatment of certain inflammatory conditions of the mucous surfaces, as those of the mouth and urinary passages. Its use is prohibited as a food preservative. See BORACIC ACID.

**Bor'beck**, commune, province Rhineland, district Düsseldorf, Prussia, 3 miles northwest of Essen. It comprises the towns of Borbeck, Boschold, Vogelheim, Gerschede, and Dellwig. It is an industrial centre, with blast furnaces, foundries, rolling mills, and machine shops. There are coal mines in the vicinity. Pop. (1910) 59,553.

**Borchgrevink**, bôr'ch'gre-vingk, CARSTEN EGBURG (1864), Antarctic explorer, was born in Christiania, Norway. He emigrated to Australia in 1888; sailed on the *Antarctic* from Melbourne (1894), and was one of the first party to land on the Antarctic continent (Jan. 23, 1895), where he discovered a lichen, the first known vegetation within the Antarctic regions. In August, 1898, he commanded the Southern Cross expedition, organized by Sir George Newnes, reaching latitude 78° 50' s.—40 miles nearer the South Pole than the previous record by Ross. He made investigations into the volcanic disturbances in the West Indies (1902). He wrote *First on the Antarctic Continent* (1901).

**Borda**, bôr-dâ', JEAN CHARLES DE (1733-99), French mathematician, astronomer, and naval designer, was born in Dax, France. He visited America and the west coast of Africa to test marine chronometers (1771-6); took part in the American Revolution (1777-8), and was captured and released (1782) on parole by the British. He served later in the French naval department; was engaged in the measurements preliminary to the introduction of the metric system of weights and measures; made important investigations into the pendulum (1790); and was member of a commission for the measurement of a meridianal degree. He wrote *Description et Usage du Cercle à Réflexion* (1778), and other works.

**Bordeaux**, bôr-dô', city, capital of the department of Gironde, France, on the Garonne River; 60 miles from the sea, and 359 miles by rail southwest of Paris. It is the fourth seaport of France.

The harbor will accommodate 1,000 vessels, and there is always a depth of 20 feet of water, while high tide allows vessels drawing 26 feet to reach the deep water floating basin of 25 acres at the north end of the town.

Transatlantic steamers stop at Pauillac.

Features of interest are the Roman Amphitheatre, the Church of St. Croix (twelfth and thirteenth centuries), the old Cathedral of St. Seurin (eleventh to fifteenth century), and the Gothic Cathedral of St. André (thirteenth to fifteenth century). The detached bell tower of St. Michael's (354 feet high) is the loftiest spire in Southern France. Besides a university (see BORDEAUX, UNIVERSITY OF), the city has a school for hydrography and navigation (1631), an observatory, a library of 200,000 volumes, and several museums. Statues of Montaigne (mayor, 1581-4) and Montesquieu adorn the Place des Quinconces.

The wines of Bordeaux, both red and white, famed since the fourth century, are of the first importance, while the dependent industries—cooperage, bottle and cork making, and the like—engage a large population. The city also builds railway coaches, manufactures chocolate, sugar, flour, beer, tobacco, glass, textiles, paper, and pig iron, and has breweries and distilleries. Ship-building is also one of the larger industries, the output including naval vessels. Bordeaux sends a fishing fleet annually to the cod fisheries of Newfoundland and Iceland. The trade is principally maritime. The annual value of the combined exports and imports is about \$150,000,000, wine and brandy forming about one-third of the exports.

Under the name of Burdigala, Bordeaux was the capital of Aquitania Secunda in Roman times. After devastation by Vandals, Visigoths, Franks, and Normans, it enjoyed a period of peace (1152-1453) under English protection, and passed to Henry Plantagenet on his marriage with Eleanor of Guienne. Here were born Richard II. of England (1366), Magendie (1783), Joseph Black (1728), Rosa Bonheur (1822), and Desèze (1748). Pop. (1911) 261,678.

**Bordeaux**, DUC DE. See CHAMBORD, HENRI CHARLES DIEUDONNE, COMTE DE.

**Bordeaux Mixture**. See FUNGICIDES.

**Bordeaux, University of**, was founded in 1441, while the country was under the dominion of the British. At first a self-governing institution, it came under state control under Francis I. In 1808 its organization was reformed under Napoleon; in 1870 a School of Law was added, and in 1878 a School of Medicine and Pharmacy. The University has over 2,500 students, and a library of about 100,000 volumes.

**Bordeaux Wine**. See CLARET.

**Bor'den**, SIR FREDERICK WILLIAM (1847-1917), Canadian public official, was born in Cornwallis, N. S. He was educated at King's College, Windsor, and the Harvard Medical School, Boston, Mass., and began the practice of medicine in Nova Scotia in 1868. In 1869 he became connected with the government military service as assistant surgeon, and later as surgeon and surgeon lieutenant-colonel. He sat in the Canadian House of Commons from 1874 to 1911, except for the years 1883-6. He was appointed Minister of Militia in 1896, and was a member of the Imperial Council of Defence. He was knighted in 1902. He represented Canada at the Imperial Defence Conference in 1909.

**Borden**, RIGHT HON. SIR ROBERT LAIRD (1854), Canadian statesman, was born in Grand Pré, Nova Scotia. He was admitted to the bar in 1878, and was elected member of the House of Commons for Halifax, N. S., in 1896. He took a leading part in many important debates, and in 1901, upon the resignation of Sir Charles Tupper, was chosen leader of the Conservative Opposition in the House of Commons, being the first Opposition leader to receive an additional allowance voted by Parliament (1905). He was defeated for Halifax in 1904, but was returned for Carleton, Ont., in 1905, and again for Halifax in 1908 and 1911. He defeated Sir Wilfrid Laurier (q. v.) in the general elections of Sept. 21, 1911, upon the reciprocity issue, and became Prime Minister of Canada upon the resignation of the Laurier Government (Oct. 10, 1911). He was appointed to the Privy Council by His Majesty on Jan. 1, 1912.

Premier Borden was the first overseas minister to be summoned to a meeting of the British Cabinet (July 14, 1915). He represented Canada on the Imperial War Cabinet of 1917, and at the Imperial War Conference of the same year, upon his return from which he announced that Canada would adopt conscription (q. v.). In October, 1917, he formed a Coalition Cabinet, composed about equally of Conservatives and Liberals, in which he himself was Premier and Secretary of State. In the election of December, 1917, he retained the premiership on a platform of vigorous prosecution of the war and enforcement of conscription (see CANADA).

**Bor'dentown**, city, Burlington county, New Jersey, on the Delaware River, at the terminus of the Raritan Canal, and on the Pennsylvania Railroad; 6 miles southeast of Trenton and 27 miles

northeast of Philadelphia. It is the seat of the Bordentown Military Institute. Its industrial establishments include foundries, machine shops, worsted mills, shipyards, etc. Joseph Bonaparte, brother of Napoleon I., lived here (1817-32, 1837-9). Pop. (1900) 4,110; (1910) 4,250.

**Bordereau**, bôr-d'rô', French word meaning invoice, account, or memorandum. It came into prominence in connection with the Dreyfus affair in 1894. See DREYFUS AFFAIR.

**Borders**, THE, the name associated in history, poetry, and literature with the district lying on either side of the Cheviot Hills, which form in great part the dividing line between England and Scotland. On the English side are Cumberland and Northumberland; on the Scottish Berwickshire, Roxburghshire, and Dumfriesshire. The scenery is somewhat monotonous, with smooth, grass-covered, gently undulating hills, wild moorland, marsh, clear streams, and cultivated valleys; toward the west the hills are more rugged.

Before the Roman occupation, and for centuries afterward, the land was occupied by a Cymric people, who, after a long struggle with the invading Picts, Angles, and Scots, were gradually driven west to the mountains of Strathclyde, the district being occupied by Anglo-Saxon and Norse invaders. It formed part of the kingdom of Northumbria, which, in the tenth century, was brought under the English crown. Malcolm II. of Scotland, after his victory over the forces of Northumbria at Carham (1018), incorporated that portion of Northumbria lying between the Forth and the Cheviots into the Scottish kingdom.

From the close of the twelfth century the border line has been much the same as now. The peaceful times (1214-49) of Alexander II. brought extended culture and commerce. Berwick became one of the greatest seaports in Britain, and Roxburgh and Jedburgh were then important towns. Toward the close of the thirteenth century the Scottish campaigns of Edward I. provoked a state of perpetual warfare on the Borders, which continued with comparatively short intervals of peace down to the union of the crowns. To check these feuds, the Borders were divided in the fourteenth century into East, Middle, and West Marches by the English and Scottish government; and wardens, invested with arbitrary power, were appointed on both sides to keep order. Plundering raids were constantly made from one side or the other through the Cheviot passes and along the

valleys of Jed, Teviot, Coquet, Rede, and other streams, the details of which are immortalized in the romantic Border ballads.

It is chiefly to its ballads, romantic literature, and poetry that the land owes its modern interest. The memory of fairyland and witchcraft remains in *The Young Tamlane* of Thomas of Ercildoune (Earlston), or Thomas the Rhymer, and Hogg's *Queen's Wake* (1813), *Wife of Usher's Well*, and *Gay Gos Hawk*. The poetry of their history includes *Auld Mailand*, *Battle of Otterburn*, *Raid of the Redeswire*, *Jamie Telfer of the Fair Dodhead*, and *Kinmont Willie*. There are songs of pathos in *The Douglas Tragedy*, *Dowie Dens of Yarrow*, *Lament of the Border Widow*; and songs of love and emotion, as well as of descriptive poetry, in *John Hay's Bonnie Lassie*, *Etrick's Banks*, and *Warena my heart licht I wad dee*. Among general collections are Percy's *Reliques*, Herd's *Ancient and Modern Scottish Songs*, Evans' *Old Ballads*, Scott's *Minstrelsy of the Scottish Border*, Jamieson's *Popular Ballads and Songs*, and the collections of Laing, Sharpe, Cunningham, Chambers, and Aytoun. Among the later poetry of the eighteenth and nineteenth centuries are Thomson's *Seasons*, Crawford's poems, Leyden's *Scenes of Infancy*, Hogg's *Kilmenny*, Scott's *Poems*, and Wordsworth's *Yarrow Revisited*.

Consult Skene's *Celtic Scotland*; Rhys' *Celtic Britain*; Wilson's *Tales of the Borders*; Lang's *Sir Walter Scott and the Border Minstrelsy* (1910).

**Bordighera**, bôr-dê-gâ-râ, town and winter resort, province Porto Maurizio, in the West Riviera, Italy, 24 miles by rail northeast of Nice. It consists of the new town next the sea, and the sheltered old town on higher ground inland (winter mean temperature, 52½° F.). The place is famous for its palms and flowers. Pop. 4,500.

**Bordone**, bôr-dô'nâ, PARIS (1500-71), Italian painter of the Venetian school, pupil of Titian, and imitator of Giorgione, is remarkable for his delicate flesh tones and draperies. He succeeded Palma as the fashionable painter of Venice, and was invited (1538-40) to Paris to paint the members of the French court. His chief work, *Fisherman Giving St. Mark's Ring to the Doge* (Venice Academy), is a fine pageant picture.

**Bor'dure**, or BORDER, in heraldry, an ordinary (though sometimes classed with the subordinaries) which, as its name implies, extends round the edge of the field, on the surface of which it encroaches one-fifth. It was originally used as a mark of 'dif-

ference'—i.e., to distinguish the arms of cadets from those of the main line of a house, a function

Bordure.

which it still retains in Scottish heraldry—but it is now frequently borne as a charge.

**Bore**. See TIDES.

**Bore**. See GUNS.

**Boreas**, the north, or more strictly the north-northeast wind, the coldest in Greece. In ancient legend, Boreas was the brother of Hesperus, Zephyrus, and Notus, and dwelt in Thrace. He was worshipped at Athens.

**Bore'cole'**. See KALE.

**Borel**, EMILE FELIX EDOUARD JUSTIN (1871), French mathematician, was born in St. Afrique. He was educated in Paris and became director of scientific studies in the Ecole Normale and professor of mathematics in the University of Paris. His published works include monographs on the *Theory of Probabilities* and the *Theory of Functions*; *Introduction géométrique à quelques théories physiques* (1914); *Leçons sur les fonctions monogènes uniformes d'une variable complexe* (1917); and a work on *Aviation*, in collaboration with Painlevé.

**Borelli**, bô-rel'îe, GIOVANNI ALFONSO (1608-79), Italian physician and mathematician, was professor of mathematics at Messina (1649) and at Pisa (1656). He was one of the first to describe the path of comets as a parabola, and he endeavored to explain the motion of the satellites of Jupiter by the laws of attraction. He was also the founder of the iatrophysical school, which attempted to apply mathematics to medicine, as in his *De Motu Animalium* (1680-1).

**Borers**, wood-boring beetles which feed upon wood, into which they burrow. The most familiar and destructive are the ambrosia beetles, death-watch, and the bark beetles (qq. v.).

Among the oystermen of the Eastern United States the name is given to certain small carnivorous gastropod molluscs which bore through oyster shells and kill the oyster by sucking its vital juices. Where these boring molluscs are numerous, great damage is done. Other marine 'borers' are, *Limnoria lignorum* (q. v.), or the gribble, which is very destructive to submerged timber, and *Lithodomus* which penetrates submerged marble.

**Borga**, or **BORGO**, tn. prov. Nyland, Finland, Russia, on Gulf of Finland, near mouth of river Borga. It is the seat of a Lutheran bishop, and has a fine cathedral. Trades in furs, wool, and dairy produce. In 1809 the constitution of Finland was framed here. Pop. 4,420.

**Borgerhout**, suburb of Antwerp, Belgium. Pop. (1900) 37,693.

**Borghese**, a powerful Italian family which had its origin in Siena. (1.) **CAMILLO**, born at Rome; created cardinal (1596), Pope Paul v. (1605-21); excommunicated the governing bodies of Venice, in which he was opposed by Father Paul (Pietro Sarpi), historian of the Council of Trent; ordered Francesco Suarez to write *De Jenson Catholicæ Fidei contra Anglicanæ Sectæ Errores* (1613), a work against the oath of allegiance required by James I. He did much to beautify Rome, and added largely to the Villa Borghese. (2.) **PAULINE BORGHESI**

(1780-1825), sister of Napoleon I., after the death of her first husband General Leclerc (1803), married **CAMILLO FILIPPO LUDOVICO BORGHESI** (1775-1832), who served (1796-1815) in the French army, and became (1805) prince of Guastalla. He sold to Napoleon the museum of the Borghese Villa; its treasures are now in the Louvre. After Napoleon's downfall he severed his connection with the Bonaparte family, separated from his wife, and died at Florence. (3.) **FRANCESCO BORGHESI**, **PRINCE ALDOBRANDINI** (1776-1839), brother of the preceding, married the Countess Alexandra de la Rochefoucauld, and by her had three sons, of whom **CAMILLO** (1816) became minister of war in the Papal States (1848).

**Borghese Villa**, at Rome, until 1902 the summer residence of the Borghese, situated not far from the Porta del Popolo, was built by Cardinal Scipio Caffarelli-Borghese at the beginning of the 17th century, after plans by Giovanni Vansanzio, and has a superb park of nearly 250 acres. It contained formerly a splendid collection of works of art, which was given to Napoleon in 1806 by Prince Camillo Borghese, and of which nearly two hundred pieces went to the Louvre. In 1815 some of them were restored, and after 1820 a new collection of sculptures and pictures was formed. In 1922 the villa, with its picture gallery, and the park, with the buildings it contains, were sold to the Italian state for about \$1,300,000.

**BORGHESI PALACE**, in Rome, the town residence of the Borghese, is situated in the square of the same name. This palace,

known also as 'Il Cembalo Borghese' from its shape, was begun in 1560 from the plans of Martino Lunghi, and finished in 1607 by Flaminio Ponzio, when it was acquired by Camillo Borghese; it is one of the finest buildings in Rome. Besides the picture gallery, there was a collection of art treasures, which were disposed of by public auction in 1892, in consequence of the loss of his fortune by Prince Paolo Borghese (b. 1845). Pope Leo XIII. acquired for the Vatican the important family archives. The picture gallery still contains nearly six hundred paintings, all of first-rate importance, including a *Madonna* by Botticelli; another by Lorenzo di Credi; four paintings by Raphael, including the *Burial of Jesus*; two pictures by Michael Angelo; the celebrated *Sacred and Profane Love* by Titian; *Danaë* by Correggio; and the portrait of *Marie de' Medici* and *Christ on the Cross*, both by Van Dyck.

**Borghesi**, **BARTOLOMEO**, **COUNT** (1781-1860), Italian archaeologist and numismatist, born at Savignano; catalogued the Vatican collection of coins. He resided at San Marino (1821-60). His collection of coins was the best in Italy, and his researches elucidated much of the sacerdotal, military, and political life of the ancient Romans. See his *Nuovi Frammenti dei Fasti Consolari Capitolini* (1818-20). His works were collected in ten volumes (1862-97).

**Borgia**, **CESARE** (1478-1507), was the second son of Rodrigo de Borja, a Spanish noble, who afterward became (1492) Pope Alexander VI. Cesare was made by his father archbishop of Valencia, and afterward (1493) cardinal. The Borgias waged a war of extermination against the Orsini, Colonna, Savelli, and other baronial families of the Roman state, whose lands and castles they seized. In June, 1497, his brother, Giovanni Borgia, Duke of Gandia, was murdered, and his body thrown into the Tiber—the crime being instigated, it was said (c. 198), by Cesare, though historically it has not been proved. Immediately after this Cesare threw off the priesthood and resigned his cardinalate. Proceeding on a diplomatic mission to France, he was made Duke of Valentinois by Louis XII., and in May, 1499, he married Charlotte, sister of Jean d'Albret, king of Navarre. With French assistance Cesare now assailed the towns of Romagna, which refused to acknowledge the supremacy of the court of Rome. Entering Rome in triumph in February, 1500, he was created Duke of Romagna and gonfalonier of the

Holy See. He next defeated the Sforzas and Malatestas, and caused the two princes of Faenza to be treacherously put to death. Unsuccessful in attacking Bologna and Florence, he accompanied the French army in the invasion of Naples, when the greatest atrocities and infamies were committed by the invaders. In 1502 Cesare took Urbino and Camerino, where he put to death the Varani, Orsini, and Vitelli. He had now become the terror of all Italy, and contemplated making himself king of the Romagna, the Marches, and Umbria. His father's death by poison in 1503, on which occasion his own life was also (probably) attempted, was the signal for a coalition of his enemies and in 1504 Cesare's forces were defeated, and he was arrested by Pope Julius II., and eventually sent prisoner to Spain. Escaping in 1506, he volunteered in the army of the king of Navarre, and on May 12, 1507, he was killed by a musket shot at the siege of the small town of Viana, near the Ebro. Cesare Borgia was a man of ungovernable passions, and reckless of human life in the pursuit of his ends. With a towering ambition he trampled on all laws, human and divine; yet he was an able administrator, and a patron of art, befriending Pinturicchio and Leonardo da Vinci. Machiavelli's notorious *Il Principe* (1535) was modelled upon Cesare Borgia. His *Life* has been written in Italian by Tomasi (1655), in French by Yriarte (1899), in German by Schubert-Soldern (1902), and in Eng. trans. by Villari (1878-83).

**Borgia**, **LUCREZIA** (1478 or 1480-1519), only sister of the preceding, was born at Rome. She married in 1493 Giovanni Sforza, lord of Pesaro; but her father, who had become Pope in 1492, annulled this marriage, and gave her hand in 1498 to Alfonso, prince of Bisceglie, natural son of the king of Naples. Still ambitious for her future, her father and brother caused her second husband to be assassinated; and in 1501 Lucrezia married Alfonso d'Este, son of the Duke of Ferrara, whom he soon succeeded. She now appeared as the patroness of literature, and especially encouraged Bembo, who seems to have indulged a platonic passion for her. Though while at the Vatican she was represented as the sharer with Cesare in all the crime, vice, and licentiousness of the time, nothing is alleged against her after she became duchess of Ferrara. Victor Hugo made her the subject of a drama (1833), and Donizetti the central figure of an opera (1834). Her character has been defended by Rescoe in his *Life of Leo X.*; by W. Gilbert, in *Life of Lucrezia*

*Borgia* (2 vols. 1869); and by Gregorovich, in *Lucrezia Borgia* (1874).

**Borglum**, JOHN GUTZON DE LA MOTHE (1867), American sculptor and painter, born in Idaho, studied art in San Francisco and Paris, settled in New York in 1902, and was appointed sculptor for the Cathedral of St. John the Divine (P. E.). His works include the gargoyles on the '99 class dormitory at Princeton, two bronze groups in the Metropolitan Museum of Art, figures, animals, and mural work in painting, and figures, horses, and bronze groups in sculpture.

**Borgne**, a lake in S. E. La., 12 m. E. of New Orleans in reality a shallow arm of the Gulf of Mexico.

**Borgo**. (1.) B. SAN DONNINO, tn. and episc. see of prov. Parma, Italy, 14 m. N.W. of Parma. It is identified with the ancient *Fidentia Julia*. Pop. (1901) 12,019. (2.) B. SAN SEPOLCRO, or SAN SEPOLCRO, tn. and episc. see, prov. Arezzo, Italy, 28 m. N.E. of Arezzo; was the birthplace of the painter Piero della Francesca. Pop. (1901) 9,077.

**Borgognone**, properly AMBROGIO DI STEFANO DA FOSSANO (†1445-1523), Italian painter, pupil of Foppa and a master of Bernardino Luini, is distinguished by great devotional feeling. He worked as architect and painter for the Certosa, Pavia, where his chief works are to be seen. Among the great masters Leonardo da Vinci was chiefly studied by him, and the effect is distinctly traceable in many of Borgognone's paintings. Among his chief pictures are his *Crucifixion* (1490, Pavia); an altar-piece, *St. Ambrogia* (Milan); an *Assumption* in the Brera in Milan; and in the National Gallery, London, a *Virgin and Child*, *The Two St. Catharines*, *Triptych*, and two portrait groups. See Morelli's *Italian Painters in German Galleries*.

**Borgomanero**, tn., prov. Novara, Italy, 19 m. by rail N.N.W. of Novara, with silk industries. Pop. (1901), 10,131.

**Borgo Pass**, in the Carpathians, is in the Hungarian co. of Bistritz-Naszód, and facilitates communication between Bukovina and Transylvania. It lies 3,940 ft. above sea-level.

**Borgu**, or BUSSANGA, a native kingdom of W. Africa, partly in the French colony of Dahomey, partly in the British protectorate of N. Nigeria, the latter part forming one of the sixteen provinces of N. Nigeria. It lies W. of the Niger, and immediately N. of 10° N.; is a green and pleasant land, a low plateau of 31,000 sq. m. in area, and is inhabited by Fulbe and Yoruba tribes.

**Boring** holes in wood is accomplished by means of awls, gimlets,

augers, or brace and bits. For making holes in metals rotary drills are used, either in the form of a hand implement or of a special machine driven by power, or in conjunction with a lathe. (See DRILLS.) Boring mills consist of adjustable cutting tools firmly fixed with reference to a flat circular table on which the casting to be machined is made to revolve by means of a worm arrangement. This method is used in finishing fly-wheels, facing engine-cylinders, etc. Boring into the earth, in prospecting for minerals, is done by hand within limited depths. The surface soil is sunk through by men working in an excavation. On reaching the hard substratum, a chisel screwed on to the end of a solid iron rod is driven down, raised slightly and turned, and then driven down again. As the hole gets deeper a second rod, and then others, are screwed on. After a time the hole is choked, and then the sludger is sent down in place of the chisel. This is a tube with a valve at the bottom, of such a nature that it retains the debris, which is brought to the surface and examined. When the rods become too heavy for the men to lift, they are suspended from a 'spring pole' or latch-tree 30 to 40 ft. long, fixed in the ground with its thin end inclined over the bore-hole; the pole is then started springing, and after each descent the rods are turned. Below depths of 100 yards, a steam engine is used. The drills, which sometimes weigh over a ton, are attached to a wire rope, which passes over a pulley at the top of a derrick and down to one end of a beam, the other end of which is driven by the piston rod. By this means as much as 200 ft. has been bored in twenty-four hours. In gas wells it is customary to sink a casing to nearly the depth of the well, and then put the pipe for gas inside of this. Such construction permits the gas to reach the top of the well without the water, which is forced up through the annular space between gas-pipe and casing. The diamond boring machine, used for hard strata, grinds away an annular hole, leaving a central core which is afterward extracted. Hollow steel rods are used, and diamonds are let in to the grinding face of the lowest. The rods spin round at the rate of three hundred revolutions per minute, and water under pressure is forced down their interior. By this means 50 to 60 ft. may be bored per day in coal-measure rocks. The calyx drill is similar to the diamond, except that saw-teeth of very hard steel are substituted for the diamonds. An ingenious

method for surveying the inclination of bore holes is effected by MacGeorge's clinometer. It often happens that the course of the boring is deflected by a hard rock or by a highly inclined stratum. When this is suspected, a number of glass tubes containing melted gelatin are sent down in a special case. At each end of the tube is a bulb, one containing a magnetic needle supported by a float, and the other a small plumb bob similarly supported. The gelatin sets; the apparatus is drawn up; and the angle of inclination, as well as its bearing, can be read off. For books on this subject, see MINING.

**Boring Machine**. See DRILLS.

**Boris Godunoff** (1551-1605), Czar of Russia from 1598 to 1605, was of Tartar origin, and in his youth accompanied Ivan IV., the Terrible, in all his expeditions. Appointed by Ivan one of the council to assist his young son, Czar Theodore I. (1584-98)—who in 1580 married Boris's sister—Boris soon became the real ruler of the country. During this time he made the Russian Church independent of the patriarch of Constantinople by creating the first Russian patriarchate at Moscow; he won over the boyars or nobles by the famous ukase of 1597, by which he virtually converted the peasants into feudal serfs; he completed the conquest and fostered the colonization of Siberia, founding the town of Tobolsk and others; he secured the country against the invasion of the Tartars by fortifying Kursk and other places in the south. The Rurik dynasty becoming extinct through the death of Theodore in 1598, the boyars offered the throne to Boris Godunoff. As Czar, Boris continued his reforms, and endeavored to attract into the country foreign (Western) savants and artisans, and even planned to found a university at Moscow. But in the last year of his reign Russia was ravaged by famine and plague; also by civil war, for a pretender came forward to represent Demetrius, a second son of Ivan IV., whom Boris had put to death. In the midst of this crisis Boris died suddenly (April 13, 1605). His life forms the subject of dramas by Pushkin (1831) and Count Alexis Poistoy (d. 1876). See Brückner's *Die Europäische- und Russlands* (1888).

**Borisoglebsk**, tn., Tambov gov., Russia, 120 m. E.S.E. of Voronej, on the Orel-Tsaritsyn Ry.; important cattle fair in July. Pop. (1897) 22,370.

**Borisov**, tn., Minsk gov., Russia, on the Berezina, 50 m. by rail N.E. of Minsk; tanneries, breweries, tobacco manufactures. Pop. (1897) 14,931.

**Borisovka**, bō-rē-sōf'kā, town, Russia, in the government of Kursk, on an affluent of the Dnieper; 118 miles south of Kursk. Pop. 20,000.

**Borjesson**, bŭr'yēs-on, JOHAN (1790-1866), Swedish dramatist and poet, was born in Tanum. He first became famous as a lyric poet in the school of the Fosforists but in 1820 ceased to write for twenty-five years, and then came forward as a dramatist with his *Erik XIV.* (1846), a fine poem, full of glowing color, and with unusually strong characterization. Its successors, *Erik XIV.'s Son* (1847) and *Solen Sjunker* (1856), did not justify the hopes of the public and the critics. He was chosen a member of the Academy in 1861. His lyrical powers are best exhibited in *Blommor och tarar vid en dotters graf* (1854).

**Borkum**, the largest of the East Frisian Islands, belonging to the Prussian province of Hanover, opposite the estuary of the Ems. It is a popular summer resort and is annually visited by many thousand persons for sea-bathing. Pop. 3,300.

**Borlase**, WILLIAM (1695-1773), English antiquary and correspondent of Pope, was a native of Cornwall. In 1722 he became rector of Ludgvan, near Penzance, and in 1732 was transferred to Saint Just. His most important works are *Antiquities of Cornwall* (1753; 2nd ed. 1769), *Observations on the . . . Islands of Scilly* (1756), and *Natural History of Cornwall* (1758), all illustrated with plates after his own drawings. He presented the whole of his collections to the Ashmolean Museum.

**Bormann**, bŏr'män, EDWIN (1851-1912), German humorous poet, was born in Leipzig. His works were written in classic High German, for example *Schwalbenbriefe* (1885; 19th ed. 1894), *Schwalbenpostkarten* (1885; 31st ed. 1897), *Die Tafelrunde* (1886; 14th ed. 1894); and in the Leipzig dialect (Saxon), for example *Mei Leibz low' ich mir* (1881; 7th ed. 1898), *Leib'ger Allerlei* (1884; 8th ed. 1895), *Säck'sche Allerweltsbostkarten* (1892; 7th ed. 1898), *Gemeinliche Bostkarten* (1897-8; 17th ed. 1898). In several books—e.g. *Das Shakespeare-Gehemmiss* (1894), he also contended energetically for the Baconian origin of Shakespeare's plays.

**Bormio**, bor'myō, health resort, Italy, in the province of Sondrio, at the foot of the Stiffler Joch, and on the Adda; 35 miles northeast of Sondrio. It is famous for its hot mineral waters (salt and gypsum, temperature 102° F.), which were used by the Romans. The season is July and August. Pop. 2,000.

**Börne**, bŭr'ne, LUDWIG (1786-1837), German author, whose original name was LÖB BARUCH, was born in Frankfort-on-the-Main. He studied medicine and law, and for some time (1811) held the office of police actuary

work, however, is fragmentary and not constructive. His writings include *Briefe aus Paris* (1832-8) which reveal a visionary and impatient temperament, ultra-radical and bitterly satirical; *Menzel der Franzosenfresser*

John Bartholomew & Co.

in his native town, but in 1813 he was dismissed on account of his religion and in 1818 he became a Christian. From 1818-21 he edited *Die Wage*, a review which he had founded and which had attracted attention. In 1830 he went to Paris, where he and Heine became known as the foremost leaders of 'Young Germany.' His love for democracy amounted to a passion. His

(1837), and *Briefe des jungen Börne an Henriette Herz* (1861), perhaps his most eloquent work. His *Gesammelte Schriften* appeared in 1829-34 (newer ed. 1899). Consult Gutzkow's *Börne's Leben* (1840); Heine's *Ueber L. Börne* (1840); Brandes, *Das junge Deutschland* (1899); Holzmann's *Leben Börnes* (1888) and J. Proels's *Das junge Deutschland* (1892).

**Bor'neo**, island of the Malay Archipelago, after Australia, Greenland and New Guinea, the largest island on the globe. It is divided politically between the Netherlands and Great Britain, which has also protectorates over Brunei and Sarawak. It is about 690 miles long by 605 miles wide, and has an area of from 263,000 to 300,000 square miles.

The coasts, except in the north, are low-lying and irregular. A series of four mountain ranges, enclosing four tablelands of slight elevation, radiate north-east and southeast from a common centre in the southwest. The chief of these culminates in Mt. Kinabalu (13,455 feet), in British North Borneo. The other ranges have an extreme elevation of 6,000 feet. The mountains and forests contain many monkeys, among which is the orang-outang, Tapirs, a small kind of tiger, small Malay bears, swine, wild oxen or banteng, and various kinds of deer abound. The elephant is only found in the north, and rhinoceros in the northwest. The few domesticated animals are buffaloes, sheep, goats, dogs, and cats. A few horses are seen in Banjermassin. Among the birds are eagles, vultures, Argus-pheasants, peacocks, flamingos, pigeons, parrots, and the swallows (*Collocalia esculenta*) which construct the edible nests prized by the Chinese for making soup. The rivers, lakes, and lagoons swarm with crocodiles, and many kinds of snakes, frogs, lizards, and leeches. Fish are plentiful, and the coasts are rich in tortoises, pearl-mussels, oysters, and trepang. Brilliant butterflies and moths are found in great variety.

Coal is found, notably at Sarawak, Labuan, and Gaya. Gold is obtained in Dutch Borneo; iron in South Borneo; antimony and mercury in Sarawak, and west of South Borneo; other minerals are platinum, silver, tin, copper, zinc, lead, and sulphur. There are also rich oil-wells particularly in Dutch Borneo, where they have proved an important aid to wealth and prosperity. Diamonds and gems are obtained in West and South Borneo, notably at Landak.

Borneo is traversed by several large rivers, of which the most important are the Kapuas, the Kinabatangan, and Barito. They are mostly steep and torrential in their upper courses, but nearer the sea they overflow, and form wide, swampy marshes and lagoons (*danaus*). Of the interior little is known, except that it is covered with primeval forests yielding valuable timbers (teak, ebony, ironwood and sandalwood), gums and resins (india-

rubber, gutta-percha, and camphor), rattans, fibres, benzoin, spices (cloves, pepper, camphor, etc.), and magnificent flowers (orchids, pitcher plants and rhododendrons). On the whole the surface is fertile, and without much cultivation produces abundance of food stuffs. The climate is hot and humid, the average temperature in South Borneo being 82° F., and in North Borneo 95° F.; the rainfall is heavy.

Trade in raw products (edible birds' nests, sago, fruits and gums), and in manufactured wares, rice, and food stuffs, is carried on, principally with Batavia, Singapore, and Hongkong, by Arabs, Chinese, Malays, and Europeans. The rubber industry is increasingly important and an adjunct of prosperity. The population is estimated at about 2,500,000. It consists of three classes: the Dayaks or Dyaks, who are the aboriginal heathen inhabitants, and constitute the great bulk of the population; the Mohammedans or 'Malays'—for this name is extended so as to include all professors of Islam, whether true Malays, Buginese, Javanese, Dyaks, or Arabs; and the Chinese. The Dyaks live chiefly in the interior, and employ themselves with tillage and the collecting of gutta-percha, resin, gums, rattans, gold-dust, and wax. They are divided into numerous tribes. The Malays (taking the name ethnographically) dwell on the coasts, are traders and bold sailors. They are more civilized than the Dyaks, cultivate the grounds around their houses, lay out gardens, keep cattle, and live partly by fishing. The Chinese, chiefly from Canton, have penetrated far into the interior.

The European history of Borneo begins with its discovery by Lorenzo de Gomez in 1518. The Portuguese first opened up commerce, and were followed by the Spaniards. Early in the 17th century the Dutch established themselves in South Borneo. The English soon followed, but were later driven out, and it was not till the 19th century that British influence was again felt, this time in North Borneo, where in 1842 Sir James Brooke established the independent territory of Sarawak, now a British protectorate.

**British North Borneo** has a coast-line of over 900 miles, and an area of 31,106 square miles. The chief exports are rubber, timber, tobacco, copra, coal and cutch. There are 125 miles of railway, with 20 miles additional in Sarawak. The capital is Elopura or Sardakan; pop. (1921) 11,936. It is administered by a company, incorporated by royal charter, Nov. 1, 1881. Brunei

lies southwest of British North Borneo; it has an area of about 2,500 square miles, and a population (1921) of 25,444. It is governed by a native sultan under British protection. Sarawak has an area of about 42,000 square miles, and an estimated population of 600,000. Kuching, about 23 miles up the Sarawak River, is the capital and chief town. Pop. of British North Borneo (1921) 257,804.

**Dutch Borneo** is divided administratively into (1) West Borneo (area 56,838 square miles), with a pop. of (1920) 605,402—chief town Pontianak; (2) East and South Borneo (area 149,972 square miles), with a pop. (1920) of 1,020,599—chief town Banjermassin. Within these are several native states, more or less subject to the Netherlands. The chief exports are timber, oil, coal, diamonds, gutta-percha, copra and rubber. There are a few good roads in South Borneo.

Consult Furness' *Home Life of Borneo Head-hunters*; Rutter's *British North Borneo* (1922); *Handbook of the Netherlands East Indies* (1924); Owen's *British North Borneo* (1926); Hose's *A Record from Borneo* (1927); Krohn's *In Borneo Jungles* (1927).

**Bornholm** (abbreviated from *Borgundarholm*), a Danish island in the Baltic, about 25 miles from the southern point of Sweden; area, 225 square miles. Geologically it is the southeastern spur of the Scandinavian granite formation. It is well wooded, and has a rich vegetation. Kaolin and other fine clays, in which the island abounds, originate the chief industries. During the Viking and early Middle Ages it was one of the principal trade centres in the Baltic, and indeed in the north. During the 16th century it was ravaged repeatedly by the Hanseatic League, and suffered greatly during its temporary domination by Lübeck (1525-75), and also under Swedish rule (1654-8). Since 1660 Bornholm has been incorporated with Denmark. The chief town is Rönne. Pop. (1920) 43,600.

**Bornu**, bór-nōō' (57,000 sq. m.), province, formerly a negro kingdom, Nigeria, Central Africa, lying west and south of Lake Chad. It was explored in 1822 by Denham and Clapperton. A large part of the country is perfectly level, and is liable to be overflowed in the rainy season which lasts from October to April. The heat from March to June is excessive, ranging from 104° to 107° F. A large portion of it is exceedingly fertile, especially the regions bordering the rivers Shari and Komadugu, feeders of Lake Chad.

The capital, Kuka or Kukawa, a most important trading centre, lies close to the w. shore of the lake, and has a population of about 60,000; the former capital (15th century to 1809), Birnie, is now almost in ruins. The Kanuri race is predominant, the others being Tuaregs, Tibbus, Haussas, and Arabs. Mohammedanism is the adopted religion. Trade is done in cotton, indigo, ivory, ostrich feathers, skins, the Shea butter-nut, leather. Pop. 4,000,000. Bornu, formerly a part of the kingdom of Kanem, was founded as an independent state shortly after the middle of the 15th century, but declined again early in the 17th. This continued till the end of the 19th century, when its territories were appropriated by France, Great Britain, and Germany. See Barth's (1857) and Nachtigal's (1881) *Travels*; also *Nigeria, Our Latest Protectorate* (1900), and other works cited under NIGERIA.

**Boroach.** See BROACH.

**Boro-Budur**, ruined Buddhist temple in Central Java, E. Indies; stands beside the Praga R., 15 m. n.w. of Jokjokarta. It consists of six square platforms superposed one upon another, and upon the topmost of them stands a lofty cupola, immediately surrounded by three concentric circles of bell-shaped cupolas. The bottom platform measures 500 ft.

*Boro-Budur Temple, Java.*

by 500 ft., and the total height is 118 ft. The edge of each of the platforms is protected by a balustrade of highly ornamental sculpture, and has midway an open-work cupola sheltering an image of Buddha. In addition to this there are a great number of smaller niches, each filled with a representation of Buddha, and a series of over 2,000 bas-reliefs depicting various incidents in the history of the same divinity. See Leemans's *Borô-Boedoe*, with nearly 400 plates (1873), and Crawford in *Trans. of the Lit. Soc. of Bombay*, vol. ii. (1823).

**Borodino**, vil., Moscow gov.,

Russia, 72 m. w. of Moscow, on Kaluga R., trib. of Moskwa, celebrated for Napoleon's victory over the Russians under Kutusoff in 1812. In the battle the Russians lost 50,000, and the French 30,000.

**Boron** (B,11), an element found in combination in boric acid, tincal or native borax, boracite, and other minerals. It is a dark-brown powder procured by heating boron trioxide (obtained by heating boric acid) with magnesium powder, and is of no commercial value. Several of its compounds, such as boracic acid and borax, are, however, used in medicine and the arts.

**Bororos**, a S. American people who occupy a vast domain of about 270,000 sq. m. in the Brazilian states of Matto Grosso and Goyaz. They were reduced about 1650 by the Portuguese. They are a tall race like the Tehuelches (Patagonians), of whom they are regarded by some ethnologists as the parent stock.

**Borough English.** An ancient English tenure in which lands descend not to the oldest son, as is the rule of the common law, but to the youngest. The custom still exists in some parts of England and the Continent, and appears to be a survival from a primitive system of law, no other traces of which exist.

**Borromeoan Islands**, four small islands in Lake Maggiore,

made him (1560) a cardinal and archbishop of Milan. He established an academy in the Vatican for the promotion of learning. When the Council of Trent terminated its labors in 1563, Borromeo was commissioned to draw up the famous exposition of Roman Catholic doctrines known as the *Catechismus Tridentinus*. Borromeo enforced much-needed reforms upon the clergy and the monastic orders, and himself led the way by his saintly and humble life and his benevolence to the poor. A monk of the order of the Umiliati attempted (1569) the cardinal's life. Borromeo visited all parts of his diocese, reforming abuses, and establishing colleges, schools, and asylums for destitute children. He founded (1570) the Helvetic College at Milan, and during the plague in that city in 1576 personally visited the sick and relieved the poor. It was through Borromeo that the Golden League—an alliance of the seven Catholic Swiss cantons—was founded for the united defence of the faith. Borromeo was canonized in 1610 by Pope Paul v. A colossal bronze statue was erected (1697) to his memory near his birthplace, on the west bank of Lago Maggiore. His *Works* were published in 1747, and his *Life* has been written by Guissano (Eng. trans. by Cardinal Manning, 1884) and Sylvain (1884).

**Borrow**, GEORGE HENRY (1803–81), English philologist, traveller, and author, was born at East Dereham, Norfolk. His father rose from the ranks to be captain and adjutant in the W. Norfolk Militia. His mother, Ann Parfremment, was of Huguenot (not as is sometimes stated, of gypsy) blood. Borrow's life is sketched in a romantic spirit, with the suppression of real names and places, in *Lavengro* and *The Romany Rye*. His boyhood was spent wandering with the colors; and voluntary studies in French, Italian, and Spanish, as well as the lore of boxers, horse-coupers, and gypsies, supplemented a scanty education picked up at the High School, Edinburgh, and Norwich Grammar School, and elsewhere. In 1819 he was articulated to a solicitor, but continued to study philology, and obtained some sort of acquaintance with about twenty tongues. His chief associates were John Thurtell, afterward hanged for murder; and William Taylor of Norwich, whose moral influence upon him was thoroughly bad. In 1824 he went to London, where he supported himself by hack work. In 1825 came the famous ramble through England, immortalized in *Lavengro*. Between 1826 and 1833 little is known of Borrow's life. During this time he seems, with the excep-

Italy, opposite to Pallanza. Isola Bella ('Beautiful Isle') was in 1650–71 converted by Count Vitaliano Borromeo and Cardinal Giberto, his brother, from a bare rock into a rich terraced garden, and crowned with a splendid specimen of an Italian 17th-century baronial palace. Isola Madre ('Mother Isle') has a botanical garden and an 'English park.' The other two islands are Pescatori (Fishers' or Upper Isle) and San Giovanni (St. John).

**Borromeo**, CARLO, COUNT (1538–84), cardinal and archbishop of Milan, was born at Arona, on Lago Maggiore. His uncle, Pope Pius IV., called him to Rome, and

tion of a journey (1826-7) through France and Spain, to have been working for booksellers in London and Norwich. In 1832 he was made an agent of the British and Foreign Bible Society, and was sent by it to St. Petersburg (1833) to superintend the printing of the New Testament in Manchu. In 1835 he was then as the society's agent and colporteur to Portugal and Spain, and at this work he spent five years. In 1840 he married and settled near Lowestoft. Here Borrow began the literary period of his career with *The Gypsies in Spain* (1841). This was followed by *The Bible in Spain* (1843); and then he set to work on the autobiography, which was much delayed—*Lavengro* appearing in 1851, and *The Romany Rye* in 1857. Leisure increased his nervous troubles, so in 1844 he travelled through Europe as far as Constantinople. In 1853 he moved to Great Yarmouth, and began a series of peregrinations through the British Isles, one of which resulted in *Wild Wales* (1862). In 1860 he moved again to Brompton, but in 1874 he returned to Oulton, where he died. His *Romano Lavo-Lil* (Gypsy Word-Book) appeared in 1874. Borrow's philology was thoroughly superficial; but his vivid and adventurous imagination, his passion for 'the wind on the heath,' and his uncompromising and intolerant Protestantism, give a unique fascination to the records of his journeys. Works: *New and in some cases enlarged editions of The Bible in Spain* (1899), *Lavengro* (1900), *The Romany Rye* (1900), *The Gypsies in Spain* (1901), *Wild Wales* (1901). Biography: *Life, Writings, and Correspondence*, by W. I. Knapp (1899), with full bibliography; *George Borrow in E. Anglia*, by W. A. Dutt (1896); and T. Watts-Dunton's papers in *Athenaeum*, Sept., 1881.

**Borrowdale**, eccles. par. (ac. 16,666) and tnsnip., par. of Crosthwaite, W. Cumberland, 5 m. s. of Keswick. Plumbago mines. The name also applies primarily to the valley itself, stretching from Glaramara Mt. along the river Derwent between the 'Jaws of Borrowdale,' to the s. end of Derwentwater. It contains the famous 'Bowder Stone.'

**Borrowing**. A gratuitous bailment in which one person receives personal property from another with the obligation to return it on demand or at a specified time. A borrower is held to strict accountability for his use of the property entrusted to him and is liable for even slight negligence resulting in damage thereto. Like other bailees, however, he is entitled to protect his possession against strangers interfering

therewith and may maintain an action for the full value of the property against any one who destroys it or wrongfully deprives him of it. The term borrowing is popularly employed, also, to

ited to the debt created by the loan. See BAILMENT; BARTER; SALE. **Borrowstounness**, or BO'NESS, par. (ac. 5,930) and seapt., bur. of barony and pol. bur., on s. shore of upper part of Firth of Forth,

*The Bororos of South America.*

1. Young men's house. 2. Shooting with the bow. 3. Chief, with headdress of macao feathers. 4. Bororo man; 5, profile. 6. Woman. 7. Boy.

describe the receiving of money or other property not to be returned *in specie* but only in kind. This is not properly a bailment, but a transaction of barter or sale, in which the title to the property, and not a mere right of possession, passes to the borrower. In such case the borrower may make any use he pleases of the borrowed property, his obligation being lim-

Linlithgowshire, Scotland, 3 m. from Linlithgow. It has coal mines and iron works, brickfields and potteries, distilleries, salt refineries, fishing and shipbuilding, and a considerable trade in pit props with Scandinavia and Finland. Remains of Antoninus's Wall, locally known as Graham's Dyke, a-e near. Pop. of tn. (1911) 10,866; of par. 14,034.

**Borsna**, bôrz'nä, town, Ukraine, in Chernigov government, on a sub-affluent of the Dnieper; 51 miles southeast of the city of Chernigov. It has tanneries and tobacco culture. Pop. 13,000.

**Borsod**, bôr'shöd, county of Hungary, stretches northwest from the middle course of the Tisza (Theiss), and is crossed by its tributary the Sajó, and by the Bükk Mountains. Nearly one-half of the surface is covered with forest, but the rest produces first-rate wine, wheat, maize, tobacco, hemp, and fruit. Copper, coal, and iron are mined, and marble is quarried. Area 1,355 square miles.

**Borszék**, bôr'säk, health resort, Roumania, formerly in Hungary, in a valley of the Carpathians, 60 miles northeast of Maros-Vásárhely. It has nearly a dozen springs, and the water is exported in considerable quantities. Pop. about 1,700.

**Bortnyanski**, bôrt-nyän'skê, DMITRI STEPANOVITCH (1751-1825), Russian composer, was born in Glukhov. He was sent by the Empress Elizabeth to Italy, and there studied for eleven years. Returning to Russia (1779) he was appointed composer for the court choir, which subsequently became the Imperial Capella, with Bortnyanski as its director (1796-1825). He composed two operas, *Creonte* (1776) and *Quinto Fabio* (1778), but is distinguished primarily for his religious compositions, which marked an epoch in Russian musical history. His works were edited by Tschaikowsky in ten volumes.

**Bory de Saint Vincent**, bô-rê' de sañ-vañ-sän', JEAN BAPTISTE GEORGES MARIE (1780-1846), French geographer and naturalist, was born in Agen. He explored Bourbon, Réunion, and St. Helena (1798-1802); fought at Austerlitz, in Spain, and at Waterloo. After editing scientific and other journals in Belgium and France, he was appointed leader of a scientific expedition to Morea and the Greek islands in 1829, and president of the scientific commission for the exploration of Algeria in 1840. His works include: *Essai sur les Iles Fortunées* (1803), *Voyage dans les Quatre Principales Iles des Mers d'Afrique* (1804), *Expédition scientifique de Morée* (1832), and *L'homme, essai zoologique sur le genre humain* (1836).

**Boryslaw**, bô'rê-slôf, town, Poland, in Galicia, at the north foot of the Carpathians, 6 miles southwest of Drohobycz. It is a centre of the petroleum and ozocerite industries. Pop. about 9,000, mostly Jews.

**Borysthenes**, bô-ris'thi-nêz, the modern Dnieper. Near its mouth lay the town called by the same name, and also Olbia, Olbiopolis, and Miletopolis, which was a col-

ony from Miletus, founded in the 6th century B.C., and the most important town on the north of the Black Sea, especially for export of corn.

**Borzhom**, bôr-zhom', health resort, Russia, in the Caucasus, on both banks of the Kura, 18 miles from Mikhailovo. It is beautifully situated in the hills, and its mineral springs are famous. Remertovski and Vorontzów Parks are interesting. Pop. about 6,000.

**Borzoi**, bôr'zoi, or RUSSIAN WOLF-HOUND, a hound of the

philosophy at St. Andrews. His publications include *Logic or Morphology of Knowledge* (1888); *Civilization of Christendom* (1893); *Essentials of Logic* (1895); *Psychology of Moral Self* (1904); *Philosophical Theory of the State* (1912); *Implication and Linear Influences* (1919); *What Religion Is* (1920); *The Meeting of Extremes in Contemporary Philosophy* (1921).

**Bosboom** - Toussaint, bos'bôm-tôo-saň', ANNA LOUISA GERTRUIDA (1812-86), Dutch novelist, was born in Alkmaar, and

Photo by Edwin Levick, N. Y.

#### Borzoi, or Russian Wolfhound

general size and shape of the greyhound, but having a long silky and somewhat curly white coat, sometimes spotted with black or tan. It is a beautiful high-bred animal, generally, with a good disposition, although it is occasionally inclined to be quarrelsome. In Russia the borzoi is used for hunting wolves, being trained to run alongside a fleeing wolf, seize him by the neck, and hold tenaciously until the hunter arrives. The dog has been introduced into England and America in comparatively recent years, the first specimens in England having been presented by the Tsar to the Prince of Wales in 1870.

**Bosanquet**, bôs'sän'kä', BERNARD (1848-1923), English philosopher, was born in Alnwick and was educated at Harrow and at Oxford. From 1871 to 1881 he was lecturer at University College, Oxford, and from 1903 to 1908 he was professor of moral

spent most of her life (1851-86) at the Hague. She was the wife of the painter Jan Bosboom. She wrote principally historical novels, showing remarkable insight into human nature, combined with wide and accurate knowledge of the past. Good specimens of her work are *Het huis Lauernesse* (1841; 10th ed. 1885), *Graaf van Devonshire* (1838), *Engelschen te Rome* (1840), *Leycester in Nederland* (1846), *Vrouwen van het Leycestersche Tijdperk* (1849), *Gideon Florensz* (1854)—all historical novels. Her social novels, as *De Delftsche Wonderdokter* (1871) and *Majoor Frans* (1875), are less successful. Her collected novels appeared in 25 volumes in 1880-8. There is a *Life* in Dutch by Jan ten Brink.

**Boscan-Almogaver**, bôs-kän'almô-gä-var', JUAN (c. 1495-1542), Spanish poet, was born in Barcelona. He served as a soldier in Italy until 1519, when he re-

turned to Spain, and became tutor (1520-6) to the great Duke of Alva. His earlier compositions are in the old Castilian measures, but he was induced by the Venetian ambassador Navagiero to adopt the Italian hendecasyllabic metre in 1526, and was mainly instrumental in changing the fashion of Spanish verse. For the rest of his life he closely imitated the verse forms of the Italian poets, especially Tasso. He also translated excellently Castiglione's *Cortegiano* (1534; new ed. 1873). Most of his poetic works were published after his death with those of his friend Garcilaso de la Vega (1st ed. Barcelona, 1543). A good edition of Boscan's alone, with a biography by W. I. Knapp, appeared in Madrid in 1875.

**Boscawen**, bos'ka-wen, EDWARD (1711-61), British admiral, known as 'Old Dreadnought,' was the third son of the first Viscount Falmouth. He distinguished himself at the taking of Porto Bello in 1741. In 1744, when in command of the *Dreadnought*, he assisted in the capture of the French ship *Médée*, and in 1747, after commanding the *Namur* in the action off Finisterre, where he was wounded, he became a rear-admiral. Having subsequently rendered useful service in India, he became a lord of the Admiralty in 1751, and a vice-admiral in 1755. He effected the reduction of Louisburg and Cape Breton Island in 1758, and in the following year chased and destroyed a French squadron under De la Clue off Lagos. In 1758 he attained the rank of admiral, and in 1760 was made general of marines.

**Bosch**, JEROM. See ÆKEN.

**Boscobel**, parish, England, in Shropshire, famous as containing the farmhouse where Charles II. hid after his defeat (1651) by Cromwell at Worcester. The Royal Oak in whose branches the king concealed himself for twenty-four hours no longer stands, but a tree said to have been grown from one of its acorns commemorates the event.

**Boscovale**, bos'kō-rā-ā'lā, city, Italy, in the province of Naples, at the foot of Mt. Vesuvius, 2½ miles north of Pompeii. Here in 1895 treasures of silverware and domestic utensils, and two years later, a villa with general offices, a wine press, and household furnishings were excavated.

**Boscovich**, bos'kō-vich, RUGIERO GUISEPPE, or ROGER JOSEPH (1711-87), Italian mathematician and astronomer, was born in Ragusa. He entered the Jesuit order in 1725, was appointed professor of mathematics and philosophy at the Roman College, about 1740, and was com-

missioned by the Pope to measure a degree of the meridian in the Papal States, an account of which was published in 1755. After holding university appointments at Pavia and Milan, he was appointed director of optics to the French navy (1774-83). His chief works are *Elementa Universa Matheseos* (3 vols. 1754), *Opera Pertinentia ad Opticam et Astro-nomicam* (5 vols. 1785), and a long Latin poem, *De Solis ac Lunæ Defectibus* (1764). He died insane.

**Bosio**, bō'zyō, FRANÇOIS JOSEPH, BARON (1769-1845), French sculptor, was born in Monaco. He executed bas-reliefs for the column in the Place Vendôme at Napoleon's request; was made royal sculptor by Louis XVIII; and was created baron by Charles X. His best-known works are *Cupid Darting Arrows* (1808); *Henry IV. as a Child*; *Aristée*; *Dieu des Jardins* (1811), in the Louvre; *Hyacinthe* (1817), also in the Louvre; and an equestrian statue of *Louis XIV.* (1824), in the Place des Victoires, Paris. He also executed busts of Napoleon I. and members of his family, of Louis XVIII., Charles X., and others.

**Bosjesman**. See BUSHMEN.

**Bosna**, bos'nā, a river of Bosnia, in the Balkan Peninsula, rises south of Sarajevo, winds northward past that town, and enters the Save from the right at Samac after a course of 125 miles. It is navigable for about two-thirds of its length, as far up as Vranduk.

**Bosna Sara**. See SARAJEVO.

**Bosnia-Herzegovina**, boz'ni-a her'tse-gō-vē'na, district of Jugoslavia, including the provinces of Bosnia and Herzegovina, formerly provinces of Turkey, and from 1908 until the Great War, of Austria-Hungary. It is situated in the northwestern part of the Balkan peninsula, bounded on the north by Croatia and the river Save, on the east by Serbia and Montenegro, and on the south and west by Dalmatia and the Adriatic. It has an area of 19,768 square miles. The climate is moist and temperate, but the winters are severe, particularly in Herzegovina. In general it is mountainous and picturesque, over half the area, especially Herzegovina, being covered with forests. The principal rivers are the Save, the Bosna, the Una, the Drina, the Narenta and the Vrbas. Bosnia-Herzegovina is rich in natural resources; minerals, including coal, iron, copper, silver, lead, salt, and manganese occur abundantly in the mountains, and forests of fir, pine, oak, and beech cover the central part. Agriculture is the leading industry; live-stock raising is important, and the rivers are full

of fish. The valleys are extremely fertile, and cereals, fruits of all kinds, vegetables, dairy products, and tobacco are produced. Manufacturing is undeveloped, being confined chiefly to chemicals, iron and leather goods, coarse textiles, and carpets. The chief exports are fruits, live-stock, and timber; the imports, food-stuffs and textiles. For administrative purposes Bosnia-Herzegovina is divided into 6 districts named for the important towns, all but one of which are in Bosnia. The people are mostly of Serbian blood; about two-thirds of them are Christians, the rest Mohammedans. Education is in a backward state. Sarajevo, with a population of 50,000, is the capital. Pop. (1920) 1,889,929.

*History*.—After forming successively part of Illyria, Pannonia, and Dalmatia, Bosnia was peopled in the 6th and 7th centuries by Slavs. Then for eight hundred years it was subject successively to Serbia, Croatia, and a line of native kings, until, in 1463 Bosnia, and in 1483 Herzegovina was subjugated by the Turkish sultan Mohammed II. Thereafter it played an important part in supplying the famous Janissary corps of the Turkish armies. In 1849-50 and in 1875 the peasantry, who mostly clung to their Roman Catholic faith, rose in revolt against their masters (countrymen of their own whose ancestors accepted Mohammedanism in order to retain their estates) and against their Turkish rulers. In 1878 the Berlin Congress gave Austria a mandate to occupy and administer Bosnia, Herzegovina, and the sanjak of Novi-Bazar, under the suzerainty of Turkey, and in 1908 Austria annexed all three. In 1914 the assassination of Archduke Ferdinand in Sarajevo, the capital, precipitated the Great War, at the close of which the provinces of Bosnia and Herzegovina were allotted to the newly formed state of Jugoslavia (1918). Consult Munro's *Rambles and Studies in Bosnia-Herzegovina*; Nikaschinovitch's *Bosnia und die Herzegowina* (4 vols.); Olivier's *La Bosnie et l'Herzegovine*; Stoianovitch's *Bosnie-Herzégovine* (1917); British Foreign Office *Handbook No. 12* (1920).

**Bosporus**, bos'pō-rus (also BOSPHORUS), or STRAITS OF CONSTANTINOPLE, strait, Turkey, separating Europe from Asia, and connecting the Black Sea with the Sea of Marmora. Its length is 17 miles, and its breadth is from a mile to 2 miles. Its well-wooded shores are elevated and picturesque, with many bays, the most important of which is the Golden Horn. The towns

of Scutari, Pera, Therapia (the castles of Europe and Asia), and the city of Constantinople stand on the strait. By the Treaty of Berlin (1878) it is stipulated that no warships except those of Turkey are allowed to pass through. (See DARDANELLES.)

The CIMMERIAN BOSPORUS (the Straits of Kaffa), between the Sea of Azov and the Black Sea, was called after the Cimmerii (q. v.), who were supposed to have lived there. On the west side of the strait, in the modern Crimea, the Milesians founded a colony in the sixth century B. C., called Bosporus or Panticapæum,

affords direct communication between Bohemia and the Adriatic. The tunnel (opened 1905) is 3 miles long; its summit elevation, 2,405 feet above sea level.

**Boss Rule.** In our present usage of the terms, the 'boss' differs from the political 'leader' in that the latter keeps ever foremost the highest welfare of the country, and uses only methods that will be morally helpful to the voters; while the boss advances primarily his own power by serving special interests—frequently by methods that are considered immoral and corrupting to the voters.

of the voters, he must be straightforward in his dealings with those from whom he, directly or indirectly, receives his pay, and with the subordinate leaders who serve under his direction. He must be skilful in putting before the voters plausible reasons for his plans, and must maintain the appearance, at least, of service to the public. Doubtless in many cases where his own interests, or those of the few whom he is serving, are not at stake, he gladly promotes the public interest.

The boss must have ability in leadership. He must be a man who can stimulate the imagination of his followers, who has great organizing ability, and who understands human motives. Even the greatest and most unscrupulous bosses maintain their power largely by direct personal attention and actual kindnesses to their followers, frequently giving presents to wives and children attending weddings and funerals, organizing picnics and excursions, giving liberally to charity, and ministering to the personal wants of their followers, thus winning their real affection. They promote their interests by furnishing jobs to a large number of workers, often on public improvements, by distributing patronage of the higher offices to their leading followers, and by similar methods. Sometimes the work that they do is not contrary to the public interest; but much of it may be injurious, and the purpose of the boss is primarily selfish rather than patriotic.

The effects of boss rule are distinctly evil. First, the methods of the boss are likely to render the voters even more indifferent to the public needs, and more inclined to use public positions for private gain. Such rule is destructive of patriotism. Second, a skilful boss by controlling the voters in the interests of a few, if he wields his power successfully and it is long continued, often discourages many good citizens who feel that time devoted to the public service is wasted, as nothing permanent can be accomplished. And, third, such rule is very expensive to the public, as not only are its interests not served, but the revenues go largely into private pockets.

The remedies for the evils of boss rule must be found—first, in an aroused public opinion that comes from knowledge of actual conditions, the public thus seeing how their interests are sacrificed; second, and no less important, from an aroused public conscience which will compel citizens to perform their civic duties at

The Bosporus.

the modern Kerch. From the fifth century B. C. it had a dynasty of its own, and its kings were in active communication with Athens, especially in the time of Demosthenes. But in 115 B. C. the last king, being hard pressed by the Scythians, ceded it to Mithridates VI. of Pontus, to whose son Pharnaces it was given by Pompey in 63 B. C. The kingdom was destroyed in the third century A. D. by the Goths.

**Bosquet, PIERRE FRANÇOIS JOSEPH** (1810–61), French marshal, was born in Mont-de-Marsan, Landes. He served in numerous campaigns in Algiers (1834–52), and fought with distinction at the Alma and at Inkerman, and in the storming of Sebastopol, in the Crimea (1854–5). He was promoted field marshal and was appointed senator.

**Bosruck**, Alpine tunnel of Austria, on the Pyhrn Railway,

Boss rule is probably dependent primarily upon the indifference and mental inertia of the average voter. The large majority of voters have drifted into their political parties on account of their early environment and personal relationships. Not being persons of initiative or great independence of judgment, they naturally remain in the party regardless of changing policies. They follow the leader, adopting whatever plans and methods he puts forward. Usually their motives are not corrupt; they are simply blind followers.

In order to secure and maintain his position, the boss must be skilful in serving the special interests that have influence in the community, wealth to furnish means for his political plans and to reward him for his services. In order to maintain the confidence of these interests, and

the sacrifice of personal comfort, and even of personal interests.

This civic conscience will compel able men to be willing to lead unselfishly in public affairs, and to esteem it a privilege to have the opportunity of serving the public. No less must it stimulate the ordinary voter whose time, owing to the necessity of earning a living, cannot be so readily commanded, to think independently and unselfishly, and to be willing to follow movements that are in the public interest, and not in the interest of merely his class.

The overthrow of boss rule needs an organization as skillfully planned and managed as that of the boss himself. The main difference between this organization and that of the boss must be its purpose to carry out the will of the citizens in the interest of the citizens, and not the will of the boss in the service of special interests.

The method most frequently advocated for the overthrow of boss rule is the establishment of the direct primaries for the nomination of candidates for office. Doubtless some of the direct primary laws would tend to contribute to that end; but neither direct primaries nor other methods can be successful unless a large percentage of the voters are so aroused to the need of unselfish, personal action that they are willing themselves to take trouble and sacrifice time—and, if necessary, money—in doing their duty as citizens.

Too frequently the assumption is made that everything connected with a strong political organization savors of boss rule and is an evil. Leadership is an essential of success in party government, however; and under a free government, owing to differences of human temperament and judgments, parties always arise. Neither strong leadership nor effective organization necessarily leads to boss rule; and yet, unless the public is unusually alert and patriotic, the tendency is in that direction; for most persons shrink from responsibility, and their bent is to follow rather than to lead.

Times of business prosperity and peace within the country and without are likely to encourage boss rule; for then most people are so eagerly looking after their private affairs that they neglect the public welfare, and are glad to have others take the trouble of managing. In times of war or of real danger to the country, the average voter becomes a patriot, alive to his country's welfare. The boss must

then become a leader in the right direction or he is overthrown.

The boss can hold his position only by his ability to use the traits of human nature. Whatever the form of government or whatever the nature of human association, there will always be leadership. The only final security against the evils arising from corrupt leadership is found, therefore, in uplifting or upholding the character of the leaders, and in improving and maintaining the standard of intelligence and character of the people.

Consult Macy's *Political Parties in the United States* (1900); Woodburn's *Political Parties and Party Problems in the United States* (1903); Steffens' *Shame of the Cities* (1904); Paine's *Thomas Nast* (1904); Howe's *The City the Hope of Democracy* (1905); Alexander's *Political History of New York* (1909); Bryce's *American Commonwealth* (1910 edition); Goodnow's *Municipal Government* (1909).

**Bossu, RENÉ LE.** See LE BOSSU.

**Bossuet, JACQUES BÉNIGNE** (1627-1704), French preacher, historian, and controversial writer, was born in Dijon. Educated by the Jesuits of his native town, and at the Collège de Navarre in Paris, he was admitted doctor in theology in 1652, and proceeded the same year to take up the duties of a canon at Metz. Here he entered into controversy with the Protestants, and wrote his *Réfutation du Catéchisme de Paul Ferry* (a Protestant minister of the town). In 1659 he went to Paris, where he soon won reputation as a preacher, and from 1661 preached frequently at the court. Appointed bishop of Condom in 1669, he resigned the see a year later, on being made tutor to the Dauphin. For the Dauphin's instruction, he wrote, among other works, the *Discours sur l'Histoire Universelle* (1681), remarkable for its vivid generalizations and sense of historical continuity, and by some considered as the first attempt at a philosophy of history.

At this time the question of the rights of the Gallican Church again assumed importance, and Bossuet became its recognized champion in opposition to Fénelon and the Ultramontanes. To the assembly of the clergy in 1681 he preached the sermon *Sur l'Unité de l'Eglise*, designed to effect a reconciliation between the Pope and the king; and he inspired the *Déclaration* of 1682, which formulated the liberties of the Gallican Church. On relinquishing the tutorship of the Dauphin (1681) he was rewarded

with the bishopric of Meaux. Thereafter he delivered his most celebrated funeral orations—on Marie-Thérèse (1683), Anne de Gonzague or Anne de la Palatine (1685), Le Tellier (1686), and, greatest of all, Condé (1687).

In 1688 he published *L'Histoire des Variations des Eglises Protestantes*, and in 1694 *Maximes et Réflexions sur la Comédie*, in which he attacked the theatre, and especially the plays of Molière. He again crossed swords with Fénelon on the burning topic of the Quietist heresy, which he denounced in *Instructions sur les Etats d'Oraison* (1697) and *Rélation sur le Quiétisme* (1698). From 1697 to 1701 he carried on negotiations with Leibniz to bring about a union of the Catholics and Lutherans, but without success.

A man of fervent piety and generous emotions, in theology and politics Bossuet was rigorously orthodox and conservative. In the orations the personal panegyric is always employed to illustrate a greater theme—the littleness of earthly greatness in the presence of death; but there are not wanting traits of personal emotion, and in general the style is sonorous, grave, imaginative. In the sermons, though the rhetoric is less elaborate, the poetic sensibility of the preacher finds more abundant expression; the language is pure and limpid, the argument forcible and well sustained, and many of them—as that of *Sur la Mort*—are unequalled in French oratory. The eighteenth century (*e. g.*, Voltaire) ranked Bossuet below Bourdaloue and Massillon, but modern criticism has restored him to his place as the first of French orators, and considers him one of the greatest masters of French prose.

Bossuet's Complete Works were issued in 1815-19 (Versailles Edition, 43 vols.), and in 1862-6 (Paris Edition, ed. by Lachat, 31 vols.). His *Œuvres Oratoires* were published in 1890-96, and his *Oraisons Funèbres* in 1908 (in Dent's *Les Classiques Français*). Consult Floquet's *Etudes sur la Vie de Bossuet*; Lanson's *Bossuet*; Rabelliau's *Bossuet*.

**Boston**, the capital and largest city of Massachusetts, one of the most historically significant and commercially important cities of the United States, and the fifth in population, is situated at the head of Massachusetts Bay, Suffolk county, in lat. 42° 21' 27.6" N. and long. 71° 3' 30" W. It is 450 miles by rail northeast of Washington, and 232 miles northeast of New York City. It comprises several former cities

 5. State House. 6. Old South Meeting House.

and towns about Boston Harbor and along the Charles River, and includes Old Boston, or Boston proper, situated on a peninsula nearly 2 miles long and about a mile wide; East Boston, on Noddle's and Breed's Islands; South Boston, formerly Dorchester Neck, on a peninsula separated from Old Boston by an inlet called South Bay; Charlestown, on a peninsula whose water front is bounded by the Mystic and Charles Rivers and part of Boston Harbor; and the former towns of Brighton, Roxbury, West Roxbury, Dorchester, and Hyde Park (1911), which contain a number of villages. The area of the city is about 48 square miles.

Surrounding Boston, and within a radius of 12 miles, are 40 cities and towns which are closely affiliated with it. Commercially prominent among these are Lynn, Cambridge, Somerville, Chelsea, Watertown, Quincy, Everett, and Malden. The finest of the residential suburbs is Brookline.

Boston is an important railroad centre, being the terminus of several branches of the New York, New Haven, and Hartford, the Boston and Albany, and several branches of the Boston and Maine Railroads. There are two large terminal stations: the North Station, serving the railroads from northern points, and the larger South Station, serving the roads from the west and south.

The city's shipping facilities are enhanced by deep-water freight terminals and wharves, permitting rapid and convenient transfer to and from railroads and ships. In 1911 the Massachusetts legislature appropriated \$2,500,000 for developing the port of Boston. The first improvement was the remodeling of the Commonwealth Docks to accommodate the Hamburg-American steamship lines passenger service. A further appropriation of \$3,000,000 was made to build a large dry dock capable of accommodating steamers of great size, and further to develop the port according to a consistent scheme. This dry dock was completed in 1919 and was formally taken over by the U. S. Navy, Dec. 22. The city is connected by ocean steamship lines with Liverpool, London, Hamburg, Glasgow, the chief Mediterranean ports, and the West Indies. Domestic lines run to the leading ports of the New England and Southern coasts and of Nova Scotia and New Brunswick.

The climate is fairly equable; winters are cold and summers are generally hot, but tempered by the winds from the Atlantic.

The old part of the city has narrow, crooked, poorly planned and poorly graded streets, but the modern city has nearly 600 miles of paved streets and the Back Bay district is handsomely laid out. The spacious Commonwealth Avenue, 240 feet wide, with lines of trees shading the central parkway, and adorned with stately residences, is one of the finest streets in the world. Beacon Street, in the aristocratic section, also deserves special mention. These two streets, which run through the Back Bay district, rank in the fashionable world of Boston as Washington and Tremont Streets rank in the business, and State Street in the financial quarter.

Boston's street railway system is admirably organized, practically under one management, and allows liberal transfer privileges. The subway, opened in 1897 and since extended—the first public work of its kind built and owned by an American city—has greatly relieved excessive traffic pressure in the crowded business quarters. A branch extends to East Boston, by a tunnel under the Charles River, and another to South Boston. There is also an extensive system of surface and elevated electric-railways, while steam railways co-operate with the elevated, tunnel, and surface lines in increasing the facilities of transit to any part of the city and suburbs. There is a ferry service to East Boston and Chelsea.

The Metropolitan Water System is distinguished by the Wachusett Lake reservoir, on the Nashua River, the largest freshwater reservoir in the world. The basin has an area of 6½ miles, an average depth of 46 feet, and a capacity of more than 63,000,000 gallons. The dam is 1,250 feet long.

**Parks.**—The park system of Boston covers over 2,300 acres. The most noteworthy among the parks is Boston Common (48 acres), which has been dedicated to public purposes since 1634. Immediately adjacent is the fine Public Garden (24 acres), reclaimed from what was once low-lying wet land. There are numerous other parks and playgrounds in the city system, which extends in a connected series from the Common and Public Garden to City Point.

A noteworthy feature is the Boston Metropolitan Park System, including a chain of parks reaching from the Back Bay Fens up through the West Roxbury district and along Dorchester Bay to South Boston. Beautiful parkways form uniting threads; and along the Boston side of the Charles River there is an embankment laid out with

boulevards and pleasure grounds. (See PUBLIC PARKS.)

The beauty of the parks, squares, and public buildings is enhanced by monuments and statues, of which the following are among the most important: Bunker Hill Monument, in Charlestown, 221 feet high, built of granite, and commemorative of the heroism of the American patriots at the Battle of Bunker Hill (q. v.); the equestrian statue of Washington in the Public Garden; the monument to Col. Robert Gould Shaw, who raised and commanded the first colored regiment of Union troops in the Civil War; the Soldiers' Monument in the Common; the Crispus Attucks monument, a memorial of the Boston Massacre (q. v.) of 1770; statues to Gen. Joseph Hooker, Edward Everett, Charles Sumner, Alexander Hamilton, Governor Winthrop, Samuel Adams, William Lloyd Garrison, Benjamin Franklin, Josiah Quincy, Beethoven, Daniel Webster, Horace Mann, Rufus Choate, Admiral Farragut, and many other notable men.

**Buildings.**—Boston contains an unusually large number of public buildings, many of which are of historic interest. The State House, a fine edifice with an imposing front and surmounted by a gilded dome, the County Court House, the Federal Government Building, the City Hall, and the Custom House are handsome structures in varied styles of architecture. Grouped around Copley Square are Trinity Church, one of the best examples of Romanesque architecture in the United States; the Boston Public Library (see LIBRARIES), costing \$2,486,000, and containing over 1,006,000 volumes; the New Old South Church, and the Copley Plaza Hotel (1912). The Museum of Fine Arts, opened to the public in 1909, is situated on the Fenway. It is constructed of cut granite and brick, and has a frontage on Huntington Avenue of 500 feet. In 1909 a new Opera House, located on Huntington Avenue, was opened. It has a seating capacity of 2,750, and cost \$1,200,000.

Other notable edifices are the Exchange Building, Tremont Temple, the Museum of Natural History, the Chamber of Commerce, the Massachusetts General Hospital, the Roman Catholic Cathedral, the Christian Science church, the Boston Athenæum (with a library of over 200,000 volumes), Symphony Hall, Horticultural Hall, the buildings of the Massachusetts Historical Society, and the new marble building of the Harvard Medical School.

In addition to the structures previously referred to, there are several which, by reason of their historical associations, are looked upon with interest as part of the city's life and reputation. Such are Faneuil Hall (see FANEUIL, PETER), originally built in 1742, under whose roof public meetings and discussions of vital moment were held previous to and during the Revolution, as well as during the Abolitionist agitation and the Civil War; the famous Old South Meeting House (1729), the historic scene of Revolutionary gatherings, the rendezvous from which the Boston Tea Party (q. v.) started on its mission, and where the annual election sermon was preached during 150 years; the old State House (1748), whose original appearance has been preserved; the Old North Church (1723); King's Chapel (1754). Of marked historic interest also are the three old burying grounds, Copp's Hill, the Central, and Old Granary.

**Schools and Churches.**—As an educational and literary centre Boston occupies a high position. Its public school system, which comprises kindergartens, primary, grammar, junior high and high schools, as well as trade and industrial schools, is excellent.

As a seat of learning it may justly claim the prestige of Harvard University (q. v.), and the Massachusetts Institute of Technology (q. v.), the greater part of whose schools are in the adjoining city of Cambridge and the remainder in Boston. Among other institutions of higher education are Boston University (q. v.), with its affiliated colleges, its schools of law, medicine, and theology, and its post-graduate department in philosophy, science, and language; the Medical, Dental, and Agricultural Schools of Harvard University; Boston College (Jesuit, 1860); the Medical and Dental Schools of Tufts College (q. v.); the New England Conservatory of Music (1870); the Massachusetts Normal Art School; the Lowell Institute; the High School of Commerce; and the Massachusetts College of Pharmacy. Within the city or near by are three important colleges for women—Radcliffe, Simmons, and Wellesley.

Among the many churches perhaps the most interesting architecturally are the Park Street Church (Congregational), King's Chapel (Unitarian), and the Old South (Congregational). Others of importance are the Clarendon Street Church, Ruggles Street Church, and Tremont Temple (Baptist); Arlington Street Church, New Old South, and Central Church (Congregational); Church of the Advent, Em-

manuel Church, Trinity Church, and St. Paul's Cathedral (Episcopal); First Church and People's Temple (Methodist); Parker Memorial and First Church in Boston (Unitarian); First Church of Christ (Christian Science); Cathedral of the Holy Cross, Church of the Immaculate Conception and Church of the Holy Trinity (Roman Catholic).

Charitable institutions include the splendidly equipped Massachusetts General Hospital, the Homeopathic Hospital, the Children's Hospital, the Peter Bent Brigham, Robert Bent Brigham, Carney, Psychopathic, St. Elizabeth's, Baptist, and City Hospitals, the Horace Mann School for the Deaf, the Eye and Ear Infirmary, the New England Women's Hospital, and institutions for the indigent aged and for the reform of erring young persons and of criminals.

In musical art Boston ranks high, and its famous Symphony Orchestra (see BOSTON SYMPHONY ORCHESTRA) has no superior in the United States. The paintings in the Museum of Fine Arts and other public institutions are supplemented by private galleries, especially that at Fenway Court, the home of Mrs. John L. Gardner, which contains one of the best collections of art treasures in America.

**Commerce and Industries.**—As a commercial and financial centre Boston ranks third, after New York and Chicago. Its wool trade is second only to that of London. Its foreign commerce in merchandise is fifth among the cities of the United States, following New York, Washington, Philadelphia, and New Orleans.

In 1919 the imports were valued at \$299,365,000 and the exports at \$334,487,000. The exports are chiefly meat and fish products, leather, cotton and cotton waste, breadstuffs, live cattle and sheep, machinery, paper, books and printed matter, manufactures of leather, fruits, and manufactures of iron and steel, rubber, lumber, and brass. The principal imports are raw cotton and cotton waste, hides and skins, wool and camel's hair, raw fibres, fibre fabrics, chemicals and dyes, machinery, paper stock, wood pulp, fruit, etc. Vessels of 2,391,528 tons burden entered and cleared the port in 1918.

According to the United States Census of Manufactures for 1914, Boston had 3,138 industrial establishments, employing 78,894 wage earners, and a capital of \$215,177,000. The cost of material used was \$150,568,000, and the value of products \$284,802,000, of which \$134,234,000 represented the value added by manufacture.

The factory products include boots and shoes, men's clothing, confectionery, sugar, cotton manufactures, foundry and machine-shop products, women's clothing, tobacco manufactures, druggists' compounds, musical instruments, electrical machinery, and leather. Boston also occupies a prominent position as a book-publishing centre. The Boston Chamber of Commerce, with a membership of 7,500, is the largest organization of its kind in the world.

In 1920 the assessed valuation of real estate was \$1,329,290,100, and of personal estate \$180,509,300. The tax rate was \$24.10.

**Population.**—The population of Boston (1920) is 748,060, which represents an increase of 77,475, or 11.6 per cent. over the 1910 census. The population at different periods has been as follows: (1790) 18,320; (1800) 24,937; (1830) 61,392; (1850) 136,881; (1860) 177,840; (1870) 250,526; (1880) 362,839; (1890) 448,477; (1900) 560,892; (1910) 670,585.

**History.**—Old Boston, or Boston proper, was first settled by a number of colonists who came with John Winthrop from Salem in 1630, and went to Charlestown, but who soon after moved to the peninsula which was the original site of the old city. This peninsula, named Shawmut, or Sweet Waters, by the Indians, had been occupied by Rev. William Blackstone, an Anglican clergyman; but he sold his rights to the settlers four years after they had established themselves. The place was then named Boston after Boston in Lincolnshire, England.

The civic and educational beginnings of the new Boston were soon evident in the town meeting; the free school, founded in 1635; Harvard University, founded in 1636; and in the establishment of trial by jury and the legal safeguards of life, property, and religious liberty according to the Puritan notions which had been frowned on in England, but which were the basis of the new settlement.

Fierce persecutions and vexatious religious controversies marred the early life of the town. Roger Williams (q. v.), the first advocate of religious toleration in America, left Boston, accompanied by his sympathizers; and for more than fifty years afterward, superstition and bigotry, manifested in the execution of women as witches and the persecution of Quakers, continued to exist.

In the meantime a post office, a printing house, a mint, and a bank had been established; and at the beginning of the eighteenth century, its increased

growth and the founding of the first American newspaper, the *Boston News Letter* (1704), gave the town a leading position and a larger political life.

The independent spirit which rose against the impressment of seamen in 1747 and the Stamp Act (q. v.) in 1765 had already been seen in resistance to arbitrary interference by England; but it became more fixed and hostile after the Boston Massacre (q. v.), March 5, 1770, while the Boston Tea Party (q. v.) of 1773 was a decided defiance of the British government, that led to far-reaching consequences. Throughout these disturbances, 'no taxation without representation' was the guiding principle of the colonists; and this principle was held more firmly than ever when the Boston Port Bill (q. v.) of 1774 was enacted by the British Parliament as a punishment for the Tea Party. As a natural consequence, the inhabitants were among the first in active duty on the outbreak of the Revolution; and the Battle of Bunker Hill (q. v.) was fought on June 17, 1775. After a long siege the British were compelled by Washington to evacuate the town in March, 1776. (See *REVOLUTION, AMERICAN.*)

The embargo during Jefferson's administration retarded the shipping and commerce of Boston; but these rapidly increased after the War of 1812. Henceforth the only serious interruption to Boston's business growth was the Civil War.

Two notable events, significant of the moral force of the city, were the establishment of the *Liberator* in 1831, by William Lloyd Garrison (q. v.), and the founding of the New England Anti-Slavery Society in 1832.

A fire in the business district in November, 1872, destroyed more than \$75,000,000 of property; within two years, however, this area was rebuilt, and presented a much finer appearance than before the fire.

In 1907 a commission of seven was appointed by Mayor Hibbard to devise a practical working form of government for the city. This commission drafted a new charter, by which the finance commission, of five members appointed by the governor, became a permanent body, the council was reduced to nine members, and the mayor's executive and appointive powers were largely increased. In 1909 the legislature adopted this new charter. The mayor is elected for four years but may be recalled at the end of the second year. His appointments do not require city council confirmation, but

may be rejected by the State Civil Service Commission.

A series of strikes on shipbuilding and government construction work broke out in and around Boston in the fall of 1917, but they were quickly put in the hands of government officials for settlement and soon ended. An event of national importance, because of its effect on the public safety of the whole country, was the strike of the Boston police in September, 1919, which left the city unprotected and at the mercy of an army of thugs and criminals. Governor Calvin Coolidge (q. v.) took a firm stand, treated the strikers as mutinous, and quickly suppressed the strike.

**Bibliography.**—Consult Drake's *Old Landmarks and Historic Personages of Boston*; Hale's *Historic Boston*; Lodge's *Boston* (Historic Town Series); *Memorial History of Boston* (ed. by Winsor); Ernst's *Constitutional History of Boston*; Howe's *Boston, the Place and the People* (1907); Crawford's *Old Boston Days and Ways* (1909).

**Boston**, seaport, England, on the River Witham, 4 miles from the sea, and 30 miles southeast of Lincoln, on the Great Northern Railway. Its most noteworthy feature is the Church of St. Botolph (Boston-Botolph's town), one of the largest (290 X 98 feet) and finest specimens of the Decorated style, with a tower 290 feet high, forming a conspicuous landmark for mariners. There are a Grammar School (1554), a Blue-Coat School, an Athenæum, and a Guildhall. The chief industries are the manufacture of agricultural implements, sails and ropes, brewing and tanning, iron and brass founding. Coal, corn, and agricultural implements are exported. Some shipbuilding is carried on, and there are lines of steamers for Hull, London, and Hamburg. The sea approach was formerly silted up, but has been much improved by deepening and straightening the channel. The corporation dock has an area of 7 acres, and a quayside of 2,330 feet. Deep-sea fishing is carried on.

In Plantagenet times Boston was a chief port of the kingdom, and much frequented by traders of the Hanseatic League. Foxe, author of the *Book of Martyrs*, and Ingram, founder of the *Illustrated London News*, were natives of the town. Pop. (1911) of parliamentary borough, 16,673; of municipal borough, 21,910. Consult French's *Story of Old Boston*.

**Boston**, THOMAS (1676-1732), Scottish divine, was born in Duns, Berwickshire. He was ordained to the Presbyterian

ministry in 1699 and labored at Simprin (1699-1707) and Ettrick, Peeblesshire (1707-32). He became known throughout Scotland for his defence of the right of Christian people to choose their own ministers; his refusal to take the abjuration oath (see *ABJURATION*); his opposition to Simson, divinity professor at Glasgow, on account of his doctrinal teaching; and for his share in the 'Marrow Controversy' (q. v.). His treatise on *Human Nature in Its Fourfold State* (1720) exercised a powerful influence on the religious life of Scotland. *The Crook in the Lot* was also a great favorite with the Scottish peasantry. His *Memoirs* (1776) are a valuable commentary on his time.

**Boston College**, a Roman Catholic educational institution in Boston, Mass., founded in 1864, and conducted by the Fathers of the Society of Jesus. It includes preparatory and collegiate departments with a college course of four years, leading to the bachelor's degree. It has about 45 founded scholarships.

**Boston Massacre**, a riot which occurred in Boston on March 5, 1770, the culmination of a series of disturbances due to the quartering of British soldiers in that city. A crowd of citizens, led by one Crispus Attucks, threw snowballs and other missiles at a small party of soldiers, who fired into the crowd, killing three and wounding seven, of whom two died. Eight soldiers, with Captain Preston, were placed on trial for the shooting. Preston and six of the soldiers were acquitted, while two were convicted of manslaughter and branded in the hand.

**Boston Port Bill**, a bill passed by the British Parliament on March 31, 1774, providing for the shutting up of the port of Boston, Mass., and the removal of the seat of government to Salem. The bill was introduced by Lord North in retaliation for the events of the Boston Tea Party (q. v.). So far from having the effect of reducing the people to submission, the bill only inflamed them to a more spirited resistance; and with the hearty assistance of the towns contiguous to Boston, it was never more than a dead letter.

**Boston Symphony Orchestra**, of Boston, Mass., one of the best orchestras in the United States, was founded in 1881 by Henry Lee Higginson. Its first conductor was Georg Henschel. He was succeeded, after three years, by William Gericke, of Vienna, under whom considerable advance was made, many Viennese and other foreign musicians, including Franz Kneisel as leader,

being engaged. After an interval, during which Arthur Nikisch and Emil Paur were successively conductors, Gericke resumed the direction of the orchestra. The present conductor is S. Koussevitsky (1924- ). The Orchestra gives twenty-four concerts annually during the winter season, besides visiting New York five times, and Baltimore and Philadelphia once a year.

**Boston Tea Party**, an incident occurring in the United States just previous to the American Revolution. As a practical protest against the principle of 'taxation without representation,' a party of Bostonians, disguised as Indians, boarded three ships laden with taxed tea, and threw 350 chests into Boston Harbor (Dec. 16, 1773). Governor Hutchinson had previously refused to accede to the request of the Boston town meeting that the vessels be ordered back to England without being unloaded; and the English government had refused to accept the equivalent of the tax offered by the East India Company, on condition that they should be allowed to deliver the tea in America free of duty. In retaliation the home government, by an act of Parliament, declared the port closed (see BOSTON PORT BILL).

**Boston University**, a privately controlled institution of higher learning, established by members of the Methodist Episcopal Church, May 26, 1869. Through the relationship of its founders, Isaac Rich, Lee Clafin and Jacob Sleeper, to Wesleyan University, it traces its descent via Cokesbury College and John Wesley to ancient Oxford. It is composed of ten Departments and is controlled by a self-perpetuating Board of fifty Trustees of which the President of the University is an ex-officio member.

Within seven years after its incorporation, Boston University opened seven colleges and schools. The first, in 1871, was the School of Theology, continuing on new foundations the work of a theological seminary which had been transferred from Newbury, Vermont, to Concord, New Hampshire, in 1847, and thence to Boston in 1867. The next department, opened in 1872, was the School of Law. In succession followed, in 1872, the College of Music, the first undergraduate department; the School of Medicine, developed from the New England Female Medical College, which had been in existence since 1848; the School of Oratory in 1873, and the College of Liberal Arts in the same year; the Graduate School of Arts and Sciences in 1874. Articles of agreement were ratified in 1875 whereby the Massachusetts Agri-

cultural College at Amherst became (and until 1911 continued) substantially an agricultural department of the University. The School of Oratory was discontinued in 1879. In 1891 the College of Music was discontinued, but was reestablished in 1928.

More recent departments are the College of Business Administration (1913), the School of Education (1918), the School of Religious Education and Social Science (1918), and the College of Practical Arts and Letters (1919). The University Summer Session, initiated by the College of Liberal Arts, was first organized in 1915. In the several departments, the usual degrees are offered. The Graduate School offers courses leading exclusively to the degrees of A.M. and Ph.D.

In addition to the above Schools and Colleges, a Summer Session of the University is maintained, and there is also an Extension Department carried on. For recent statistics see Table under the heading COLLEGE.

**Bostrom**, bō'strūm, KRISTOFFER JAKOB (1797-1866), Swedish philosopher, who exercised an extraordinary influence over his pupils by the magnetism of his personality, was born in Pitea. After studying at the University of Upsala, in 1833-7, he became tutor of the royal princes; but he returned to the university, and in 1840 was made professor, a post he held for twenty-three years.

**Bostwick**, ARTHUR ELMORE (1860- ), American librarian and editor, was born in Litchfield, Conn. He was graduated (1881) from Yale University (Ph.D., 1883), and after being assistant editor of the *Forum* (1890-92) and holding various appointments in New York libraries, in 1909 he became librarian of the St. Louis Public Library. He was president of the American Library Association in 1907-08 and of the American Library Institute, 1909-12 and 1925-27. In 1925 he made a survey of Chinese libraries at the invitation of the Chinese Association for the Advancement of Education. He was an associate editor of the *Standard Dictionary*, has been science editor of the *Literary Digest* since 1894, and has published the *Young Folks' Cyclopaedia of Games and Sports* (with John D. Champlin); *The American Public Library* (1910; 4th ed., revised, 1929); *The Different West* (1913); *Earmarks of Literature* (1914); *The Making of an American's Library* (1915); *Librarian's Essays* (1920); *A Librarian's Open Shelf* (1920); edited 'Classics of American Librarianship' (10 vols., 1915-date) and

has contributed to encyclopedias and periodicals.

**Boswell**, borough, Pennsylvania, in Somerset County, on the Baltimore and Ohio Railroad; 18 miles southwest of Johnstown. The leading industries are coal mining, lumber yards and textile manufactures. Pop. (1910) 1,878; (1920) 2,168.

**Boswell**, boz'wel, JAMES (1740-95), the biographer of Samuel Johnson, and eldest son of Lord Auchinleck, a Scottish judge, was born in Edinburgh. He visited London for the first time in 1760. In 1762 he made his first attempt at authorship by contributing to *A Collection of Original Poems by Scotch Gentlemen*. Early in 1763, while passing through London, he was introduced to Dr. Johnson, and a warm friendship sprang up between them. In 1767 he published *Dorando*, a Spanish tale little known; and in 1768, *The Essence of the Douglas Cause*, a defence of the claim of Archibald Douglas to the dukedom of Douglas. In 1768 appeared his *Account of Corsica, with Memoirs of General Paoli*; and in the following year a volume of *British Essays in Favor of the Brave Corsicans*. In 1773 he accompanied Johnson on his journey to the Hebrides. From 1777-9 he wrote a series of papers, called 'The Hypochondriac,' in the *London Magazine*. In 1785 he published the *Journal of a Tour to the Hebrides*, and in 1786 he was called to the English bar.

In May, 1791, Boswell produced his extraordinarily successful *Life of Dr. Johnson*. But the author succumbed to hypochondria and alcoholism, to which he had given way after his wife's death in 1789, and died in London on May 19, 1795. It is generally conceded that the *Life of Johnson* stands alone in the English language for the faithful portraiture of its subject. Boswell's *Letters to the Rev. W. J. Temple* were published in 1857; and Charles Rogers edited (1874) for the Philobiblon Society a curious tract relating to Boswell, called *Boswelliana*.

**Boswellia**, a genus of trees of the family Burseraceæ, natives of India, Persia, and Arabia. The flowers have five petals and a crenulated granular disc. The fruit consists of a triangular capsule with three valves and three cells, each cell containing one seed. *B. serrata* is a large tree with pinnate leaves and small pink flowers in axillary racemes. Boswellia is the tree which produces the fragrant resin olibanum, believed to be the frankincense of the Bible.

**Bosworth** (MARKET BOSWORTH), market town, England, in Leicestershire, 13 miles west

of Leicester. Here Richard III. was defeated and slain by Henry Richmond (1485). Pop. (1921) 23,202.

**Bosworth, JOSEPH** (1789-1876), Anglo-Saxon scholar, was born in Derbyshire. While vicar of Little Harwood in Buckinghamshire (1817-29) he published his *Anglo-Saxon Grammar* (1823). In 1829-40 he acted as chaplain in Holland, and in this time appeared the *Anglo-Saxon Dictionary* (1838), his principal work; *Origin of the Dutch* (1836); *Scandinavian Literature* (1839). From 1840 to 1857 he was vicar of Waithe in Lincolnshire, and later rector of Water Shelford in Buckinghamshire. In 1858 he was appointed to the Rawlinson professorship of Anglo-Saxon at Oxford, and in 1867 he gave \$50,000 for a similar endowment at Cambridge.

**Böszörmény, bú's'ur-mán-y'**, or HAJDU-BÖSZÖRMENY, town, Hungary, in the county of Hajdu, 13 miles northwest of Debreczin. Pop. 28,000.

**Bot.** See BOT-FLY.

**Botanical Society of America**, a general association of leading American botanists, organized in 1893. In 1906 it was enlarged by federation with the Society for Plant Morphology and Physiology and the American Mycological Society.

**Botanic Garden**, a garden in which the plants grown, and the method of their arrangement and cultivation, are intended to subserve some definite scientific purpose. The botanic gardens in connection with universities, and as independent establishments all over the world, are the direct outcome of the physic gardens in which simples were formerly cultivated. Perhaps the first record of a garden of this kind occurs early in the 14th century, as belonging to a member of the Salernitan school of medicine; and before the first half of that century had run its course, the republic of Venice had also established a similar garden. With the Renaissance and the study of what is now called natural science came the establishment in Italy (Ferrara, Padua, Pisa, Bologna, Florence, Naples) of botanic gardens in the modern sense. Germany (Nuremberg, Leipzig, Breslau, Heidelberg, Giessen, etc.) and France (Montpellier, Paris, the Jardin des Plantes) were not long in following the example thus set. In the United States, the garden at Bronx Park, in New York City, is one of the most recent as well as the most important. The Missouri Botanical Garden in St. Louis is an outgrowth of the Shaw Gardens, and in Brookline, near the city of Boston, is the Arnold Arboretum, a public park

which is especially rich in trees and shrubs. The most noted gardens in Great Britain are those of Oxford (1632), Chelsea (1677), and Kew (1670). There is a famous tropical garden at Buitenzorg, Java, another at Calcutta, India, and one in Sin-

gapore, Straits Settlements. South America has one at Rio de Janeiro. At the present time nearly all great universities have at least a small botanic garden in connection with research work in botany.

Botany: Histology

Types of plant cells:—1. Cells of yeast, a simple fungus, showing cell spaces or vacuoles (v). 2. Two cells from a leaf, showing chlorophyll corpuscles (c), nucleus (n), and cell spaces (v). 3. Starch-containing cells from seed-leaf of pea—(s) starch grain. 4. Sieve-tube from vascular-bundle, showing sieve-plate (s) or perforated partition, at the sides are nucleated companion cells (after Strasburger). 5. Elements of wood. a, wood fibre; b, tracheid, with pitted wall; c, vessel with spiral thickening; d, vessel with pitted wall—the cross bands show the original cell walls.

gapore, Straits Settlements. South America has one at Rio de Janeiro. At the present time nearly all great universities have at least a small botanic garden in connection with research work in botany.

**Botany**, that branch of the wider science of biology which deals with plants. Since the simplest organisms consist of a single cell, it is not an easy mat-

**History.**—It was not until the first half of the 16th century that there was anything like a scientific treatment of botany, which is generally thought to have commenced with Brunfels of Strassburg (1488-1534), who described 340 species. Lobel, a Dutchman (c.1538-1616), physician to James I., raised the number to 2,191, which was trebled by Caspar Bauhin in the early part of the 17th

century (1623). Among British botanists of the pre-Linnaean period must be mentioned Turner (d.1568); Morison (1620-83), regius professor of botany at Oxford; and John Ray (1628-1705), who introduced the word 'species' in

where no scientific work had been done.

*Classification.*—Early systems were on broad lines, taking little note of minute differences. Thus for a long period 'herbs, shrubs, trees' were the only classes recog-

Linnaeus. It had two main divisions—herbs and trees. Under herbs were three subdivisions—(1) with simple flowers; (2) with compound flowers; and (3) destitute of flowers, including grasses, ferns, and mosses. The trees were divided into four groups, based on the characters of the petals. The characters and arrangement of the reproductive organs (stamens and pistils) were the basis of the Linnaean system (1735). It consisted of twenty-four classes, of which the last contained the mosses, ferns, lichens, seaweeds, and fungi, while the rest comprised the flowering plants. This was avowedly provisional, and intended to pave the way for a natural system based on relationships of which the sum of the characters was to be the test. Of this only a fragment was issued in 1738. Antoine Laurent de Jussieu (1748-1836) worked on the lines of relationship; but no classification indicating real relationship was possible till it was attempted on the basis of evolution. The following gives the principal points of such a classification, omitting details on which there is much difference of opinion:—

1. Cryptogams. (1.) Thallophytes.—Single or many celled plants, the vegetative portion not being differentiated into leaves and stem. Here are grouped bacteria, diatoms, algae, fungi, and stoneworts. (Lichens are not regarded as distinct plants, but as resulting from the union of a fungus and an alga.) (2.) Bryophytes.—The liverworts spring from a thallus, while the mosses show division into stem and leaf; but none have true roots. (3.) Pteridophytes.—These show relationship to the flowering plants in having root, stem, and leaves, and in the possession of vascular bundles.

2. Phanerogams, the true flowering plants. (1.) Gymnosperms.—The flowers always unisexual, generally naked, though in a few cases there is a small perianth consisting of scale leaves. The cycads and conifers constitute nearly the whole class. (2.) Angiosperms.—The flowers generally hermaphrodite, and provided with a perianth divisible into calyx and corolla. Here belong the grasses, herbaceous plants, and shrubs, and all foliage trees. There are two sub-classes: (a) Monocotyledons—seed with a single cotyledon or root leaf; stem usually simple, as in the palm; (b) Dicotyledons—seed with two root leaves; stem generally well branched.

*Morphology.*—Here we have to do with external form and internal structure. The simplest conceivable plant-form is a single spherical cell, such as may be met with

Botany: Classification of Plants.

1. Thallophytes—an alga or seaweed (*Fucus*). 2. Bryophytes—a liverwort (*Marchantia*). 3. Pteridophytes—part of the fertile shoot of horsetail (*Equisetum*). 4. Gymnosperms—branch of fir (*Pinus*) with male and female cones. 5. Monocotyledons—Rowers of bur reed (*Spartagnum*). 6. Dicotyledons—male and female catkins and fruit of hazel (*Corylus*).

a technical sense, and to whom we probably owe the first clear idea of a natural system. Linnaeus (1707-78) is justly reckoned the father of modern botany. Not only did he systematize it; he enlarged its province by sending many of his best pupils to explore and collect in regions

nized. Then followed an alphabetical arrangement. Cæsalpinus, physician to Pope Clement VIII., in 1583, published a system based chiefly on the fruit; but Tournefort (1656-1708), professor of botany at the Jardin des Plantes, Paris, drew up a scheme which held its ground till the days of

in some of the fresh-water algæ, though an aggregation of such cells is more common. The next step in development is shown by the attachment of plants by a base, and the formation of a growing point, or apex, at the opposite extremity. This may be seen in sea-lettuce. In the bladderwrack, an equally common seaweed, the branching of the original apex gives rise to a number of growing points. In the mosses, with stem and leaves, there is a foreshadowing of roots in the rhizoids by which these plants attach themselves to the surfaces on which they grow. In the next higher group, the ferns and their allies, true roots are present, so that they resemble the phanerogams in this respect. A typical phanerogam consists of a root, or descending axis; a stem, or ascending axis, which may be simple or branched; and the leaves—all subserving the purpose of nutrition. Leaves vary greatly in size and shape, and all the appendages of the stem or branches may be traced to modifications of the foliage or surface leaf, which normally consists of an expanded portion called the blade, connected with the stem by a petiole or leaf-stalk, which may be protected at the base by a sheath, or by leaf-like appendages called stipules at each side. The typical flower of the angiosperms consists of four whorls of metamorphosed leaves, arranged thus from the outside: calyx, formed of sepals; corolla, formed of petals; the andrœcium, or male system, consisting of anthers containing pollen; the gynecium, or female system, the important part of which is the ovary, containing the ovules, surmounted by a style, expanded at its apex into a stigma. The first two whorls are protective of the others, which are the reproductive organs. If both systems are present, the flower is bisexual; if either is absent, it is unisexual, and the sex is determined by the system present. If male and female flowers grow on the same plant, it is said to be monœcious; plants bearing only male or female flowers are diœcious. Of the former, the box is an example; of the latter, the common nettle. Internal morphology (often called histology or vegetable anatomy) shows how this structure is built up. In all organisms the ultimate unit is the cell. Hooke was the first to detect plant cells, and figured dead cork cells in his *Micrographia* (new ed. 1667). Their importance, however, was not recognized till Schleiden's work in 1838 showed that plants were built up of cells and modifications of cells. In its simplest form a plant cell is more or less globular. When aggregated,

plant cells may be of various forms and sizes, and, in addition to the protoplasm, contain a nucleus; there may also be chlorophyll, or green coloring mat-

rows of superposed cells, the walls of the adjacent cells in each row having been absorbed, thus forming tubes. Aggregations of vascular tissue (vascular or

*Botany: External Morphology.*

1. External morphology of tulip, showing roots, modified stem or bulb, leaves, and flower. 2. Section of tulip flower; s, one of outer leaves or sepals; p, one of inner leaves or petals; a, anther of stamen. 3. Stamens and gynecium of tulip; o, ovary; st, stigma—the style is here absent—s, stamens. 4. Catkin of willow, a diœcious plant. 5. Individual florets of willow; m, male flower, with two stamens; f, female flower, with ovary crowned with cleft stigma. In these flowers sepals and petals are absent.

ter (sometimes masked by other pigments, as in red and brown seaweeds), starch grains, aleurone grains, and crystalline bodies. Aggregations of cells constitute cellular tissue, well seen in the leaves and stem of mosses. Vascular tissue, of which there are many modifications, is formed of

fibro-vascular bundles) are always found in the phanerogams, though they may be first clearly made out in the ferns and their allies, and there seems to be a foreshadowing of them in the mosses.

*Physiology* is concerned with plants as living organisms—*i.e.* with the functions of the organs

of nutrition and reproduction. In the simplest form—such as slime fungi (by some claimed as animals)—food may be taken in at any part of the body, while reproduction is effected by means of single-celled bodies called spores. This method is peculiar to the cryptogams, in some of which, however, there is alternation of generations, well seen in the ferns, where the spore gives rise to a leafy growth, on which are developed male and female systems, and from the union of the products of these systems new fern plants arise. The food of plants (with some few exceptions) is liquid and gaseous. The former is water combined with various earthy salts, and is absorbed by the roots; the latter consists of carbon dioxide, absorbed from the atmosphere by the leaves, in which it is broken up under the influence of sunlight, the carbon being retained to nourish the plant, while the oxygen is given back to the air. The crude sap (the water impregnated with salts) taken up by the roots passes through the stem to the leaves, where starch is formed and free oxygen given off. During the darkness the starch is dissolved in the cell sap, and passes downwards through the tissues of the stem. By the leaves excess of carbon is got rid of through the absorption of oxygen and the giving off of carbon dioxide in the process of respiration, and by their stomata or pores excess of moisture is exhaled in the process of transpiration. The reproduction of the higher plants is sexual. In the stamen the essential part is the anther, or little bag at the top, containing the pollen grains or male cells, while the ovules in the ovary enclose the female cells in the embryo sac. When in the process of fertilization the pollen is shed on the stigma, the grains send out tubes which carry the male cells down to the egg cells. By this process, and the consequent changes, the ovule becomes a seed, and the persistent parts of the flower a fruit.

*Geographical Distribution.*—With the general adoption of the theory of evolution, and the disappearance of that of special creation, the distribution of plants on the earth's surface had to be accounted for. This led to the mapping out of the globe into regions and sub-regions, characterized by a distinctive flora. About forty years ago George Bentham distinguished three distinct floral regions:—1. Northern, characterized by conifers and the catkin-bearing Amentaceæ, and its vast assemblage of herbaceous plants, and having three subdivisions—Arctic-Alpine, Intermediate or Temperate,

and Mediterraneo-Caucasian. 2. Southern, broken up, so that the connection is only traceable by the possession by two or more of them of the large characteristic groups, such as the Restiaceæ, Proteaceæ, Diosmeæ, etc. The divisions are the Antarctic-Alpine, Australian, Andine, Mexico-Californian, and South African. 3. Tropical, characterized by the Anonaceæ, Restiaceæ, Proteaceæ, palms, and giant grasses, with three divisions—Indo-Malayan, American, and African. These nearly correspond to the later divisions—Boreal, Tropical, and Austral—of Oscar Drude, though he had a greater number of subdivisions or 'floral domains,' and separated the aquatic from the land flora.

*Fossil Plants.*—It was not till the beginning of the 19th century that anything of importance was done in the study of fossil plants and the first book published in Britain on the subject was Lindley and Hutton's *Fossil Flora of Great Britain* (1831-7). This study has confirmed the theory of evolution; for with plants, as with animals, there is an upward tendency from the lower and older to the higher and more recent rocks. In the Primary or Palæozoic rocks seaweeds occur as low as the Silurian; and in the Upper Silurian, ferns, horse-tails, and lycopods, which attained their maximum in Carboniferous times, marked also by conifers and cycads. Palms and dicotyledons appear in early Tertiary times.

See A. Kerner, *The Nat. Hist. of Plants* (Eng. trans. by F. W. Oliver; new edition, 1902); A. Gray, *Botanical Text-book* (1880); L. H. Bailey, *Lessons with Plants* (1898); Coulter, *Manual of the Botany... of the Rocky Mt. Region* (1886); N. L. Britton and A. Brown, *Ill. Flora of the Northern United States* (1896-98); A. W. Chapman, *Flora of the Southern United States* (1897).

**Botany Bay**, a suburb (5 m. s.) of Sydney, New South Wales, a picnic resort, with a magnificent beach (Lady Robinson's Beach) on the w. side of Botany Bay, a nearly land-locked inlet of the sea about 5 m. long. On the s. side of the bay is a monument commemorating the landing of Captain Cook on April 28, 1770. The place is popularly associated with the transportation of criminals, the British government having sent Commodore Phillip to found a penal settlement there in 1787. He, however, selected a more suitable site a little farther north. Pop., including Botany North (1901), 7,167.

**Bot-fly**, or HORSE BOT-FLY (*Gastrophilus equi*), an insect which lays its eggs on the hair

of horses, especially the hair of the legs and breast. The animal, apparently owing to irritation set up at the spot, licks the eggs or larvæ off, and the latter thus ultimately reach the stomach. Here they attach themselves to the mucous membrane, and feed on the gastric secretions. When mature, the larvæ quit the body of the host with the fæces; and after pupation the winged adults emerge, to begin the cycle anew. The warble-flies (*Hypoderma*) of oxen and the nostril-flies (*Estrus*) of sheep are related forms, to which the name of bot-fly is sometimes extended. The bot of sheep is related but differs in habits. See SHEEP-BOT.

Horse Bot-fly and Mature Larva.

**Both**, JAN (1610-52), Dutch painter, one of the first of his countrymen to become Italianized. He went to Rome with his brother Andreas (1609-50), who painted figures and animals into his landscapes. His subjects are in the style of Claude Lorraine, wrought in warm color, with beautiful sunlight effects. Chief works: *Landscape with Muleteers*, and five others (National Gallery, London); *Artist Studying from Nature* (Amsterdam, Van der Hoop collection); *Baptism of the Eunuch* (Duckingham Palace, London); and landscapes in Dulwich, S. Kensington, and Wallace collections, London. See H. Havard's *Dutch School of Painting* (trans. by G. Powell, 1885, and Radcliffe's *Schools and Masters of Painting* (1898).

**Botha**, LOUIS (1863), commandant-general of the Boer forces in the South African War (1899-1902), and Prime Minister (the first) of the Transvaal Colony, since March, 1907, was born at Greytown hamlet, colony of Natal. As a member of the Volksraad for Vryheid, he, together with De la Rey, took a liberal and temperate view in politics. When war was declared, Assistant Field-cornet Louis Botha fought as Lukas Meyer's subordinate at Dundee (October, 1899); but when his old friend retired, ill, to Pretoria, Botha was given the command of the Utrecht, Vryheid, and Wakkerstroom commandoes. On December 6, 1899, Botha was appointed commander of the Tugela positions, against General Buller, and on March 27, 1900, on the death of General Joubert, he succeeded him as commandant-general. Botha's history from the time he assumed

command on the Tugela is, in fact, the history of the war from Colenso (Dec. 15, 1899) down to the signing of the terms of surrender at Vereeniging (May 31, 1902).

**Bothnia.** See SWEDEN. For GULF OF, see BALTIC SEA.

**Bothriocephalus**, a genus of tapeworms, of which *B. latus*, the broad or Russian tapeworm, occurs frequently in man. The first stage occurs in fish, especially the pike and turbot. In consequence, the parasite is particularly common in countries where much fish is eaten in an uncooked or imperfectly-cooked state. The adult tapeworm has two suckers, but no hooks, and may reach a length of eleven yards; the eggs hatch into free-swimming ciliated embryos—a very remarkable fact among tapeworms.

**Bothwell**, tn. and par. (13,595 ac.), N. Lanarkshire, Scotland, on r. bk. of river Clyde, 8 m. S.E. of Glasgow; sandstone quarries, coal mines, and iron mines. Part of the town is a residential quarter for Glasgow merchants. About a mile S.E. is Bothwell Brig, in the haughs at which (June 22, 1679) the Covenanters were routed by the Duke of Monmouth. (See Scott's *Old Mortality*.) Joanna Baillie, the poetess, was born here in 1762. Pop. (1911) of par. 54,891; of tn. 3,015.

**Bothwell**, JAMES HEPBURN, FOURTH EARL OF (?1536-78), husband of Mary Queen of Scots. He led certain Border attacks on the English, and in October, 1559, intercepted £3,000 sent to Elizabeth for the use of the Lords of the Congregation. In 1560 the queen-dowager entrusted him with a special mission to France. After her death he was, in January, 1564, sent a prisoner to England, whence he was permitted to go to the Continent. Recalled by the queen in 1565 to assist her in subduing Moray's rebellion, he, after the murder of Rizzio in March, 1566, gradually acquired a supreme influence in her counsels; and there can be no doubt that his determination to secure her hand was the chief cause (though there were others) of Darnley's murder. At the same time, both he and the queen were the dupes of cooler and cleverer intriguers, and his marriage rendered the ruin of both inevitable. At Carberry Hill (June 15, 1567) the queen, to save Bothwell's life, made arrangements by which he should be permitted to escape. After lurking for some time in the north of Scotland, he made an attempt to establish himself in the Orkneys as a kind of pirate; but on being pursued by Kirkcaldy of Grange, he escaped to Denmark, arriving at Copenhagen on September 30, 1567. At first he met with a favorable reception, but

was never at liberty. In June, 1573, he was removed from the castle of Malmö to close imprisonment at Drangholm, in Zealand, where he died (April 14, 1578).

**Botocudos**, a primitive Brazilian people who are at present confined to the Aymores coast range between the Rio Doce and Ilheos, but who formerly occupied a great part of the eastern seaboard, and spread inland as far as the Tocantins basin. Owing to their savage customs, cannibalism, and intractable disposition, they were treated as wild beasts by the early European settlers, and their numbers were thus reduced from perhaps 60,000 or 70,000 to less than 15,000 in 1900. They call themselves *Nac-nanuk*, sons of the soil, and undoubtedly represent the aboriginal element in E. Brazil, being distinguished by round, flat features, rather oblique eyes, small nose, and a general Mongolic expression, heightened by a dirty yellowish complexion. See Deniker's *Races of Man* (1901).

**Botone**, or BOTONNY, in heraldry, said of a cross the ends of whose arms are shaped like trefoils or buds.

**Botoshani**, tn., Roumania, on Roman-Czernowitz Ry., divided into an inner, badly-built town, and handsome suburbs full of boyar palaces. Pop. (1899) 32,193, sixty-three per cent. of whom are Jews.

**Bo-Tree**, also called PIPAL or PEEPUL, the *Ficus religiosa*, or

Leaves and Fruit of Bo-Tree.

sacred fig-tree of India, held in veneration by the sect of Vishnu (who is said to have been born under its leaves), and also by the

Buddhists. It is a tree of considerable size, with sap abounding in caoutchouc, while it also yields lac, the lac insect making its abode in the branches.

A sacred bo-tree exists at Anuradhapura, in Ceylon, said to have been planted in B.C. 245, as a sprig of the tree at Gaya. Under this latter, Prince Siddhartha sat when he became a Buddha. Its history, in detail, has been faithfully kept in the native chronicles for centuries, so that it is perhaps the oldest tree in existence of which an authenticated history can be given.

**Botrychium.** See MOONWORT FERN.

**Botta**, CARLO GIUSEPPE GUGLIELMO (1766-1837), Italian historian, born in Piedmont; favored the French revolutionary party, and, after suffering imprisonment for his views (1792-4), entered the French service as military surgeon. He became a member of the French legislative body (1804), and was appointed rector of the academies of Nancy and Rouen (1817-22). In 1809 Botta published at Paris his *Storia della Guerra dell'Indipendenza d'America*, thought by some to be the best history of the Revolutionary War that has been written outside the United States. More important is the *Storia d'Italia dal 1789 al 1814* (Pa is, 1824; Eng. version, Lond., 1826), which narrates events of which the author had largely been an eyewitness. He shows himself a partisan throughout; but the work is written with an enthusiasm and in a style which secured it a great popular success, and the prize of the Accademia della Crusca. A third essay, the *Storia d'Italia continuata da quella del Guicciardini dal 1534 al 1789* (1832), is a comparative failure. See *Lives* by Dionisotti (1875) and S. Botta (1877); also Pavesio, *C. B. e le sue Opere Storiche* (1874).

**Botta**, PAUL EMILE (1802-70), archæologist, son of the preceding, born at Turin. He became successively French consul at Alexandria, Mosul, Jerusalem, and Tripoli. In 1843 he began a series of archæological investigations among the Babylonian ruins, and conveyed to Paris a large number of fragments of monuments, which now form an Assyrian museum. His chief works are *Mémoires de l'Écriture Cunéiforme Assyrienne* (1848), *Monument de Ninive* (1847-50), and *Lettres sur ses Découvertes à Khorsabad* (1845).

**Botta**, VINCENZO (1818-94), Italian-American educator, was born at Cavaller Maggiore, Piedmont, Italy, and was educated at the University of Turin, in which he became professor of philosophy. He prepared reports on the German educational system for the

Sardinian government, and came to the U. S. for the purpose of studying its public-school system in 1853. He soon made up his mind to remain, was naturalized, and was appointed professor of the Italian language and literature at the University of New York, a position which he held until a few years before his death. He married (1855) Anne Charlotte Lynch, the poet, and their literary receptions were frequented by people of note in letters and art for more than thirty years. Professor Botta published works on Dante and Cavour.

**Bottesini, GIOVANNI** (1823-89), famous player on the double-bass, was born at Crema in Lombardy, and died at Parma. After studying at Milan, he made tours over Europe and America, often visited Great Britain (first in 1849), and everywhere created an immense sensation. He lived in Havana, Cuba, from 1846 to 1849, and during that time visited the U. S. on several occasions, appearing at one of these visits with the violinist Arditì and meeting with great success throughout his tour. He was also a director—e. g. at Paris (1855-7), Palermo (1861-2), Barcelona, London (1871), Cairo. In 1887 his oratorio, *The Garden of Olivet*, was produced at the Norwich musical festival. He also composed operas, and wrote a work on his instrument.

**Botticelli, ALESSANDRO** ('SANDRO') DI MARIANO FILIPEPPI (1447-1510), Florentine painter, took his name from the goldsmith to whom he was apprenticed. For painting he was placed under the best master of the day, Fra Lippo Lippi, and later studied with Pollaiuolo and Leonardo. Botticelli was a man of marked originality and poetical imagination, and by nature a mystic and symbolist. His work is marked by brilliance of color, admirable lineal decoration, and exquisite delicacy in the execution of flowers, foliage, stone-work, jewels, etc. There is charm in his figures—in the melancholy of the face, in the floating, curving draperies. The known details of his life are few. His finest work was done under the patronage of the Medici. He owed the inspiration of his mythological and classical subjects to the poet Poliziano, and to Leon Battista. In 1478, upon the murder of Giuliano de' Medici, he painted the portraits of the murderers on the walls of the Bargello; and in 1480 he commemorated Lorenzo's victory over the Pazzi faction by painting the fine *Pallas and the Centaur* now in the Pitti Palace. In the *Adoration of the Magi* (Florence Academy) all the members of the Medici family are represented as participating in the scene. In 1481 he was called

to Rome, and there painted in the Sistine Chapel three frescoes, containing admirable groups of energetic, vital figures. His chief paintings comprise *Venus Rising from the Sea* (Uffizi, Florence); *Spring, or Venus and the Graces* (Florence Academy); the exquisite circular panel of *Madonna and Child* (Uffizi); *Annunciation* (Uffizi); *Venus and Mars* (National Gallery, London); *Calumny* (Uffizi). In 1500 he painted the symbolical *Nativity* (National Gallery, London). In his later years he devoted himself to engraving. Among these engravings are the designs (Beilin) of the *Inferno* for Landino's edition of Dante (1481). There are about 250 engravings, dating to the end of the 15th century; the subjects are religious and mythological. Of these, Botticelli is usually credited with the design, and Baccio Bandini with the execution. See Supino, *Sandro Botticelli* (1900); Plunkett, *Sandro Botticelli* (1900); Steinman, *Botticelli* (Eng. trans. 1901); Berenson, *Florentine Painters of the Renaissance* (1898); Cole, *Italian Masters* (1892); Cartwright, *The Painters of Florence* (1901); and Crowe and Cavalcaselle, *History of Painting in Italy* (1864).

**Bötticher, KARL HEINRICH VON** (1833-1907). German statesman; was born in Stettin; entered the Prussian civil service in 1855; became governor of Schleswig in 1876 and president of the province of Schleswig-Holstein in 1879. He was appointed imperial secretary of state for the interior in 1880 and also vice-president of the Prussian ministry in 1888; resigned in 1897; was president of Saxony in 1897-1906.

**Böttiger, CARL VILHELM** (1807-78), Swedish author; professor of aesthetics (1856) and modern literature (1858) at the University of Upsala; early published several volumes of poetry remarkable for great beauty of style, and a mild elegiac tenderness not without a touch of morbid sentimentality—e. g. *Nyare sanger* (1833) and *Lyriska Stycken* (1837-9).

**Bottini, ENRICO** (1837-1903), Italian surgeon, was born at Stradella, prov. Pavia. In 1865 he became lecturer in obstetrics and surgery at Novara. In 1866 he anticipated Lord Lister by publishing a work on the use of carbolic acid in surgical operations; and he was one of the first to recognize the part played by parasitic organisms in the etiology of morbid conditions. In 1877 he was appointed professor of surgery at Pavia, a chair occupied by Scarpa and Porta. Here he distinguished himself by remarkable advances in operative surgery. In 1887, on the death of Depretis, he resigned his chair on his election as member of

Parliament for Stradella, which he afterward represented in the Chamber of Deputies. He returned for a time to his professorship, but died in retirement at San Remo.

**Bottle**, a vessel with a narrow mouth for holding liquids. The first bottles were probably made of the skins of animals, principally goats. Not only are skin bottles represented on the monuments of Egypt, but Herodotus describes how those Egyptian bottles were made—by sewing up the skin and making one of the legs to serve as a neck. Repeated reference is made in Scripture to the skin bottles of the ancient Hebrews, and vessels of this nature were also used by the Greeks and Romans. Skin bottles are still employed in S. Europe, W. and Central Asia, and Africa for holding wine or water. But the ancient Egyptians had bottles and vases of various other materials, such as stone, alabaster, porcelain, ivory, gold, silver, bronze, and glass, some of them of beautiful design. The Phœnicians and Romans also made bottles of glass. Earthenware bottles were possessed by the Egyptians and Hebrews, and are still used in the East. Venice held the monopoly of the manufacture of glass bottles during the middle ages. In China, beautiful bottles of various forms and substances, such as jade, agate, and rock-crystal, have long been known.

Bottles made of the dried rind of gourds are used by the Italian peasantry. In the middle ages leather bottles were in common use in Europe, and the sign 'The Leather Bottle' is still used for inns. Modern bottles are mostly made of glass, though earthenware or stoneware bottles for special purposes are extensively manufactured. Some years ago the manufacture of unbreakable paper bottles was attempted. A long slip of paper is made into a tube by being wound round a revolving mould; the bottom and neck are afterward added. The outside is glazed, and the inside coated with an acid-resisting medium.

Bottle-making is the simplest branch of glass-working. The operator gathers sufficient molten glass on the end of his blowpipe, partially inflates it by the breath, and drops it into a brass or iron mould, in which it is blown into its permanent form. The jagged mouth is moulded in the working furnace or 'glory-hole,' and the bottle is placed in the 'leer' or annealing tunnel, where it is tempered. The moulds, which are either in two pieces, hinged at the base, or in three pieces, one for the body and two for the neck, are kept at a red heat dur-

BOTTICELLI'S 'VIRGIN AND CHILD, WITH ST. JOHN AND AN ANGEL'  
(NATIONAL GALLERY, LONDON).

ing use. The blowing is now done, especially in the case of wide-mouthed bottles and jars, by machinery.

**Bottle Chart.** See OCEANOGRAPHY.

**Bottle Gourd,** or CALABASH, a plant of the genus *Lagenaria* and order Cucurbitaceæ. The common

*Bottle Gourd, and Section.*

bottle gourd is a native of India, and is cultivated in other warm climates. It is a creeping plant with white flowers, and its bottle-shaped fruit, with a hard rind, used for holding water, is termed a calabash. This fruit, which may be also club- or urn-shaped, is eaten when immature, or even when fully ripe.

**Bottle-head or Bottle-nose,** a small whale (*Hyperoodon rostratus*), the bottle-nose whale, or blackfish, which reaches a length of about 30 ft., and inhabits the N. Atlantic Ocean. It resembles the sperm whale in structure and habits, and has an oil cavity in the top of the head, from the contents of which spermaceti is made; the blubber

*Skull of Bottle-nose Whale.*

\* Centre of Spermaceti Cavity.

also yields a valuable sperm oil. The food consists chiefly of cuttles.

**Bottle-Tree.** An Australian tree (*Sterculia rupestris*), noted for the bottle-like shape of its swollen trunk, the limbs springing from its brim, as it were. The wood is soft, and is said to be tapped by travellers, to obtain water stored in the globular expansion.

**Bottling Machine,** a machine constructed for filling bottles

Many machines have been patented for the purpose, suitable for bottles provided with corks and those with various forms of patent stoppers. Previous to bottling, care must be taken to see that the bottles are thoroughly clean, by leaving them in hot water containing soda, and washing them afterward in cold water, while similar care must be taken with the corks. In the case of fine wines this is a matter of the greatest importance. The bottling machine for ordinary liquor is of a simple character. The commonest consisting of a small trough connected with a barrel the contents of which flow through siphon tubes or by means of air or gas pressure. The aerated-water machine is more complicated as provision is made for the bottle being raised into position and filled, while means have to be taken to prevent the escape of gas, and to close tightly the bottle.

**Bottomry.** In maritime law, a conditional obligation in which the ship or its cargo or both are pledged as security for a loan. When the cargo alone is pledged the obligation is known as a *respondentia*. The condition of a bottomry agreement is that the ship shall reach its destination and the obligation is void if the ship becomes a loss. A bottomry contract must be in writing, and it is usually in the form of a bond, known as a bottomry bond. A captain or master has an implied authority to borrow money on bottomry but only for the purpose of completing the voyage, and if all other means of raising money fail. Bottomry takes priority over a mortgage, or a subsequent purchase without notice, but not over claims for wages, salvage, pilotage, etc. When several bottomry bonds are given by a master or owner for the purpose of saving the 'bottom,' or ship, the later rank for payment before the earlier, the latest ranking first.

**Bottrop,** comm., dist. Münster, prov. Westphalia, Prussia, 9 m. N.E. of Duisburg, with coal mines. Pop. (1900) 24,847.

**Botzaris.** See BOZZARIS.

**Botzen.** See BOZEN.

**Boucher,** FRANÇOIS (1703-70), French painter and decorator of the Louis xv. period. He was the pupil of Le Moine, and was to some extent influenced by Watteau. His imagination was extremely fertile, his hand facile, and his brilliant, daring, superficial work appeals frankly to the eye and to the senses. A hard worker, he lived also a life of pleasure, and gradually the precision of his early work gave way to the perfunctory and displeasing pictures of his decay. His decora-

tions for the boudoir of Mme. de Pompadour, his friend and patroness (some of his most charming work), were bought by the Marquis of Hertford. He painted several portraits of his patroness, one of which is in Edinburgh, another in South Kensington; and also painted pastoral and religious subjects, designed tapestry, and executed scene-paintings. He was professor of painting in Paris (1744), member of the Academy of Painting (1734), and was appointed (1765) painter to the king. After France, the Wallace Collection London, possesses the greatest number of his pictures. See Lady Dilke's *French Painters of the Eighteenth Century* (1899).

**Boucher Crevecoeur de Perthes,** JACQUES (1788-1868), French author and archæologist, who advocated extreme views of the antiquity of man, basing his arguments on the human remains found in the Moulin-Quignon quarry near Abbeville. His chief works are *Da la Création* (1839-41) and *Antiquités Celtiques et Antédiluviennes* (1846-65). See *Life* in French, by Ledieu (1885).

**Bouches-du-Rhone,** dep. of S. France, on the Mediterranean, E. of the Rhone. It contains large tracts of uninhabitable land, such as the Camargue, or alluvial and malarial delta of the Rhone; the Crau, on the l. bk. of the E. branch of the Rhone, considered as an ancient stony delta of the Durance; and the Etang de Berre. The coastline is 80 m. in length. The east is hilly, being traversed by three ranges more or less parallel to the coast. The climate is hot and dry, with occasional strong north winds (*mistral*). The chief product is fruit, as the olive, fig, almond, and mulberry. The only minerals are lignite and bauxite. There is some marble and slate. Industry and commerce are mainly concentrated in Marseilles, the capital. Area, 2,026 sq. m. Pop. (1901) 734,347.

**Boucicault,** DION (Dionysius Bouricault) (1822-1890), Irish dramatist and actor, was born in Dublin, Ireland, and received his education partly at Tottenham, and partly at London University under his guardian, Dr. Dionysius Gardner. His first play, *London Assurance*, was produced at Covent Garden Theatre in 1841, and won him instant recognition. From that time until his first appearance as an actor, 1852, he produced fourteen plays by himself or in collaboration with Benjamin Webster; among them, *The Irish Heiress* and *Old Heads and Young Hearts*. His own first appearance was at the Princess's Theatre in his adaptation

of *The Vampire*, which was followed at the same theatre by clever adaptations of *The Corsican Brothers* and other standard plays. In 1853 he married Miss Agnes Robertson, who acted with him during his first visit to America, 1853-60, where he repeated his English successes. Boucicault made another signal triumph, on his return to England, with *The Colleen Bawn*, a sensational drama—the first of its kind—following in some degree the plot of Gerald Griffin's *The Collegians*. It was succeeded by *The Octoroons* (1861), *Arrah-na-Pogue* (1865), *Led Astray* (1874), and *The Shaughran*, particularly an American favorite (1875). Boucicault visited America twice more, remaining there after 1876, and dying in New York. The plays mentioned form but a small portion of his dramatic works, which were usually adaptations of some book or play already in existence, but illumined and transformed by his native wit into something new and strange. As an actor Boucicault was not exceeded in light touches of humor and pathos by any performer of his time.

**Boudinot**, ELIAS (1740-1821), American statesman and philanthropist, was born in Philadelphia, Pa., studied law under Richard Stockton, and practised in N. J. He was president of the Continental Congress, 1782-4, and was a member of the House of Representatives from N. J., 1789-95. Mr. Boudinot was director of the U. S. mint from 1795 to 1805, when he retired to Burlington, N. J., and devoted himself to philanthropic and religious pursuits, being a founder and first president of the American Bible Society. One of his books, *A Star in the West* (1816), is an effort to identify the North American Indians with the lost tribes of Israel.

**Boufarik**, or BOUFFARIK, tn., Algeria, 23 m. s. of Algier; by rail, now one of the healthiest spots in Algeria. Important market. Pop. (1901) 9,284.

**Boufflers**, STANISLAS, MARQUIS DE (1738-1815), French poet, born at Nancy. He became a marshal (1784), governor of Senegal (1785), and member of the French Academy (1788). At the Revolution he retired to Berlin, returning to Paris in 1800. His *Œuvres Complètes* were published in several editions (e.g. in 4 vols. 1817). They include *Voyage en Suisse* (1770), a good collection of letters; *Aline* (1761), a story; and *Poésies et Pièces Fugitives* (1782). An edition of his *Poésies Diverses* was published by Uzanne in 1886.

**Bougainville**, island of the Solomon group, Pacific Ocean,

discovered by Bougainville in 1768; is separated from Choiseul I. by Bougainville Strait. It is 150 m. long by 30 m. wide; alt. 10,000 ft.

**Bougainville**, LOUIS ANTOINE DE (1729-1811), French admiral, served in Montcalm's campaign in Canada (1756-9), and again in Germany during the Seven Years' War. After a futile attempt to colonize the Falkland Is., he commanded the first French expedition round the world (1766-9), which led to many important geographical discoveries. Bougainville acted as a naval commander in the American Revolutionary War, and took part in several naval battles between the French and British, and in 1780 became a field-marshal. Napoleon made him senator and count. See his *Voyage autour du Monde* (1771-2; new ed. 1889); Pascal's *Essai sur la Vie et les Ouvrages de Bougainville* (1831); and Parkman's *Montcalm and Wolfe* (1884).

**Bougainvillea**, in botany, a genus of the order Nyctaginaceæ, a native of S. America. The flowers are almost hidden by large red or purple membranous bracts, which form magnificent masses of inflorescence. *B. glabra* is grown extensively, as a creeper in greenhouses.

**Bough**, SAMUEL (1822-78), British landscape painter, was entirely self-taught, and spent much of his early life wandering about the country sketching. His occupation as scene painter in Manchester (1845), and later in Glasgow and Edinburgh, influenced strongly his later landscape work. About 1849 he was induced by Macneé to devote himself to landscape, and in 1857 became A.R.S.A., and R.S.A. in 1875. The best of Sam Bough's work is in water-color, and is marked by boldness of execution and command of atmospheric effects. See his works in Edinburgh National and Glasgow Art Galleries; also Mrs. Tytler's *Modern Painters* (1873).

**Bought and Sold Note**. A memorandum of sale of chattels made and delivered to the buyer and seller respectively by the broker by whom the sale was effected. The notes describe the subject matter and terms of sale in identical form, and the parties accepting them without protest are bound by the terms expressed in them. Though employed also in brokerage sales in the United States, bought and sold notes play a much less important rôle here than they do in similar transactions in England.

**Boughton**, GEORGE HENRY (1836-1905), one of the most graceful and refined of modern English painters, was born near Norwich, but was brought by his parents to

the United States, where they settled near Albany. He took up the study of art at an early age, and without a master, but later went abroad to study and settled in London in 1862. He was a constant exhibitor at the Royal Academy, to which he was elected associate in 1879, and member in 1896. In 1871 he was made a member of the National Academy of Design, New York. In 1886 he published, in conjunction with E. A. Abbey, a volume of *Sketching Rambles in Holland*. *Weeding the Pavement* is in the Tate Gallery, London. Boughton's subjects were taken from the Puritan days in New England, the 'Knickerbocker' life of New York, and modern English scenes, and his work is highly esteemed in the U. S. as well as in Great Britain. Among his popular pictures is the *Return of the Mayflower*. His *Edict of William the Testy* is in the Corcoran Art Gallery at Washington. See Muther's *Hist. of Modern Painting* (1895-6), and Sheldon's *Hours with Art and Artists* (1882).

**Bougie** (Fr. 'candle'), a solid cylindrical instrument passed by surgeons into the membranous passages of the body—e.g. the gullet or urethra. Bougies are made in various sizes and materials. The term is also applied to rods of substances which melt at the body temperature, and are introduced into the body passages as a vehicle for various drugs incorporated with them.

**Bougie** (anc. *Saldæ*; Arab. *Bejaia*), fort, sept., Algeria, on bay of the same name, beautifully situated on the slope of Mt. Guraya (2,300 ft.), 120 m. by rail E. of Algiers. In the 5th century it was made by Genseric the capital of the Vandal kingdom in Africa. In 708 it was conquered by the Arabs; and in the 10th century a Berber tribe, the Bejaia, took possession of the town, gave it their name, and raised it to such importance that it was called 'Little Mecca.' It had then a population of 100,000, and was the entrepôt between N. Africa and Europe. In 1152 it became subject to Morocco, and in 1555 to the pashas of Algeria, and under their rule it sank lower and lower, until, when the French, occupied it in 1833, it was merely a ruinous village. The French have transformed it into a strongly fortified place, which is rapidly growing through commerce. Pop. (1872) 7,200; (1901) 14,552.

**Bouguer**, PIERRE (1698-1758), French mathematician, born at Le Croisic in Brittany. With La Condamine, Jussieu, and Godin, he was engaged (1735-42) in measuring a degree of meridian among the Cordilleras of S. America, and put together the

### FAMOUS BOULEVARDS

1. The Brienerstrasse, Munich. 2. The Avenue du Bois de Boulogne (left) and The Avenue de la Grande Armée, Paris

results of his discoveries in *Théorie de la figure de la terre* (1749). Among other things, he investigated the height of the snow-line, the inclination of the orbits of planets, the expansion and contraction of metals, the deviation of the plummet, density of the atmosphere, and refraction. His experiments in measuring the intensity of light are contained in *Traité d'optique* (1760).

**Bouguereau**, bōō-g'rō', ADOLPHE WILLIAM (1825-1905), French painter, was a pupil of Picot, and studied in Rome (1850-5). His first Salon picture was *Egalité* (before the Angel of Death), in 1849, and he afterward contributed regularly to the old Salon. He also painted many portraits, and executed decorative work in the churches of St. Clotilde and St. Augustin in Paris. His pictures are mythological, semi-religious, and fanciful in subject. Chief among them are the celebrated *Vierge consolatrice*, *La jeunesse et l'amour* (1877), *Le triomphe du martyr* (1855), in the Luxembourg, Ghent, Marseilles, Dijon, and Bordeaux museums have examples of his work; but the greater number are in private hands, many in the United States.

**Bouille**, bōō-yā', FRANÇOIS CLAUDE AMOUR, MARQUIS DE (1739-1800), French general, was born in Cluzet, Auvergne, of a noble French family. He entered the army, served in Germany, and in 1761 became governor of Guadeloupe. In 1778 he defended the French Antilles, and captured several islands from the British. As commander-in-chief of the army of the Meuse, the Saar, and the Moselle, he repressed the insurrection of the garrisons of Metz and Nancy (1790), and the following year attempted to rescue Louis XVI. during the flight to Varennes. Having been exiled, he entered the Swedish army, and later served under Condé. Finally in 1794 he settled in England, and died in London. He published, in English, *Memoirs Relating to the French Revolution* (1797).

**Bouilly**, bōō-yē', JEAN NICOLAS (1763-1842), French dramatist and author, was born near Tours. He held various public appointments during the Revolution. The sentimental vein in his works procured him the surname of the *poète lacrymal*. Two of his comic operas have music by Grétry (*Pierre le Grand*) and Cherubini (*Les deux journées*) respectively; others are *L'abbé de l'épée* (1795), *Fanchon* (1803), *Mme. de Sévigné* (1805). He also wrote *Contes à ma fille* (1809) and *Conseils à ma fille* (1811).

**Boulainvilliers**, bōō-lān-vē-yā', HENRI, COUNT DE (1658-1722), French historian, was born in Normandy. He served for some time in the army but later devoted himself to study. His works include *Histoire des Arabes* (2 vols. 1731), and an incomplete *Vie de Mahomet*. His contributions to old French history, published in 1727, 1733, and 1753, are characterized by an immoderate admiration of feudalism and similar institutions.

**Boulanger**, bōō-lān-zhā', GEORGE ERNEST JEAN MARIE (1837-91), French general and agitator, was born in Rennes. He was educated at St. Cyr and saw service in Algeria, Italy, and Cochinchina, and was at Metz with Bazaine in 1870; but escaped capture by the Germans, and shared in the defence of Paris. In 1876 he went to the United States as head of the commission to the Centennial celebration, and again in 1881 headed a French deputation at the celebration of the centenary of the battle of Yorktown. He was appointed brigadier general in 1880, and commanded the army of occupation in Tunis in 1884-5. In January, 1886, he was appointed minister of war in the Freycinet cabinet, when the various manifestations of his strongly democratic spirit soon made him the idol of the populace—'*Le brav' général*.' In May, 1887, however, he was removed from the office of war minister, and shortly afterward placed under arrest for attacking his successor, and in March, 1888, was deprived of his command and placed on the retired list. In July, 1888, he fought a duel with the prime minister, M. Floquet, whom he had insulted. Boulanger, now the idol of the Parisian populace, was returned for the city by a crushing majority, being also favored by the royalists; but on April 2, 1889, he caused considerable excitement by suddenly disappearing from Paris, to escape an impending prosecution for conspiracy by the French government. At the elections in September Boulangism suffered a signal defeat, though Boulanger himself was returned for the Montmartre division of Paris. His election, however, was declared invalid, and his opponent was awarded the seat. On Sept. 30, 1891, he committed suicide in a cemetery near Brussels.

**Boulay de la Meurthe**, bōō-lā' d'lā mūr't', ANTOINE JACQUES CLAUDE JOSEPH, COMTE (1761-1840), French statesman, was born in Chaumouzey in the Vosges. He was minister of state during the Hundred Days and in 1813 Napoleon made him Count, but he was banished from

1815 to 1819. He published *Bourrienne et ses erreurs* (2 vols. 1830), and two works on the English revolutions.

**Boulder**, bōl'der, city, Colorado, county seat of Boulder County, on Boulder Creek, at the eastern base of the Rocky Mountains, and on the Union Pacific and the Colorado and Southern Railroads; 30 miles northwest of Denver. It is the seat of Colorado State University and of the Colorado Chautauqua Institute. The city has a public library and a sanatorium, and on account of the climate and the mineral springs is in high repute as a health resort. Not far from the city is the noted Boulder Cañon. There are valuable mines and oil wells in the vicinity. Pop. (1910) 9,539; (1920) 11,837.

**Boulder Clay**, or TILL, a tough, unstratified clay, full of boulders, formed by glacial action. Great deposits occur in Northern Europe and America which were overrun by the continental ice sheets during the Pleistocene period. The boulders vary in size, and are, in the main, striated and rounded, the scratches being parallel to their longer axis. The outcrops of the various rocks represented often lie great distances from the clay deposit. Layers of sand and irregular patches of gravel may be mixed with the clay; the latter is fine-grained and impermeable to water, and varies in color with the rocks from which it has been derived, but is mostly dark gray, weathering to brown. The boulder clay is, as a rule, unfossiliferous, but contains occasional layers of peat, and other deposits which have been formed during a recession of the ice-sheets and are known as interglacial beds. The surface of the clay is rarely level, usually showing rude, rounded hummocks, which are known as drumlins, often with shallow, marshy pools between them. See GLACIAL PERIOD.

**Boulevard**, bōōl'e-vārd (Fr.; Ger. *bollwerk*, and Eng. 'bulwark'), a word originally denoting the outer fortifications or ramparts of a town. It was later applied to a broad avenue on the site of the demolished fortifications, planted with rows of trees, and now designates broad thoroughfares generally well paved and lined with trees, irrespective of their origin. The boulevards of Paris are its finest streets.

**Boulger**, bōl'jer, DEMETRIUS CHARLES DE KAVANAGH (1853- ), British author and editor. In 1885 he assisted Sir Lepel Griffin in the founding of the *Asiatic Quarterly Review* which he edited for almost five years. He has published several important works on Eastern subjects and on

questions of French and Belgian frontiers. His works include *Life of Yakoub Beg, of Kashgar* (1878); *England and Russia in Central Asia* (1879); *History of China* (3 vols. 1881-4); *Lord William Bentinck* (1891); *Life of Gordon* (1896); *The Congo State* (1898); *India in the 19th Century* (1901); *History of Belgium* (1902); *Belgian Life in Town and Country* (1902); *Life of Sir Halliday Macartney* (1909); *Battle of the Boyne and the Irish Brigade in the Service of France* (1911); *Belgium of the Belgians* (1911); *Holland of the Dutch* (1913); *Reign of Leopold II.* (1924).

**Boulimia**, bōo-lim'i-a, or BULIMIA, an excess of appetite, often arising from an irritated stomach, or in the course of certain nervous disorders. The word is also used to describe the extraordinary but physiologically natural appetite which follows on recovery from wasting disease.

**Bouille**, bool, the name of a famous French family of cabinet makers, whose most distinguished member was ANDRE CHARLES (1642-1732), who enjoyed the patronage of Louis XIV. He made many beautiful articles of furniture for the royal family, numerous specimens of which are preserved in the Louvre, Paris, and in Versailles and Fontainebleau. His name is given to the marquetry which he brought to a high state of perfection. Four sons followed their father's trade and their work is often difficult to distinguish from his own.

**Boulogne-sur-Mer**, bōō-lō'-ny'-sūr-mār', important seaport, France, in the department of Pas-de-Calais, on the English Channel, at the mouth of the Liâne; 157 miles northwest of Paris, and connected with Folkestone by a daily cross-Channel service. It consists of two parts, the Haute-Ville, a square surrounded by ramparts built in the 13th century which occupies the hill-top on the right bank of the river, and the Basse-Ville, lying between the old town and the river. The quarter on the left bank is known as Faubourg Capécure. The beach and the casino are on the right bank. In the Haute-Ville are the Palais de Justice, the beautiful Cathedral of Notre Dame, and the Château, now used as barracks. Basse-Ville contains most of the shops and hotels. The harbor ranks first in France for herring and cod fishing. The imports consist mainly of textiles, coal, and wood; the exports comprise eggs and fowls, dried fish, watches, tools, textiles, leather, and wine. There are steel and iron works, sawmills, dyeworks, soap and pen factories, and cement works. Sainte-Beuve

(1804-69) and Mariette (1821-81) were born here.

Boulogne, the *Gesoriacum* of the Romans, was in the hands of the English from 1544 to 1550. Here in 1802 Napoleon mustered an army for the purpose of invading Britain. Pop. (1921) 55,336.

**Boulogne-sur-Seine**, sãn', a suburb of Paris, France, between the fortifications on the right bank of the Seine, and the Bois de Boulogne, the pleasure ground of the Parisians. It has laundries and chemical works. Pop. (1921) 68,008.

**Boulton**, bōl'tun, MATTHEW (1728-1809), English engineer and inventor, was born in Birmingham. In 1762 he founded the Soho metal-stamping works and seven years later became the partner of James Watt, inventor of the steam-engine, to whom Boulton's financial assistance and practical ingenuity were invaluable. He also designed (1788) machinery adopted by the Mint, and was interested in the reform of coinage; in 1797 he contracted for a new copper issue for Great Britain.

**Boundary**, the legal extent of a parcel of land as laid out and defined in the description thereof or as marked by known and ascertained monuments. In modern conveyances, especially in the United States, the land conveyed is generally described with great fulness and exactness, often with reference to a map or plan or to an official survey. But in many cases the boundaries are in doubt owing to a conflict between the amount of land specified and the survey, or between the courses and distances set forth in the deed and the monuments actually set up to mark off extent of the land, or to the fact that a boundary described is not a line but something having breadth, as a watercourse, a highway, or a hedge. These conflicts are determined in accordance with settled rules of law. In general, monuments govern courses and distances; *i.e.* the location of a tree or stake or other object mentioned in the deed or recognized by the parties thereto as marking the boundary at the point where it stands, determines the boundary at that point whether it coincides with the survey described in the deed or not. When a boundary is described as running from one point to another, it is presumed to be a straight line between them. When property is bounded by a road or a river, the middle line of the road or river is presumed to be the boundary. A hedge or a tree on the boundary line is the joint property of the adjoining owners. Strips of waste land beside a highway are presumed to belong to the adjoining owners. Trees which over-

hang a boundary line belong to the owner of the land on which the trunk stands, but the limbs that overhang may be lopped by the adjoining owner back to the line.

In Scots law, a *bounding charter* is a conveyance in which the boundaries of the land conveyed are set out in any way by which they can be definitely ascertained.

**Bound Bailiff**, a bailiff or sheriff's officer, who is bound by an obligation with sureties to perform the duties of his office properly. It was formerly the duty of such bailiffs to arrest insolvent debtors and convey them to prison, and, as the release of such a prisoner resulted legally in the discharge of the indebtedness for which he had been arrested, only bailiffs who had given proper security could safely be employed in that service. Hence the term bound bailiff, in its corrupted form of 'bum' bailiff, appears frequently in the literature of the 18th century in England in connection with the woes of insolvent debtors.

**Bound Brook**, borough, New Jersey, in Somerset County, on the Raritan River, the Delaware and Raritan Canal, and on the Central of New Jersey, the Baltimore and Ohio, the Lehigh Valley and the Reading Company Railways; 7 miles northwest of New Brunswick. The chief manufactures are engines, automobiles, incubators, lumber, woollen goods, paint, chemicals and roofing. It was the site of Washington's winter quarters for two years during the Revolution. Pop. (1910) 3,970; (1920) 5,906.

**Bounding Charter**. See BOUNDARY.

**Bounty**, a name given to a grant from the public treasury in aid of some industry the development of which is regarded as of peculiar public importance. During the 17th and 18th centuries, owing to the extraordinary importance assigned to exportation, all the chief countries of Europe granted bounties upon the export of certain commodities, especially manufactures. The most important of these bounties was the English bounty of 5s. per quarter upon the export of corn, when the domestic price fell below 48s. This bounty, introduced in 1689, continued in force for about a century. Bounties were frequently granted in aid of shipbuilding, since the development of this industry was essential to naval power. For a like reason, liberal bounties in aid of the deep-sea fisheries were granted, as the fisheries were regarded as a nursery for seamen. Bounties were also commonly granted by European nations to their colonies, to encourage the production of raw materials of which

the mother country stood in need. Thus England granted bounties on shipping supplies, indigo, and several other products of the American colonies upon exportation to England.

During the 19th century the principal industries which received aid through bounties were the beet sugar industry and shipbuilding. In the countries of continental Europe excise taxes upon sugar have always been an important source of revenue. When sugar was exported, these taxes, as a rule, were refunded. Where the tax was levied upon the estimated product of a factory, or upon the estimated sugar content of the raw material, the drawback upon exportation often exceeded the tax actually paid, and thus amounted to a concealed bounty. Thus, from September 1, 1869, to July 31, 1886, Germany levied an excise tax of 17 cents per hundred pounds on all sugar beets produced, and paid a drawback of 2 cents a pound on sugar exported.

In France, Austria, and Russia the sugar industry was largely built up by export bounties, direct or concealed. Since the Brussels Sugar Convention in 1903 no bounties, direct or concealed, have been paid by the important exporting nations. (See BRUSSELS SUGAR CONVENTION. For bounties in aid of shipping, see SHIPPING SUBSIDIES.)

In the United States bounties in aid of industry have found only limited application, owing to the constitutional provision that taxes shall be levied only for public purposes. Grants by States and cities in aid of private enterprises have frequently been made, but in every case which has come directly before the courts they have been declared unconstitutional, on the ground mentioned. With the exception of a bounty upon the export of the products of the cod-fisheries, granted in 1866 and defended as a drawback on the salt duties, no direct money grant in aid of industry was made by Congress until 1890, when, upon the repeal of duties on imported sugar, a bounty was granted to domestic producers, amounting to two cents a pound on all domestic sugars made from maple sap, beet root, sorghum or cane, testing 90 degrees by the polariscope; and one and three-fourths cents on sugars testing from 80 to 90 degrees. Under this act the sugar production of the country rapidly increased, and in 1894 over \$12,000,000 was paid in sugar bounties. After the repeal of the Act in 1894, in the case of the Nules Plant and Manufacturing Company v. John G. Carlisle and Joseph S. Miller, the Court of Appeals of the

District of Columbia held that the bounty provisions of the law of 1890 were unconstitutional.

The name is also applied to a premium, in addition to the customary remuneration, granted to persons upon the performance of important public services, as upon enlistment in the army or navy in time of war. During the Civil War many of the Northern States offered bounties, sometimes amounting to over \$500, to persons who should volunteer to serve in the Union army. The practice gave rise to gross frauds, many men, 'bounty jumpers,' entering the army in order to secure the bounty, and then deserting. Bounties are awarded by the United States to the officers and crews of a war-ship which destroys an enemy's war-vessel. If the enemy's ship is superior in force to the American ship which destroys it, the bounty awarded is \$200 per man; if of inferior force, the bounty is \$100. If the ship is not destroyed in action, but after its capture, the bounty paid is \$50 per man.

**Bounty**, MUTINY OF THE. On Dec. 23, 1787, H.M.S. *Bounty*, with Lieut. William Bligh in command, left Spithead for the South Seas. The ship arrived at Tahiti in October, 1788, and started on her return in April, 1789. Because of alleged tyranny and injustice, Bligh and 18 loyal men were seized and turned adrift in the launch. They ultimately reached Timor, making a voyage of 3,618 miles without the loss of a life by sickness. The mutineers returned with the *Bounty* to Tahiti, and most of them settled there; but a few who feared capture sailed (1790) to Pitcairn Island. Of this party, after eighteen years, but one Englishman, John Adams, survived. He had organized a prosperous and peaceful miniature colony. Of the mutineers who stayed at Tahiti, twelve were captured by the *Pandora*, Captain Valentine Edwards, and three were hanged. The fate of the party which had colonized Pitcairn Island remained unknown till 1808, when the island was visited by an American vessel, the *Topaz*. John Adams, who was never proceeded against, died in 1829. Consult Barrow's *Muliny of the Bounty*.

**Bounty**, QUEEN ANNE'S. See QUEEN ANNE'S BOUNTY.

**Bouquet**, bōō-kā', the characteristic flavor and aroma of a wine, due partly to the presence of volatile organic ethers, such as acetic, propylic, butylic, and amylic, and partly to the ferments (yeasts) used in fermenting the must.

**Bouquet**, HENRY (1719-66), a Swiss soldier in the British service

in America, was born in Rolle, Switzerland. After being in turn in the Sardinian and the Dutch service, in 1754 he entered the British army, as lieutenant colonel, becoming one of the officers of the Royal American Regiment in 1758, and in the same year was second in command, under Gen. John Forbes, of the expedition against Fort Duquesne. During Pontiac's War, as colonel, he led a force of about 500 men against the Indians in Western Pennsylvania, defeated them in the battle of Bushy Run (Aug. 5 and 6, 1763), and occupied Fort Pitt (the former Fort Duquesne), thereby winning the formal thanks of King George III., and the following year led an expedition from Fort Pitt into the Muskingum Valley, the heart of the Indian country, and brought the enemy to terms. Early in 1765 he became a brigadier general, and until his death was in command of the Southern Department of America, his headquarters being at Pensacola.

**Bourbaki**, bōōr-bā'kē, CHARLES DENIS SAUTER (1816-97), French general, was born in Pau. He served in Algeria, and distinguished himself in the Crimea (1854) and in Italy, especially at Solferino (1859). On the outbreak of the Franco-German War he was in command of the Guards, and fought in the battles round Metz (1870). Although captured with that fortress, he was allowed to go, or escaped, to England on a mission to the Empress Eugénie. Then he took command of the Army of the Loire, but was driven into Switzerland by Manteuffel (January, 1871). He retired from the army in 1881.

**Bourbon**, ISLE. See RÉUNION. **Bourbon**, bōōr'bun, CHARLES DUC DU BOURBON (1490-1527), French general known as 'Constable de Bourbon, who assumed the title of the Duc de Bourbon on his marriage in 1505 to Suzanne, daughter and heiress of Pierre, Duke of Beaujeu, the last male representative of the elder line of the Bourbons. His royal blood, great military talents, and his personal bravery, especially at Agnadello and Marignano in 1515, induced Francis I. of France to make him constable of the kingdom, the highest military officer in France, when only in his twenty-sixth year. Becoming embroiled in a lawsuit with the Duchess of Angoulême, mother of Francis I., he formed a conspiracy against the latter, and upon its detection fled to Italy and in 1523 entered the service of Charles v. He distinguished himself at Sesia (1524), and at the battle of Pavia (1525), in which Francis I. was taken prisoner. Being unable

to pay his troops, he attacked Rome with the object of plunder on May 6, 1527, and, being the first to mount the walls, was killed by a random shot, which Benvenuto Cellini asserts was fired by himself; but Cellini was given to boasting. The constable was buried at Gaeta. See Deppeyre, *Les Ducs de Bourbon* (1897), and Robertson's *History of the Reign of Charles V.* (1864-67).

**Bourbon Family**, the name of a dynasty which reigned over France from 1589 to 1792, and from 1815 to 1848. The name was derived from the castle of Bourbon, in the old province of Bourbonnais. The founder of the family was Robert (d. 1317), Count de Clermont, son of King Louis IX. His son Louis (1279-1341) was the first Duke of Bourbon, and fought against the English for Charles de Bel. Pierre (1310-56), the second duke, a son of Louis I., was killed at the battle of Poitiers. His son Louis (1337-1410), third duke, was one of the most powerful vassals of the crown of France, and made large additions to the duchy by his marriage. When Charles V. concluded a peace with England, the duke was appointed guardian to the young Duke of Orleans. He was succeeded by his son Jean I. (1381-1434), who was taken prisoner by the English at the battle of Agincourt, and detained till his death in London. His son, Charles I. (1401-56), defended Orleans against the English. His son, Jean II. (1426-88), distinguished himself in the wars against the English, joined the Duc de Bretagne in the league against Louis XI., and in 1483 became constable of France. The seventh duke was Charles (1437-88), Cardinal de Bourbon, brother of Jean II. He was a diplomatist, and a favorite counsellor of Louis XI. The last and greatest of the eldest branch of the Bourbons was Charles, 'the Constable.' (See above.)

Among the collateral branches of the Bourbon family were those of Vendôme, Condé, Montpensier, Orleans, Conti, and Soissons. Antoine de Bourbon (1518-62), Duc de Vendôme, became king of Navarre by marriage (1548) with Jeanne d'Albret. His son, Henry of Navarre, was the first French king of the house of Bourbon, as Henri IV. His two sons were Louis XIII. and Gaston, Duc d'Orléans; one of his daughters, Elizabeth, married Philip IV. of Spain, and the other, Henrietta, became the queen of Charles I. of England. Louis XIII. left two sons—Louis XIV. and Philip, Duc d'Orléans, who was the ancestor of King Louis Philippe. The eldest son of Louis XIV. died in 1711, leaving three sons, the eldest of whom died in the following year—his eldest son, Louis,

succeeding (as Louis XV.) his great-grandfather, Louis XIV., in 1715. His eldest son also died before his father, and his three sons reigned in succession as Louis XVI., Louis XVIII., and Charles X. Louis XVII., the only surviving son of Louis XVI., died (1795) in prison in the Temple, the second grandson of Louis XV. succeeding as Louis XVIII.; upon whose decease (1824), without issue, the third grandson, Charles, succeeded as Charles X., but was forced to abdicate in consequence of the revolution (July, 1830). Charles X.'s grandson, Henri, Count de Chambord, was styled by the Legitimists Henri V.

The younger branch of the Bourbons is the house of Orleans, whose descent starts from Philip of Orleans, brother of Louis XIV. His son Philip was great-grandfather of Louis Philippe, known to the revolutionists as 'Citoyen Egalité,' and his son Louis Philippe became king of the French in 1830, and was dethroned in 1848. On his death, his sons, the Duc d'Orléans the Duc de Nemours, the Prince de Joinville, the Duc d'Aumale, and the Duc de Montpensier, became the representatives of the house of Bourbon. The first named had two sons, known as the Comte de Paris and the Duc de Chartres. The present head of the house of Orleans, and probably the chief claimant to the throne of France, is Prince Louis Philippe Robert, born 1869. See ORLEANS, HOUSE OF.

Philip, Duke of Anjou, the second of the three sons of the Dauphin (eldest son of Louis XIV.) and brother of Louis, Duke of Burgundy (father of Louis XV.), became (1700) Philip V. of Spain, under the will of Charles II. The reign of the family was cut short by the dethronement of Queen Isabella in 1868; but in 1875 the dynasty was restored in the accession of Alfonso XII., whose son, Alfonso XIII., is now the Spanish sovereign. Philip was also ancestor of the Bourbon dynasties of Naples and Parma, both of which are extinct. The last king of Naples was Francis II., who had to flee (1860) before the troops of Garibaldi; while Parma was incorporated with the kingdom of Italy in 1859. The last of its dukes were Charles III., who was assassinated in 1854, and his son, Robert I. See Achainre, *Histoire Chronologique et Généalogique de la Maison Royale de Bourbon* (1825); Dussieux, *Généalogie de la Maison de Bourbon* (2nd ed. 1872); Bingham, *Marriages of the Bourbons* (1889); Deppeyre, *Les Ducs de Bourbon* (1897); and Coxé, *Memoirs of the Kings of Spain of the House of Bourbon* (1813).

**Bourbonne-les-Bains**, health

resort and dist. tn., dep. Haute-Marne, France, 30 m. s.w. of Chaumont; has hot mineral springs (122°-138° F.) known from Roman times. Pop. (1901) 4,038.

**Bourboüe, La**, health resort, dep. of Puy-de-Dôme, France, on upper reach of the Dordogne (alt. 2,790 ft.), 34 m. s.w. of Clermont, with hot-waterspring (81°-129° F.). Pop. (1901) 1,947.

**Bourchier, ARTHUR** (1864), British actor. In 1899 he joined Mrs. Langtry's company at Wolverhampton, as Jacques in *As You Like It*, and afterward played the same part at the St. James's Theatre, London. He also toured with Miss Fortescue; then played with Sir Charles Wyndham (Charles Courtly in *London Assurance*, and Joseph Surface), with Daly's company (when he appeared in the U. S.), with John Hare in *Money*, and in 1894 took the leading part in *The Derby Winner* at Drury Lane. In the same year he married Miss Violet Vanbrugh, and, with her, took important parts under Mr. Hare's management; and in the autumn of 1895 himself undertook managerial responsibilities at the Royalty, producing *The Child Widow* and *The Queen's Proctor*. Having toured (1896) Great Britain and the U. S., Bourchier opened the Camberwell with *A Marriage of Convenience*, and played in 22a Curzon Street. In 1903 he played in *The Bishop's Move*, *The White-washing of Julia*, and *The Golden Silence*, at the Garrick, in London.

**Bourdaloüe, LOUIS** (1632-1704), French pulpit orator, member of the Society of Jesus (1648), was successively professor of humanity, rhetoric, and philosophic and moral theology at the Jesuit College of Bourges, his native town. From 1659-69 he preached in the provinces. In 1669 he came to Paris, where he obtained a very high reputation. After the revocation of the Edict of Nantes he went (1686) to Languedoc, to convert the Protestants, and on his return became for a time confessor to Madame de Maintenon. His later years were devoted to visiting the sick and the poor. His simple, earnest, and fearless character gave him a great influence over all classes. As a preacher he excelled in the orderly treatment of his theme, in logic, and in acute psychological analysis. His scientific and didactic methods made him the least ornate of orators, but his intense earnestness heightened his eloquence. Though not rising to the sublimity of Bossuet, he was, as Voltaire called him, 'the first model of good preachers in Europe.' *Works*, P. Bretonneau (16 vols. 1707-37), Lefèvre (3 vols. 1833-4); *Life*, by Lauras, in French (1881), and by Castets (1901).

Died  
Sept 14  
1927

**Bourdon de l'Oise**, FRANÇOIS LOUIS (c. 1750-97), a French revolutionist; born near Compiègne. He assisted in storming the Bastille (1792), and in forming plans for the execution of the king and the Girondists. But he joined the enemies of Robespierre on the 9th Thermidor, and was one of the party chiefly responsible for his downfall. Elected to the Council of Five Hundred, he afterward opposed the republicans, and for his royalist tendencies was transported (1797) by the Directory to Cayenne, where he died. See Thiers's *Hist. de la Révolution Française* (new ed. 1882).

**Bourg-en-Bresse**, cap. of dep. Ain, France, 35 m. by rail n.e. of Lyons; an important railway junction; contains the church of Notre Dame de Brou (1511-36), with fine tombs of Philibert, Duke of Savoy, his mother Margaret of Bourbon, and his wife Margaret of Austria. It is known to the English-reading world from Matthew Arnold's poem (cf. Edgar Quinet, *Œuvres Complètes*, vol. vii., ed. 1857-79). The town has monuments to General Joubert, Bichat, and Quinet. Bourg has manufactures of jewellery, copper ware, pottery, clogs, candles, etc.; a considerable trade is done in corn, cattle, horses, and the 'volaille de Bresse.' Pop. (1901) 18,887.

**Bourgeois**. See TYPE.

**Bourgeois**, LÉON VICTOR AUGUSTE (1851), French statesman; born in Paris; became minister of public instruction (Freycinet cabinet) 1890-2. He was minister of justice in 1893, and in 1895 formed a cabinet, in which he was minister of the interior, and later of foreign affairs. In 1898 he was minister of public instruction, and did much for the organization of schools. In 1902 he was elected president of the Chamber of Deputies and in 1905 to the Senate. In March, 1906, he became minister of foreign affairs in the Sarrien cabinet. He was a delegate to The Hague peace congresses of 1899 and 1907. In 1902 he was made a member of the permanent court of arbitration at The Hague. He has written several works on political subjects.

**Bourgeoisie** (literally, the class of 'burgesses' or citizens of towns) is a French expression, generally used contemptuously by the aristocratic, labor, proletariat, socialist, and 'intellectual' classes for what they conceive to be a mean, philistine, and selfish breed of capitalists, shopkeepers, and professional men, whose only ideals are a certain sordid comfort, petty ostentation, and a grotesque respectability.

**Bourges**, tn., formerly cap. of prov. Berry, now of dep. Cher, France, 144 m. by rail s. of Paris,

on a plateau not far from the geometrical centre of France. It is the seat of an archbishop, the headquarters of the 8th Army Corps, and has a large arsenal. Among the objects of historical interest are remains of a Roman wall, the cathedral of St. Etienne (one of the finest churches of France, dating from 1182), the churches of Notre Dame, St. Pierre, and St. Bonnet. The town has flour mills and breweries; manufactures cloth, leather, knives, rope, and bricks; and a considerable trade is carried on in corn, wine, wool, and hemp. Caesar destroyed it (52 B.C.), but Augustus made it the capital of Aquitania. It is notable for the mediæval struggle between the Duke of Berry and the archbishop. Owing to its central position it has often been chosen as a meeting-place of councils, seventeen in all, of which the most important was held in 1438; it asserted the independence of the Gallican Church by an instrument known as the 'Pragmatic Sanction.' Louis XI. (1423) and the preacher Bourdaloue (1632) were born here. Pop. (1901) 46,551.

**Bourget**, LAC DU, the largest lake in France, dep. Savoie, at an altitude of 758 ft. above sea-level, 11 m. long by 2 m. broad, with a depth of 476 ft. It is connected with the Rhone by the Canal de Savières (2½ m. long). On the shore of the lake stands the abbey of Hautecombe (1125; restored 1824), which contains the family tombs of the princes of Savoy. To the e. of the lake is Aix-les-Bains.

**Bourget**, PAUL CHARLES JOSEPH (born at Amiens, 1852), member of the French Academy (1894), and one of the most successful of modern French novelists and critics. He became, in 1873, a contributor to the *Revue des Deux Mondes*, the *Renaissance*, the *Parliament*, and the *Nouvelle Revue*. His first separate publications were in poetry—*La Vie Inquiète* (1875), *Édel* (1888), *Les Aveux* (1882). In 1885 he issued a novel, *Cruelle Enigme*, which at once made his reputation. Since then he has published a great number of novels, and with these has alternated studies in criticism, written in the urbane but not very vigorous style which marks most of the French writers who have formed their prose on that of Renan. Several of these were collected in the volume styled *Essais de Psychologie contemporaine* (1884), in which he gave appreciations of Renan, Baudelaire, Flaubert, and Taine; a second series (Dumas fils, Leconte de Lisle, the Goncourts, Tourguéniev, Amiel) appeared in 1885. Of late years M. Bourget has published some volumes of

travel, of which his *Outre-Mer* (*Voyages en Amérique*), in 1895, is the best known. Probably his best novel is *Le Disciple* (1889), which contains the elements of fine tragedy. Of late, since *Cosmopolis* was published (1892), M. Bourget has seemed to take special pleasure in depicting the mixed society of all nations to be met with in Rome or on the Riviera. Publications (in addition to those already named): *Études et Portraits* (1888), which contains his reminiscences of a visit to England and Ireland; *Sensations d'Italie* (1891); *Psychologie de l'Amour moderne* (1891). Novels, etc.: *Un Crime d'Amour* (1886); *L'Irréparable* (1888); *André Cornélius et Pastels* (1889); *Notre Cœur*, *Un Cœur de Femme*, and *Nouveaux Pastels* (1890); *La Terre Promise* (1892); *Un Scrupule* (1893); *Un Saint* (1894); *Une Idylle Tragique* (1896); *Recommencements* (1897); *Complications Sentimentales*, *La Duchesse Bleue*, *Drames de Famille*, and *Voyageuses* (1898); *Trois Petites Filles et Mensonges* (1899); *Un Homme d'Affaires* (1900); *Le Fantôme* (1901); *Monique* and *L'Étape* (1902); and *Le Divorce* (1904). A collected edition of his works began to appear in 1900.

**Bourguignons**—i.e. BURGUNDIANS—the name of a political party in France, which, during the civil war (1410-35), was opposed to the Armagnacs. They were so called from their chief, John the Fearless, Duke of Burgundy (Bourgogne), and represented the popular party, being supported by the bourgeoisie of the big towns in the north of France. The struggle between these parties was ended by the treaty of Arras (1435), concluded between Charles VII., king of France, and Philip the Good, Duke of Burgundy.

**Bourignon**, ANTOINETTE (1616-80), a French 'visionary,' and founder of a sect called by her name, was born at Lille. To avoid a marriage, she fled from her father's house; and on her father's death (1648) she became head of a hospital in Lille (1653-62). After that she proceeded to Holland and the north-west of Germany. The leading idea of her system was that religion consists in elevated emotions, not in knowledge and practice. The Bourignonists spread from Holland to Germany, France, Switzerland and even to Scotland (early 18th century), and held a position not unlike that of the Swedenborgians in later times. An edition of Bourignon's tracts (19 vols.) was published in Amsterdam (1686), to which is prefixed her *Life*. Three of these were translated into English—*Treatise of Solid Virtue* (1699), *Restoration of the Gospel Spirit* (1707), and

Diad  
Sept. 29,  
1925.

*An Abridgment of the Light of the World* (1786).

**Bourinot**, SIR JOHN GEORGE (1837-1902), British historian, became clerk to the Canadian House of Commons in 1880; he was created K.C.M.G. in 1898. He published *Canada* ('Story of the Nations Series,' 1898); *How Canada is Governed* (1895); *Parliamentary Procedure and Government in Canada* (1884); *Cape Breton and its Memorials of the French Régime* (1892); *Builders of Nova Scotia; Canada Under British Rule* (Cambridge Hist. Series; new ed. 1901); *Constitutional History of Canada* (new ed. 1901).

**Bourke**, RICHARD SOUTHWELL. See MAYO, EARL OF.

**Bourmont**, LOUIS AUGUSTE VICTOR DE GHAISNES, COMTE DE (1773-1846), marshal of France was born in the department of Maine-et-Loire. He became an officer of the French Guards, and in 1791 fought on the side of the royalists. He took a prominent part in the civil war in La Vendée, but on his return to Paris in 1799 incurred Napoleon's suspicion, and was imprisoned. After his escape he became reconciled to Napoleon, and served (1808-15) with distinction in Naples, Russia, and Germany. On Napoleon's flight from Elba he was appointed to a division, but subsequently joined the Bourbons, and in 1823 was appointed commander of the army sent into Spain. On his return to France he was created a peer. In 1829 he became minister of war. He commanded in the invasion of Algeria (1830), for which service he was promoted to the rank of marshal. But he declined to take the oath of allegiance to Louis Philippe (1830), and lived for some time in England.

**Bourne**, EDWARD GAYLORD (1860-1908), Amer. author and educator, was b. of Pilgrim descent, at Strykersville, N. Y., and graduated (1883) at Yale, where he remained as a graduate student until 1888, lecturing on political science during the last two years of his stay. From 1888 to 1895 he was instructor and professor of history at Adelbert College, Cleveland, O., being appointed in the latter year to the chair of history at Yale. Author of *Essays in Historical Criticism* (1901), *Spain in America* (1904), and *Life of John Lothrop Motley* (1905); and associate editor of the *Yale Review*.

**Bourne**, GEORGE (1780-1845), American clergyman, was born at Westbury, Wiltshire, England, and coming to America set up a printing establishment at Harrisburg, Pa., for the education of his parishioners. He was an early abolitionist and wrote and preached against slavery. His

activity in this direction obliged him to remove to Germantown, Pa., and other places. He finally settled in New York, where he edited the *Protestant Vindicator*. Among his books were *The Book and Slavery Irreconcilable* (1815) and *Slavery Illustrated in its Effects upon Women* (1834).

**Bourne**, HUGH (1772-1852), founder of the Primitive Methodists, was a carpenter and builder; became local preacher among the Wesleyan Methodists, and in 1802 built a chapel at Harseahead, near Newcastle-under-Lyme. In 1807, in imitation of the practice in the U. S., he began to hold large camp meetings for the revival of religion; and though the conference the same year passed a resolution condemning such meetings, Bourne continued to hold them, the result being his summary expulsion from the society (1808). Only when convinced that his expulsion was final did Bourne proceed to establish a new denomination. The first general meeting of the new society was held at Tunstall in 1811; the name, 'Primitive Methodists,' was adopted in 1812. See J. Walford's *Memoirs of H. Bourne* (1855); J. Petty's *Primitive Methodist Connection* (1864).

**Bourne**, JONATHAN, JR. (1855), American legislator, was born in New Bedford, Mass.; settled in Portland, Ore., in 1878; admitted to the bar in 1881; abandoned law practice for mining and other operations; elected U. S. Senator (Rep.) for the term 1907-13.

**Bourne**, VINCENT (1695-1747), English poet, became a master at Westminster, where Cowper was one of his pupils, and in 1734 was appointed deputy sergeant-at-arms to the House of Commons. His *Poëmata* appeared in 1734. Translations from his verse appear in Cowper and Lamb. See his *Poëmata*, ed. by Mitford, with Memoir (1840).

**Bournemouth**, wat.-pl., munic. and co. bor. on the s. coast of England, on Poole Bay, with two stations on the London and South Western Ry., 5 m. s.w. of Christchurch, Hampshire. Originally a small fishing village, it was not until the middle of the 19th century that it came into notice as a health resort. It was incorporated in November, 1890. Its position on the coast and in the pine-sheltered valley traversed by the Bourne, its equable climate, its fine stretch of sand, and its magnificent views, especially from W. Cliff, make it an ideal seaside resort. It is beneficial to consumptive patients, and there are numerous hospitals and homes. Pop. (1861) 1,940; (1881) 16,858; (1901) 47,003.

**Bourrienne**, LOUIS ANTOINE FAUVELET DE (1769-1834), French diplomatist, born at Sens, was a

fellow-student of Napoleon at Brienne, and in 1797 became confidential secretary to Napoleon. He was minister plenipotentiary to Hamburg in 1804, but was dismissed in 1810 by Bonaparte, on a charge of peculation; and in 1814 he deserted the cause of his former patron for that of Louis XVIII., by whom, in 1815, after Waterloo, he was appointed minister of state. The loss of his fortune at the time of the revolution of 1830 affected his reason, and he spent the last two years of his life in an asylum at Caen. His *Mémoires* appeared in 1829-31 (new ed. 1899-1900), and caused a sensation for their Napoleonic details. But they are unreliable, and their mistakes were exposed by Boulay de la Meurthe in *Bourrienne et ses Erreurs Volontaires et Involontaires* (1830).

**Bourse**, the European name for a stock exchange or money market, of which the most important are those at Paris, Berlin, and Vienna. The Paris Bourse is a handsome Grecian building with Corinthian pillars, designed by Alex. Théod. Brongniart (1813), and completed by Labarre in 1827. See STOCK EXCHANGE.

**Bousecat**, L.E., tn., dep. Gironde, France, 3 m. n.w. of Bordeaux, of which it is a suburb; has a hydropathic establishment. Pop. (1901) 10,446.

**Boussa**, or BUSSA, or BUSSANG, tn., kingdom of Gando, W. Sudan, on the Niger. Here, in 1806, Mungo Park, the traveller and explorer, was murdered. Pop. 12,000.

**Boussingault**, JEAN BAPTISTE JOSEPH DIEUDONNÉ (1802-87), French chemist, who, after travelling in company with Bolivar the Liberator through Colombia, Peru, and Venezuela, became professor of chemistry at the Sorbonne in Paris (1839). He carried on investigations into the composition of the atmosphere, and studied poisons; but his most important work was in agricultural chemistry. See his *Economie Rurale* (1844; Eng. trans. 1845; newer ed. in 8 vols. 1860-91).

**Boussu**, tn., prov. Hainault, Belgium, 7 m. by rail w. of Mons; has coal mines, copper and iron foundries, engineering and boatbuilding works. Pop. (1900) 10,932.

**Bouterwek**, FRIEDRICH (1765-1828), German philosopher, poet, and critic, was appointed professor of philosophy at Göttingen in 1797. He wrote *Ideen zu einer allgemeinen Aesthetik* (1799), and *Aesthetik* (1806), but is remembered chiefly for his *Geschichte der neuern Poesie u. Beredsamkeit* (1801-19).

**Bouts**, DIERICK (d. 1475), also called STUERBOUDT and THIERRY DE HAARLEM, Dutch painter, was probably Van der Weyden's pupil. He was appointed mu-

nicipal painter at Louvain about 1468. His manner is rather stiff; his personages are imposing, with long heads and fixed expressions. Among his works are *The Judgment of the Emperor Otho* (Brussels), *Martyrdom of St. Erasmus*, and *Last Supper* (St. Pierre, Louvain—the wings of this are in the Berlin and Munich galleries); Vienna and Bruges also have pictures by him. *The Exhumation of Bishop Hubert*, in the National Gallery, London, has been ascribed to him. See F. T. Kugler's *Handbook of Painting: Dutch, German, and Flemish Schools* (new ed. 1879).

**Bouts-rimés** (Fr. 'rhymed ends'), a poetical amusement, very popular in French literary circles in the 17th and 18th centuries, in which the rhymes of a poetical composition are prescribed in their due order, and the contestants are required to compose verses to suit them. Alex. Dumas published a collection of *bouts-rimés* in 1865. See Addison's *Spectator*, No. 60.

**Boutwell**, GEORGE SEWALL (1818–1905), American lawyer and statesman, born at Brookline, Mass. He was admitted to the Mass. bar in 1836, soon entered politics as an Anti-Slavery Democrat, was a member of the lower house of the Mass. Legislature (1842–4 and 1847–50), was governor of Massachusetts (1851–3), and was secretary of the Mass. Board of Education (1855–61). He was one of the organizers of the Republican Party in Mass., was a delegate to the Republican National Convention in 1860, became the first commissioner of internal revenue (1862), was a member of Congress (1863–9), and was one of the seven who conducted the impeachment of President Johnson (1868). During Pres. Grant's first term he was Secretary of the Treasury (1869–73), and subsequently was a member of the U. S. Senate (1873–7). He disapproved of his party's policy with regard to the Philippines after the Spanish-American War, and in 1900 was president of the Anti-Imperialist League. He published *Educational Topics and Institutions* (1858); *Manual of the United States Direct and Revenue Tax* (1863); *Why I am a Republican: History of the Republican Party* (1884); *The Lawyer, the Statesman, and the Soldier* (1887); *The Constitution of the United States at the End of the First Century* (1895), and *Reminiscences of Sixty Years in Public Affairs* (1902).

**Bouvardia** (named after Bouvard, physician of Louis XIII.), a genus of plants of the Rubiaceæ. They are natives of Mexico; possess a tubular, four-lobed corolla with four stamens; and

the fruit consists of a two-celled capsule. They are greenhouse plants, cultivated for their showy, mostly orange or red, flowers.

**Bovidæ** (forms 'like oxen'), a family of mammals which includes all the hollow-horned ruminants, and therefore the most specialized types of the artiodactyle ungulates. The members of the family are commonly known as antelopes, sheep, goats, and oxen, but the different types are not very sharply separated from one another. They show their specialization in the development of horns, in the complex stomach which makes the act of rumination possible, in the nature of the teeth, and in the structure of the limbs. The family is widely distributed, but it is a remarkable fact that no hollow-horned ruminant is indigenous to S. America, though those introduced by Europeans have thriven amazingly, and become half wild. See CATLE.

**Bow**. See ARCHERY.

**Bow**. See VIOLIN.

**Bow**, or STRATFORD-LE-BOW, suburb of London.

**Bowdich**, THOMAS EDWARD (1791–1824), African traveller; born at Bristol, England; conducted a mission to Ashanti (1816), and was the first to open up that part of the interior of Africa. He set out on a second expedition in 1822, but died of fever at Bathurst, on the Gambia. His works include *Mission from Cape Coast Castle to Ashanti* (1819), *Discoveries of the Portuguese in Angola and Mozambique* (1824), and the *Description of the Island of Madeira*, published in 1825 by his wife.

**Bowditch**, HENRY INGERSOLL (1808–92), American physician, son of Nathaniel Bowditch (q.v.), was born at Salem, Mass., and graduated (1828) at Harvard where and in Paris (1833–5) he received his medical education. Dr. Bowditch on his return from abroad established at Boston a private medical school in which instruction was given similar to that afterward given in post graduate schools. He became an authority on pulmonary diseases, and published a series of papers on this subject, being also the first to practise the puncturing of the chest cavity in cases of pleural effusions. He was an ardent abolitionist, and was respected for his honesty, even by his adversaries. During the Civil War Dr. Bowditch promoted the adoption of a proper ambulance service by the government and finally effected his purpose. He was professor of clinical medicine at Harvard, 1859–67, and held state and urban medical offices.

**Bowditch**, NATHANIEL (1773–1838), American astronomer and mathematician, was born at Sa-

lem, Mass., and during a strenuous youth, in which he was a cooper, ship-chandler, clerk, supercargo, and shipmaster, he devoted himself to the study of practical mathematics. He sailed as supercargo of a merchant-ship in several voyages in order to complete his studies in navigation by practical experience. Refusing the offer of a professorship at Harvard, he became actuary (1823) to an insurance company. He published a *New American Practical Navigator* (1802), and a translation of Laplace's *Mécanique Céleste* (1829–38). See *Life* by his son, J. Bowditch (1839).

**Bowdler**, THOMAS (1754–1825), editor of the expurgated Shakespeare, practised as a physician, and devoted himself subsequently to philanthropic work in London, the Isle of Wight (1800–10), and Rhyndings, near Swansea. Bowdler's reputation depends on his '*Family Shakespeare in ten volumes; in which nothing is added to the original text; but those words and expressions are omitted which cannot with propriety be read aloud in a family*,' (1818)—a work whose method has given us the term 'to bowdlerize' (first used in General Peronet Thompson's *Letters of a Representative to his Constituents*, 1836).

**Bowdoin**, JAMES (1727–90), American statesman, was born in Boston, Mass., and graduated (1745) at Harvard, falling heir to his father's large fortune two years later. Bowdoin was a friend of Benjamin Franklin, to whom he communicated some of his own discoveries in physics. He was a member of the Mass. General Court (1753–6), and was a member of the council thereafter until the outbreak of the Revolution, being a constant opponent of the royal governors with voice and pen. He was hampered by ill-health during the war, taking local office only, but was governor of Mass., 178–7, and in that capacity put down Shays's rebellion. Gov. Bowdoin was a founder and the first president of the American Academy of Arts and Sciences, was prominent in other public ways, and Bowdoin College was named in his honor.

**Bowdoin**, JAMES, 2d (1752–1811), American philanthropist, son of the foregoing, was born in Boston, Mass., graduated (1771) at Harvard, and passed several years in study and travel abroad. He served in the Mass. Legislature and was a member of the state constitutional convention in 1789. He was appointed U. S. minister to Spain, 1805, and, being unsuccessful in an effort to adjust matters in dispute with that country, returned in 1808. He presented Bowdoin College,

named in honor of his father, with 6,000 acres of land, and bequeathed to it his extensive collections of books and philosophical appliances made in Europe and the reversion of Naushon Island.

**Bowdoin College**, bō'd'n, an institution of higher learning for men in Brunswick, Me. It was incorporated by the General Court of Massachusetts in 1794 and named in honor of James Bowdoin, a former governor. The earliest patron of the college was James Bowdoin, son of the governor, who bequeathed to it land, money, and his valuable library and art collection. It was opened in 1802. By order of the governing boards the total number of students residing in college is limited to about 500, the Freshman class being limited to about 150. The college confers the degrees of A.B. and B.S. and the honorary degrees of A.M., sc.D., LITT.D., D.D., L.H.D., and LL.D.

The principal buildings are Massachusetts Hall; the dormitories, Maine Hall, Winthrop Hall, William De Witt Hyde Hall, and Appleton Hall; the Chapel; Seth Adams Hall; Memorial Hall; the Observatory; Walker Art Building; Hubbard Hall, which houses the library of 140,000 volumes; the Mary Frances Searles Science Building; the Sargent Gymnasium; Hyde Athletic Building; and the Dudley Coe Memorial Infirmary. For recent statistics see Table under the heading COLLEGE.

**Bowel**. See **INTESTINES**.

**Bowen**, bō'en, FRANCIS (1811-90), American philosophical writer, was born in Charlestown, Mass. He was graduated (1833) from Harvard, where he later became lecturer on philosophy and political economy, and afterward (1854) professor of natural religion, moral philosophy and civil polity, being an advocate of the views held by Locke and Berkeley, as opposed to those of Comte, Kant, Mill, and others. He was editor of the *North American Review* (1843-54); and is the author of *American Political Economy* (1870); *Modern Philosophy* (1877); *Gleanings from a Literary Life* (1880); *A Layman's Study of the English Bible* (1886).

**Bowen**, SIR GEORGE FERGUSON (1821-99), British colonial governor, was born in Ireland. He was chief-secretary to government in Ionian Islands (1854-9), and was successively governor of Queensland (1859-67), New Zealand (1868-72), Victoria (1873-9), Mauritius (1879-82), and Hongkong (1883-7). He was knighted in 1856. His works include *Ithaca in 1850* (1850; 3rd ed. 1854), which he identified

with the Ithaca of the *Odyssey*; *Mount Athos, Thessaly, and Epirus* (1852); *Imperial Federation* (1886), and Murray's *Handbook for Travellers in Greece* (1854; 6th ed. 1896); *Thirty Years of Colonial Government* (1889).

**Bowen**, HENRY CHANDLER (1813-96), American publisher, was born in Woodstock, Conn. At the age of twenty he began work as a clerk in a dry-goods house in New York, and five years later he organized his own dry-goods firm of Bowen & McNamee. In 1848 he and three associates established *The Independent* as an anti-slavery Congregationalist paper, with four Congregational clergymen as editors. On the retirement of these editors, in 1861, the paper was made undenominational, with Henry Ward Beecher as editor. The latter was succeeded by Theodore Tilton, and, in 1871, Bowen himself assumed the editorship. When his firm was boycotted in the South because of his denunciation of the Fugitive Slave Law, Bowen & McNamee issued a card stating that 'our goods, and not our principles, are on the market.'

**Bowenite**, a variety of serpentine found in Smithfield, R. I. It is light green in color, resembling jade, and is noteworthy for its fine texture and hardness.

**Bower**, ARCHIBALD (1686-1766), British ecclesiastical historian, was born near Dundee, Scotland. He was educated at Douay and at Rome, where he joined (1706) the Society of Jesus. He then served (1723-6) on the Court of the Inquisition, but returned to England in 1726 and became a Protestant, though later he rejoined (1745) the Catholic communion. He edited the *Universal History* (1735-44), and wrote a *History of the Popes* (1748-66).

**Bower**, or **BOWMAKER**, WALTER (1385-1449), Scotch historian, 'the continuator of Fordun's *Scotichronicon*,' was born in Haddington. At the age of eighteen he assumed the religious habit, and went to Paris to study civil and canon law. On his return to Scotland in 1418 he was elected abbot of Inchcolm, in the Firth of Forth. On the death of Fordun he completed the *Scotichronicon*, continuing the narrative to the death of James I. (1437). The only complete edition of the text is that of Goodall (1759); there is no complete translation.

**Bowerbank**, JAMES SCOTT (1797-1877), English geologist was born in London. He was one of the founders of the London Clay Club (1836), and of the Palaeontological Society (1847) and made an exhaustive study of fossil and living British sponges.

His publications include *A Monograph of British Spongiadae* (Ray Society, 1864-82), and *Fossil Fruits of the London Clay* (1840). His fine collection was purchased (1864) by the British Museum.

**Bower-bird**, a name applied to several different birds inhabiting the Australian region and belonging to the family Ptilonorhynchidae. They are all small birds, from 8 to 14 inches long, with a stout bill and, in some species, brilliant plumage. They are characterized by a remarkable habit of constructing bowers or runs, which have nothing to do with nesting, but are apparently built only for sport and aesthetic satisfaction. Certain species—e.g. *Scenopæetes dentirostris*—make clearings in the forest, and decorate these with leaves, berries, and flowers. The species of *Prionodura* build bowers or huts between trees, the main hut being decorated with ferns and moss, and surrounded by smaller structures. Most remarkable of all is the 'garden' and hut of *Amblyornis inornata*. The hut is of elaborate structure, with a central cone of moss, and a surrounding gallery built of orchid stems, open in front to the lawn or 'garden,' which is some nine feet in diameter, and consists of a bed of bright green moss, decked with brilliant flowers and berries. It appears probable that it is the males who construct the bowers, apparently as places in which they may display themselves before their mates.

**Bowers**, ELIZABETH CROCKER (1830-95), American actress, was born in Stamford, Conn. She made her first appearance on the stage as Amanthis at the Park Theatre, New York, in 1846. She married her fellow-actor, David P. Bowers, the following year, and on their removal to Philadelphia she acted at the Arch Street Theatre of that city, where she became a favorite. After successful performances in Great Britain, she returned to New York and appeared for a while at the Winter Garden. Among her notable roles were Julia in *The Hunchback*, Lady Macbeth, and Juliet.

**Bowfin**, or **MUD-FISH** (*Amia calva*), a ganoid fish found in still water in the Mississippi Valley and the Great Lakes region and known locally as 'grindle,' 'lawyer,' or 'dogfish.' It is about two to two and a half feet long, dark mottled green in color. It is voracious and extremely tenacious of life, being an excellent game fish, although its flesh is not appetizing.

**Bowie-knife**, bō'ī or bō'ō'ī, the heavy sheath knife of the early Southwestern States, called after Colonel James Bowie of Texas

(1790–1836), who invented it. The wide, curved blade is about a foot long.

**Bow-legs**, or *GENU-VARUM*, a bending of the femur or tibia or both, with convexity outwards. It may occur in one leg only, following an accident or operation; but it is usually found in both legs, and the trouble starts when the child begins to walk. The usual cause is rickets, which renders the skeletal structure of the lower limbs unfit to bear the weight of the body, so that the bones curve both in the thigh and below the knee, which becomes the most prominent point of the convexity. Bow-legs are also induced by certain occupations, as that of postilion or jockey, followed before the bones have attained full growth and hardness. When the deformity is restricted to the part below the knee, the bones have a forward or outward convexity, or a double curve, caused by rickets.

Treatment depends upon the cause of the deformity and the age of the patient. In a rickety case diet and general hygiene are even more important than local treatment, which, however, must not be neglected. Full rest, on the back, is important; and the nurse can assist by systematic straightening and stretching of the limbs, and by daily massage. The bending of the long bones depends on the amount and direction of the pressure to which they are subjected. It does not occur to any extent in infants who are kept lying flat. In more pronounced cases, treated while the bones are still soft, the legs are often bandaged together, or to splints on the inner side of the curvature or with plaster casts. Later, when the disease process has healed and the bone is firmer, osteoclasm, or the breaking of the bone and setting it straight in splints, is performed. In the case of strong, fully-grown bones osteotomy is practised—an operation involving the removal of wedge-shaped portions of bone.

**Bowles**, bölz, CAROLINE. See SOUTHEY.

**Bowles**, FRANCIS TIFFANY (1858– ), American naval architect, was born in Springfield, Mass. He was graduated (1879) from the U. S. Naval Academy at Annapolis, subsequently taking a course in naval architecture at the Royal Naval College, Greenwich, England. He was appointed assistant naval constructor in the U. S. navy, 1881, was promoted naval constructor, 1888, and from 1901 to 1903, was chief constructor of the U. S. navy, with the rank of rear-admiral. He resigned from the navy in 1903 and became president of the Fore

River Shipbuilding Corporation, Quincy, Mass. In 1917–19 he was assistant general manager of the U. S. Shipping Board Emergency Fleet Corporation.

**Bowles**, SAMUEL (1826–78), American journalist, was born in Springfield, Mass. He received a high school and private education and at the age of seventeen began work as office-boy on his father's paper, the *Republican*, then a weekly. At his suggestion the *Republican* was made a daily the following year (1844), and at first he was concerned chiefly with its management, but became increasingly associated with the editorial department, with which Dr. J. G. Holland was also connected. On the death of his father in 1851, Bowles became sole manager of the paper, which had by that time achieved an enviable reputation. The *Republican* maintained an aggressive attitude both before and during the Civil War. Bowles supported Greeley in the presidential campaign of 1872, after which the *Republican* became an independent paper. He travelled extensively in the United States and Europe. He published *Across the Continent* (1865) and *The Switzerland of America* (1869).

**Bowles**, WILLIAM LISLE (1762–1850), English poet and antiquary, was born in Northamptonshire. He was educated at Oxford, took orders and after a few years as rector in Chicklade, in 1804 became rector of Bremhill in Wiltshire, where he remained until his death. From 1828 he was canon residentiary of Salisbury Cathedral and after 1818 was chaplain to the prince regent. His first and best work, *Fourteen Sonnets on Picturesque Spots* (1789), met with a warm reception and is said to have been greatly admired by Coleridge and Wordsworth. His subsequent poetical works are numerous, but not of great merit. Among them are *Verses to John Howard* (1789), *The Spirit of Discovery* (1805), *The Missionary of the Andes* (1815), *St. John in Patmos* (1833). In 1807 appeared his edition of Pope, and his strictures on the classical theory of verse gave rise to a long discussion, in which his chief opponents were Lord Byron, Campbell, and the *Quarterly Review*.

**Bowling**, a game developed from that of lawn bowls, first played in London in about the 12th century. The first record of a match game in America was in New York City in 1840, and since that time the game has steadily grown in favor until it is played in almost every city and town in the United States. Until 1875 there was much diversity as to the length of the alleys and the

size of the pins, and at that time a set of rules was made by a number of players in convention, which served their purpose for about twenty years. By 1895 the game had become so widespread that a new set of rules was necessary and the American Bowling Congress was formed which made new laws for the game which have, with some modifications, existed to the present time. The alleys upon which the game is played are perfectly level, of polished wood, and are not less than 41 or more than 42 inches wide, with a gutter on each side, and must be 60 feet from the head pin to the foul line, which the bowler may not pass before dropping the ball. Back of the foul line there must be a clear run of fifteen feet, and at the other end of the alley there must be a pit for the reception of the balls and the pins as they are knocked down. The pin spots, upon which the ten pins are placed at the beginning of the game, must be clearly described or imbedded in the alleys and be placed 12 inches apart from centre to centre, and be  $\frac{3}{4}$  inches in diameter. The pins must be set in pyramidal form, four at the pit end of the alley three inches from the pit edge measuring from the centre of each pit spot, and the head pin must be in the middle of the alley.

The pins must be fifteen inches high,  $2\frac{1}{2}$  inches in diameter at their base, 15 inches in circumference at a point  $4\frac{1}{2}$  inches from their base,  $11\frac{5}{8}$  inches in circumference at a point  $7\frac{1}{4}$  inches from their base,  $5\frac{1}{4}$  inches in circumference at their neck, a point 10 inches from their base, and 8 inches in circumference at their head, a point  $13\frac{1}{2}$  inches from their base. They are made of hard maple, having a minimum weight of 3 pounds, 2 ounces. The ball must not exceed 27 inches in circumference or  $16\frac{1}{2}$  pounds in weight, although it may be as much smaller as the player desires.

The game may be played by any number, each player in turn rolling ten frames, or innings. Each player rolls two balls except when he makes a strike or when a tenth strike or spare is made in the tenth frame. A strike is when the player bowls down all ten pins with his first ball and is designated by an X in the upper right-hand corner of the frame, and the count is left open until the player shall have rolled his next two balls, when all pins made on the three balls are counted in the first frame or inning. Thirty is the highest number which can be made in any frame. A spare is made when a player bowls down all ten pins with two balls and is

mour of the British navy. The allied troops again advanced, and after heavy fighting at Tien-tsin, Fei-tsang, and Yang-tsun, succeeded in relieving the besieged on Aug. 14, 1900. The court fled from the capital, and the allies remained in possession until peace was signed on Sept. 7, 1901, one of the conditions of which was that China should pay \$320,000,000 as indemnity to the foreign powers. The share allotted to the United States was \$24,500,000. By 1908 China had paid about \$9,000,000, and Congress then remitted half of the total indemnity. For this act China sent official thanks and announced that the sum remitted would be used to send Chinese students to the United States.

**Box Fish.** See COFFER FISH.

**Boxhauling**, a mode of turning a ship, when the swell of the sea renders tacking impossible, or when the ship is too near the shore to allow room for veering. The operation is effected by hauling the head sheets to windward, bracing the head yards aback, and squaring the after yards, the helm at the same time being put alee. *Boxing off* is a similar operation.

**Boxing**, or PUGILISM, the art of fighting with the fists, generally with padded gloves. The development of modern boxing dates from the early eighteenth century. The sport was first brought into prominence by James Figg, in London, in 1719, and became popular in 1734-50, when Jack Broughton flourished. To this noted boxer we are indebted for the invention of the boxing glove, or muffer as it was then called, as well as for the first code of rules, from which those at present in force have been developed. After Broughton's death, pugilism declined in favor for a time; but John Jackson, the first 'gentleman' fighter, restored its popularity. Then began the period of highest prosperity for the ring in England, which lasted until the retirement of Tom Spring in 1824. From that time interest in the sport declined in Great Britain, although the contest between Saenans, an Englishman, and Heenan, an American, in 1860, caused a temporary revival of enthusiasm.

Much of the scientific development of boxing has originated in the United States, and there most of its professional champions have lived. Though the prize fight to a finish, or 'knock out,' is now forbidden in nearly all the States, limited-round bouts between professionals, under varying legal restrictions (e.g., that no decision shall be announced), are of frequent occurrence in the larger cities. Amateur boxers form a numer-

ous host, and many of the foremost athletic clubs promote the sport by holding boxing tournaments. Annual championships are conducted under the auspices of the Amateur Athletic Union.

Boxing contests in America are governed by the Marquis of Queensberry Rules, frequently modified in minor points by the principals or their managers. The ring is a roped arena, from 16 to 24 feet square. Eight-ounce gloves are used in amateur and most professional contests.

The six main fighting classes or weights are the Bantam (116 lbs.), Feather (122), Light (133), Welter (145), Middle (158), and Heavy (over 158 lbs.).

Since the days of John L. Sullivan, the United States has boasted an unbroken series of professional heavy-weight champions, though all have not been born in America, and one title holder (Jack Johnson) was a negro.

**Boxing Day**, an English bank holiday falling on the day after Christmas and so called because on that day Christmas boxes were given to employees. The actual origin of the holiday is obscure.

**Boxtel**, boks'el, town, Netherlands, in the province of North Brabant; 7 miles south of 's Hertogenbosch (Bois-le-Duc). It has manufactures of linens, paper, and salt. Here, in 1794, the French defeated the allied Dutch and English. Pop. (1920) 9,677.

**Box-thorn** (*Lycium*), a genus of Solanaceæ, having funnel-shaped or tubular flowers, and two-celled berries. *L. vulgare*, the Matrimony Vine, a Southern European shrub, cultivated in the United States, has small, narrow grayish green leaves, and purplish or violet-colored flowers followed by scarlet or black berries.

**Boyacá**, bō-yā-kā', or BOJACA, department, Colombia, having

BOXING: *Heavy-weight Contests of Recent Years*

1928	July 26	New York	Gene Tunney	Thomas Heeneey	11

**Boxing Rules.**—In boxing competitions the result is usually decided by the *Marquis of Queensberry Rules*, which are principally as follows: A boxing match shall be a fair stand-up contest in a 24-foot ring, or as near that size as practicable. No wrestling or hugging shall be allowed. The rounds shall be of three minutes' duration, with one minute's time after each round. If either man fall, he must get up unassisted, ten seconds to be allowed him to do so. When he is on his legs again the round is to be resumed, and continued until the three minutes have expired. If he fails to come to scratch in the time allowed, the referee may award the match to the other. A man on one knee is considered down, and if struck is entitled to the stakes.

The rules for the London prize ring are used to settle other points, especially fouls, which are blows struck when a man is down, blows below the waist-band, butting with the head, biting, kicking, etc.

Consult *Boxing* (Spalding's Athletic Library); Trotter's *Practical Treatise on Boxing*; Wignall's *The Story of Boxing* (1923).

the republic of Venezuela on its eastern frontier, and traversed by the Eastern Cordilleras of the Andes; area, 16,460 square miles. There are fertile lowlands and extensive prairies; among the mountains, numerous minerals are found, especially emeralds. Cattle raising is the chief industry. Pop. (1918) 311,300.

**Boyacá**, town, Colombia, in the department of Boyacá; 70 miles northeast of Bogotá. It was the scene of the victory of General Bolivar over the Spaniards (Aug. 7, 1819), by which Colombia secured her independence. Pop. 7,000.

**Boyar**, bō-yār', the highest rank, military and civil, next to *knyaz* (prince), in the old Russian aristocracy. Before the organization of the empire under Peter the Great, the boyars, at first a nobility of office, had considerable independence in the separate principalities, and might withhold consent to any ukase of the Czars. Peter the Great finally abolished the order by giving them a place among the Russian nobility, but at the same time stripping them of their peculiar privileges.

**Boy Bishop.** On St. Nicho-

las' Day (Dec. 6) in the mediæval church, it was the custom to allow choir boys of churches to choose one of their number who acted as boy bishop until Holy Innocents' Day (Dec. 28). The custom also prevailed in England in the schools of Eton and Westminster. The boy bishop, attired in suitable vestments and attended by a number of assistants, travelled about, blessing the people, and performing many of the episcopal ceremonies. The practice was abolished in England in the reign of Elizabeth, and on the Continent by the Council of Basel (1431).

**Boycott**, a term originating in 1880 during the struggle between the Irish Land League and the English landlords. The harsh exactions of Captain Boycott, agent of Lord Erne, led the tenantry to organize a movement to hold no dealings with him or his family. The word 'boycott,' coined at that time to describe the action of the tenants, later came to indicate the concerted refusal of organized workers to purchase commodities produced in a shop whose management refused to apply trade-union wage rates and working conditions. This concerted action usually included, also, efforts to persuade others to divert their patronage from the 'unfair' concern—the so-called 'secondary boycott.' In three cases carried to the U. S. Supreme Court it has been decided that the boycott is a combination in restraint of trade, and therefore illegal.

**Danbury Hatters Case.**—In July 1902, the employees of the firm of D. E. Loewe & Co., hatters, of Danbury, Conn., went on strike, with the main object of securing a union shop. The strikers were aided by their national organization, the United Hatters of America, while the company was supported by the American Anti-Boycott Association. The boycott was not only primary but secondary—i.e., the strikers and their friends not only refused to buy the firm's goods, but organized boycotts against all firms selling these goods.

The case was eventually carried to the U. S. Supreme Court, which on Feb. 3, 1908, handed down a decision: (1) that the United Hatters of America was 'a combination in restraint of trade or commerce' under the Sherman Anti-Trust Act; and (2) that individual members of the Danbury hatters' union could be held liable for damage of three times the amount of the actual loss inflicted, costs, and attorney's fees. On Jan. 5, 1915, the same tribunal held that use of the primary and secondary boycott and the circulation of a list of 'unfair dealers' to persuade customers of Loewe to withhold

their patronage was actionable, and affirmed the judgment of the U. S. district court of Oct. 11, 1912, awarding damages which totalled \$252,130 in favor of the plaintiffs.

**Buck's Stove Case.**—In 1906, the union metal polishers employed by the Buck's Stove and Range Company of St. Louis, Mo., went on strike because of the firm's refusal to reinstate certain polishers who had been discharged in a dispute over the length of the working day. The company thereupon announced its refusal to have any dealings with the representatives of organized labor, and its intention of operating an 'open shop,' an action which involved other unions as well. The American Federation of Labor having failed to effect a settlement, the executive council of the Federation declared the Buck's Stove and Range Company an 'unfair concern' (March 1907), and published its name in the 'we don't patronize' list of *The American Federationist*. In addition, a vigorous secondary boycott was initiated. Suit was thereupon brought by the company to enjoin the Federation from continuing the boycott; and on Dec. 18, 1907, Judge Gould, of the Supreme Court of the District of Columbia, issued an injunction against a continuation of the boycott.

In December 1908, Justice Wright, of the Supreme Court of the District of Columbia, adjudged the three labor leaders, Samuel Gompers, John Mitchell, and Frank Morrison, guilty of contempt for violation of the injunction and sentenced them to imprisonment. In 1909, on application of the American Federation of Labor, the sweeping injunction of 1907 was substantially modified by the Court of Appeals of the District of Columbia, but the sentence for contempt was upheld. In May 1911, the U. S. Supreme Court reversed the judgment of the lower court without denying the right to punish the defendants for contempt. New action for contempt having been begun in the Supreme Court of the District of Columbia, the original judgments were reimposed (June 1912); they were subsequently reduced (May 1913) by the District Court of Appeals, and eventually set aside by the U. S. Supreme Court (May 1914), under the Statute of Limitations (see LIMITATIONS, STATUTES OF).

**Duplex Printing Company Case.**—Between 1909 and 1913 the International Association of Machinists induced three of the four printing press manufacturers of the United States to recognize the union. The fourth, the Duplex Printing Press Company, of

Battle Creek, Mich., having refused such recognition, the machinists' union declared a strike at the Battle Creek factory; while District No. 15 of the International Association instructed its members not to work on the installation of presses which the company had delivered in New York, and undertook to persuade other workers not to handle the presses, and customers to divert their patronage to other concerns. The Duplex Company brought suit, under the Sherman Anti-Trust Act, to restrain the officials of the New York Machinists Union from continuing the boycott. The U. S. Circuit Court of Appeals denied the injunction on the ground that the Clayton Act amended the Sherman Act to the extent of legalizing the secondary boycott. This decision was reversed by the U. S. Supreme Court, which in a majority opinion handed down on Jan. 3, 1921, applying its decision in the Danbury Hatters Case, affirmed that the machinists' boycott was a restraint of trade prohibited by the Sherman Act.

In addition to its use in labor disputes the boycott is not infrequently employed in certain forms of mass action, as consumers' boycotts, buyers' strikes, etc. It also includes the practice of social and political ostracism (q. v.), which has been known for centuries.

Certain of the States have statutes in definite terms prohibiting the boycott; while a majority of the others have enacted laws designed to render the practice illegal. See BLACK LIST.

**Boyd, ERNEST AUGUSTUS** (1887— ), American journalist, critic and translator, was born in Dublin, Ireland. He was educated abroad and in 1913 entered the British Consular Service, serving in the United States, Spain and Denmark. In 1920 he resigned from the service, settled in New York City and for two years was on the editorial staff of the *Evening Post*. From 1922 to 1923 he was literary adviser for the Knopf publishing house. His published works include *Contemporary Drama of Ireland* (1917); *Ireland's Literary Renaissance* (1922); *Portraits—Real and Imaginary* (1924); *Studies in Ten Literatures* (1925); *Literary Blasphemies* (1926); besides many translations of Anatole France, Guy de Maupassant and others.

**Boyd, SIR JOHN ALEXANDER** (1837–1916), Canadian jurist, was born in Toronto. He was graduated from Toronto University (1860), and was admitted to the bar (1863). In 1881 he was appointed chancellor of Ontario, and in 1887 president of the high court of justice for Ontario. He acted as arbitrator for the Do-

minion Government (1888) in claims against it by the Canadian Pacific Railway; for Ontario (1893) in settlements of accounts between the Dominion and the provinces; and for the Canadian Pacific Railway (1902) in difficulties with its trackmen. He has served on various royal commissions, and as director of several public institutions. He was made honorary LL.D. in 1889, and knighted in 1901. He has published *A Summary of Canadian History* (1856).

**Boyd, JAMES** (1888- ), American author, was born in Dauphin County, Pa. He was educated at Princeton University and at Trinity College, Cambridge, and served with the American Expeditionary Force in France during the Great War. He holds high rank among the younger generation of American writers, his work showing evidence of careful research. His published works include *Drums* (1925), *Marching On* (1927).

**Boyden, SETH** (1785-1870), American inventor, was born in Foxboro, Mass. He invented a machine for splitting leather (before 1815); introduced the manufacture of patent leather into America (1818); discovered the process of making malleable cast iron (1826); and improved the machinery for making hat bodies. He also constructed locomotives with the driving rod attached to the wheel, the 'link motion' of reversal, the 'cut off,' and double valve gear. He published *Correspondence on the Subject of Atmospheric Electricity* (1868).

**Boyen, bō'yen, HERMAN VON** (1771-1848), Prussian field marshal, was born in Kreuzburg, East Prussia. He entered the government service (1809); was director of the War Department and confidential adviser of the king (1810-12), and later Minister of War. He early advocated the substitution of general military duty for the existing militia system, and the statute making military service compulsory (1814) was carried into effect during his ministry. After a period of retirement he acted as general of infantry (1840-41), and was a second time Minister of War (1841-7), retiring with the rank of field marshal.

**Boyer, bwá-yá', ALEXIS, BARON DE** (1757-1833), French surgeon, was called to the chair of operative medicine in the Ecole de Santé, Paris (1792), and appointed second surgeon in the Hotel Dieu (1794). In 1805 he became premier surgeon to Napoleon whom he accompanied on many of his campaigns. After the Restoration he was appointed consulting surgeon to Louis XVIII., a post which he held under the two succeeding mon-

archs. He published two standard works, *Traité complet d'anatomie* (1797-9); *Traité des maladies chirurgicales* (11 vols., 1814-26).

**Boyer, JEAN PIERRE** (1776-1850), mulatto general and president of the republic of Haiti, was born in Port-au-Prince. He received a good education and joined the military service, taking part in the revolution of 1793, and in the internal wars that followed. He joined Pétion and Christophe in overthrowing Dessalines (q.v.); and on the death of Pétion, in 1818, was elected president, and soon ruled over the whole island. In 1825 he obtained recognition of the republic from France. His cruel, despotic administration eventually stirred up an insurrection, and in 1843 he was forced to flee to Jamaica and later to France, where he died.

**Boyertown**, borough, Pennsylvania, in Berks County, on the Philadelphia and Reading Railroad; 37 miles northwest of Philadelphia. Manufactures include iron goods, machinery, gas ranges, automobiles, cigars, and caskets. Pop. (1910) 2,433; (1920) 3,189.

**Boyesen, boi'e-sen, HJALMAR HJORTH** (1848-95), American author and educator, was born in Fredericsvaern, Norway. He was graduated from the University of Norway and went to the United States in 1868, settling in Chicago, where he edited a Scandinavian paper entitled *Fremad*. He was professor of German at Cornell University from 1874 to 1880, and at Columbia University from 1880 until his death. He was active in the literary life of New York, lectured on literary topics, and was a founder of the Authors' Club. His published works include: *Gunnar, a Norse Romance* (1874); *Falconberg* (1878); *Goethe and Schiller* (1878); *Ilka on the Hill-top* (1881; dramatized in 1884); *Idyls of Norway* (poems, 1882); *A Daughter of the Philistines* (1883); *Social Stragglers* (1884); *Story of Norway* (1886); *The Golden Calf* (1892); *Essays on German Literature* (1892).

**Boyle, town, Ireland**, in County Roscommon, on the River Boyle; 24 miles southeast of Sligo. The town grew up round a Cistercian abbey founded in 1161. It has trade in grain and butter. Pop. 2,700.

**Boyle, EARLS OF ORRERY**. See ORRERY.

**Boyle, RICHARD, EARL OF CORK**. See CORK, EARL OF.

**Boyle, ROBERT** (1627-91), English physicist and chemist, the seventh son of the first Earl of Cork, was born in Lismore Castle, Ireland. He lived successively in Stalbridge in Dorsetshire, Oxford (1654-68), and

London. Devoting himself to chemistry, in 1660, he published, *New Experiments, Physico-Mechanical*—in an appendix to the second edition of which (1662) he enunciated and roughly proved the statement, now known as *Boyle's Law*, that 'the volume of a given mass of gas is inversely proportional to its pressure' (see GASES, LAWS OF). He was closely connected with the Royal Society; was identified with many philanthropic works; and founded the 'Boyle Lectures' (q.v.). His complete works (with his correspondence and a *Life* by Dr. Birch) were published in 1744.

**Boyle Lectures**, a series of lectures instituted by Robert Boyle (q.v.) and delivered annually at St. Mary-le-Bow Church, London, 'to prove the truth of the Christian religion against atheists, deists, pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves.' The first series of lectures were given by Richard Bentley in 1692. The published lectures comprise more than 200 volumes.

**Boyle's Fuming Liq'uor**, a mixture of ammonium polysulphides obtained by distilling a mixture of slaked lime, sal ammoniac, and sulphur.

**Boyle's Law**. See GASES, LAWS OF.

**Boyne, boin**, an important river of Ireland, rises near the village of Carbery, Kildare, on the borders of King's County. It flows through Meath in a northeasterly direction, passing Trim, Navan, and Slane; separates Meath from Louth; and enters the Irish Sea a little below Drogheda, after a course of about 70 miles. It is navigable for vessels of 250 tons to Drogheda, and for barges to Navan.

At the *Battle of the Boyne*, fought on its banks, 3 miles west of Drogheda, on July 12, 1690 (July 1 o. s.), William III. with 40,000 men defeated James II. with an ill-equipped army of 26,000. The Orange Duke of Schomberg (q.v.) was shot dead and James fled from the field to France. The outcome of the battle decided the fate of the Stuart cause and assured the Protestant cause in England.

**Boyne, Battle of the**. See BOYNE.

**Boyne City**, city, Michigan, in Charlevoix County, at the mouth of the Boyne River, and on the Boyne City, Gaylord, and Alpena Railroad; 180 miles by rail north of Grand Rapids. There are foundries, repair shops, and boat building plants. It is also a popular summer resort. Pop. (1910) 5,218; (1920) 4,284.

**Boys' Brigade, THE**, a movement set on foot in 1883 by Sir

W. A. Smith of Glasgow, Scotland, its object being 'the advancement of Christ's kingdom among boys, and the promotion of habits of obedience, reverence, discipline, self-respect, and all that tends toward a true Christian manliness.' The boys are formed into companies in connection with churches, missions, and Sunday schools, their ages varying between twelve and seventeen years. They adopt a simple uniform of cap, belt, and haversack, in addition to their ordinary clothes; and they are trained by military drill and discipline. The organization is also established in the British colonies and the United States. Its total strength is about 70,000 officers and boys.

**Boy Scouts**, an organization of boys and youth between the ages of twelve and eighteen years and upward, which aims to develop character, to aid in furnishing equipment for a career, and to train in service for others, physical health, and efficient citizenship, by utilizing the natural activities and interests of the adolescent period.

The development of the boy scout movement in England is due to Lieut.-Gen. Sir Robert S. S. Baden-Powell (q.v.), who, during the siege of Mafeking (1899), had seen the boys, under Lord Edward Cecil's command, organized and drilled into an efficient messenger service. When Baden-Powell returned to England, in 1902, the idea was fostered and received popular support, and a general plan of organization was adopted. The first boy scouts organization was formed in 1908, and a Royal Charter of Incorporation was granted in 1910, the organization being recognized as a 'non-military, public service body.'

In the *United States* Daniel Carter Beard, with his 'Sons of Daniel Boone,' Ernest Thompson Seton (q.v.), with the 'Woodcraft Indians' (1902), and others had much to do with the early success of the movement, their ideas, in conjunction with those of Sir Robert, forming the basis of the Boy Scouts of America. This organization was incorporated under the laws of the District of Columbia on Feb. 8, 1910.

The *Boy Scouts of America* is non-military and interdenominational in character, the movement being supported by Catholics, Protestants, and Jews alike. Of late it has also been given consideration as an educational adjunct by well known educators: some schools adopting the scout programme in part or as a whole, while a number of universities and colleges conduct special courses for scoutmasters and scout officials.

The administration of the Boy Scouts of America is in the hands of a National Council, working through an Executive Board. The Council includes many men of national prominence, and has the President of the United States as honorary president, and the former Presidents of the United States as honorary vice presidents. The National Scout Commissioner is Daniel C. Beard. The National Headquarters is at 200 Fifth Avenue, New York City, where are issued the official publications, including the *Handbook for Boys*, *Handbook for Scoutmasters*, *Boys' Life*, the official Boy Scouts' magazine, issued monthly, and *Scouting*, a semi-monthly bulletin for scout officials.

Local councils are organized to supervise and extend the movement in communities, upon application by representative citizens to national headquarters. Such local councils work through an executive committee and a commissioner, with a paid executive when developments warrant.

The scouts themselves are organized into patrols of eight boys, three or four patrols forming a troop under a scoutmaster. Each troop has also a committee of three or five men, representing the organization with which it is connected, such as schools, churches, settlement houses, play grounds, etc. This committee recommends the selection of the scoutmaster to the local council, or to national headquarters direct where there is no local council, and cooperates with him. Any boy of twelve or older may become a scout upon fulfilling certain conditions. This includes taking the scout oath, which reads as follows: 'On my honor, I promise that I will do my best— (1) to do my duty to God and my country, and to obey the scout law; (2) to help other people at all times; (3) to keep myself physically strong, mentally awake, and morally straight.' He also subscribes to the twelve points of the Scout Law: a scout is trustworthy, loyal, helpful, friendly, courteous, kind, obedient, cheerful, thrifty, brave, clean, and reverent. The motto of the organization is 'Be Prepared'; and the principle, 'Do a Good Turn Daily,' is kept constantly before the boys.

Scouts are divided into three classes—tenderfoot, second-class, and first-class scouts. Promotion in these classes is conditioned on passing certain requirements, after which the goal is the attainment of merit badges given for special proficiency in such subjects as first aid, life saving, tracking, signalling, cycling, nature study, seamanship, campcraft, woodcraft, the handicrafts,

and the like. In all, fifty-seven merit badges are provided. If a scout earns a certain five of these, he becomes a life scout; ten, a star scout; and twenty-one, an eagle scout, which is the highest degree in scoutcraft. Special honor medals in bronze, silver, and gold are given for life saving.

A book department is maintained by the national organization, which, with the assistance of a library commission composed of expert book men, makes available reliable advice as to worthwhile books for boys, and, under the leadership of this department, arranges with publishers for reprint editions of a high grade of books for boys at prices which will compete with the trashy material found in the markets. The results of this department in the shape of definite lists, carefully subdivided, are made available without charge to librarians, local councils, troops, and parents of boys throughout the country. Many hundreds of parents have already been given special advice as to courses of reading for their boys.

In 1926, in Great Britain and the British colonies, there were 521,147 scouts and scoutmasters; and in the United States, 756,857. Scouting is established in nearly every country of continental Europe, with a total membership numbering approximately 1,700,000.

In August, 1926, the fourth biennial International Conference of Boy Scouts was held in Kandersteg, Switzerland. Delegates from 32 nations were present.

**Boyton**, PAUL (1848– ), natatory expert, was born in Dublin, Ireland. As a youth he went to the United States, and served during the Civil War. He became a submarine diver, and invented an inflated rubber suit for swimming long distances. One of his journeys was from the mouth of Cedar Creek, Mont., to St. Louis, Mo., a distance of 3,580 miles. His plunge from a vessel 40 miles off the Irish coast, in a furious storm, and his crossing of the English Channel in twenty-four hours (1875) were noteworthy. He wrote *Roughing It in Rubber* (1886).

**Bozeman**, boz'man, city, Montana, county seat of Gallatin County, on the Northern Pacific and the Chicago, Milwaukee and St. Paul Railroads; 75 miles southeast of Butte. It is the seat of the State Agricultural and Mechanical College. There are manufactures of brick, lumber, and flour. A canal 20 miles long has been recently built for irrigation purposes and as a waterway. Pop. (1910) 5,107; (1920) 6,183.

**Bozen**, town and summer resort

in Tyrol, Austria, on the Etsch, 83 m. s. of Innsbruck; in the middle ages an important emporium in the trade between Venice and Central Europe, and still the chief commercial centre of Tyrol. It has as interesting church of the 14th and 15th centuries, and a monument to the poet Walther von der Vogelweide. The people grow fruit and wine, and manufacture cottons. Pop. (1900) 13,632.

**Bozrah** (mod. *El-Buseirah*), chief city of the Edomites, 25 m. S.E. of the Dead Sea, Palestine. It was a place of great antiquity (Gen. 36:33); it is now in ruins.

**Bozzaris, MARCOS** (1788-1823), celebrated Greek patriot, 'the modern Leonidas,' was born at Suli in Epirus. From early youth he was in the midst of the struggle for Grecian independence. Defeated in 1803 by Ali Pasha, and compelled to retreat to the Ionian Isles, he afterward joined Ali in 1806, on the latter's revolt against the Sultan, and kept up the war after Ali's defeat and death at Yanina (1822). He died near Missolonghi, which he had long defended, in the course of a daring night attack on the Turkish army in August, 1823.

**Bra, tn.**, prov. Cuneo, Italy, 31 m. by rail S.E. of Turin; breeds silkworms, and trades in wine, truffles, and silk. Pop. (1901) 15,821.

**Brabançonne, La**, the national song of Belgium, composed and sung during the revolution in 1830. The words were by Jenneval—i.e. Dechet (1801-30)—a French actor, an active revolutionist, killed fighting near Antwerp in October, 1830. The music was composed by François van Campenhout (1779-1848).

**Brabant. (1.)** SOUTH BRABANT, prov. of Belgium, in the middle of the kingdom, between the Meuse and the Scheldt. It is flat, fertile, and the most densely inhabited province of Belgium (998 inhabitants to the sq. m.). Both agriculture and manufacturing industries flourish—the latter producing lace, linen, cloth, carpets, hats, spirits, tobacco, starch, paper, chemicals, beer, machinery, leather, pottery, and soap. Area, 1,267 sq. m. Pop. (1900) 1,263,807. Chief town, Brussels. **(2.)** NORTH BRABANT, prov. in s. of Holland, to the E. of Zealand; very level, marshy, and generally unfertile. Area, 1,980 sq. m. Pop. (1899) 553,842. Cap. s'Hertogenbosch (Bois-le-Duc).

**Brac, Dalmatia.** See BRAZZA.

**Bracara Augusta,** Portugal. See BRAGA.

**Bracciano, tn.**, prov. Rome, Italy, 27 m. N.W. of Rome, on the s. side of the Lake of Bracciano. Its principal feature is the vast baronial castle, built by one of the Orsini in 1480, and since 1696

a possession of the Odescalchi. Pop. (1901) 3,560.—THE LAKE OF BRACCIANO, known to the ancients as *Lacus Sabatinus*, fills an extinct crater, and lies 540 ft. above sea-level, but has a depth of over 800 ft., or 260 ft. below sea-level. It measures about 20 m. in circumference, and has been famous for its fish since Roman times.

**Braccio, or FORTEBRACCIO**, whose real name was ANDREA DA MONTONE (1368-1424), Italian condottiere, or captain of mercenaries, prince of Perugia and lord of Capua, was born at Perugia. Banished from Perugia in 1400, he aided, in 1408, Ladislaus, king of Naples, in taking the city, of which, on the death of Ladislaus, he assumed (1416) control. In 1416 he made himself master of Rome for a period of over two months (June-August). In 1421 he espoused the cause of Joanna II. of Naples, surprised Capua, and entered Naples in triumph. His ambition awakened the suspicion of Joanna, who joined Anjou and Sforza against him. At the siege of Aquila Braccio was wounded, and died three days afterward of voluntary starvation, from chagrin at his defeat.

**Bracciolini, FRANCESCO** (1566-1645), Italian poet, born at Pistoia, enjoyed the patronage of Cardinal Maffeo Barberini, who became Pope Urban VIII. He produced an imitation of Tasso, much admired in its time, in the *Croce Riacquistata* (1605-11), which narrates in thirty-five cantos the war waged by the Emperor Heraclius against the king of Persia for the recovery of the cross. In the burlesque poem, *Lo Scherno degli Dei* (1618-26), the ancient gods are parodied after the manner of Tassoni. See G. Cegani, *F. B. eil suo Poema, in Ateneo Veneto* (1883, vol. ii.); M. Menghini, preface to our poet's *Psiche* (1889); and Barbi, *Notizia della Vita e delle Opere de F. Bracciolini* (1897).

**Brace, CHARLES LORING** (1826-90), American philanthropist and author, born at Litchfield, Conn., and graduated at Yale, where he also studied theology. After extensive travels in Europe he settled (1852) in New York, and devoted himself to ameliorating the condition of the lowest classes by founding the New York Children's Aid Society and other organizations. His most important publications are *Hungary in 1851* (1852); *Home Life in Germany* (1853); *Norse Folks* (1857); *Races of the Old World* (1863); *The New West, or California in 1867-8* (1868); *The Dangerous Classes of New York* (1872); *Gesta Christi* (1883); *The Unknown God* (1889). See *Life* by his daughter (1894).

**Bracebridge, tn.**, Muskoka

co., Ont., Canada, 98 m. N. of Toronto, on the Muskoka R. and on the Grand Trunk R. R. It is the chief settlement of the surrounding lake region and is in high favor as a summer resort. There are manufactures of lumber, flour, woollens, etc. Pop. (1901) 2,479.

**Bracegirdle, ANNE** (?1663-1748), English actress, made her début in *The Orphan* at the Duke's Theatre in Dorset Garden, London, and from 1693 appeared at the Theatre Royal as Lucia in Shadwell's *Squire of Alsatia* (1688), and with Betterton at the Lincoln's Inn Theatre as Angelina in Congreve's *Love for Love* (1695); she created Belinda in Vanbrugh's *Provoked Wife*, and Almeria in Congreve's *Mourning Bride*. She was at home in tragedy as well as in comedy, and her professional career was a long series of triumphs until she retired from the stage in 1707, eclipsed by Mrs. Oldfield. See Baker's *English Actors* (1879), Cibber's *Apology* (1822), and W. Clark Russell's *Representative Actors* (1875).

**Bracelet.** An ornamental band worn on the arm or wrist. In the stricter sense, bracelets or armlets are of various types:—(1.) Prehistoric bracelets (*armillæ*) of gold and bronze, both penannular, and with trumpet-shaped ends, the gold generally plain, the bronze most frequently richly decorated with zoomorphic designs, and sometimes set with enamels. Some of the latter were also arranged as a coil down the arm. (2.) The Norse or Viking type, which consisted of large bracelets of finely-twisted silver terminating in knobs or in hooks. A special variety of bracelets of bronze is the massive armlet of 'late-Celtic' type peculiar to Scotland, an enrichment of the coiled serpent variety. Bracelets of chain-work were worn by Hebrew women. Enamelled bracelets of various metals prevailed in Egypt. In the regalia of the Mogul emperors of India was a unique pair of bracelets set with diamonds of unequalled beauty and costliness. Bracelets were worn by both men and women among the ancient Germanic tribes and among the Romans, and were bestowed upon distinguished warriors and others as a mark of honor. But since about the end of the 12th century the wearing of bracelets has been chiefly confined to women. Horn and mother-of-pearl, besides copper and brass, have been used for bracelets; and in Anglo-Saxon tombs bracelets have been found made of beads of vitreous paste strung together.

**Brachial Artery,** the artery carrying the blood to the arm. It

is a prolongation of the axillary artery. It begins at about the lower border of the armpit, and ends by dividing into the radial and ulnar arteries just below the bend of the elbow, lying, in its upper part, in a position corresponding to that of the inner seam of a sleeve, and gradually sweeping outward to the front of the elbow joint. When hæmorrhage occurs below the armpit, and cannot be stopped by direct pressure on the bleeding spot, forcible pressure should be applied on the line of the inner seam of the sleeve, high up on the arm; this compresses the brachial artery against the bone (humerus). This vessel gives off several branches before dividing below the elbow.

**Brachial Plexus**, the network of nerves which supply the arm. It is formed by the four lower cervical nerves and part of the first dorsal, and lies between the root of the neck and the axilla or armpit, where it breaks up into several branches.

**Brachiopoda**, brak-i-op'ō-da or brak-i-ō-pō'da ('arm-footed'), or LAMP-SHELLS, an interesting group of animals which, owing to the presence of two calcareous shells, have sometimes been included in the group Mollusca, but which are now placed in proximity to the Polyzoa or Bryozoa, which they resemble in many points. They vary from less

*Brachiopoda*

1. With one shell removed. 2. Entire.

than half an inch to 1 or rarely 2 inches in length and externally resemble the ordinary bivalve. The shells, however, lie dorsally and ventrally instead of right and left. The ventral valve is in many cases provided with hinge teeth, which fit into depressions in the upper valve and lock the two halves firmly together. The body proper lies towards the hinge, and the large space between the two mantles is occupied by two long tubes, bearing on one side movable cirri, and varying greatly in their degree of freedom and manner of twisting. They are tentacular, or labial organs, and arise from the out-pulped margins of the mouth.

The adult Brachiopods are excessively passive organisms. Some are fixed by whole or part of their ventral valves, others seem to have been anchored in the mud by long spines, while a few are stalked either for life or in their earlier stages. The food

seems largely to consist of diatoms, but the Lingulidæ are also known to sweep in small crustaceans and abundance of mud. They are all marine, and attach themselves to rocks, corals, molluscs, etc.

Brachiopods flourished from the Cambrian to the Carboniferous era, then decreased in numbers during the Permian and Triassic periods, and again became comparatively abundant in the Jurassic and Cretaceous seas. There are about 100 species existing at the present time.

**Brachycephalic**. See SKULL.

**Brachyura**, brak-i-ū'ra ('short tails'), a name given to those decapod crustaceans in which the tail is short and bent beneath the body—e.g. the common edible crab. See DECAPODA and CRAB.

**Bracken**. See BRAKE.

**Brack'enridge**, borough, Pennsylvania, Allegheny county, on the Allegheny River, and the Pennsylvania Railroad; 23 miles northeast of Pittsburgh. Coal, natural gas and oil are found, and glass and steel are manufactured. Pop. (1910) 3,134; (1920) 4,987.

**Brackenridge**, HENRY MARIE (1786–1871), American lawyer and author, son of H. H. Brackenridge, was born in Pittsburgh, Pa. He was admitted to the bar in 1806, was appointed a district judge in Louisiana in 1812, and was United States judge for the western district of Florida from 1821 to 1832, serving also on diplomatic missions to Mexico and South America. He wrote a *History of the Late War between the United States and Great Britain* (about 1816), and *Recollections of Persons and Places in the West* (1834).

**Brackenridge**, HUGH HENRY (1748–1816), American lawyer and author, was born near Campbellton, Scotland. He was brought as a child to York county, Pa. (1753), and worked his way through Princeton where he held a position as tutor while studying for the ministry. He taught school in Maryland for several years, and in 1776 removed to Philadelphia, where he edited the *United States Magazine*. He subsequently practised law at Pittsburgh and was a justice of the State Supreme Court from 1799 until his death. He wrote *Modern Chivalry*; or *the Adventures of Captain Farrago* (1796–1806), and *The Battle of Bunker Hill*, a drama (1776). He composed, with Philip Freneau, a poetical dialogue, *The Rising Glory of America* (1772).

**Brack'ett**, CYRUS FOGG (1833–1915), American educator, was born in Parsonfield, Me. He received the degree of A.B. from Bowdoin College in 1859, and of M.D. in 1863 (LL.D., 1892; Lafayette, 1883). He was instructor in

chemistry in Bowdoin in 1863 and professor from 1864 to 1873, when he became professor of physics in Princeton.

**Brac'ton**, or BRATTON, HENRICUS DE (d. c. 1268), English ecclesiastic and judge, was born in Devon or Somerset. He was archdeacon (1264–5) of Barnstaple and chancellor of Exeter Cathedral, where he lies buried. He was also one of the royal judges (1245) who went on circuit in the later years of the reign of Henry III. His comprehensive treatise, *De Legibus et Consuetudinibus Angliæ*, one of the greatest of European mediæval law books, was written just as the victory of the royal courts over their rivals, the feudal and the local courts, was being completed. Bracton did much to bring about the victory, and to establish one 'common law' for the whole of England. Two editions of the book were printed, in 1569 and 1640. See also Sir Travers Twiss' edition (Rolls Series, 1878–83); Professor Maitland's edition of the *Notebook* (1887), and his admirable account of Bracton (Selden Series).

**Brad'dock**, borough, Pennsylvania, Allegheny county, on the Monongahela River, and the Baltimore and Ohio, the Pennsylvania, the Pittsburgh and Lake Erie, and the Union Railroads; 10 miles southeast of Pittsburgh. It has the first Carnegie Library established in America and a hospital, and nearby is Kenneywood Park. The principal manufactures are iron and steel. Other products are cars, plaster, cement, and wire. According to the Federal Census for 1919, industrial establishments number 49, with products valued at \$9,438,995. The locality was the scene of General Braddock's defeat, July 1755. Pop. (1900) 15,654; (1910) 19,357; (1920) 20,879.

**Braddock**, EDWARD (1695–1755), British soldier in America, was born in Perthshire, Scotland. He entered the British army in 1710, and in 1754 was made a major-general and was placed in command of the British regular and colonial forces in America, landing at Hampton, Va., in February, 1755. In pursuance of a campaign against the French, he started from Fort Cumberland for Fort Duquesne (now Pittsburgh) on June 10, 1755; on July 9 when about 10 miles from Fort Duquesne, on the banks of the Monongahela River, he was ambushed by Indians and French, and after displaying great bravery was mortally wounded and his army routed with great slaughter, Col. George Washington, one of the few officers who escaped unharmed, conducting the retreat. Of 86 officers, 63 were killed or wounded; of 1,370

soldiers, 914 were killed or wounded.

**Brad/don**, MARY E. (1837–1915), English novelist, was born in London. The Strand Theatre produced her comedietta, *Loves of Arcadia*, in 1860, and in 1861 she published a volume of verse entitled *Garibaldi, and Other Poems*. About this time, also, a young printer of Beverley commissioned her to write for his weekly newspaper her first novel, *The Frail of the Serpent*, originally published as *Three Times Dead*. *Lady Audley's Secret*, published in 1862, made her name as a novelist, and was followed by the equally popular *Aurora Floyd* (1863), *Eleanor's Victory* (1863), *Henry Dunbar* (1864), and numerous other works, bringing her total production to well over sixty novels. Her later works include: *Ishmael* (1884); *Wylard's Weird* (1886); *London Pride* (1896); *Rough Justice* (1898); *The Conflict* (1903); *A Lost Eden* (1904); *Our Adversary* (1909); *The Green Curtain* (1911); *Miranda* (1913). Miss Braddon became the wife of Mr. John Maxwell, publisher, in 1874. Their son, William B. Maxwell, is a novelist of note.

**Brad/dentown**, city, Florida, county seat of Manatee county, on the Manatee River, and the Atlantic Coast Line, the East and West Coast, and the Seaboard Air Line Railroads; 45 miles southwest of Tampa. Pop. (1910) 1,886; (1920) 3,868.

**Brad/ford**, city, England, in West Riding, Yorkshire, on Bradford Beck, a tributary of the Aire and on the Leeds and Liverpool Canal; 9 miles west of Leeds. Notable buildings are the Town Hall in mediæval Gothic style; the Exchange; St. George's Hall; the Library; the Technical College; the Grammar School, founded in 1662; the Art Gallery and Museum; St. Peter's Church; and Cartwright Hall. Bradford is the centre of the worsted industry of Great Britain, all kinds of woollen fabrics being produced here. There are iron mines, engineering shops and collieries in the vicinity. The tramways, water works, and lighting system are owned and operated by the municipality. Thornton, 4 miles from Bradford, is the birthplace of the Brontës. Pop. (1921) 285,979.

**Bradford**, city, Pennsylvania, McKean county, on an affluent of the Allegheny River, and on the Buffalo, Rochester and Pittsburgh, the Erie, and the Pennsylvania Railroads; 140 miles northeast of Pittsburgh, and 3 miles from the Allegheny State Park (65,000 acres). The district is one of the richest in the country in petroleum and natural gas, the latter affording lighting and heating facilities. There are

flourishing manufactures, including those of oil-well implements, gas engines, boilers, refined oil, chemicals, wood alcohol, glass, brick, and toys. According to the Federal Census for 1919 industrial establishments number 83, with \$8,665,704 capital, and products valued at \$10,861,158. Pop. (1900) 15,029; (1910) 14,544; (1920) 15,525.

**Bradford**, AMORY HOWE (1846–1911), American clergyman, was born in Granby, N. Y. He was graduated (1867) from Hamilton College, completing his theological studies at Andover, 1870. The same year he became pastor of the First Congregational Church at Montclair, N. J., and in 1901 was moderator of the National Council of Congregational Churches. Dr. Bradford was a founder and second president of the American Institute of Christian Philosophy, and took an active part in settlement work among the poor. He became an associate editor of *The Outlook*, and published many thoughtful volumes of a semi-religious, semi-literary character, including *Old Wine: New Bottles* (1892), *The Pilgrim in Old England* (1893), *The Age of Faith* (1901), *Spiritual Lessons from the Brownings* (1901), *My Brother* (1910), and *Preludes and Interludes* (1911).

**Bradford**, GAMALIEL (1863– ), American author, was born in Boston, Mass. He entered Harvard University in 1882, but was compelled to leave almost immediately on account of ill health. With the exception of some tutoring and lecturing he devoted his attention to literature after 1886. He wrote: *Types of American Character* (essays, 1895); *A Pageant of Life* (1904); *The Private Tutor* (1904); *Between Two Masters* (1906); *Matthew Porter* (1908); *Lee, the American* (1912); *Confederate Portraits* (1914); *Union Portraits* (1916); *A Naturalist of Souls* (1917); *Portraits of American Women* (1919); *A Prophet of Joy* (1920); *American Portraits* (1922); *Damaged Souls* (1923); *The Soul of Samuel Pepys* (1924).

**Bradford**, JOHN (1510–55), English Protestant preacher and martyr, was born in Manchester. He was educated at Cambridge, converted to Protestantism by Latimer, and appointed (1553) royal chaplain to Edward VI., after whose death, for his fearless advocacy of the reformed faith, he was tried before Gardiner and Bonner, condemned as a heretic, and burned at Smithfield. He wrote many theological treatises, published in the collections of the Parker Society (1848–53).

**Bradford**, WILLIAM (?1589–1657), one of the leaders of the 'Pilgrim Fathers,' was born in Austerfield, Eng. While still a

young man he identified himself with the Separatists at Scrooby; in 1608 he accompanied them to Holland, and in 1620 he was one of the *Mayflower* emigrants. From 1621 until his death, except in 1633, 1634, 1636, 1638, and 1644, he was governor of the Plymouth Colony, and during this period rendered services of inestimable value to the colony. He wrote a *History of Plimouth Plantation*, which is indispensable to the student of the colony's history. Bradford's manuscript, after being long lost, was discovered in the library of the Bishop of London in 1855, and the book was first published in 1856, being republished several times subsequently. The manuscript was returned, with much ceremony, to Massachusetts in 1897; it is sometimes incorrectly called the 'Log of the *Mayflower*.' Consult Walker, *Ten New England Leaders*.

**Bradford**, WILLIAM (1663–1752), the first printer in Pennsylvania, was born in Leicestershire, Eng. He emigrated to Pennsylvania in 1682; there in 1685 set up the first printing establishment in the Middle Colonies, and in 1693 removed to New York where he was the printer of the government for more than half a century. In 1725 he founded the *New York Gazette*, the first New York newspaper.

**Bradford-on-Avon**, market town, England, in Wiltshire, on the Avon, and on the Kennet and Avon Canal, 9 miles southeast of Bath. It has a unique little Saxon church of St. Lawrence, built by Aldhelm in the 8th century. The manufacture of kerseymer or cassimere in England is said to have originated here. Pop. (1921) 4,621.

**Brad/ding**, town, England, on the Isle of Wight, Hampshire. The ancient stocks and bull-baiting ring are preserved, and here are the ancestral home and burial chapel of the Ogländers, a family who came over with William the Conqueror. Pop. about 1,500.

**Bradlaugh**, CHARLES (1833–91), social and political reformer, was born in London. From an early date he was a strong advocate of the secularist and advanced radical causes, writing and lecturing under the name of 'Iconoclast'; and he took a prominent part in all popular movements. His organ, *The National Reformer* (1862), was the subject of a futile government prosecution, which led to the repeal of statutes still fettering the liberty of the press. In 1872 he published *The Impeachment of the House of Brunswick* (7th ed. 1880), and in 1873 he lectured in the United States and the British colonies. In 1876 the republication by Bradlaugh and Mrs. Annie Besant of *The Fruits*,

of *Philosophy*, which advocated the restriction of progeny, led to a sentence of six months' imprisonment and a fine of £200; but the sentence was reversed on appeal. In 1880 Bradlaugh became M.P. for Northampton, and a struggle ensued with the House of Commons on the question of the parliamentary oath, which Bradlaugh, an atheist by conviction, refused to take. Afterward he offered to take it (avowedly as a mere form) or to affirm, but the House would not allow him to do either. He was re-elected in 1881, 1882, and 1884, but was still excluded from his seat. Once more elected for Northampton in 1885, he was at length permitted to take the oath and his seat in January, 1886. Bradlaugh died on January 30, 1891, three days after the House of Commons had expunged the resolution passed against him in 1880. See Bradlaugh's *Autobiography* (1873); the *Biography of Charles Bradlaugh*, by A. S. Headingley (1880); *Life of Bradlaugh*, by C. R. Mackay (1888), and G. Bonner (1895).

**Bradley, GEORGE GRANVILLE** (1821-1903), dean of Westminster from 1881 to 1902, was a pupil of Dr. Arnold at Rugby, and a student at University College, Oxford, under Dean Stanley. He was assistant master at Rugby from 1846, and in 1858 was appointed headmaster of Marlborough College. In 1870 he left Marlborough to become master of University College, Oxford; and in 1881 he succeeded Stanley as dean of Westminster, which office he resigned in 1902. He published a revised edition of Arnold's *Introduction to Latin Prose* (1884), *Recollections of A. P. Stanley* (1883), *Aids to Writing Latin Prose Composition* (1884), and, with Mr. R. E. Prothero, *Life of Dean Stanley* (1893).

**Bradley, HENRY** (1845), English lexicographer, was born in Manchester, and became a clerk and foreign correspondent in a commercial house in Sheffield. In 1884 he went to London, and contributed to the leading literary journals, and was twice (1891-3 and 1900-1) elected president of the Philological Society. Since 1889 he has been joint-editor with Dr. Murray of the *New English Dictionary* (Oxford). He is the author of *The Story of the Goths* (1888), and has edited numerous English texts, notably Caxton's *Dialogues* (1900), for the Early English Text Society.

**Bradley, JAMES** (1693-1762), English astronomer. His chief astronomical researches were conducted from the beginning at Wanstead in Essex. In 1721 he was appointed to the Savilian chair of astronomy at Oxford,

and in 1729 lecturer on experimental philosophy; and in 1742 succeeded Halley as astronomer-royal. Bradley's reputation rests on his accuracy as an observer; his discovery of the 'aberration of light,' by which he accounted for the apparent displacement of the fixed stars; and his discovery of the nutation of the earth's axis, due to the moon's unequal action on the equatorial parts. These discoveries, by making exact knowledge of the position of the fixed stars possible, laid the foundation of modern observational astronomy. See Rigaud's *Memoirs* in his edition of Bradley's *Miscellaneous Works* (1832).

**Bradley, JOSEPH P.** (1813-92), American jurist, was born at Berne, near Albany, N. Y., worked on his father's farm, taught school, and graduated (1836) at Rutgers College. He was admitted to the bar at Newark, N. J., 1839, and was counsel for the New Jersey Railroad, and prominent in many leading cases, from that time until his appointment to an associate-justiceship of the U. S. Supreme Court in 1870, being assigned to the fifth circuit, including the Gulf States from Georgia to Texas. His opinions in railroad and other cases settled many open questions. He was a member of the electoral commission (1876), and gave the casting vote in favor of Hayes.

**Bradley, WILLIAM O'CONNELL** (1847), American legislator, born in Garrard, Ky.; was admitted to the bar in 1865; elected prosecuting attorney in 1870; presidential elector in 1872; several times defeated for Congress; delegate-at-large to six Rep. National conventions; four times defeated for U. S. Senator; appointed minister to Korea, but declined, in 1889; first Rep. governor of Ky., in 1895-9; elected U. S. Senator (Rep.) for the term of 1909-15.

**Bradshaw, GEORGE** (1801-53), originator of railway guides, began life as an engraver in Manchester, England (1821). In 1839 appeared *Bradshaw's Railway Time-tables*, enlarged and changed next year to *Bradshaw's Railway Companion*. The monthly *Railway Guide* dates from December, 1841. His other publications include the *Continental Railway Guide* (begun Paris, 1847), and the *Railway Directory and Shareholder's Guide* (1849).

**Bradshaw, HENRY** (1831-86), English scholar, antiquary, and librarian, was born in London, and educated at Eton and Cambridge. As assistant in the Cambridge University library he unearthed the ms. of the famous *Book of Deer*, and rediscovered the Vaudois MSS. (1862), contain-

ing the earliest remains of the Waldensian language and literature. In 1863 he assisted in the exposure of Simonides, the forger of the Codex Sinaiticus, discovered by Tischendorf in 1859. He also brought to light (1866) two previously unknown works ascribed to Barbour, *The Siege of Troy* and *Lives of the Saints*. His *Collected Papers* were published in 1889, a *Memoir* by G. W. Prothero having appeared in 1888.

**Bradshaw, JOHN** (1602-59), English regicide, son of a well-to-do country gentleman in Cheshire, was judge of the sheriff's court in London (1643-9) and chief-justice of Chester from 1647, but was comparatively unknown when called upon to preside over the commission for the trial of King Charles (1649), where he is accused of acting with undue harshness. President of the Council of State from 1649 until its dissolution by Cromwell in 1653, he was a strong opponent of Cromwell's later policy. Under Richard Cromwell he was again president of the Council of State. After the Restoration (1661) his body was dug up, hanged at Tyburn, and decapitated.

**Bradstreet, ANNE** (c. 1612-72), known as 'The Tenth Muse,' and the daughter of Gov. Thomas Dudley of Mass., was born probably at Northampton, England, and sailed for America with her husband, Simon Bradstreet, it is thought, in Winthrop's company, 1631. Her husband (q.v.) became governor of the colony. Madame Bradstreet's poems were first published at London as *The Tenth Muse Lately sprung up in America* (1650), with introductory verses by Nathaniel Ward and others, and attracted attention as the first formal effort in verse coming from New England. See her *Works* (1867), edited by John H. Ellis.

**Bradstreet, JOHN** (1711-74), an English soldier in America. He served as a captain in the Louisburg expedition of 1745, and as a lieutenant-colonel in the French and Indian War, being placed in command of Shirley's boatmen in 1756 and defeating a force of French under Coulon de Villiers near Oswego (July 3, 1756), taking part in the assault on Ticonderoga (July 8, 1758), and capturing Fort Frontenac (Aug. 27, 1758). In 1764, during Pontiac's conspiracy, as colonel, he led an expedition against the Indian tribes about Detroit, but wasted time in futile and unauthorized negotiations with the Indians, and in general showed his incapacity. On his return in Nov., a number of his men lost their lives in storms on Lake Erie and Lake Ontario. Parkman says of him, 'He was a man of more activity than judgment,

self-willed, vain, and eager for notoriety.'

**Bradstreet**, SIMON (1603-97), American colonial governor, born at Horbling, Lincolnshire, Eng. He was educated at Emmanuel College, Cambridge, emigrated to the Massachusetts Bay Colony in 1630, settling at Cambridge, was sent to England as the agent of Mass. in 1662, was deputy-governor in 1678-9 and was governor in 1679-86 and 1689-92. His wife was Anne Bradstreet (q.v.), the poet.

**Bradwardine**, THOMAS (?1290-1349), Archbishop of Canterbury, and one of Edward III.'s chaplains, slyed 'Doctor Profundus.' He was entered at Merton College, Oxford, and there delivered those lectures against Pelagianism afterward expanded into the treatise known as *De Causâ Dei contra Pelagium* (ed. 1618). Bradwardine was a strong opponent of the doctrine of works, and a stout upholder of the doctrine of free grace, which he regarded as inextricably bound up with the doctrine of God's foreknowledge. He was canon of Lincoln, chancellor of St. Paul's, and in 1349 was consecrated Archbishop of Canterbury, but died a few weeks later. See Milner's *Church Hist.*, vol. iv. pp. 79-106.

**Brady**, CYRUS TOWNSEND (1861), American author, was born at Allegheny, Pa., and graduated (1883) at Annapolis. He was obliged to abandon service in the navy, was ordained in the Episcopal Church (1890), was archdeacon of Kansas in 1892-95, when he was made first archdeacon of the Pennsylvania diocese, was rector of St. Paul's Church, Overbrook, Pa., in 1899-1902, resigned to devote himself to writing, became rector of Trinity Church, Toledo, O., in 1905. Of his publications, many are works of fiction dealing with adventure on the high seas. They include *For Love of Country* (1898), *Recollections of a Missionary in the Great West* (1900), *Stephen Decatur* (1900), *Sir Henry Morgan, Buccaneer* (1903), *A Little Traitor to the South* (1904), *The Two Captains* (1905), also a vol. of sermons, *The Love Test* (1908).

**Brady**, JAMES TOPHAM (1815-69), American lawyer, was born in New York city, and received his education, legal and otherwise, from his father, Thomas S. Brady, a leading member of the bar. Young Brady was admitted in 1836, and soon won prominence by securing the release of a young English girl who had been bound out by the N. Y. authorities. He was immensely successful as a jury lawyer in patent and criminal cases, and was counsel for Daniel E. Sickles, in his famous trial for the killing of Philip Barton

Key. A states-right man before the Civil War, he supported the administration during that contest, on the platform. He wrote occasionally for the old N. Y. magazines.

**Brady**, JOHN (1840), Irish-American R. C. prelate, was born in Co. Cavan, Ireland, studied at the College of All Hallows, and was ordained a priest, 1864. He was assistant pastor at Newburyport, Mass., 1864-8, and in the latter year became pastor of St. Joseph's, Amesbury, Mass., preserving his connection with this parish after his appointment as auxiliary bishop of Boston, and his consecration as titular bishop of Alabanda, in 1891.

**Bradycardia**, an abnormal slowness of pulse, which may be either peculiar to the individual or due to disease, exhaustion, pain, poisoning, or other cause.

**Bradypus**. See SLOTH.

**Braemar**, vil. and dist. in pars. of Braemar and Crathie, S.W. Aberdeenshire, Scotland; the vil. Castleton of Braemar is 18 m. s.w. of the Ballater terminus of the Deeside Ry. The district is exceedingly picturesque, and contains several lofty peaks of the Cairngorm group. Balmoral Castle is close to Crathie. Pop. (1911) of Braemar and Crathie, 1,401.

**Braga**. (1.) Administrative dist. in the Portuguese prov. of Entre Minhoe e Douro. Area, 1,054 sq. m. Pop. (1900) 356,819. (2.) The ancient *Bracara Augusta*, tn. and archiepisc. see of Portugal, in the dist. of Braga, 33 m. N.N.E. of Oporto. It is a mediaeval-looking place, still surrounded by walls, and has picturesque old houses, an imposing cathedral, large citadel, and archiepiscopal palace. It manufactures cutlery, firearms, and jewellery. Pop. (1900) 24,309.

**Braganca**. (1.) Administrative dist. in the Portuguese prov. of Traz-os-Montes. Area, 2,573 sq. m. Pop. (1900) 185,586. (2.) Town and seapt. Para, Brazil, 90 m. by rail E. of Belem. It is an agricultural centre. Pop. 18,000. (3.) Town, prov. São Paulo, Brazil, 50 m. by rail N. of São Paulo, with numerous sugar mills, and trade in pigs and cattle. Pop. 10,000.

**Bragg**, BRAXTON (1817-76), American Confederate general, born in Warren co., N. C. He graduated at West Point in 1837, was engaged in the Seminole War (1837-9), and served with distinction in the Mexican War (1846-8) under General Taylor, and in 1859 he retired from the army and became a planter in Louisiana. When the Civil War began, Bragg was made (1861) commander-in-chief of all the state troops in Louisiana. In February, 1862, he

became a major-general, with his headquarters at Mobile, in command of the second division of the Confederate army, and he commanded the centre at the battle of Shiloh (April). He was next appointed (June, 1862) commander of the department of the Mississippi. In Aug., 1862, at the head of an army of about 45,000 men, he invaded Ky., but he was outmanœuvred by the Federal general Buell, and after the battle of Perryville (Oct. 8) withdrew into Tenn. He was repulsed by Rosecrans at Murfreesboro (Dec. 31, 1862, and Jan. 2, 1863); but in Sept., 1863, he defeated that general in the battle of Chickamauga, which proved a brilliant but barren victory for the Confederates. In Nov., 1863, he was decisively defeated by Grant at Chattanooga and in Dec. was relieved of his command. In 1864 he was called to Richmond, and appointed military adviser to Jefferson Davis, and in 1865 served under Gen. J. E. Johnston. His brother, THOMAS BRAGG (1810-72), was successively governor of N. Carolina (1855-9), U. S. senator (1859-61), and Confederate attorney-general (1861-3).

**Bragi**, or BRAGR, a famous minstrel in the ancient Norse sagas, sometimes called a son of Odin, and esteemed as a god. His name is identified with eloquence.

**Braham**, JOHN (b. 1774-1856), tenor singer, born in London of Jewish parents (his name was really Abraham), and made his début at Covent Garden in 1787. In 1796 he was engaged for Drury Lane, and next year for the Italian opera. After studying and singing in Italy and Austria, he reappeared at Covent Garden in 1801, and composed the music of his own part for several operas. His subsequent career was one of continuous success. He was the original Max in Weber's *Der Freischütz* (1824), and the original Sir Huon in *Oberon* (1826).

**Brahé**, TYCHO or TYGE (1546-1601), Danish astronomer, born at Knudstrup in S. Sweden (then a province of Denmark). An eclipse of the sun in 1560 directed his mind to astronomical study. In 1572 he discovered a new star in Cassiopeia. Down to this period he had resided mostly in Germany; but in 1576 Frederick II., the Danish king, helped him to build and equip in an exemplary way the observatory of Uraniborg, on the little island of Hven in the Sound, north of Copenhagen. There he labored until 1597, when intrigues compelled him to carry his instruments to Germany; and in 1599 he was invited to Prague by the Emperor Rudolph II. There Brahé had for a fellow-worker

the famous Kepler, but died two years later. Tycho Brahé held that the planets moved round the sun, and the sun round the earth. This hybrid theory was expounded in the second volume of his *Astronomia Instaurata Mechanica*, printed in 1598 (new ed. 1901). The first volume of the work, containing a dissertation on the star of 1572, was published by Kepler in 1602. Tycho Brahé first assigned to comets their position in interplanetary space. He discovered the variation and annual equation of the moon, investigated precession, and introduced a correction for refraction. His observatory of Uraniborg was excavated in 1901. See *Lives* by Gassendi (Latin, 1655) and Dreyer (1890).

**Brahma**, the creator of the universe, according to Brahmanism; the first person of the Trimurti, or trinity, of Hinduism. The Brahmans are his peculiar offspring, and the sole exponents of his will. See BRAHMANISM.

**Brahmanas**, those prose versions of the Vedas which describe the elaborate ritual to be observed by Brahmans (Hindu priests) in sacrifice and worship. The oldest is supposed to have been written about the 7th century B.C.

**Brahmanbaria**, munic. tn. in Tipperah dist., Bengal, India, 50 m. N.E. of Dacca. Pop. (1901) 19,915.

**Brahmani**, riv. in Chota Nagpur, Bengal, India; traverses Chota Nagpur and Orissa. It is famous in Hindu lore as the traditional scene of the love of the sage Parásara and the mother of Vyasa, reputed compiler of the *Vedas* and the *Mahābhārata*.

**Brahmanism** or BRAHMINISM. The name given to the system which, persisting with remarkable continuity, connects modern Hinduism with the religion of the Vedas. Its essence is twofold, the inspiration and divine authority of the Vedas, and the irreversible superiority of the Brahmans to all other castes. The rise of Brahmanism was due to two causes: (a) the claim of the Brahmans (which was allowed) to ability to sacrifice more acceptably to the gods than any others, developing into the exclusive right of that caste to conduct the 'all-powerful sacrifice;' (b) this was founded on the other fact that as the language of the Vedas became obsolete, the Brahmans assumed the guardianship of the holy books, so that access to the gods was possessed by them alone. The caste system developed, separating the Brahmans from the Kshatriyas (warriors nobles), the Vaisyas (husbandmen), Sudras (laborers) and no-castes or out-castes. A mythical origin ac-

counted for division into caste. This system riveted the fetters with which the Brahmans bound all India. Its dominance has continued to the present except during the 800 years when Buddhism was supreme (B.C. 300—A.D. 500). The audacity of the Brahman creed may be seen from the statement in the Satapatha Brahmana, 'The Brahman is the god of gods.'

A large part of the immense literature of India is from their hands. A most elaborate philosophy, absolutely fearless in its pursuit of reasoning, has been developed with a profound logical and metaphysical apparatus. Out of a gross polytheism there was developed the most thorough-going pantheism the world has known. And with it a trinity in the discussion of which every variety of doctrine ever proposed in connection with the Christian Trinity was anticipated over and over. The pre-Buddhistic domination of Brahmanism was won comparatively easily. A harder struggle came when Buddhism had become decadent and the Aryans were face to face with the host of religions in Southern India. The problem was solved by the double device of accepting the aboriginal doctrine of reincarnation, and of accounting for the existence of the gods of the South by the doctrine of Avatars, or the local appearance in historic form of a member of the trinity for reproof of evil or encouragement of good. Thus the Brahmans claimed to account for all forms of religion and claimed all religions as virtually their own. Frazer's *Literary History of India* (1899) is the best single work; see also Monier Williams's *Brahmanism and Hinduism* (1887), and *Indian Wisdom* (1893); Hopkins's *Religions of India* (1895), and the *Sacred Books of the East*, volumes dealing with Indian literature.

**Brahmapurana**. See PURANAS.  
**Brahmaputra** (lit. 'son of Brahma or God'), one of the largest rivers of India. Its highest source, known as Tsangpo or Sanpo (Tibetan = 'river'), is in Lake Manasarowar, at the base of Kadas Hill, in W. Tibet, the altitude being between 15,000 and 16,000 ft. It flows e. for about 1,000 m. on the plateau of Tibet; then turning s.e. penetrates the Himalayas, under the name of Dihong, and descends to the valleys of Assam. There it assumes the name of Brahmaputra, flows in a s.w. and s. direction, and after partial confluence with the Ganges enters the Bay of Bengal in an expansive delta. Its length is about 1,800 m. During the rains the Brahmaputra floods and fertilizes hundreds of square miles of country. It is navigable for steamers to

Dibrugarh, 800 m. from the sea. Here the discharge of the river at its lowest is said to be 116,115 cub. ft. per second.

**Brahma Samaj** ('the Society of God'). The most remarkable religious revival of modern times in India has been that of the Brahma Samaj. Its founder, Raja Ram Mohun Roy, born in 1774, had studied the philosophy of Hinduism at Benares and of Buddhism in Tibet. Denouncing *sati* and idol-worship, he sought to establish an eclectic system of practical morality. Although undoubtedly influenced by Christianity and Sufiite Islamism, it is important to note that the Hindu Unitarian Church which he founded (about 1830) was a return to a professedly ideal Brahmanism—the worship of a supreme deity, the essence of the universe. Raja Ram was born a Brahman, and died a Brahman. After his death the movement received a certain impetus (about 1842) as the Adi Samaj (New Church), under the leadership of one Debendra Nath Tagore; and Debendra Nath was followed by Keshub Chandra Sen (1838–84). Inspired by Sen's religious fervor and lofty eloquence, the Adi Samaj marked a distinct change of creed. In 1866 a breach took place, the Brahma Samaj was formed, the old society continuing as the Adi Brahma Samaj. God the Father was substituted for the Vedic definition of the Creator, and in the establishment of the 'brotherhood of man' the new church shook off all vestige of Brahmanism, and grew and prospered. A false step checked its career, and disappointed those who thought that they saw in this last development an approach of Hindu Unitarianism towards the theism of the West. Keshub Chandra Sen, who had repeatedly and strenuously opposed infant marriage, sanctioned the nuptials of his own daughter, at the age of fourteen, with the maharajah of Kuch Behar. In the succeeding disruption (1878) the mass of his congregation took refuge with the dissenters, the Sadharana (general) Brahma Samaj of the present day. In a conservative reaction this Samaj fell back on Vedic authority for the theism which it professes. Allied to this movement of religious thought in India are other forms of Vedic theisms, among which may be mentioned the Prasthanas Samaj (Prayer Society) of Bombay, and the Arya Samaj (Aryan Society): the latter, however, is rather a political organization than a religious body. See Illingston's *Indian Theism* (1901); Keshub Chunder Sen, *Brahma Samaj* (1870); Miss Carpenter's *Memoirs of Ram Mohun Roy*; Miss Collet's

Historical Sketch of Brahma Samaj; *Sacred Books of East*, i., lxii. ff.; Bose's *Works of Ram-mohun Roy* (1888), Mozoomdar's *Life and Teachings of Keshub Chunder Sen* (1887), and Max Müller's *Ramakrishna* (1899).

**Brahmin Ox.** See ZEBU.

**Brahms, JOHANNES** (1833-97), an eminent composer and pianist, born at Hamburg. His musical education, begun by his father, was continued by Marxen of Altona. He began the study of composition at a very early age, was first known to the public as a pianist, and in 1853 was hailed by Schumann as a new and illustrious genius. Brahms settled in Vienna in 1861, and after some years concentrated his energies on composition. As his productions became known, it was acknowledged that he was one of the greatest composers of recent times. His music, however, appeals more to the musician than to the multitude. In the development of his ideas the serious purpose and lofty aim of his work preclude any pandering to mere ear-pleasing devices, and the superlative excellence of his compositions is only revealed to the trained intelligence of the cultured musician. Brahms wrote in practically every branch but the dramatic. His symphonies, overtures, and other orchestral compositions; his great choral-orchestral works, such as the *Deutsches Requiem* (op. 45), the *Song of Destiny* (op. 54), etc.; also his productions in the domain of chamber music in all its forms, take rank with the greatest creations in their several classes of composition. His concertos, Hungarian dances, etc., for piano, and his violin concerto (op. 77, written for Joachim), are works of conspicuous merit; while as a vocal composer in every form, and especially as a song-writer, Brahms occupies a position of almost unique distinction. As a pianist he showed great intellectual power. See Deiters, *Brahms, a Biographical Sketch* (1888); Dietrich and Widmann, *Recollections of Johannes Brahms* (1899); Mason, *From Grieg to Brahms* (1904).

**Brahui.** See BALUCHISTAN.

**Braid, JAMES** (1795-1860), Scottish writer on hypnotism, was led to a scientific examination of this subject by La Fontaine's lectures in Manchester (1841), where he practised medicine most of his life. He demonstrated the subjective nature of the phenomena, and their independence of the alleged magnetic influence passing from the operator, and was the first to use the term 'hypnotism.' He wrote *Neurypnology, or the Rationale of Nervous Sleep, considered in Relation to Animal*

*Magnetism* (1843); *Magic, Witchcraft, Animal Magnetism, Hypnotism, and Electrobiology* (3rd ed. 1852); and *Observations on Trance* (1850).

**Braidwood, Thomas** (1715-1806), was born in Scotland, and was a teacher of the deaf and dumb in Edinburgh. Encouraged by his success in teaching a pupil, Charles Sherriff, born deaf, and therefore mute, to speak (1760), Braidwood established his academy for teaching the mute, which was visited by Dr. Johnson. The academy was afterward removed to Hackney, London. See Johnson's *Works* (1806), ix. p. 337; Boswell's *Life of Johnson*.

**Braila, tn., Roumania**, 10½ m. above Galatz, on l. bk. of Danube, and on state line Galatz-Buseu. It exports wheat, tallow, meat, and wool. Before 1883 Braila was a free port. From the end of the 16th to the end of the 18th century it belonged to the Turks. Pop. (1899) 58,392.

**Braille, Louis.** See BLIND.

**Brain**, the organ of thought, sensation, and voluntary movement. It is protected by the skull, between which and the brain are delicate serous membranes (meninges) and a small quantity of fluid (the cerebrospinal fluid), which acts as a water-bed, lessening the shock of any blow. The brain is divided by anatomists into four principal parts—the *cerebrum* (brain proper), the *cerebellum* (Lat. 'little brain'), the *pons Varolii* ('bridge of Varolius'), and *medulla oblongata* (Lat. 'oblong marrow'). The cerebrum, or fore brain, is divided longitudinally into two cerebral hemispheres, the right and left by the great longitudinal fissure. This completely divides it, except where, towards the middle, the two halves are joined by a broad band of white substance (nerve fibres) called the *corpus callosum* (hard body). The surface of each cerebral hemisphere is divided (arbitrarily) by anatomists into four lobes, marked off from one another more or less plainly by fissures of various lengths and curves. These lobes and fissures are named and described in anatomical works for convenience in mapping out the brain, and locating the seats of its functions as far as possible. They have not precisely the same appearance in all brains, nor are the two sides exactly equal; and although useful to the surgeon as guides in operations, the fissures can only be considered very vague landmarks by the physiologist and the psychologist, our knowledge of the action of different parts of the brain being still comparatively rudimentary. Its minute anatomy must be looked for in the microscopical laboratory and

in text-books. Broadly speaking, the cerebrum is made up of gray matter (cells which in groups form centres for thought, action, or sensation) and white matter (nerve strands acting as lines of communication). The surface of the cerebrum, in fact of the whole brain, is covered with gray matter—i.e. brain-cells, or centres—and owing to the arrangement of the surface in convolutions, the gray matter dips into the fissures and *sulci*, and so covers a larger area than it would were the brain uniformly smooth. Islands of gray matter are also embedded in the white. It is believed that brain power depends not altogether on the apparent size or the weight of the brain, but partly on the amount of convolution, which is much more marked on some brain surfaces than on others. Weight, however, seems to give a general index of brain power, and this argument is used by some when comparing the brain capacity of man and of woman—the average male brain weighing 49½ ounces, the average weight of the female brain being 44 ounces. Male brains range in weight generally between 46 and 53 ounces; female, between 41 and 47 ounces. Classical examples of heavy brains are Cuvier's (64 ounces) and Dr. Abercromby's (63 ounces). The weight of the brain should, however, be compared with the weight of the individual to whom it belonged. A big head does not necessarily mean a big brain, for that may arise from hydrocephaly. Below a certain size and weight we get microcephaly, and idiocy generally goes with these, though some remarkably powerful minds have accompanied exceptionally small heads (e.g. Shelley, Descartes, Foscolo, Donizetti, and Schumann). The cerebrum forms the largest part of the brain, and contains what are commonly spoken of as the 'higher centres'—*vis.* those for the higher or thinking faculties. This seems beyond question, although many higher centres cannot be exactly localized; and there are cases on record where a considerable quantity of cerebral brain substance has been injured or destroyed without any obvious psychical result. The whole brain is supplied with blood from the two internal carotid arteries and two vertebral arteries. There is also a circulation of lymph; each cell of gray matter lies bathed in lymph.

*Functions of the Cerebrum.*—From experiments made by Ferrier, Horsley, and others, those parts of the gray matter (cerebral cortex) concerned in certain actions have been mapped out roughly. The centres for movement of one side of the body lie

on the opposite side of the brain. Thus, the right hand is guided by the left cerebral hemisphere. Motor areas—*i.e.* areas of the gray brain covering, apparently necessary for voluntary movement—have, until recently, been supposed to lie about the fissure of Rolando, on both sides of it; and the respective centres were roughly shown by taking a model

the brain of a child agreed with these conclusions. The matter is still in dispute, the majority accepting the older statements. When an injury to the brain is followed by loss of voluntary movement, the mischief may lie either in the gray matter, or motor area, concerned in that movement, or it may be in the communication fibres, which nor-

longata, and two more form the pons Varolii. The cerebellum is divided into lateral hemispheres, with six lobes lying between. It is formed, like the cerebrum, of gray matter overlying white, with distinct masses of gray also in the interior. Disease of certain parts (lobes) of the cerebellum is believed to affect equilibration (balancing) and co-ordinated (controlled) movements. Some of the nerve fibres (white matter) are believed to be concerned in muscular sense (the sense of weight when exerting a group of muscles in lifting), but the function of the greater part of the cerebellum is unknown.

*Pons Varolii.*—The pons Varolii is made up mostly of bundles of nerve fibres joining the higher parts of the brain with the medulla. The cerebrum lies above it, the cerebellum behind it, and the medulla oblongata below.

*Medulla Oblongata.*—The medulla oblongata (sometimes called the spinal bulb) is the expanded upper end of the spinal cord. Of its nerve fibres, some run through the pons Varolii into the cerebrum, while others run directly into the cerebellum. It must be understood that all connections of the brain with the spinal cord pass through the medulla. In it there is also gray matter, which forms various collections of cells known as the vital centres. These work independently of the will, and govern respiration, the heart's action, the constriction of blood-vessels, swallowing, and secretion of saliva. The last six of the twelve pairs of cranial nerves (nerves emerging from the cranium or skull) arise in the medulla. When the medulla is cut all sensation is lost, because all impulse fails to reach the cerebrum. All voluntary movement is abolished, because the cerebrum cannot send down a message. Death immediately follows, because of interference with the impulses by which heart and lungs are kept in action. It is in the medulla that most of the nerve fibres cross; so that fibres which started on the right side of the brain reach the left side of the spinal cord, and those starting on the left go to the right.

The base of the brain, resting on the base of the skull, the floor of the cavity which holds the brain (or rather on the water-bed of cerebro-spinal fluid), gives off cranial nerves in twelve pairs, each cranial nerve arising from a spot on one half of the brain corresponding to that from which its fellow arises on the other half, and each being traceable to a similar centre; the centre, or directing cells of gray matter, being also in pairs—*i.e.* in corresponding positions in the cere-

The Brain.

1. Cerebrum from above, showing convolutions; 2, right hemisphere; 3, section through the centre of brain; 4, cerebellum; 5, 6, motor areas of brain; 7, 8, lobes of the right hemisphere, exterior and interior aspect.

of a brain and tracing the outline of a man's figure covering the fissure, head downward, looking backward, and with his arms and legs flexed. It has been stated by some observers that these motor areas lie entirely in front of the fissure of Rolando, and dip into the fissure, but do not cross it. These conclusions were reached by electrical experiments on the brains of anthropoid apes; but, at the same time, another investigator showed that the arrangement of fibres in

mally carry the impulse from the motor centre to the part paralyzed. The brain is not bilaterally symmetrical (equal-sided) any more than is the skull, which shows curious asymmetry in many cases, when accurate measurements are taken.

*Cerebellum.*—The cerebellum, or little brain, lies under the after part of the cerebrum, and is connected with that and other parts of the brain by processes called *crura* (legs). Two join it to the cerebrum, two to the medulla ob-

brum or cerebellum on either side of a longitudinal mesial line. Certain special centres (not for cranial nerves) are apparently single. Such is the speech centre, low down on the gray matter in the front of the left cerebral hemisphere. Any brain centre may conceivably be trained by use, enfeebled by disuse or insufficient use, excited by irritants, and paralyzed by a sufficient injury. Thus, one becomes expert in any movement through habit, and loses expertness for want of practice; and this not merely because of muscular incapacity, but because the impulse is not properly generated in the brain and transmitted by a nerve. Also, a nerve centre becomes irritated by a certain degree of pressure, and works independently of volition—as in epilepsy, started by the pressure of blood or broken bone on the brain surface. A greater degree of pressure from the same cause will produce, not movement, but immobility, followed, if the pressure reach vital centres, by insensibility and death. The sensory centres are not so well mapped out as the motor, for obvious reasons.

**Development.**—The brain at birth is heavy in proportion to the total body weight. It increases rapidly during the first seven years; more slowly from then until the age of about twenty; then more slowly still, until about forty. Soon after that age the weight begins to lessen very slowly. Sight and hearing are dormant at birth, and all the other senses are probably almost functionless.

**Diseases.**—Development may stop prematurely, and is followed by premature ossification of the cranial sutures, producing microcephaly. Hydrocephalus (water on the head), if severe, is also a cause of impaired development of the brain, and consequently of the faculties. Brain troubles in children occur chiefly through faults of development, or through the greater instability of the developing tissues. In old age, cerebral troubles arise from the weakness of degeneration, due in some cases to age alone, and in others to the gradual effect of chronic disease. The commonest of brain affections in old age arise from the loss of elasticity of vessel walls, and perhaps a roughening of their inner surface. Thereafter any increased blood pressure tends to rupture the walls and produce cerebral hæmorrhage; or a thrombus forming in the vessel, and blocking the circulation, may cut off the blood supply from a part of the brain, so that it ceases to work. 'A man is as old as his tissues,' and their age, for working purposes, is governed by the

treatment which he has given them: one may suffer from the cerebral effects of old age before one has reached middle life. The commonest symptoms of disease of the unstable, developing brain are convulsions, often slight, and

sypilitic, tubercular, or alcoholic. Physical violence producing hæmorrhage, or pressure of depressed bone, often starts brain symptoms. Gradually growing tumors, either of the brain substance, or arising from the inner

*Brain Cells.*

1. From third cerebral convolution  $\times 75$ .—a, Superficial layer with scattered cells; b, layer of small pyramidal cells; c, broader layer of pyramidal cells separated by radiating nerve fibres; d, narrow layer of small irregular cells; e, layer of fusiform cells in medullary centre. 2. Large cells from the gray cortical layer of the cerebellum  $\times 230$ . 3. Ganglion cells of various sizes from the gray matter of the cerebral hemisphere. 4. Vertical section of the gray matter of the cerebellum  $\times 75$ .—a, Superficial (molecular or fibrillar) layer; b, second layer = ganglion cells of Purkinje; c, nuclear layer; d, white substance. 5. Basket-work fibres round the cells of Purkinje.

do merely to distant irritation (such as worms), or developing to the extent of true epilepsy. Inflammation of the brain coverings (meningitis) may be simple, or may arise from tubercle. Syphilis, tubercle, and alcohol are probably the commonest causes of cerebral degeneration; but it must not therefore be supposed that all cerebral mischief is either

table of the skull, will slowly disturb those parts of the brain on which they press, and first excite and then destroy their powers. The brain is remarkable as an organ both for its extreme delicacy and its great power of resistance and recuperation. A man may live with a bullet in or through his brain, and may die as the result of brain trouble the

originating cause of which cannot be detected by any known method; he may live after an iron bar has passed through the roof of his mouth and out at the crown of his head, yet he may die because of a minute clot of blood. See Ferrier's *The Functions of the Brain* (2nd ed. 1886); Horsley's *Structure and Functions of the Brain* (1892); Barker's *The Nervous System and Its Constituent Nerves* (1899); Obersteiner's *The Anatomy of the Central Nervous System* (trans. Hill, 1890); Luys's *The Brain and its Functions* ('International Science Series,' 1884); Quain's *Anatomy*, vol. iii. pt. 1 (10th ed. 1893).

**Brainard, DAVID LEGGE** (1856), American explorer, was born at Norway, Herkimer co., N. Y., and enlisted, 1872, in the U. S. army. He saw much Indian service in the West under Gen. Miles, and received his promotion as sergeant in 1879. He was detailed to accompany the Lady Franklin Bay expedition (1881-4), under Lieut. Greely, of which he was first sergeant, and in which he took a prominent and heroic part — with Lieut. Lockwood reaching the, at that time, farthest northern point (83° 24' 30" N. lat.) ever reached by an explorer. He was one of the seven survivors of the expedition rescued by Schley. For these and other services he was commissioned a 2nd lieutenant in the army, and after further service in Alaska and the Philippines, was promoted major in the subsistence department (1900).

**Brainard, JOHN GARDINER CALKINS** (1796-1828), American poet and journalist, was born at New London, Conn., and graduated (1815) at Yale. He studied law, and practiced for a while at Middletown, Conn., but in 1822 removed to Hartford where he edited the *Connecticut Mirror* until failing health forced him to abandon the position in 1827. His own contributions to the paper were chiefly metrical. His *Poems* (1825) are included in a collection of his *Literary Remains* (1832), with a biographical introduction by Whittier.

**Brain Coral** (*Meandrina*), one of the madreporian or reef-forming corals, which has the surface of the corallum curiously convoluted, so that in the surface view of a dead mass it somewhat resembles the human brain.

**Braine-le-Comte** (Flemish, 's *Graven-Brakel*), tn., prov. Hainault, Belgium, 18 m. s.s.w. of Brussels; makes lace thread. Pop. (1900) 78,694.

**Brainerd**, city, Minn., co. seat of Crow Wing co., 115 m. N.N.W. of St. Paul, on l. bk. of the Mississippi R., and on the N. Pac. and the Brainerd and N.

Minn. R. Rs. There is a U. S. signal station, a Y. M. C. A. building and a lumbermen's hospital. Machine shops and car works of the Northern Pacific Railroad are situated here. Other important industries include the production of lumber, flour, cigars, and beer. Pop. (1910) 8,526.

**Brainerd, DAVID** (1718-47), American missionary, born in Conn., devoted his life to work among the Indians of Massachusetts, and those living near the Delaware and Susquehanna rivers, under the auspices of the Scottish society for promoting Christian knowledge. His *Journal* (1746) has taken rank as a religious classic. He died in the house of Jonathan Edwards, who afterward became his biographer (1749; new ed. 1884).

**Braintree**, tn., Norfolk co., Mass., 10 m. s.s.e. of Boston, on the N. Y., N. H. and H. R. R. It includes the villages of S. and E. Braintree, has the Thayer Library, and is the seat of Thayer Academy. The manufactures include electrical machinery, leather, shoes, carpets, absorbent cotton and paper. Granite is quarried. The portion of old Braintree now included in Quincy, was the birthplace of John Adams, John Hancock, and J. Q. Adams. Pop. (1910) 8,066.

**Braithwaite, JOHN** (1797-1870), English engineer, was born in London. In 1822 he devised the donkey engine. In 1829, in conjunction with Captain John Ericsson, he constructed for the Stephenson's locomotive engine the 'Novelty,' the first that ever ran a mile within a minute. He also manufactured the first practical steam fire-engine; and in 1833, with the assistance of Ericsson, he built the calorific en-

and giving off roots in all directions; this stem sends up each year a single leaf or frond, which may vary in height from six inches to twelve feet, according to the conditions in which the plant is growing. The spore cases occur in lines along the margin of the pinnæ. At the summit the leaf-stalk bears three branches, which are bipinnate; the pinnules are again pinnatifid, so that the frond has a broad, triangular effect. These fronds are used in Europe in large quantities for bedding cattle, and even in some instances for thatching stacks and houses; and the subterranean stem has been employed as an article of food, on account of the large quantity of starch and mucilage which it contains. The plant at one time was used medicinally, being bitter and anthelmintic.

**Brakes** are devices for arresting motion or for absorbing energy. The former are familiar in their use on ordinary vehicles, railway cars, and street cars. They are also necessary on elevators (lifts), on hoisting engines and appliances, and on inclined railways or cableways. There is a large variety of different forms for these various uses, and hand, steam, air, hydraulic, or electric power may be utilized for working them, often in conjunction with springs. Of course, all these brakes absorb power, but their direct function is to reduce excessive speed, or bring a moving machine to a stop. Absorption brakes (used in engine testing), however, primarily absorb energy (by converting it into heat), the engine running at uniform speed. The Prony brake, rope brake, and hydraulic brake are used for this purpose. They are also called absorption dynamometers. For brakes of this class see DYNAMOMETER.

A vehicle may be braked by means which tend to prevent the wheels from turning (wheel brakes), or by grips or friction devices which take hold of the track, and thus check the vehicle (track brakes). The former are most common. They comprise: simple or shoe brakes, in which a block (brake-shoe) fastened to the car is pressed against the wheel to resist its turning by producing friction between wheel and shoe; band or strap brakes, in which a loose band surrounding an enlarged hub of the wheel is drawn up tight, producing great frictional holding; disk brakes, in which a disk fast on the axle and a disk held by the car are pressed together to produce friction; cone or cup brakes, like disk brakes, but having instead of disks a cone and cup which are forced into each other; electric

Brain Coral.

gine. In 1836-8 he and Ericsson fitted a canal boat with screw propeller, which voyaged from London along the canals to Manchester, returning by way of Oxford and the Thames.

**Brake or Bracken** (*Pteris aquilina*) is of almost world-wide distribution. Its stem is a wide-spreading underground structure, covered with fine brown hairs,

eddy-current brakes, in which a disk fast on the axle turns past the faces of an electromagnet so as to set up eddy-currents in the disk which resist the rotation; and electric generator brakes, which consist of a motor run reversed as generator, so that the induced currents drag back on the armature and resist the rotation.

*Sand tracks*, used on railways at times to prevent a car going beyond a fixed danger limit, are also brakes. They consist simply of a layer of sand over the track, 1 to 3 ins. deep over top of rail, which checks the wheels. This simple device, not much used, needs no further reference.

Of the above forms, *shoe brakes* exclusively are used for railway cars. The prototype (hand operated) is seen on ordinary vehicles. Railway car brakes are operated by hand and by power (steam, vacuum, compressed air). Street railway cars mainly use hand and air operated shoe brakes,

The motors are so connected (by shifting the controller to the braking point) that their rotation generates current at the expense of the car's momentum, which is sent

a trigger, which is worked either by hand or by a speed-governor. (Electric elevator motors similarly are braked by a band brake held in action by strong springs, and

*Electromagnetic Track Brake for Street-Cars.*

through magnet windings on the track shoes, drawing these down upon the track by magnetic attraction. The drag of these shoes against the rail not only retards the car directly, but also through a set of links presses a set of brake shoes against the wheels. The gripping-jaw type of track brake, on the other hand, is used as safety brake on elevators, on inclined railways, and on cableways. In the first case it grips the guide bars; in the second, the head of the track-rail; and in the third, the carrying-rope. Usually, these safety brakes are thrown on by strong helical springs released by

released only when current is applied to a set of magnets arranged to pull off the brake against the spring pressure.) In elevators and cable railway inclines, also, there is usually a spring-operated safety brake which is held off by levers on which the cables pull, so that if the cables should be broken the jaws will grip the rail and bring the car to a stop.

The chief details which we can consider here are the arrangement and operation of band brakes and pneumatic railway brakes.

*Band Brakes.* The best form of band brake consists of a metal or leather band completely encir-

*Example of Gripping Track Brake.*

Compressed-Air Safety Clutch on an Incline Railway.

but occasionally track brakes are employed, and electric cars may always be braked electrically through the motors.

*Band brakes* are used on automobiles exclusively, and on hoisting-engines, crane motors, and electric elevator motors.

*Disk brakes* have been tried for street cars, but have been abandoned. The best example of the disk brake is found in the speed-governor of the phonograph, where a fly-ball governor presses against a friction disk when the correct speed is just exceeded. Some types of geared hoisting blocks use disk brakes to hold the load against running down. Cone brakes are sometimes used in such appliances.

*Eddy-current brakes* are used chiefly in electric meters, where they regulate the speed to the proper amount for correct registry.

*Track brakes* are either simple friction shoes or gripping jaws. A track-brake frequently employed for electric cars uses friction shoes in conjunction with shoe wheel-brakes and electric braking.

*Band Brake on an Electric Hoisting Winch.*

cling a smoothly turned hub or rim on the axle to be braked. The ends of a band are not joined directly, but have one of two forms of connection: (1) One end may be fastened to a fixed support adjacent to the brake rim, while the other end is hitched to a lever so pivoted that a pull on the handle exerts a multiplied pull on the band. The rotation of the axle should be in the direction from the fixed support toward the lever end of the band, so that the band tends to draw itself tight by the drag of the wheel, the lever having little more to do than take up the slack. (2) Both ends of the band may be fastened to the lever, being attached on the same side of the fulcrum, but at different distances from it. Such a brake, if these distances from the fulcrum are suitably proportioned, will draw itself tight just as soon as the lever is pulled enough to lay the band snug on the brake rim. An enormous braking force may be obtained with very slight pull on the lever; in fact, unless the band when released by the lever holds itself clear of the rim it may draw itself into full action by slight initial contact friction.

*The Railway Air-Brake.* Railway vehicles, which have smooth iron wheels running on smooth steel track, may be braked only with a limited force, for so soon as the wheels are held hard enough to slip on the track, or skid, the braking effect on the train is much reduced. On the other hand, short of skidding it is desirable to have the maximum braking force so that trains may be stopped at a reasonably short distance. Hand brakes are so slow in applying, and usually give so low a braking force, that modern fast railway traffic could not be operated safely or conveniently without a more rapid and powerful yet accurately controlled brake. The automatic compressed-air brake invented by George Westinghouse in 1872 meets these requirements almost ideally, and therefore it has been a prime factor in modern railway development.

*Straight-Air Brake.* For braking a single car, and sometimes for braking short trains, the fundamental or straight-air system of compressed-air braking is used. It comprises a cylinder fixed to the car floor, whose piston is linked to a set of levers arranged to press a brake shoe against each wheel. A steam or electric-driven compressor pumps air into a reservoir, and a hand valve may either admit compressed air from the reservoir to the cylinder or release air from the cylinder. The reservoir pressure being kept up to a fixed point—say 40 lbs. per sq. in.—the cylinder when

fully charged will always exert the same piston pressure—hence the same brake pressure—which is adjusted to be a maximum, yet not able to skid the wheels.

This system, widely applied to electric cars, includes a compact motor-driven compressor and a pressure governor. The latter communicates with the air reservoir; when the reservoir pressure falls below normal, the governor throws an electric switch and starts the compressor, while as soon as the pressure is up to normal again it opens the switch and stops the compressor. Thus the brake apparatus requires no attention, the motorman simply applying or releasing the air as needed to check or again free his car.

*The Automatic Brake.* If a train braked by the straight-air system were to pull in two, the air would all escape and no braking power would be left on either part. This dangerous condition must be avoided. Also, if in a straight-air system on a long train the engine-man (at the head end) were to open the brake valve and admit air through a continuous brake-pipe to the brakes of all the cars, the first cars would be braked first, while the air would flow slowly to the following cars, and so delay their braking; this would cause the train to crowd together with destructive force, and therefore such a brake system could not be used safely on long trains. Westinghouse's automatic brake system overcomes both of these difficulties. The primary part of each car equipment is the same as already described; *i.e.*, brake cylinder and system of brake rods and levers (the brake rigging); this cylinder is not supplied directly from the train pipe, however, but from a storage reservoir on the car itself (auxiliary reservoir). Between reservoir and cylinder is interposed a highly ingenious multiplex valve, the famous 'triple valve,' which controls the admission of air to the brake cylinder and its release therefrom. This valve is set in action by pressure fluctuations in the train pipe, as follows:

The train pipe normally is full of compressed air, at reservoir pressure. The engineer of the train has at his hand in the engine cab a valve controlling this train pipe—the engineer's valve. Turning its handle closes off the train pipe from the main or pump reservoir, and opens an exhaust hole which releases air from the train pipe. Now the train-pipe pressure falls, the wave of pressure-reduction passing through the train at high speed (with the velocity of sound). At each triple valve the pressure-reduction shifts

a valve plug and opens temporary communication from auxiliary reservoir to brake cylinder. This sets all the brakes. Owing to the way the valve plugs of the triple valve are controlled, the braking force developed in the brake cylinders is proportioned to the pressure-reduction in the train pipe. Thus, the train pipe containing normally a pressure of 70 lbs. per sq. in., a reduction of 10 lbs. applies the brakes moderately, a reduction of 20 lbs. applies them about twice as hard, etc. For maximum rapidity of stopping the train in emergency (as to prevent collision), a further action is provided for: When the train-pipe pressure is reduced very sharply, by a large opening of the engineer's valve (or by an emergency valve contained in each car), the plug of the triple valve is thrown farther than ordinarily, and opens a passage from train pipe to the atmosphere so as to still further release air from the train pipe and reinforce the pressure-reduction wave traveling along the column of air in the pipe. This action gives the maximum braking force, in the shortest possible time.

With this system, when the train breaks apart it tears the hose couplings of the train pipe and releases the air in the latter very suddenly. This promptly applies the brakes on all cars of both parts of the train with 'emergency' force.

To release the brakes after having applied them, the engineer simply turns his valve so as to admit fresh compressed air from the main pump reservoir to the train pipe. The increase of pressure, when it reaches the triple valve of each car, returns the plug of the latter, connects the brake cylinder with the atmosphere so as to exhaust its contained pressure, and connects the auxiliary reservoir to the train pipe so as to recharge the auxiliary.

This system has been brought to a high degree of perfection by mechanical refinement of manufacture and by additional devices and improvements. A notable improvement is a brake system which permits of increased braking effect, based on a peculiar phenomenon. It is found that when a train is running at high speed, it can stand a much higher brake-shoe pressure, without skidding the wheels, than at low speed. It is permissible, therefore, to put a very high pressure into the brake cylinders at the start of the braking, provided this pressure is gradually reduced to about two-thirds the initial value as the train slows up. This principle is utilized by employing a very high reservoir pressure—even 100 or 110 lbs. per sq. in.—which goes

*Detailed Diagram of the Air-Brake Apparatus on a Freight Car.*

The hose at either end of the car is coupled to the hose of the adjoining car, so that the train pipe becomes continuous throughout the train. The pin at the end of the brake-cylinder piston rod is connected with a lever adapted to pull the eight brake shoes (one on each wheel) against the wheel rims.

*Air-Brake Equipment on Passenger-Car Truck (car body removed.)*

At the right is the auxiliary reservoir, with the triple-valve attached at the front. The brake cylinder is at the left, in front of it being the automatic brake-slack adjuster. The system of levers leads from the piston rod at the far end of the brake cylinder to the brake-beams. The brake-beam for the near pair of wheels is seen in the foreground, with brake shoes attached. The train-pipe, on the car body, will be connected with the pipe elbow at the bottom of the near side of the triple-valve.

into the brake cylinder when the brakes are first applied. The brake cylinder, however, has a small escape valve, through which its charge slowly escapes to the atmosphere, and this valve gradually closes under pressure of a spring. The adjustment of the device is such that by the time the train is nearly stopped the brake cylinder pressure is only moderate and the escape valve is shut, thus holding the brakes on.

In the practical application of the automatic brake, every car must be equipped with a longitudinal air pipe under the floor, provided at either end with a short length of hose, terminating in a coupling, so that it can be connected up with the adjoining cars. The locomotive carries a small direct-acting, steam-driven compressor, started and stopped by a governor controlled by the pressure in the main reservoir. The locomotive has also a set of brake shoes and cylinder and valve like each car, but usually the locomotive brakes can be applied independently of those in the train.

The use of the automatic air brake has been made compulsory on railways in the United States by Congress, as a necessary safety appliance, and it is now universal, every passenger car and practically every freight car being equipped with it.

A simple and useful brake for short trains is the *vacuum brake*, which acts somewhat in an opposite manner to the air brake. The brake cylinders work by having air exhausted from one side of the piston, so that the atmospheric pressure on the other side moves the piston and thus applies the brakes. A steam ejector on the locomotive produces the vacuum in the train pipe. Such brakes work very smoothly, but more slowly than the compressed-air brake.

Modern motor cars have commonly two sets of brakes, one set being used for ordinary purposes, and the other kept in reserve for emergency stops. The emergency brake is most often operated by a hand lever, with a pawl and ratchet to lock it in the applied position, and the other brake by a foot lever. (See MOTOR CARS.) So far, no form of brake has been devised for ships sufficiently successful to be generally adopted, although a system of wings or fins projected out into the water at right angles from the hull has been tried with modified success. Steamships, however, can reduce speed quickly by reversing their paddle wheels or propellers. In flying machines, a braking effect can be secured by tilting the height-control planes for a sudden rise (see FLYING MACHINES).

**Bra'ma**, or RAY'S BREAM (*Brama raii*), a genus of bony fishes of the Chaetodontidæ. In this genus the body is laterally compressed and more or less deep, the spinous portion of the long dorsal fin is not well developed, and the tail is deeply forked. Its total length may be as much as 2 feet. The flesh is said to be good eating.

**Bra'mah**, JOSEPH (1748-1814), English mechanical inventor, was born at Stainborough in Yorkshire; worked for some time in London as a cabinet maker. In 1796 he invented the hydraulic press that bears his name (see HYDRAULIC MACHINERY). In 1806 he patented a machine for printing bank notes which was adopted by the Bank of England. He also devised improvements in locks, pumps, wheel carriages, engine boilers, fire engines, and paper making. Consult Smiles' *Industrial Biography*.

**Bramante**, brä-män'tā, DONATO D'AGNOLO (1444-1514), Italian architect of the Renaissance, was born near Urbino. He at first studied painting, but upon reaching Milan (1472) he devoted himself to architecture. He next settled (1499) in Rome, and became a favorite with Pope Julius II. His chief works are the joining of the Belvedere Palace with the Vatican by means of two grand galleries (*loggie*), and the rebuilding of St. Peter's at Rome, begun in 1506, and finished, with alterations by Michelangelo and others, after his death. In the Raphael Palace and the chancery and church of San Lorenzo, in Rome, he showed a predilection for Grecian architecture, in which he instructed his nephew Raphael (q. v.), whose genius he was the first to bring to light. Bramante stands at the head of the Renaissance architects of Italy. Breadth, mass, and classic grace are the principal characteristics of his style.

**Bramantino**, brä-män-tē'nō, whose proper name was BARTOLOMMEO SUARDI (?1470-c. 1535), Italian painter of the Lombard school, born at Milan. He was the pupil of Foppa and Leonardo da Vinci, then of the architect Bramante, hence his cognomen ('Little Bramante'). He occupied an important position in Milanese art after the departure of Leonardo in 1499, and influenced Luini and Gaudenzio Ferrari. In the meantime, however, he seems to have accompanied Bramante to Rome; for in 1506 he collaborated with Sodoma in Rome upon frescoes in the Vatican, afterward destroyed and replaced by those of Raphael. His chief works are to be found in Milan. There are six panels of heads by him in the South Kensington Museum, and

two frescoes in the Wallace collection.

**Brambanan**, bräm-bä'nän, or PARAMBANAN, a village of Java, 10 miles by rail east of Jokjokarta, with ruins of six groups of ancient temples, in all probability Buddhist. They resemble in plan and arrangement the famous temple of Boro-Budur. Local tradition puts their erection back to the second half of the thirteenth century. The edifices are composed entirely of hewn stone, and no mortar has been used in their construction.

**Bramble**. See BLACKBERRY.

**Brambling**, or BRAMBLE FINCH (*Fringilla montifringilla*), a beautiful little bird allied to the chaffinch (q. v.), which nests in Northern Europe and Asia, and migrates northward in autumn. It is occasionally caged for the sake of its song.

**Bramhall**, JOHN (1594-1663), Irish prelate; a scion of the Bramhalls of Bramhall Hall, Cheshire, England; passed over to Ireland in 1633 as Wentworth's chaplain, was consecrated bishop of Derry (1634), and became one of Wentworth's chief agents in his proceedings against the recusants and the covenanting Ulster Scots. On Stafford's impeachment Bramhall was also imprisoned and impeached by the Irish Commons, but was liberated by the king. At the Restoration he became archbishop of Armagh, and rigorously carried out his policy of compelling conformity.

**Brampton**, town, county seat of Peel county, Ontario, Canada, on the Grand Trunk and Canadian Pacific Railroads; 20 miles northwest of Toronto. It has manufactures of flour, boots and shoes, bricks, elevators, and office supplies. Pop. (1900) 2,748; (1911) 3,412.

**Brampton**, BARON. See HAWKINS, SIR HENRY.

**Bramwell**, SIR FREDERICK JOSEPH (1818-1903), British engineer, was born in London. After some experience as manager of an engineering factory, he started business as a civil engineer, and obtained an extensive practice. He was president of the Institute of Civil Engineers (1884-5), chairman of the executive committee of the Inventions Exhibition (1884), and president of the British Association (1888). In 1874-5 he acted as president of the Institute of Mechanical Engineers.

**Bramwell**, JOHN MILNE (1852), Scottish physician, was born at Perth, and studied in Edinburgh. He practised for some years at Goole in Yorkshire, and after 1889 attracted considerable attention by his publications on hypnotism and his treatment by suggestion. He settled in London in 1892. His

works include: *James Braid, Surgeon and Hypnotist; Hypnotic Anæsthesia; Suggestion, Its Place in Medicine and Scientific Research; Dipsomania and its Treatment by Suggestion; Hypnotism: its History, Practice, and Theory* (1903); *Hypnotism and Treatment by Suggestion* (1909).

**Bran** is the material obtained from the outer covering or husk of grain during the process of grinding, and which is separated from the finer flour before the latter is made into bread. It is generally met with in commerce in thin, scaly, yellowish-brown particles, with sharp edges. Wheat bran is the most common kind, although rye, corn, and rice brans are sold in considerable quantities. In 100 parts of wheat bran, on an average, are approximately 12 parts of water, 6 parts ash, 15.5 parts protein, 4 parts fat, 9 parts fibre, and 53.5 parts nitrogen free extract.

The main uses to which bran is put are in the feeding of horses, cattle, and poultry, and in clearing and brightening goods during the processes of dyeing and calico printing. In the practice of medicine, bran is employed as a warm poultice in abdominal inflammation, spasms, etc., and an infusion is used as an emollient foot bath.

**Bran**, a name in Celtic legend variously associated with the hero of the Welsh *Mabinogion* of *Branwen*, the hero of the eighth-century Irish epic, *The Voyage of Bran*, and the dog in Ossian's *Fingal*.

**Branch.** See BRANCHING.

**Branchiæ.** See GILLS.

**Branchidæ**, brang'ki-dē, an ancient town near Miletus, on the coast of Asia Minor, famous for its temple and oracle of Apollo Didymæus.

**Branching.** When any part of a plant gives rise to second parts similar to itself, it is said to *branch*. Thus, a stem forms stem branches, and a root forms root branches. More strictly, however, the term is restrained to the ramification of stems. The growing point in many cryptogams forks constantly, while in the higher plants we have a potential branch in every vegetative bud except the terminal one which continues the main axis (see BUD). The number and position of the branches is thus in the first place determined by those of the leaves; but in the vast majority of cases such exuberant ramification is impossible, and many or most of such buds perish early or never even develop.

The general aspect of trees depends more upon their mode of branching than the form of exuberance of their foliage. The angle at which branches come off varies

largely; usually ascending and acute, they may be at a right angle—e.g., cedar—or even droop, as in 'weeping' trees. In the conifers, it may be noticed that the shortened branchlet of the larch, with its tuft of needle-like leaves, is represented in the pines by a still more reduced form, which has only two leaves, surrounded at the base by a number of bud scales. When the vegetative life of these ceases, the branchlet is disarticulated as a whole—a fact the more curious in relation to the separation of the large lower branches of the stem, which also snap off, leaving a clean cicatrix.

Branches may arise either from the sides of the parent structure (*monopodial branching*), or from division of its growing apex (*dichotomous branching*). In the former case the branch or branches may remain subordinate in size and position to the parent axis (*racemose branching*), or may displace and overtop it (*cymose branching*). In many forest trees—e.g., lime, elm, birch, etc.—the buds which are formed throughout the growth of any one year grow out, during the following spring, into lateral branches, the branching being thus typically racemose. The last formed bud, however, grows very rapidly, and pushes to one side the prolongation of the main axis, taking its place, and becoming the main axis of the following year, so that the sequence of racemose branching is annually interrupted by the occurrence of a single cymose branching at the end of each year's growth.

In the common lilac, a very similar mode of annual cymose branching may be observed; but in this case the branches are arranged in pairs and the last pair of buds formed in each year grow equally, forming two main axes of the second year, while the prolongation of the preceding main axis dies. When two new main axes arise, as in the lilac, the cyme is said to be *biparous*; when only one, as in the lime, etc., it is said to be *uniparous*.

The underground branches of a rhizome are often thickened as *tubers*; or they may send up tertiary branches to become new ascending axes—the *suckers* of the raspberry or rose. A *stolon* is a prostrate branch which roots at the tips and then develops an ascending branch; it may often be long and threadlike, and is then called a *runner* (strawberry).

**Bran'chiop'oda**, a sub-order of Crustaceans in the order with leaf-like feet (Phyllopoda). The name ('gill-footed') refers to the fact that many of the numerous (10-40 pairs) appendages bear respiratory appendages. The body

is distinctly jointed; the shell may be absent, shield shaped, or bivalved; there are well-developed steering antennæ; the eggs are borne on several of the legs, or, in Branchipoda and Artemia, in a special brood sac. The heart is unusually elongated. They are mostly comparatively small, though not microscopic. None of the Branchiopoda are marine; a few live in salt lakes and brine pools; the rest in fresh water, in pools, ponds, marshes, lakes, etc.

**Branco, Cape**, bräng'kō, headland, Parahyba state, Brazil, 60 miles north of Pernambuco, forms the most easterly point of the South American continent.

**Branco, Rio** ('white river'), a river of Northern Brazil, rises in the Parima Mountains, between Venezuela and Brazil, and after a course of 400 miles joins the Rio Negro, a tributary of the Amazon.

**Brancovan**, bräng'kō-vän, CONSTANTIN (1654-1714), prince of Wallachia from 1688; rendered great service to the Porte in the campaign against Austria in 1690, and helped Tököly (q. v.) to become prince of Transylvania. In the contest between the Porte and Peter the Great of Russia his attitude was doubtful, but in the disastrous campaign of Peter the Great on the Pruth, when he was forced to make peace (1712), Brancovan again took the part of the Porte; whereas Dmitrii Cantemir, the prince of Moldavia, rendered all possible assistance to Russia. Notwithstanding that, Brancovan was accused of treason, deposed, carried prisoner to Constantinople, and put to death, together with his four sons (1714), and his fortune was confiscated. See ROUMANIA.

**Brand** is the mark made upon the skins of cattle for the purpose of recognition by the owner, as in cattle ranches, and is produced by searing with a hot iron; or a mark made in the same way on a cask or box for trade or excise purposes. The branding of criminals is treated in a separate article (see BRANDING).

**Brand**, bränt, SIR JAN HENDRIK (1823-88), president of the Orange Free State, was born at Cape Town. He practised as a barrister till 1863, when he was elected president of the Boer state, a position which he held for four successive terms of five years each. At the beginning of the struggle between Great Britain and the Transvaal in 1880, Brand maintained the strict neutrality of his republic, and was present as mediator in 1881 at the conference which led to the final arrangement of peace after the British defeat at Majuba Hill.

**Brand**, JOHN (1744-1806), English antiquary, born in Durham.

In 1784 he was presented to a rectory in the city of London, and in the same year became secretary of the Society of Antiquaries. His *Observations on Popular Antiquities*, first published in 1777, and edited with additions by Sir Henry Ellis (3 vols. 1813), was corrected, extended, and rearranged alphabetically as *Faiths and Folklore of the World* by W. C. Hazlitt in 1905.

**Brande, WILLIAM THOMAS** (1788-1866), English chemist, was born in London. He became professor of chemistry to the Apothecaries' Company (1812), succeeded Davy in the same capacity at the Royal Institution (1813), and in 1854 became chief officer of the coinage department at the Mint. He was author of a *Manual of Chemistry* (1819), *Elements of Chemistry* (1831), and a *Dictionary of Pharmacy and Materia Medica* (1839), and edited the *Dictionary of Science, Literature, and Art*.

**Brandege, FRANK BOSWORTH** (1864), American legislator, was born in New London, Conn. He was graduated from Yale in 1885, and was admitted to the bar. In 1888 he was elected to the State assembly, and again in 1899, when he was speaker. From 1902 to 1905 he was a member of Congress; and from 1905 to 1915 was U. S. Senator.

**Brandeis, brän'dis, FREDERICK** (1855-99), Austro-American musician, was born in Vienna, and studied the pianoforte and composition under Viennese masters. He was brought by his parents to America in 1849, and after engagements in concert tours, settled in New York in 1855. There he occupied himself with composition and as an organist, holding positions in several prominent churches. His orchestral compositions include *Dulce est pro Patria Mori* and *Prelude to Schiller's 'Maria Stuart'*, and many pieces for the organ, piano, and voice. He is the composer of 'My Love is like the Red, Red Rose.'

**Brandeis, LOUIS DEMBITZ** (1856), American jurist and U. S. Supreme Court Justice, was born in Louisville, Ky. He was graduated from the Harvard Law School in 1877, after which he took up the practice of law in Boston. In 1908 he was counsel for the Anti-Merger League, to prevent the merger of the New York, New Haven, and Hartford and the Boston and Maine Railroads; in 1910 counsel for Louis B. Glavis in the Ballinger-Pinchot investigation; and in 1911 and 1913 counsel for shippers in the advanced freight rate investigations before the Interstate Commerce Commission. He has been counsel for the people in the proceed-

ings involving the constitutionality of the women's ten-hour laws in Oregon and Illinois, the California eight-hour law, and the minimum wage law in Oregon; and for the preservation of the Boston municipal subway system, and the establishment of the Boston sliding scale gas system and the Massachusetts savings banks insurance. In 1910 he was chairman of the arbitration board in the New York garment workers' strike. He was appointed by President Wilson in 1916 to succeed Justice Lamar, deceased, as Associate Justice of the U. S. Supreme Court—the first Hebrew to hold that office.

occupation for a considerable number of the inhabitants. The chief manufactures are cotton, wool, linen, sugar, glass, tiles, and machinery. There are also numerous distilleries. Berlin is the capital. Other important towns are Frankfort-on-the-Oder, Potsdam, Charlottenburg, Spandau, and Brandenburg. Area, 15,383 square miles. Pop. (1900) 3,108,554; (1910) 4,092,616.

In the beginning of the Christian era Brandenburg was inhabited by the Semnones, and afterward by Slavonic tribes. In 927 Henry I. defeated the latter at the Elbe, and plundered their capital of Brennibor, afterward

The Province of Brandenburg.

**Brandenburg, brän'den-böörch**, province of Prussia, occupying the middle of the North German plain—i.e., the Havel-Spree depression, the valleys of the middle Oder and its tributary the Warthe, and a part of the valley of the middle Elbe. Forty-six per cent. of the area is under cultivation, the most fertile land lying in the north and middle. Fruit, flax, hemp, and vines are cultivated. In the south, forests cover thirty-two per cent. of the area. Lignite is mined to the annual value of \$3,750,000; other mineral products are iron, lime, and gypsum. Shipping, agriculture, and the rearing of cattle afford

raising the district into a *Mark*. Albert the Bear became the first Margrave in 1134, and in 1356 it was made an electorate of the empire. In 1415 the emperor conferred the electoral dignity of Brandenburg upon Frederick, burgrave of Nuremberg, of the house of Hohenzollern. The mark or electorate became united with the duchy of Prussia in 1611, which, under the great elector, Frederick William I., shook off the suzerainty of Poland in 1657, to become, under the great elector's son Frederick, in 1701, the kingdom of Prussia. See Prussia.

**Brandenburg**, town, province, Brandenburg, Prussia, on the

River Havel; 38 miles southwest of Berlin. It produces baskets, bricks, leather, flour, and silks. From 949 to 1544 it was the seat of a bishop. Pop. (1910) 53,456.

**Brandes**, brän'des, CARL EDWARD COHEN (1847), Danish author, brother of Georg Brandes (q. v.), distinguished himself early as an Orientalist and original dramatist, as a member of the Folkething, as one of the best debaters of the Left since 1880, and as assistant editor of the influential *Morgenblad*, and subsequently of *Den Politiker*. Like his brother, a decided radical, with a somewhat pessimistic point of view, his brilliant talents are counterpoised by an irritating dogmatism. He has written several plays—e.g., *Lägemidler* (1881), *Et Besøg* (1882), *Under Loven* (1890), *Asgerd* (1895), *Vera* (1904), and *Haardt imod Haardt* (1904). A romance by him, *Jung Blut* (1899), led, because of its unveiled naturalism, first to a bitter controversy, and finally to a prosecution and fine.

**Brandes**, GEORG MORRIS COHEN (1842), Danish author and literary critic, of Jewish extraction, was born in Copenhagen. After graduating from the Copenhagen University (1864) he spent much time in travel and study in England and on the Continent, coming under the influence of Renan, Taine, and John Stuart Mill, to whose teaching the philosophical basis of his criticism may be traced. During this period he published *Aesthetic Studies*, *The French Aesthetics of Our Day: An Essay on Taine, Criticisms and Portraits*, and a translation of Mill's *The Subjection of Women*.

Brandes returned to Copenhagen in 1871, and as privatdocent in the University delivered the first of his great series of lectures on *Main Currents in the Literature of the Nineteenth Century* (published in 6 vols., 1871-82; Eng. trans. 1886). These lectures, attacking as they did the traditional prejudices and beliefs of Denmark, aroused a storm of protest from the orthodox, but gave Brandes a large following among the younger radicals. He defended himself in a number of able pamphlets and through the columns of *Nyt Dansk Maanedskrift*, and of *Det Nittende Aarhundrede*, of which he was co-editor (1874-7). In 1877 he removed to Berlin, where he remained until 1883, when he returned to Copenhagen as a public lecturer. He was later made professor in the University. In 1914 he made a brief visit to America.

The influence of Brandes in Scandinavia and on the Conti-

nent has been incalculable, though his one-sidedness and strong antipathies sometimes obscure his judgment, and his anti-clericalism closely approaches fanaticism. His great accomplishments have been the breathing of a new spirit into Danish literature and the substitution of a scientific method of criticism for narrow traditional standards of literary value.

Works not already mentioned include: *Danish Poets* (1877); *Ferdinand Lassalle* (1877; Eng. trans. 1911); *Lord Beaconsfield* (1879; Eng. trans. 1880); *Eminent Authors of the Nineteenth Century* (1882; Eng. trans. 1886); *Men and Works in European Literature* (1883); *Berlin as an Imperial Capital* (1884); *Impressions of Poland* (1888; Eng. trans. 1903); *Impressions of Russia* (1888; Eng. trans. 1889); *Essays* (1890); *William Shakespeare* (1898; Eng. trans. 1898), a remarkably sympathetic and authoritative study of the great English dramatist; *Poems* (1899); *Anatole France* (1905; Eng. trans. 1908); *Recollections of My Childhood and My Youth* (Eng. trans. 1900); *Erinnerungen* (1908).

**Branding** (cognate with Ger. *brennen*, 'burning') primarily denotes the impressing of a mark with hot iron upon men, beasts, or inanimate objects. From early times it was customary to brand felons and slaves with certain marks, which, being indelible, distinguished them for life from their fellow men. Hence the secondary application of 'brand' and 'stigmatize.' The Greeks marked their slaves with the stigma; in Rome runaway slaves (*fugitivi*) and thieves (*fures*) were branded with the letter F; and slaves and convicts were also branded on the forehead for identification.

Offenders against English law were branded on the breast, on the cheek and forehead, on the shoulder and hand, and on the cheek alone, according to circumstances, usually with a certain letter denoting the offence. Branding was the custom in France, where, until 1832, a letter or letters were branded on the shoulder of a galley slave; previously, the fleur-de-lis was the mark impressed. The famous Statute of Vagabonds under Edward VI. authorized the branding of the letter V on the breast of a runaway servant. In the same reign brawling in church was punished by branding with the letter F on the cheek as a fraymaker. In Great Britain, as in France, branding was abolished before the middle of the nineteenth century.

In the United States, branding was practised to some extent in colonial times; and Southern

planters were in the habit of branding their slaves on the hand with the master's initials before the Civil War.

**Brandis**, brän'dis, CHRISTIAN AUGUST (1790-1867), German philologist and philosopher, was born in Hildesheim, and was professor of philology at Bonn from 1822 till his death. He visited the principal libraries in Europe to prepare, with Bekker, the edition of the works of Aristotle (1831-6) undertaken by the Berlin Royal Academy of Science. His principal work was *Handbuch der Geschichte der Griechisch-römischen Philosophie* (1835-66).

**Brandl**, brän'd'l, ALOIS LEONHARD (1855), Austrian student of English literature, born at Innsbruck. He became professor of philology successively at Prague (1884), Göttingen (1888), Strassburg (1892), and Berlin (1895). He has written: *Coleridge und die Englische Romantik* (1886; Eng. trans.); *Geschichte der Mittellengischen Literatur* (1892); *Die Quellen des Weltaischen Dramas in England vor Shakespeare* (1898); *Persönliche Eindrücke von Amerikanischen Universitäten* (1907); *Geschichte der Allengischen Literatur* (1908); and edited a new issue of Schlegel and Tieck's German translation of Shakespeare.

**Branding** (*Lumbricus fœtidus*), an earthworm remarkable for its banded body. It is a small species, and much prized by anglers as bait.

**Brandon**, city, Manitoba, Canada, county seat of Brandon county, on the Assiniboine River, and the Canadian Pacific and Canadian Northern Railroads; 130 miles west of Winnipeg. It is the seat of a government experimental farm, Indian industrial school, insane asylum, and Baptist college. It is an important shipping point for wheat and lumber, and has grain elevators, flour and saw mills, machine shops, pump works, and breweries. Pop. (1901) 5,620; (1911) 13,839.

**Brandon**, town, Rutland county, Vermont, on the Rutland Railroad; 16 miles northwest of Rutland. Fine marble is quarried; bog iron, manganese, kaolin, and lignite are mined; and carriages and flour are manufactured. Pop. (1900) 2,759; (1910) 2,712.

**Brandon**, town, partly in Suffolk and partly in Norfolk, England, on the Little Ouse; 7 miles northwest of Thetford. The free grammar school dates from 1646. Considerable trade is done in grain, timber, coal, and rabbit skins. In 1870 implements of Neolithic times were discovered here. Pop. (1910) 8,863.

**Brandon**, CHARLES, DUKE OF SUFFOLK. See SUFFOLK.

**Brandon, RICHARD** (d. 1649), succeeded his father as public executioner (1640) of England, and is said to have beheaded Charles I., Strafford, Laud, and others.

**Brandon, St.** See BRENDAN, ST.

**Brandt, brânt, ENEVOLD, COUNT** (1738-72), Danish statesman, was, through the influence of his friend Struensee (q. v.), appointed (1770) chief warder to the imbecile Christian VII. As *maître de plaisir* of the court, he spent vast sums in frivolous amusements. His jealousy of Struensee led him to plot against that minister; but before he could take any action he was involved in the ruin of his former friend, and was beheaded.

**Brandy** (German *Branntwein*, 'burnt wine'; French *eau de vie*), a spirit prepared by the distillation of wines, the quality depending not only on the process, but also on the wine.

The fermented liquors or wines which are employed for the purpose are various, and contain a proportion of alcohol which runs from 10 to 25 per cent. of their weight. The red wines generally are preferred. In the seventeenth century French brandy was made only from white wine. About 1,000 gallons of wine give by distillation from 100 to 150 gallons of brandy, which varies in strength, but is generally diluted with water. When originally distilled, brandy is clear and colorless, and if wished to remain so, is received and kept in glass vessels; but when placed in wooden casks the spirit dissolves out the coloring matter of the wood, and acquires a light sherry tint, which may be deepened by burnt sugar and other coloring matter. The spirit owes its flavor and aroma to the presence of small quantities of furfurool, ceanthic, acetic, butyric, and other ethers. It contains from 47 to 80 per cent. of alcohol, the average being about 54 per cent.; the specific gravity varies from 0.9274 to 0.9342. Like other liquors, brandy is often concocted of alcohol flavored with the above ethers and diluted with water.

The most famous brandy is that distilled in the country round *Cognac*, in Charente, in the west of France. *Armagnac* is the brandy of another French district. The Germans use the name *Branntwein* for all kinds of grain spirit, or that distilled from plums, blueberries, etc. *Kirschwasser* or *kirschbranntwein* is distilled from cherries and their kernels. In the United States, brandy is also manufactured from cherries, apples (see APPLE JACK), pears, peaches, and other fruit.

Brandy, like other spirituous liquors, is subject to considerable adulteration, and it is a difficult matter to discriminate between the genuine article and a sophisticated or 'silent spirit' brandy. Generally it is agreed that a neutral spirit obtained by a patent still is not a true brandy; while a genuine brandy may be defined as one distilled from grape wines by a pot still. The best comes from the Charentes in France; but California, Australia, Spain, Algeria, Greece, Egypt, and Canada all export brandy. The Martell Star brandies are examples of genuine cognacs, rich in esters. Unfortunately, most of the French brandies are patent still products; hence many of them outside the Charentes are blended with cognac to improve their quality.

In deciding between brandies an analyst should determine the ethers (esters), furfuroid bases, acidity, aldehydes, and higher alcohols. The minimum for esters should be about 80 parts per 100,000 pure alcohol, and for furfurool about 0.75 part. This standard does not apply to vintage brandies, where the esters are often much lower. Examples:

QUANTITY IN PARTS PER 100,000 OF PURE ALCOHOL.

Constituents.	Genuine Brandy from Inferior Wine.	Genuine Cognac.	Sophisticated Brandy.
Acidity.....	35.38	94.76	51.8
Aldehydes.....	24.55	10.68	12.7
Alcohols (higher).....	173.60	287.94	422.9
Ethers (esters).....	98.71	116.82	40.8
Furfuroid bases.....	1.39	4.88	2.9
Total.....	333.63	515.08	531.1

Brandy is frequently administered as a stimulant, and in cases of suspended animation, exhaustion, and in mild diarrhoea. It may be used externally for checking hemorrhage and for hardening tender skin. See ALCOHOL; WINE.

**Brandy Station, village**, Culpeper county, Virginia; 55 miles southwest of Washington. It was the scene of several cavalry fights of the Civil War, notably those of June 9 and Oct. 11, 1863. In the former the Federals were defeated by the Confederates under General Stuart.

**Brandywine, Battle of.** Brandywine Creek, near Chadd's Ford, 50 miles from Philadelphia, was the scene of one of Washington's defeats. The British, under Howe and Cornwallis, landed 18,000 troops on the shores of Brandywine, intending to march to Philadelphia, but were opposed by 11,000 troops under Washington. After a frontal attack,

Washington, receiving no help from Sullivan, was forced to retreat and abandon Philadelphia (Sept. 11, 1777).

**Brandywine Creek** flows southeast through Chester county, Pa., and joins Christiana Creek near Wilmington, Del. It was the scene of the Battle of Brandywine (q. v.).

**Branford, town and borough**, New Haven county, Connecticut, on the Long Island Sound, and the New York, New Haven, and Hartford Railroad; 6 miles southeast of New Haven. The town is a summer resort, and has a good harbor. The Blackstone Memorial Library is a fine marble building. Manufactures include locks and hardware. Oyster culture, fruit farming, and granite quarrying are important industries. It was settled in 1644, and was originally called Tekotet. Pop. (1910) town, 6,047; borough, 2,560.

**Brangwyn, FRANK** (1867), English painter and etcher, was born in Bruges, Belgium. He worked for William Morris with designs for tapestries, etc., but left him when only sixteen and went to sea. He became president of the

Royal Society of British Artists, and a member of the National Academy. His paintings include: *Ashore* (1890); *Burial at Sea* (1891); *Salvage* (1891); *Convict Ship* (1892). His work is bold in design, rich in coloring, and essentially decorative. Renan wrote of his pictures, 'The eye rejoices before them; they swim in color.' His *Trade on the Beach* (1895) is in the Luxemburg, Paris; *The Scuffers* in the Sydney National Gallery; *St. Simon Stylites* in Venice; and his panel *Commerce* in the Royal Exchange, London. Among his etchings are: *Old Houses in Ghent*; *London Bridge*; *The Sawyers*; *The Paper Mill*. In 1915 he decorated the East Pavilion of the Panama Exposition. Consult S. Sparrow's *Frank Brangwyn* (1910).

**Brank** (in England), or BRANKS (in Scotland), a kind of bridle made of iron bands, formerly used to punish scolding women and those guilty of slander. It was

occasionally used as a punishment for fornication, and, still more rarely, for men guilty of abusive language. Nearly all dated specimens in British museums belong to the sixteenth and seventeenth centuries. The use of the brank in Great Britain died out about the middle of the nineteenth century.

**Brankovich**, GEORGE, prince of Servia from 1425, with intervals,

Specimens of Branks.

to 1455, served in the Turkish army under Bayazid II., and was made prisoner by Tamerlane. Two years after he became prince of Servia, Sultan Murad II. invaded that country, and Brankovich was forced to give up a part of it, to recognize the Turkish suzerainty over the part left to him, and to give his daughter to the Sultan in marriage. After being expelled from Servia, he took part with Janos Hunyadi (q. v.) in his expedition against the Turks, and regained the independence of Servia in 1444. After that, however, he was in continual conflict with Hunyadi, who often invaded Servia.

**Brantly**, EDOUARD (1844), French scientist, was born in Amiens, and was educated at the Ecole Normale Supérieure there. He then became professor at the College of Bourges, and subsequently director of physical instruction at the Sorbonne, where he remained until 1876, when he commenced a series of lectures in natural philosophy at the free school for advanced students. He has made numerous important researches in the field of electricity, including the invention of a valuable wireless telegraph receiver, and discoveries of electrostatic phenomena in batteries, positive discharge by gases, violet rays and incandescent bodies, and secrecy of wireless communication. For his exposition of radio-conductors the Paris Academy of Sciences awarded him the Houlelviqve Prize. For his wireless investigations he was made a Chevalier of the Legion of Honor, and Pope Leo XIII. invested him with the Order of Commander of St. Gregory the Great.

**Brann**, HENRY ATHANASIOS (1837), American priest, was born in Parkstown, County Meath, Ireland, and came to the United

States with his parents when twelve years old. He studied at St. Francis Xavier College at New York, St. Sulpice at Paris, and the American College at Rome, and was ordained in the Roman Catholic Church (1862). In 1863 he built the church of St. Cecelia in Englewood, N. J., and from 1870 to 1890 was rector at Kingsbridge and Fort Washington, New York City. Since 1890 he has been rector of St. Agnes' Church in that city. His congregation of about 10,000 is one of the largest in the city, largely composed of the traveling public and of dwellers in the great hotels. In 1910 the Pope made him a domestic prelate with the title of monsignor, and in 1912 he celebrated his golden jubilee as a priest. He has published: *The Age of Unreason* (1881); *Immortality of the Soul* (1882); *Life of Archbishop Hughes* (1909); *Waifs and Strays* (1909); *Life of Vincent de Paul* (1915).

**Brannan**, JOHN MILTON (1819-92), American soldier, was born in the District of Columbia, and graduated from West Point (1841). He served with distinction in the Mexican War, being brevetted captain for bravery at Contreras and Churubusco, and was employed in regular army duties until the outbreak of the Civil War, when he was appointed brigadier-general of volunteers. During 1862 and 1863 he was in command of the Department of Key West and on duty in the Department of the South; and from 1863 to the end of the war he was chief of artillery in the Department of the Cumberland. He was present at Chickamauga, Missionary Ridge, and the siege of Atlanta, and was brevetted major-general of the regular army in 1865. He was in charge of the troops at Ogdensburg, N. Y., at the time of the proposed Fenian raid into Canada in 1870, and he suppressed the railroad rioters in Philadelphia in 1877.

**Branner**, JOHN CASPAR (1850), American geologist, was born in New Market, Tenn., and was graduated from Cornell (1874). He entered the service of the Brazilian government as geologist (1875-7), and remained in Brazil in a private capacity and as the agent of the American Government until 1883. In 1885-92 he was professor of geology at the University of Indiana; and in 1892 became professor of geology at Leland Stanford University. In 1899 he was director of the Branner-Agassiz expedition to Brazil; in the same year became vice-president of Leland Stanford University; and in 1911 directed another expedition to Brazil. He has published: *From School to*

*College* (1905); *Geologic Work of Ants in Tropical America* (1911).

**Brant** (*Branta bernicla*), a small species of wild goose breeding among the Arctic Islands, and wintering along the Atlantic Coast of Europe and of North America as far south as North Carolina. It measures from 23 to 26 inches in length. The head, neck, and tail are black, with a small but conspicuous white patch on the neck; the back and wings brown; the under parts light gray and white. The birds fly in compact bodies, high over the sea and well out from the coast, feeding chiefly on eelgrass, which they tear up by the roots at low tide. Taken in early winter, the young are delicious game birds.

The Black Brant (*B. nigricans*) is a Pacific Coast species similar to the common brant. It breeds on the northeastern coast of Siberia, in Northern Alaska, and in the western part of the North American Arctic archipelago. The Snow Goose (*Chen hyperborea nivalis*) is sometimes known as the White Brant, and the American White-fronted Goose as the Gray or Prairie Brant.

**Brant**, JOSEPH (THAYENDANEGEA) (1742-1807), a noted Mohawk Indian chief. Through the favor of Sir William Johnson he was educated at Eleazer Wheelock's school at Lebanon, Conn. He fought with the English against the French in the French and Indian War, and against Pontiac in 1764. Becoming a missionary of the Church of England among his people, he translated the *Prayer Book* into the Mohawk language. In the American Revolution he received from the English a commission as colonel, and was a prominent figure in the frontier warfare in Western New York, sharing in the Cherry Valley Massacre (q. v.) and the Battle of Oriskany (q. v.). He was not present at the Wyoming Massacre (q. v.), as the English poet Thomas Campbell in his *Gertrude of Wyoming* represents him to have been. He consistently treated his prisoners with humanity. After the war he settled in Upper Canada, once more as a missionary of the Church of England, and is said to have founded the first Episcopal Church ever established in Canada. In 1786 he made a visit to England, and was entertained by Burke, Sheridan, and others. By some writers he is regarded as the ablest of all the Indian leaders in America. Consult Stone's *Life of Joseph Brant*; Eggleston and Seelye's *Brant and Red Jacket* ('Famous American Indians').

**Brant**, or BRANDT, SEBASTIAN (1457-1521), German poet and humanist, went to Basel in 1476;

became licentiate of canon law (1481) and doctor of law (1489), and in 1501 returned to Strassburg, his native city, which he served, first as syndic and later also as town clerk, until his death. He wrote many works both in Latin (mainly religious and political) and German, in prose and verse, popular and learned. The most successful of these was his famous satire *Narrenschiff* (1494), an account in Alsatian verse illustrated by rough woodcuts, of a ship sailing to Narragonia (Fool's Land), and having on board over a hundred fools, each having some representative folly. It was translated into Latin by Locher in 1496, and achieved great popularity; Low German and French translations appeared in the same year, and a Dutch translation in 1500. The English rendering of 1507 goes back to the French; but Barclay's *Ship of Fools* (1509) is mainly a free translation from Locher's Latin. The *Narrenschiff* has been edited by Zarncke (1854) and Goedeke (1872); an edition, with all the designs of the original, was issued by Bobertag in 1891.

**Brantford**, city, Ontario, Canada, county seat of Brant county, on Grand River, and on the Canadian National, the Toronto, Hamilton and Buffalo, and the Canadian Pacific Railroads; 25 miles southwest of Hamilton. Local electric lines connect with surrounding towns, and the Provincial and International Highways pass through the city. It is the seat of the Provincial School for the Blind, Collegiate Institute, a U. S. consular agency, and Mohawk Indian Institute; is the headquarters of the Indian Six Nations; and has a hospital and sanatorium, Soldiers' Home, Library, Y.M.C.A. and Y.W.C.A. buildings, and several parks.

Originally the centre of an excellent farming region, the city is now noted for its manufactures, the most important of which are agricultural implements, bricks and other clay products, iron, steel and wood products, electrical fittings, motor trucks, automatic scales, pumps, varnishes, silk, and clothing. The city's electrical power is supplied from Niagara Falls. Brantford was founded in 1823 and named in honor of Joseph Brant, the famous Mohawk chief, to whose memory a monument was erected in Victoria Square in 1887. Pop. (1901) 16,619; (1910) 23,132; (1920) 29,440.

**Branting**, KARL HJALMAR (1860- ), Swedish statesman, leader of the Social Democratic Party, was born in Stockholm. He was educated at private

schools in his native city and at the University of Upsala, and entered the journalistic field. He became editor of a small socialistic paper *Tiden* and later of the *Social-Demokraten*, and before long was known as the leading speaker and worker in the Social Democratic movement. In 1896 he was elected to the Swedish Riksdag, the first Social Democrat to sit in that body. He was premier of Sweden from March to December 1920, and was again elected to that position in October 1921. He was Swedish delegate to the League of Nations Assembly 1920-22, and received the Nobel Peace Prize in 1921.

**Brantôme**, brân-tôm, PIERRE DE BOURDEILLES, SEIGNEUR DE (1540-1614), French chronicler, was born in Périgord, of a noble family. He became abbé de Brantôme when only sixteen, but the greater part of his life was passed as a soldier and courtier. He accompanied Mary Queen of Scots to Holyrood in 1561, and afterward fought against the Huguenots in the first (1562) and third (1573) religious wars, and against the Turks (1564 and 1566). He was chamberlain to Charles IX. and Henry III.; but after the death of his patroness, Catherine de' Medici, he retired to Brantôme, and wrote his famous *Mémoires*.

**Bras d'Or**, brâ dor', LAKE, a gulf, Cape Breton Island, Canada, 50 miles long by 20 miles broad. The south end is connected by a ship canal with St. Peter's Bay, thus bisecting Cape Breton Island (q. v.).

**Brasenose College**. See OXFORD.

**Brash**. See PYROSIS.

**Brashear**, JOHN ALFRED (1840-1920), American manufacturer of astronomical and physical instruments, was born in Brownsville, Pa. He was educated in the public schools and at the age of sixteen was apprenticed to learn the pattern maker's trade. In 1870 he began constructing astronomical instruments. He was acting director of the Allegheny Observatory, and acting chancellor of the Western University of Pennsylvania (now the University of Pittsburgh), and received many honorary degrees in America and in Europe.

**Brasidas**, bras'i-das, son of Tellis, was the most famous and successful Spartan commander in the earlier part of the Peloponnesian War. He saved Methone from an Athenian invading force (431 B. C.), became ephor, and distinguished himself at Pylos in 425 B. C. The next year he defeated the Athenians outside Megara, and secured that city to Sparta. He was then on his way to Chalcidice, in Thrace, to

stir up disaffection among the Athenian subjects. Arriving there, he succeeded, by his policy of moderation and his energy, in securing Acanthus, Stagirus, Amphipolis, Scione, and Mende. He also accompanied Perdiccas, king of Macedonia, on an expedition against the Lyncestians, proving his military ability by a skilful retreat under difficulties. In 422 B. C. he gained a complete victory over an Athenian force under Cleon which was attempting to recover Amphipolis, but fell in the battle.

**Brass**, an alloy of copper and zinc in various proportions. The alloy was known to the Romans, though bronze, the alloy of copper and tin, was the material most used by the ancients. Brass is prepared by fusing the metals in the proportions of about three of copper to from two to one of zinc in plumbago or clay crucibles. First a little scrap brass is melted in the crucible with some flux or powdered charcoal; the copper is then added, and, when it is melted, the zinc. After it has stood in the furnace for some time, the alloy is cast into ingots or moulds. Sheet brass is prepared by casting into strips, and these are passed cold through rolls. The proportion of the two metals varies greatly according to the uses to which the alloy is to be put. A large proportion of zinc increases the lightness of the color, but reduces the tenacity and ductility of the alloy. Brass is highly tenacious, malleable, and ductile, and makes good castings. The addition of two to four per cent. iron gives a very hard and tenacious metal. Brass fittings in machinery are used for the bearings in which a revolving journal lies. This comparatively soft metal is introduced so that the shaft may not wear away.

**Brasses**. See MONUMENTAL BRASSES.

**Brasseur de Bourbourg**, brâ-sûr' de bôör-bôör', CHARLES ETIENNE (1814-74), French abbé, was born in Bourbourg. Proceeding to the United States in 1846, he was vicar-general at Boston, then a missionary (1848-64) in Central America and Mexico. He was the author of *Histoire de Canada* (1851), *Histoire . . . du Mexique et de l'Amérique Centrale dans les siècles antérieurs à Christophe Colomb* (1857-9), and other works dealing with the Maya civilization.

**Brassey**, THOMAS (1805-70), English engineer and railway contractor, was the son of a Cheshire farmer. In 1834-5 he executed contracts on the Grand Junction and London and Southampton Railways, and in 1836 moved to London, and began business in a large way as a railway contractor.

In 1847 and following years he constructed the Great Northern Railway, as well as railways in France, Italy, Spain, Canada, Australia, and India, the Crimean Railway, the Victoria Docks, London, and the East London Railway. His last contract was the Wolverhampton and Walsall Railway. He was said to have left a fortune of about £7,000,000.

**Brassey**, THOMAS, FIRST EARL (1836-1918), son of Thomas Brassey (q. v.), was born in Stafford, England. He was graduated from University College, Oxford; was elected for Devonport in the Liberal interest in 1865; was called to the bar in 1866, and in 1868 was elected M.P. for Hastings, which he represented until 1886. He became a civil lord of the Admiralty in 1880, and was secretary to the Admiralty in 1883-5. In 1895 he was appointed governor of Victoria, but retired early in 1900. He was founder and for a number of years editor of the *Naval Annual* and author of *Work and Wages* (1872), *British Seamen* (1877), *The Eastern Question* (1878), *Foreign Work and English Wages* (2nd ed. 1879), and *The British Navy* (5 vols., 1882-3). He was made K.C.B. in 1880 and baron in 1886. He was president of the Institute of Naval Architects in 1893-5.

**Brassica**, bras'i-ka, a genus of plants belonging to the Cruciferae and including the numerous varieties of Mustard (q. v.), and of the Turnip, Rape, Cabbage, Cauliflower, Kale, and Kohlrabi (qq. v.).

**Brassó**, Transylvania. See KRONSTADT.

**Braithwaite**, RICHARD (1588-1673), English poet, was born in Westmoreland, and lived there and in London. He was a prolific writer. His best known work, *Barnabæ Itinerarium*, or *Barnabee's Journal* (1638), also known as *Drunken Barnaby's Four Journeys*, was published under the pseudonym of Corymbæus, and is a popular record of English travel in mixed English and Latin verse. His other works include pastorals like *The Poet's Willow* (1614), satires like *A Strappado for the Devil* (1615), threnodies like *Astræa's Tears* (1641), and novels like *The Arcadian Princess* (1635).

**Bratlanu**, brä-ti-än', JON (1866- ), Roumanian statesman, son of Jon C. Bratianu (q. v.). He was educated in Bucharest and in Paris, entered upon a political career, and became the leader of the Liberal party. He was premier of Roumania in 1907-10, 1914-18, December 1918-November 1919, and was again elected in January 1922. He was Roumanian delegate to the Paris Conference of 1919.

**Bratlanu**, JON CONSTANTIN (1822-91), Roumanian statesman, was born in Pitesti, and was educated in Paris, where he took an active part in the revolution of 1848. Returning to Bucharest, he made himself one of the leaders of the revolution in Wallachia in the same year, and was elected a member of the provisional government. In 1866 he took a prominent part in calling to the Roumanian throne Prince Charles of Hohenzollern. From that time he was the leading statesman in the country, being prime minister from 1876 to 1888, a period during which Roumania took part in the Russo-Turkish War of 1877-8, became independent of Turkey, and was raised to the status of a kingdom (1881). In 1878 Bratlanu represented his country at the Congress of Berlin. During the period of his rule, also, a great number of administrative reforms were introduced in Roumania, railways were nationalized and developed, and schools and colleges were founded.

**Bratsberg**, bräts'berg, mountainous and picturesque county on the southern coast of Norway; area, 5,865 square miles. Fishing, forestry, and agriculture are the main occupations of the inhabitants. The chief town is Skien. Pop. 108,100.

**Brattia**. See BRAZZA.

**Brattleboro**, brät'l-bur-ō, village, Vermont, Windham county, on the Connecticut River, and on the Boston and Maine, and the Central Vermont Railroads; 7½ miles north of the Massachusetts boundary. The State Asylum for the Insane is situated here, and there is a public library. The beauty of the surrounding country is far famed, and the village is becoming a winter sports centre, having one of the finest ski jumps in the country. It is important in the maple sugar industry and produces furniture, pipe and cottage organs, toys, overalls, and finished granite. Pop. (1910) 6,517; (1920) 7,324.

**Bratton**. See BRACTON.

**Braun**, broun, AUGUST EMIL (1809-56), German archaeologist, was born in Gotha, and died in Rome. He studied under Schelling and Gerhard, and became secretary to the Archæological Institute of Rome in 1833. His chief works are *Griechische Götterlehre* (1851-55), *Vorschule der Kunstmythologie* (1854; Eng. trans. 1856), and *Die Ruinen und Museen Roms* (1854; Eng. trans. 1855).

**Braun**, (KARL) FERDINAND (1850-1918), German physicist, was born in Fulda. He studied at different German universities, completed his education in Scotland, and occupied professor-

ships successively at Marburg, Strassburg, Carlsruhe, and Tübingen, where he directed the construction of the Physical Institute. In 1895 he returned to Strassburg as professor of physics and director of the Physical Institute there. His studies were devoted for the most part to electricity, magnetism, and telegraphy. With the aid of Hartmann he constructed an ingenious apparatus for measuring the intensity of the magnetic field by means of a fine bismuth wire. In 1909 he shared with Marconi the Nobel Prize in Physics. In 1914 he visited the United States and was there at the time of his death, in 1918. His chief work was *Drahtlose Telegraphie durch Wasser und Luft* (1901).

**Braun**, LOUIS (1838-1916), German battle painter, was born in Württemberg. He studied with his brother Reinhold in Munich and later under Horace Vernet in Paris. He was official painter of the Franco-German war and made many striking pictures of that, as well as of the Danish and the Austro-Russian wars. Among his most famous paintings are *The Entry of the German Army into Paris*, *The Battle of Sedan*, *The Germans in Versailles*, and *The Market Place of Altiigny*.

**Braunsberg**, brouns'berch, town, East Prussia, district of Königsburg on the Passarge River; 39 miles southwest of Königsberg. It is the seat of a Roman Catholic seminary, a gymnasium and the Lyceum Hosianum founded in 1564. There is an interesting church of the 14th century. Soap, linen, cotton, and leather are manufactured. Pop. 14,000.

**Braunschweig**, Germany. See BRUNSWICK.

**Brauer**, ADRIAN. See BROUWER.

**Brava**, or BARAWA, seaport town, in Italian Somaliland, East Africa. Its trade is chiefly with India and Arabia. Pop. 5,000.

**Brava**, the southwesternmost of the Cape Verde Islands (q. v.). Pop. 10,000.

**Brava**, POINT, a cape north-west of St. Miguel Bay, Gulf of Panama.

**Bravura**, brä-voo'rá (Ital.), a term applied to a style of musical composition or performance. It denotes florid brilliancy and technical dexterity.

**Brawley**, city, California, Imperial county, on the Southern Pacific Railroad; 100 miles east of San Diego. Pop. (1910) 881; (1920) 5,389.

**Brawling**, the common law offence of wilfully disturbing any meeting of persons lawfully assembled for religious worship, or of misusing any preacher, teacher, or persons so assembled. It is

Stud  
Nov 24  
1927

a misdemeanor, punishable by fine. The offence is now defined and regulated by statute in the United States generally. See BREACH OF THE PEACE; ASSAULT.

**Brawn** (M. E. 'muscle,' 'boar's flesh'; akin to German *braten*, 'to roast'), a preparation of meat made from pig's head and ox feet, cut up, boiled, pickled, and pressed into a shape.

**Brax'field**, ROBERT MACQUEEN, LORD (1722-99), Scottish judge, was called to the bar in 1744, and gained the reputation of being the best feudal lawyer in Scotland. Raised to the bench in 1776, he became a lord of justiciary in 1780, and lord justice-clerk in 1788. His coarseness and cruelty on the bench won for him the names of the 'hanging judge' and the 'Jeffreys of Scotland.' An excellent study of him is given in R. L. Stevenson's *Weir of Hermiston*.

**Brax'ton**, CARTER (1736-97), signer of the Declaration of Independence, was born in Newington, Va., and received his education at William and Mary College. A wealthy man, he nevertheless embraced the patriot cause at an early period; was a supporter in the Virginia House of Burgesses of Patrick Henry's Stamp Act resolutions (1765); and took an active part in the Williamsburg convention (1774). He was a member of the Virginia Committee of Safety; a delegate to the Continental Congress (1775-6); a member of the first Virginia House of Delegates under the Constitution, and a member of the Virginia Council of State.

**Brax'y**, BRAKSY, BRAXES, BRAXIT, BRACKS, or BRAASOT, a name applied loosely to various animal diseases, but more strictly to a disease of sheep, sometimes known simply as 'the sickness.' This disease is due to the ingestion of the *Bacillus gastrimycolosis ovis*, and is most prevalent in cold weather. The animals affected, usually from one to three years old, lose control over their limbs, are seized with convulsions, and die in from one to six hours after the appearance of the first symptoms of the disease. The majority of cases are found dead, but in the few which have been noticed during life, the following symptoms have been observed: loss of appetite, walking with an arched back, short steps, signs of pain, hurried breathing, swelling of the abdomen, then convulsions and death. Putrefaction sets in almost before death. After death the flesh appears of a dark-red color, and the veins are charged with dark blood, the bowels are found much inflamed and filled with gases, but there are no other special symptoms to indi-

cate the disease. Adequate shelter from severe cold and rain are said to do much to prevent it. Vaccination with peritoneal fluid from diseased sheep has proven valuable.

**Bray**, town, Ireland, situated partly in the county of Dublin and partly in Wicklow; 12 miles southeast of Dublin. It is a favorite seaside resort, with fine scenery in the neighborhood. A good harbor has been constructed. Pop. 7,500.

**Bray**, district of Normandy, now the southeast part of Seine-Inférieure, famous for its cattle and dairy produce.

**Bray**, ANNA ELIZA KEMPE (1790-1883), English novelist, was born in London. Of her novels, some are concerned with foreign life, others with the history of the great Devonshire and Cornwall families. Her best general work is her *Borders of the Tamar and Tavy*. She wrote also a *Life of Handel* (1857); *Revolt of the Protestants of the Cevennes* (1870); *Henry de Pomeroy* (1842); *Warleigh* (1836); *A Peep at the Pixies* (1854). Consult her *Autobiography* (1884).

**Bray**, THOMAS (1656-1730), English divine and philanthropist, was born in Marton, Shropshire, England. From Oswestry School he passed to All Souls, Oxford, where he was graduated in 1678. In 1690 he was appointed to the rectory of Sheldon, where he wrote part of his *Catechetical Lectures*, which brought him a wide reputation. Soon after he was selected to act as the bishop of London's commissary in Maryland in the settlement of the church there. Not being able to start at once, he devoted himself to a scheme for establishing parochial libraries, and had such success that before his death eighty had been founded in England and thirty-nine in America. Out of his library scheme grew the Society for Promoting Christian Knowledge; and he may also be regarded as the founder of the Society for the Propagation of the Gospel. About the close of 1699 he sailed for Maryland, but in 1706 returned to England to accept the living of St. Botolph Without, Aldgate, London, where he labored with the utmost devotion.

**Bray**, VICAR OF. Simon Aleyn was vicar of Bray, in Berkshire, England, from 1540 to 1588, during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. He changed his faith three times, being twice a Papist and twice a Protestant, in order to adhere to his one principle, which was 'to live and die vicar of Bray.'

**Bray'man**, MASON (1813-95), American lawyer and soldier, was born in Buffalo, N. Y. He began life as a printer, and became edi-

tor of the *Buffalo Bulletin*, but turned to legal pursuits (1836), and lived in various towns in Michigan, Kentucky, and Illinois. In 1843 he was commissioned to inquire into the settlement of Mormons in the State of Illinois, and finally secured their removal (1844). During the Civil War he was chief of staff to M'Clermand, and rose to be brevet major-general. Subsequently he interested himself in railroad enterprises; edited *The Illinois State Journal*; was territorial governor of Idaho (1876-81); and a lawyer at Ripon, Wis.

**Brazen Head**, a mechanical contrivance which was fabulously reputed to possess the power of human speech, and to be capable of acting as a kind of oracle. Several are mentioned in the old necromancers and other books. One was made or owned by Pope Sylvester II. (c. 950-1003); another by Robert Grosseteste, bishop of Lincoln (1175-1253); another by Albertus Magnus (1193-1280); and another by Friar Bacon (1214-94), the most famous of all. The old folk tale of *Valentine and Orson* speaks of a large brazen head which acted as an oracle, and was kept in the castle of the giant Ferragus in Portugal.

**Brazen Serpent**, the figure which Moses set up before the Israelites, to heal those who had been poisoned by the serpents (Num. xxi. 9). It was destroyed by King Hezekiah after it had become an object of adoration (2 Kings xviii. 4).

**Brazil**, UNITED STATES OF, republic, South America, the largest state in South America and the third largest in the world, lies between latitude 4° 22' N. and 33° 45' S., and longitude 34° 40' and 73° 15' W. It is bounded on the north by Colombia, Venezuela, the Guianas, and the Atlantic Ocean; on the east by the Atlantic Ocean; on the south and west by Uruguay, Argentine Republic, Paraguay, Bolivia, Peru, Ecuador, and Colombia, bordering on every state in South America except Chile. The greatest length is 2,660 miles; the greatest breadth, 2,900 miles; and the area approximately 3,290,500 square miles. The most important harbors are Rio de Janeiro, Santos, and Bahia.

**Topography**. — Brazil is a triangular-shaped country, occupying the eastern angle of the continent. It lies almost wholly within the tropics, and is still in many parts unexplored and unsettled. On the north and west are the great depressions of the Amazon and Paraguay Rivers, which comprise large areas of flood plains and swamps, heavily wooded. The upper coast is bordered by low, alluvial bottom lands and sandy plains, full of

lakes, and in places very sterile; while the southern angle of the country is rolling *campo* land, bordered by a low, sandy coast.

The interior of the country is a high plateau, with a general elevation of 1,000 to 3,000 feet, irregularly ridged by mountains and deeply cut by large rivers. The mountainous ranges of the maritime system form the eastern margin of this plateau, the easternmost of which is known as the Serra do Mar. This range plays an important part in the development of Brazil, for it is a costly barrier to communication with the interior, and turns nearly all the great rivers inland to find outlets through the distant Amazon and La Plata. To the west of the maritime system the elevated table lands of the Paraná and São Francisco make great baylike indentations in the northern and southern margins of the mountainous area, nearly uniting about the head waters of the latter. To the westward of these plains there is a second range, nearly parallel with the maritime system, constituting the mountains of Goyaz. To the westward of these come the great elevated plains of the Amazonian and Upper Paraguayan regions.

Brazil belongs, for the most part, to four drainage basins: (1) the Amazon (q. v.) in the north, which flows through the country for nearly 2,000 miles, and which, with its tributaries—including the Rio Negro, Madeira, Tocantins, and Tapajos—furnishes 3,000 miles of navigable waterways, and forms the largest river basin in the world; (2) the Rio Paranahyba, also in the north; (3) the Rio São Francisco in the east; and (4) the Paraná-Paraguay system in the south. Besides these, several shorter rivers discharge direct into the Atlantic—e. g., the Jaguaribe, Grande do Belmonte, Doce, Itapicuru, Araguay, and Parahyba.

Large lakes, caused by the expansion of the rivers, are common in the Amazon basin. On the plateau they are also numerous; one of the largest (100 miles long by 25 broad) lies on the island of Bananal, in Goyaz.

**Climate.**—Brazil may be divided into three meteorological zones: (1) The Tropical Zone embraces the northern part of the country from 4° N. to 10° S., and has a mean temperature of 77° F. It is subdivided, according to humidity, into three regions: (a) the Upper Amazon, where the annual rainfall amounts to as much as 78 inches; (b) Matto Grosso and the interior of the states bordering on the Atlantic, with heavy rains in spring and summer, and an average rainfall of 46 inches; (c) the littoral, with rain in summer and autumn, and

an average rainfall of 58 inches. (2) The Subtropical Zone extends from 10° to 23½° S. It has a mean temperature of 74° at Rio de Janeiro, and a rainfall of 44 inches between November and April. (3) The Temperate Zone extends from the Tropic of Capricorn to the southern boundary. It possesses a fine climate, with mean temperature of 63° F., and a rainfall, chiefly in winter and autumn, of 40 to 60 inches.

**Geology.**—No comprehensive study has been made of the geology of Brazil. The Acré territory and parts of Amazonas, Matto Grosso, and Goyaz are almost entirely unknown. Indications, however, show that the prevailing rocks throughout the country are of Archæan formation, and that Brazil is geologically one of the oldest parts of the South American continent. On the flank of the Archæan area are Palæozoic strata; while a large portion of the central plains are formed of Cretaceous and Triassic beds. Along the Amazon and in the coastal regions Quaternary and Tertiary formations are developed. The coastal ranges are composed of gneiss and granite (Laurentian system); Carboniferous limestones prevail from Santa Catharina to Rio Grande do Sul.

The most highly mineralized sections are the highlands of Minas Geraes. The richest soil is the famous red earth of São Paulo, a disintegrated trap. On the higher lands and second bottom lands is found a red clay, while the bottom lands have a rich black soil.

**Flora.**—The vegetation of Brazil is luxuriant and varied. The vast forests of the Amazon contain hundreds of species of trees, draped and festooned by climbing plants, lianas, orchids, etc. The flora of the lands subject to inundation comprises forests of myrtle, rubber trees, bombax, mimosa, cinchona, etc., dominated by palms. Creeping plants are rare, but the ground grows tough grasses. American willow, plantains, palms, and the *Arundo saccharoides* (16 to 20 feet high) are found on the banks of the streams. In the virgin forest beyond the reach of floods the trees are tall (200 feet and more), and the trunks are draped with lianas bearing brilliantly colored flowers. The undergrowth consists of ferns and the phytelphas, yielding vegetable ivory. Along the Atlantic, from Pernambuco to Rio de Janeiro, mangroves and *conocarpos* grow. The *campos* are grass-covered plains, in the hollows of which grow cypresses and palms.

Other natural products include ten species of hevea (rubber), numerous fibre-producing plants,

seven species of copaiba; carnauba, cocoanut, piassava, and other palms; maté, Brazil nut, cacao, vanilla, and sarsaparilla.

The flowers of the temperate zone are common, while distinctive plants are the passion flower (100 varieties), the orchid (1,059 varieties), the *Aristolochia gigantes*, a climbing plant with flowers a foot long, and the *Victoria regia*, along the Amazon.

**Fauna.**—As regards fauna, Brazil occupies almost the whole of a sub-region of the neotropical region which extends from Mexico to Tierra del Fuego, and contains nearly all its characteristic types. Over fifty varieties of monkey, eight species of bat, the jaguar, puma, ocelot, several species of wild dog, the anta or tapir (the largest mammal), the peccary, five species of deer, the capybara, agouti, sloth, ant-eater, and two species of armadillo are among the animals.

The birds are numerous (1,700 varieties) and of brilliant plumage. There are 59 species of humming birds, 26 of Tanagridæ, and 65 of woodpeckers; while other birds are the flamingo, emeu, rhea, heron, stork, parrot, and macaw. Goatsuckers and the American ostrich belong to this region.

There are 180 varieties of snakes, of which 20 are venomous. They include the boa constrictor, bushmaster, rattlesnake, python, and anaconda. Alligators, turtles, porpoises, and manatees swarm in the Amazon. Insects are innumerable.

**Forestry.**—Brazil has vast forest regions, that of the Amazon alone covering over 2,000,000 square miles; and it has an abundance of valuable woods, as pine, cedar, mahogany, and ebony. The forests have been exploited for many years, and the Agronomical Institute of the Botanical Gardens distributes large numbers of saplings for the purpose of reforestation. There are several hundred lumber mills in the country. The railroad companies and sugar mills use native woods for ties and fuel. Approximately 90 per cent. of the large number of safety matches made in Brazil are manufactured from the Paraná pine.

**Fisheries.**—The waters of Brazil abound in fish of all kinds, Agassiz having discovered over 2,000 varieties in the Amazon alone; but up to 1912 no attempt had been made to modernize and extend the fishing industry. In that year the government established a fisheries inspection service, with 3 marine biological stations, and with practical schools. There are 13 whaling stations on the coast of Bahia. Fifty boats and 900 men are engaged in the industry.

**Mining.** — Comparatively little has been done to exploit the Brazilian mines. Minas Geraes and Bahia are the chief mining regions, yielding diamonds, gold, iron, manganese, and monazite. Gold is mined in Minas Geraes and is found in many other states. The principal mines are Morro Velho, worked since 1830, and Passagem. Coal suitable for briquets is found in Santa Catharina, São Paulo, and Rio Grande do Sul. Diamonds occur in Goyaz, São Paulo, Paraná, Bahia, Matto Grosso, and Minas Geraes. Manganese ores are found in Minas Geraes, Bahia and Rio de Janeiro, and iron occurs abundantly in Minas Geraes.

A large part of the monazite sand of the world comes from Brazil, and other mineral exports are copper ore, mica and talc, rock crystal, agate, and platinum, but these are not found in large quantities. Among the valuable stones, besides diamonds and agates, are marble, topaz, amethyst, garnet, aquamarine, ruby, tourmaline, and blue sapphire. Petroleum in workable quantities has been discovered, and there are some lignite and peat. There are famous sulphur springs at Araxa in Minas Geraes.

**Irrigation.** — The extreme northeast, between 2° and 7° s., the only section of the country that needs irrigation, is being surveyed, and storage dams, reservoirs, and artesian wells are under construction. The Oros reservoir in Ceará is said to be the largest in the world. A new inspection service maintains gauging stations on 33 rivers.

**Agriculture.** — Agriculture, which is encouraged by the state governments, is the principal occupation of the people, and agricultural products form the major part of the exports. On the Upper Amazon the chief occupation is the collection of india rubber, mostly wild. The world obtains its best rubber, the Para variety, from Brazil, the annual crop amounting to more than 25,000 tons. In the Atlantic states, farming is most developed. Coffee, the chief product, occupies about 5,500,000 acres, the chief districts being the states of São Paulo, Rio de Janeiro, Espírito Santo, and Minas Geraes, which comprise, together, about one-eighth of Brazil. Four-fifths of the world's supply of coffee comes from this region, more than one-half the coffee of the world coming from São Paulo alone. The annual crop is approximately 12,000,000 sacks (132 lbs. each). Cacao, indigenous in the Amazon Valley, is cultivated as far south as the

northern part of Espírito Santo. Bahia, with some 40,000,000 trees, produces 80 per cent. of the Brazilian crop, though the best quality comes from Maranhão. With an annual output of nearly 60,000 tons, Brazil ranks next to the Gold Coast of Africa among the countries of the world in the production of this commodity.

Sugar is grown principally in the northeast, and in Rio de Janeiro and São Paulo, the average annual output, under prevailing methods, being nearly 800,000 tons. The great tobacco state is Bahia. Cotton thrives in nearly all the states except in the Amazon Valley and the extreme south; the 1924-5 production was 131,000 tons. Maté, or yerba maté (Paraguayan tea), is grown chiefly in Paraná.

Successful experiments in wheat cultivation have been made, chiefly in Rio Grande do Sul, where the annual crop increased, in a recent five-year period, from 15,000 tons to 70,000 tons. Rice is grown in 15 varieties; but it is only within the last twenty years that scientific methods of cultivation have been attempted, the greatest progress having been made in the southern states, particularly São Paulo and Rio Grande do Sul. In these states the average yield per acre was 50 per cent. greater than in other parts of Brazil. São Paulo produces annually about 4,000,000 tons of corn. Beans, peas, sweet potatoes, and lentils are extensively cultivated for home consumption. Tropical fruits are abundant. The mulberry finds favorable conditions, and plantations are subsidized by the government, which also maintains sericulture experimental stations. The vine flourishes in the São Francisco Valley, and the native wines are of good quality.

The Federal Department of Agriculture was established in 1907; and the scientific methods which it promotes have made much progress in São Paulo, Minas Geraes, Rio de Janeiro, Rio Grande do Sul, Paraná, and Santa Catharina.

**Stock Raising.** — The vast plains furnish excellent facilities for stock raising, and rapid strides are being made in this industry. The Federal and state governments, as well as private corporations, have expended large sums of money in order to improve the stock in the states which are most suited to the industry — Rio Grande do Sul, Matto Grosso, Paraná, Santa Catharina, Piauhy, Goyaz, Minas Geraes, Rio de Janeiro, São Paulo, Bahia, and Ceará. The native cattle are small, weighing about 400 pounds when dressed,

but the size is being increased by cross breeding with imported stock from Texas, Belgium, England, and Switzerland. The stock of horses is being successfully improved by the importation of blooded strains, especially Arabian. Mules and asses, which do much of the carrying trade, are imported in large numbers from the Argentine Republic. Pigs are bred in Rio Grande do Sul, São Paulo, Minas Geraes, Santa Catharina, Goyaz, and Rio de Janeiro.

An agricultural census (1920) showed that there were in the republic 34,271,324 cattle; 16,168,549 swine; 7,933,437 sheep; 5,086,655 goats; 5,253,699 horses; and 1,865,259 mules. There are zootechnic stations, model stud farms, and a veterinary inspection service.

**Manufactures.** — The manufacturing industry is largely confined to the states of Rio de Janeiro, Bahia, São Paulo, and Rio Grande do Sul, and to the Federal District. Brazil has 19,734 factories (1920), with 350,000 employees, a total capital of \$500,000,000, and an annual output valued at \$750,000,000.

The textile industry is the most important manufacturing industry. In 1921 cotton factories numbered 242 and workers 108,960, capital amounted to more than \$80,000,000, and products were valued at \$100,000,000. About 200,000 yards of cotton cloth are produced annually. Woollen cloth, flannels, rugs, and felts are also manufactured, and the silk industry is encouraged by the government.

The manufacture of sugar is also an important industry; there are about 200 establishments in the country, distributed in Campos (Rio), Pernambuco, Bahia, and other localities. Other industries are the preparation and manufacture of hides and leather, shoes, of which about 20 million pairs are produced; hats; matches, of which some 28,800,000,000 are made every year; tobacco, over 2,000 factories employed; rubber; flour; paper; furniture; lumber; live stock and meat packing, of which there were 15 establishments in 1922 with a capital of 187,000,000 milreís; and brewing, distilling and the bottling of domestic mineral waters.

**Commerce.** — Brazil carries on a very large commerce. The total imports in 1925 were valued at \$406,162,136, and the exports at \$483,758,118. The amount and value of the leading exports for that year were as follows (all quantities are in metric tons, 2204.6 lbs. except for coffee): coffee, 13,482,000 sacks, \$348,-

\$20,282; rubber, 21,578 tons, \$21,471,889; tobacco, 34,178 tons \$10,539,246; sugar, 3,182 tons, \$271,616; yerba maté (Paraguayan tea), 86,755 tons, \$12,930,903; cacao, 64,525 tons, \$12,005,074; hides, 56,046 tons, \$14,176,226; chilled beef, 57,077 tons, \$8,459,716.

The principal countries participating in Brazil's trade in 1925 were: United States, imports, \$100,820,543, exports, \$218,168,992; United Kingdom, imports \$90,332,451, exports, \$24,175,366; France, imports, \$23,560,259, exports, \$61,534,880; Argentine Republic, imports, \$47,600,793, exports, \$25,806,952; Germany, imports, \$56,026,461, exports, \$32,728,169; Italy, imports, \$14,792,157, exports, \$30,516,478.

Extensive port improvements have been made at the principal ports. The merchant marine consists of 541 steamers with a net tonnage of 323,927. During 1924, 9,519 steam vessels, with a tonnage of 32,909,181, entered the ports of Brazil. There is steamer connection with the United States, the principal European countries, and Japan.

**Communications.**—Brazil was the first country in South America to have a steam railway, the concession for the first line being granted in 1852. On Jan. 1, 1924, there were 18,822 miles of railway in operation, of which 10,994 were owned and controlled by the government. The entire system connects the railways of Brazil, Argentine, Paraguay, and Uruguay. Most of the lines are owned either by the government, or by the states. They are principally in the coastal states of Rio de Janeiro, São Paulo, and Minas Geraes.

The most important railways are the Central (owned by the government), from Rio de Janeiro to Minas Geraes and São Paulo (1,563 miles); the Mogyana, in Minas Geraes and São Paulo (910 miles); the Sorocabana, in São Paulo (813 miles, to be extended to reach the Bolivian frontier); the Paulista, in São Paulo (690 miles), which is electrified from Jundeahy to Tatú; the São Paulo-Rio Grande, in Paraná and Santa Catharina (2,000 miles open). A railway is also being constructed for a length of 210 miles (100 miles open) round the cataracts and rapids of the Madeira and Mamore Rivers from Porto Velo to Guajara Mirim.

One of the most notable achievements has been the connecting of São Paulo with the southern states of Paraná, Santa Catharina, and Rio Grande do Sul, by a system of railways which places Grande do Sul in

direct communication with Rio de Janeiro. From the southern point, Uruguay can be entered overland across its northwestern border. From São Paulo, again, surveys have been made westward to the frontier of Paraguay; and in harmony with these extensions is a project to enter Argentine over the Rio de la Plata. Other lines are in course of construction or extension.

The chief means of communication with the interior are the navigable rivers, with a total length of some 40,000 miles, of which more than half is in actual use, through the work of some score of navigation companies. Two great highways are projected for Northern Brazil.

In 1920 there were 3,696 post offices, which handled some 12,000,000 pieces of mail. A postal savings bank was established in 1910, and parcel post treaties have been entered into with the United States, Great Britain, Germany, Austria, Italy, and several other nations. The Government controls the telegraph system, which, in 1919, had 54,526 miles of line and 850 offices, and dealt with 5,350,600 messages. There are telephone lines in Rio de Janeiro, São Paulo, Bahia, and Rio Grande do Sul. The government has five radio-telegraphic stations along the coast, and 15 in the interior, and there is cable connection with the United States and Europe. A wireless system is now (1927) in process of completion.

**Finance.**—In 1926, the revenue was estimated at 121,646,000 gold milreis, and the expenditure at 83,413,000 gold milreis. The consolidated foreign debt (Dec. 31, 1924) was £102,623,294, 336,206,500 francs, and \$67,050,500.

The monetary unit is the gold *milreis*, which is worth \$0.546 in American money; the paper *milreis* is worth about 32 cents. The *milreis* is divided into 1,000 parts, called *reis*. Silver (500, 1,000, and 2,000 *reis*) and gold (5, 10, and 20 *milreis*) coins are issued. Congress recently authorized the mintage of nickel coins of 20, 50, 100, 200, and 400 *reis*, and the retirement of bronze coins of 10, 20, and 40 *reis*. Paper money is circulated of the values of 1, 2, 5, 10, 20, 50, 100, 200, 500, and 1,000 *milreis*. By recent law, a new gold coin was issued valued at about \$5, and a new silver coin equal to  $\frac{1}{25}$  of the value of the gold coin. The metric system is used in all official departments, but the ancient measures are employed to some extent in rural districts in the interior.

**Population.**—The statistics of

population are unsatisfactory at best. Three official censuses have been taken, in 1872, in 1900, and in 1920. An estimate of the total population (1923) was 33,767,342. The table which follows is the 1923 estimate according to states.

STATES	Population
Federal District.....	1,260,498
Minas Geraes.....	6,401,923
São Paulo.....	5,169,945
Bahia.....	3,601,094
Rio Grande do Sul.....	2,433,467
Pernambuco.....	2,387,024
Rio de Janeiro.....	1,703,370
Ceará.....	1,421,514
Alagoas.....	1,049,256
Pará.....	1,124,849
Maranhão.....	961,430
Parahyba.....	1,077,025
Sergipe.....	501,266
Paraná.....	777,352
Piauhy.....	674,159
Amazonas.....	386,957
Santa Catharina.....	757,615
Espirito Santo.....	521,757
Goyaz.....	575,994
Rio Grande de Norte.....	601,930
Matto Grosso.....	279,419
Acré Territory.....	99,498
Total.....	33,767,342

The estimated population of the principal cities on Jan. 1, 1923, was: Rio de Janeiro, 1,442,000; São Paulo, 579,033; Bahia, 283,422; Recife, 238,843; Pará, 236,402; Porto Alegre, 179,263; Manaus, 75,704.

The most densely populated parts are the coastal regions and the adjoining valleys, together with some districts in the interior of Minas Geraes and the southern states. The population is mixed, the approximate proportions being, Europeans, 45 per cent.; Indian half breeds, 32 per cent.; negroes, 15 per cent.; pure Indians, 8 per cent.

Immigration has brought Portuguese, Spaniards, Italians, Poles, French, and other European races, and, for some years past, Japanese (averaging about 10,000 a year). In the southern states of Paraná, Santa Catharina, and Rio Grande do Sul there exist numerous colonies of Germans, amounting, in normal times, to nearly half a million persons in all. There are about an equal number of Italians scattered over Southern Brazil. The government has encouraged immigration by granting lands, and by forming immigrant colonies, of which there were 19 on Dec. 31, 1921, with total population of 44,459. There is an immigrant aid station at Rio de Janeiro. The number of immigrants received during 1924 was 98,125, as compared with 86,967 in 1923.

An Indian Protection Service was formed in 1910. The

principal tribes are the Caribs, Arawaks, Gessan (savages), and Tupi-Guarani.

**Religion.**—The Roman Catholic was the established religion under the empire; under the republic there is no state church, and all sects are tolerated. Except for some 100,000, however, all the people are Catholics. The Roman Catholic hierarchy includes a cardinal at Rio de Janeiro, archbishops at Bahia, Rio de Janeiro, São Paulo, Pará, and Mariana (Minas), and 44 suffragan bishops. Twenty seminaries furnish instruction to the clergy.

**Education.**—Up to 1911 each state had entire control of its own school system; but a decree issued in that year placed all elementary schools, and such higher institutions as secured subsidies, under the control of the Federal Board of Education. Institutions of higher learning are maintained by some states, and by private associations. Education is free, but not compulsory except in some states. There are 450 secondary schools, with 48,000 enrollment, 76 colleges granting teachers' diplomas, and some 22,000 primary schools attended by approximately 1,250,000 pupils. Many schools formerly gave degrees, but in 1911 that privilege was restricted to the colleges. Brazil has one official university in Rio de Janeiro, there are two private universities, at Manãos and Curityba, and degrees are conferred by 56 faculties. In Rio de Janeiro there are a military college, a naval school, a preparatory school of tactics and a school of aviation. The language is Portuguese, with dialectal varieties.

The Federal Government has in the capital a National Institute of Music and a School of Arts, as well as a school for the blind and the deaf. There are many public libraries; the National Library, in Rio, possesses over 400,000 books and manuscripts.

Much attention has been given to agricultural education, which is provided in the Superior School of Agriculture, in Rio (established 1913), and in four other agricultural schools. There are also various model farms, dairy schools, breeding stations, and other institutions devoted to agricultural pursuits. Industry and commerce are represented by 97 industrial schools and 48 commercial schools, respectively. Accurate statistics are not available but it is estimated that from 60 to 80 per cent. of the population is illiterate.

**Army and Navy.**—Military service is compulsory for all

males between the ages of twenty-one and forty-four—1 year in the ranks, 8 years in the first reserve, 7 years in the territorial army, and 7 years in the National Guard. The peace strength of the army is 45,000; there are 500,000 men in the reserve; while another 500,000 are available. There is a balloon and aeroplane section. A decree of Dec. 27, 1917, empowered the President to revise the Compulsory Service Act (1908), especially as regards: the principal of a national army, rather than a professional; the provision of first and second line armies, with their respective reserves; the setting of age limits for the first and second lines; and simplification of enlistment and drafting regulations. A decree of May 30, 1918, provided for incorporating the National Guard as part of the regular army, to constitute the second line, and to be responsible to the ministry of war, with the rest of the army.

The Brazilian navy consists of 2 dreadnoughts (*São Paulo*, and *Minas Geraes*), 3 protected cruisers, 1 coast-defence ship, 2 torpedo gunboats, 1 river monitor, 11 Yarrow destroyers, 3 submarines, a submarine salvage vessel, and a mine ship, besides school ships and transports.

**Government.**—Under the empire the government of Brazil was a constitutional monarchy. At the revolution of 1889 the empire became a republic, and in 1891 the present constitution was proclaimed by a national congress convoked by the provisional government. The United States of Brazil are a federative republic, each of the old provinces and the Federal District forming an organized state administering its own affairs at its own expense, and having distinct administrative, legislative, and judicial bodies. But the Federal Government takes charge of national defence, public order, and federal law, as well as customs, stamps, postal arrangements, and the issue of bank notes. The Republic consists of 20 states, a Federal District, and the Federal territory of Acre.

The national congress, the legislative authority, consists of a Chamber of Deputies and a Senate, which meet annually; and the president's sanction is required to new laws. Deputies and senators both receive salaries, and neither can serve as minister of state. Deputies who must have been citizens of the Republic for four years, are elected by the direct vote of the several states for three years, in the proportion of not more than one to 70,000 of the population. Senators, of whom there are 63, are chosen

by direct vote, three for each state, and three for the Federal district, for a term of nine years.

The President has supreme command of army and navy; has power to declare war and make peace, within certain defined limits; appoints and dismisses ministers, and, with the assent of Congress, appoints ambassadors and the judges of the Supreme Federal Court. He must be a native Brazilian, over thirty-five years of age, and must not be related by blood or marriage, in first or second degree, to the preceding president. The President serves for four years, and cannot serve two successive terms. Dr. Washington Luiz de Souza was elected March 1, 1926, succeeding Dr. Arturo da Silva Bernardes.

The Cabinet consists of the Ministers of Foreign Affairs, Justice, Interior and Public Works, Agriculture, and Industry and Commerce. There is a Supreme Court of 15 members.

All male citizens of twenty-one years, duly enrolled, exercise the franchise, except illiterates, beggars, soldiers in service, and monastics under vows.

The national capital is Rio de Janeiro, in the Federal District. Administration of the District is vested in a council elected by District citizens, executive power being exercised by a Prefect, whom the President appoints to hold office for four years.

**History.**—As early as 1480, expeditions sailed from Bristol in search of the island of Brasylle, rumored to exist in the western seas; Brazil was discovered on Jan. 26, 1500, by Vincente Yañez Pinzon, who landed at Cape St. Augustine, near Pernambuco, and then followed the coast north to the Orinoco. In the same year a Portuguese expedition to the East Indies, under Pedro Alvarez Cabral, discovered the Brazilian coast near Porto Seguro. Cabral took formal possession, and named his new discovery 'Terra da Vera Cruz.' Two Portuguese expeditions were sent out in 1501 and 1503, the first exploring the coast from 5° to 32° s. lat., and the second planting a colony and bringing back a rich cargo of Brazil-wood, which gave this name to Portugal's new possession.

In 1530 the Portuguese government resolved upon the definite settlement of Brazil. Many of the earliest colonies failed through lack of means, and from inability to hold their ground against the natives. In 1567 a Huguenot colony, established on the bay of Rio de Janeiro twelve years before, was overthrown by the Portuguese, who then founded the present capital of Brazil.

The first governor-general was appointed in 1549, and with him came six Jesuits, including Father Nobrega, 'the Apostle of Brazil,' who rendered important service in the first settlement and in the extension of colonization. From 1578 to 1640 Brazil, with Portugal, was under Spanish rule, with Bahia as the capital. The Dutch in the early seventeenth century succeeded in gaining control of the northern part of the country; and the Dutch-Portuguese alliance of 1641 delimited their respective territories. The Dutch colonists were driven out by the Portuguese in 1654, however; and by a treaty concluded in 1661, the Netherlands gave up all claim to Brazilian territory in consideration of the payment by Portugal of 8,000,000 florins.

The discovery of gold in Minas Geraes in 1693, and of diamonds in 1729, gave a new impetus to the growth of the country, one result of which was the removal of the colonial capital from Bahia to Rio de Janeiro. The cultivation of cotton, tobacco, and sugar-cane had already brought the land favorable notice and much prosperity. In the early nineteenth century Brazil is said to have contained 12 cities and 66 towns, and a total population of over 2,500,000. All manufactures except sugar were forbidden, and the ports were closed to foreign commerce.

In 1808 the royal family of Portugal was expelled by the French and took refuge in Brazil, and the first act of Dom João VI. was to open Brazilian ports to foreign commerce. He then removed various restrictions on domestic industries, founded a printing office and library, created new courts, and opened various schools and public institutions. All these acts greatly stimulated the growth of the country. In 1821 he returned to Portugal, leaving his eldest son in Brazil as prince-regent.

Personal ambition, and the advice of men opposed to government from Lisbon, led the young prince to declare for Brazilian independence (Sept. 7, 1822). He was proclaimed and crowned emperor—as Dom Pedro I., and before the end of the year the small Portuguese force in the country was quickly and easily expelled. The constitution was ratified and sworn to early in 1825, and some amendments were added in 1835.

The new empire, however, did not start smoothly, nor was the reign of Dom Pedro I. a fortunate one. Vexed with the opposition encountered, he voluntarily abdicated in 1831 in favor of his eldest son, and withdrew to Por-

tugal. During the next nine years Brazil was governed by regencies, but in 1840 a popular agitation led to the declaration of the young prince's majority, at fifteen years of age, and to his coronation the following year as Dom Pedro II. The reign was generally peaceful, although disturbed by two wars—one with Buenos Aires in 1852, and the other with Paraguay in 1856-70.

In 1851 the slave trade, inaugurated as early as 1530, was abolished. In 1871 infants born of slave mothers, and in 1885 all slaves over sixty years of age, were declared free. In 1888 an emancipation proclamation liberated all slaves within the empire, but failed to provide compensation for their owners. This act alienated the aristocratic slave-holding class, and hastened the revolution of November, 1889, by which the empire became a republic. Dom Pedro II. yielded to the will of the people, allowing himself to be dismissed from the country. He died in 1891.

The republican form of government was inaugurated on Nov. 15, 1889, and a new constitution was adopted in 1891. General Fonseca became the first president of the new republic; but two years later, when he dismissed Congress and assumed the rôle of dictator, he, too, was overthrown. The government for several years was occupied in suppressing revolt; but public confidence was restored by the wise and strong administration of President Moraes, and no serious trouble has been experienced since 1893.

Boundary adjustments have been made with Argentine (1895), French Guiana (1900), Bolivia (1902), British Guiana (1904), Ecuador (1904), Dutch Guiana (1906), Colombia (1907), Peru (1909), Uruguay (1913), Chile (1913), Colombia and Peru (1925); and the frontiers agreed upon have been delimited. The Acre Territory was acquired by the Bolivian treaty. In 1909 it presented a petition for statehood. Greenwich time and longitude were adopted in 1913. In that year the country was visited by P. C. Knox, U. S. Secretary of State; and in May, 1913, the visit was officially returned by the Brazilian Foreign Minister, L. S. Müller (q.v.).

The public health service has been placed on a high plane of efficiency, and the coast towns and parts of the interior have been freed from endemic diseases.

In 1914 ex-President Roosevelt headed a scientific expedition which carried on important explorations in the heart of Brazil (see ROOSEVELT, THEODORE). That year also was somewhat

disturbed by serious uprisings in some of the states, including Ceará, Pernambuco, and Pará, the trouble being largely racial in the north, where there is a considerable negro population.

The outbreak of the Great War (1914) had a disastrous effect on national finances, so great had been the value of German imports. The normal flow of immigration was greatly reduced and transportation facilities could not be expanded owing to the impossibility of obtaining steel rails and rolling stock. Brazil remained neutral for more than three years but for the sinking of Brazilian ships under Germany's policy of unrestricted submarine warfare at length led to a declaration of war against Germany, October 26, 1917. A Brazilian naval squadron was sent to European waters and many Brazilian aviators joined the Allied forces. In 1922 Brazil celebrated the centennial of her independence by an international exposition in Rio de Janeiro at which the leading countries of the world were represented by delegations. The years 1922 and 1924 were disturbed by unfortunate military revolts and periods of lawlessness and anarchy which were at length suppressed by the Federal forces. In 1926 Brazil resigned her membership in the League of Nations, the reason of her action being her refusal to acquiesce in a permanent seat on the Council for Germany unless she herself was allotted one.

**Bibliography.**—Consult Aker's *History of South America, 1854 to 1904*; Dawson's *The South American Republics* (2 vols.); Martin's *Through Five Republics of South America*; Wright's *The New Brazil*; Nabuco's *Spirit of Nationality in the History of Brazil*; Dodd's *Modern Constitutions* (1909); Roméro and Ribeiro's *Compendio de Historia da Literatura Brasileira*; Domville-Fife's *The United States of Brazil* (1910); Cook's *Through the Wilderness of Brazil* (1910); Gammon's *The Evangelical Invasion of Brazil* (1910); Winter's *Brazil and Her People of To-Day* (1910); Denis' *Brazil* (1911); Porter's *The Ten Republics of South America* (1911); Clémenceau's *South America of To-Day* (1911); Carrier's *Lands of the Southern Cross* (1911); Kerbey's *An American Consul in Amazonia* (1911); Bryce's *South America* (1912); Ray's *Brazilian Sketches* (1912); Lange's *In the Amazon Jungle*; Roosevelt's *Through the Brazilian Wilderness* (1914); Bruce's *Brazil and the Brazilians* (1915); James' *Brazil After a Century of Independence* (1925); Pan-American Union's *Bulletins* (to date).

**Brazil**, city, Ind., co. seat of Clay co., 56 m. w.s.w. of Indianapolis, on the Chi. and E. Ill., the Evansville and Terre Haute System and other R. Rs. The city has a public library. There are extensive mines of block coal in the region, and vast deposits of clay and sedimentary rock. Coal mining and the manufacture of pig iron are the chief industries. Engines, steel rails and structural shapes, boilers, brick, sewer-pipe, and kindred products are also manufactured. Pop.(1910) 9,340.

**Brazil Cabbage.** An araceous plant (*Caladium* [*Xanthosma*] *sagittifolium*) native to the West Indies. It is cultivated in many tropical countries for the sake of its rhizome; this is an important food, as it contains much starch; the foliage, also, serves as a "pot-herb."

**Brazilian Grass.** Strips from the leaves of a West Indian fan-palm (*Chamærops argentea*); exported chiefly from Cuba, and woven into cheap chip hats.

**Brazil Nut,** the seed of *Bertholletia excelsa*, a tree belonging to the Myrtaceæ, indigenous to Brazil, Guiana, and Venezuela, where it attains a height of 100 ft. or more. The fruit is a hard, hollow shell, nearly spherical, and about six inches in diameter. These fruits are borne in large numbers on the upper branches

are those called Sapucaia nuts, the seeds of the monkey-pot tree (*Lecythis Ollaria*), also enclosed in a hard pincarp, pot-shaped, which has a lid that drops off when ripe, letting the oblong, grooved nuts escape. They are rarely seen in the markets, although considered better than ordinary Brazil nuts.

**Brazil-wood** is the name given to a number of red-dye-yielding woods growing in Brazil, the W. Indies, and Japan. They were at one time largely employed in dyeing, but have now been replaced by aniline colors. Several species of the leguminous genus *Cæsalpinia* produce this dye-wood, which is yellowish when freshly cut, becoming red upon exposure. *C. Brasiliensis* furnishes, in its heartwood, much of the Brazil-wood; *C. echinata* yields Pernambuco wood, while *C. sappan* gives sappan-wood. Brazil-wood is generally sent to market in the form of sawdust.

**Brazing** is a form of soldering by means of a kind of brass called spelter. The surfaces to be united are thoroughly cleaned, and heated by a forge or a blow-pipe, spelter being applied to the joint in the form of wire or filings, along with borax, which acts as a flux.

**Brazos**, one of the largest rivers of Texas. It rises in the Llano Estacado, in the w. part of the state, and flows in a general s.e. course to its mouth in the Gulf of Mexico. Length, 900 m.; navigable at high water for 300 m.

**Brazza**, the mediæval *Brattia* (Slav. *Brac*), isl. of Austria, Dalmatia; lies between the island of Lesina and the Dalmatian coast, s. of Spalato. The surface is hilly, reaching 2,580 ft. in Mt. San Vito. The principal products are fruits, such as olives, almonds, figs, and excellent wine. It also yields good marble. Area, 153 sq. m. Pop. (1900) 24,465. Chief town, San Pietro (pop., 1900, 3,329), on the n. coast. The port of Milna (pop., 1900, 4,681) is on the s. coast.

**Brazza**, PIERRE PAUL FRANÇOIS CAMILLE, COMTE DE (1852-1905), whose real name is BRAZZA-SAVORGNAN, African explorer, of Italian parentage, was born on board a vessel in the harbor of Rio de Janeiro, and educated at the Jesuits' College at Paris and the Naval School at Brest. In 1874 he was naturalized a Frenchman, and having entered (1870) the marine service, was sent in 1875 to explore the Ogowe R., in W. Africa. He followed (1876-8) the course of the river for 430 m., and proved the practicability of penetrating into Central Africa by way of the two water-courses of the Ogowe and the Alima. In 1879-80 he again explored

the same region, and set up two important scientific stations, Franceville and Brazzaville (N. shore Stanley Pool), and twenty-five other posts, establishing France's claim to the territory about Stanley Pool before that explorer had appeared there. He returned to Europe in 1882, and the following year was dispatched by the French government to complete his exploration of the Ogowe, to determine the basin of the Alima, and to conciliate the natives. In 1886 he became commissary-general of the French settlements in W. Africa, in 1888 governor-general of French Congo, and in 1891 he explored the Sangha. Ill-health compelled him to retire in 1897. In 1902 he was awarded a pension of 10,000 francs by the Senate. In February, 1905, he was appointed by the French government to investigate the charges of cruelty against natives in the French Congo region, and in the following September it was announced that two colonial officers had been sentenced to five years imprisonment as the result of De Brazza's recommendations. Other similar sentences followed, and De Brazza was still at work formulating his report when he was taken ill at Dakar, in the colony of Senegal, where he died. See Bréard's *Les Voyages de Savorgnan de Brazza* (1884).

**Breaching Tower**, a structure which played an important part in the siege of mediæval castles. In its original form it was a long wooden shed fixed on a wheeled framework, the roof being of great strength. From the roof hung a battering-ram, which could thus be swung to and fro against the base of the castle wall without the workers being exposed to the fire from the battlements above. See BELFRY.

**Breach of Contract.** The failure to perform any material term of a contract, subjecting the defaulting party to an action for the damages sustained by the breach. In cases where the performance of a contract by one party is a condition of its performance by the other, a breach by the former relieves the latter from his obligation. In certain classes of cases, as in contracts for the conveyance of land, a breach by either party entitles the other to a decree in equity requiring the party in default to make specific performance of the contract on his part. See CONTRACT, SPECIFIC PERFORMANCE.

**Breach of the Peace.** Any violation of public order. The reign of law and order is the King's peace, or, in the U. S., the peace of the people of the state. Any act by which that order is disturbed is a breach of the peace. The term is not ap-

Brazil Nut, Fruit (cut open), and single Nut.

of the tree; when ripe they fall off, open by the removal of a small lid, and expose from twelve to twenty-two nuts. The nuts are ridged and angular, owing to the way in which they are packed in the fruit, and contain within the hard shells a pleasantly flavored, edible, white kernel from which an oil is pressed for burning.

A better quality of Brazil nuts

plied to any specific offence, but indictments for crime always state that the offence charged is against the peace of the King or of the people. In popular language, the term is generally confined to assaults, affrays, riots, and other acts of violence. A person who sees a breach of the peace being committed is entitled to arrest the offender, and any one threatening to commit an assault or other crime of violence may be arrested and bound over to 'keep the peace.'

**Breach of Promise of MARRIAGE.** The refusal of a man or woman to perform a contract of marriage. Such refusal is ground for an action for damages. It is a good defence to such an action that the defendant is an infant, or if the plaintiff is a woman, that she is unchaste, or that the plaintiff induced the promise by material misrepresentation. But a plaintiff need not disclose facts prejudicial to himself or herself—*e.g.* that he or she is a lunatic. Ill-health, or an already existing marriage, if the plaintiff is unaware of it, is no defence. A contract to marry must be carried out within a reasonable time. See MARRIAGE.

**Breach of Trust.** See TRUSTS.

**Bread.** Cereals have always been a staple food for the human race, and bread is the most satisfactory form in which they can be used, all things considered. Wheat, rye, corn (maize) and oats are most generally used for bread-making, and less commonly, barley, buckwheat, rice, etc. Grain is usually prepared for breadmaking by cleaning, crushing, and bolting to obtain a fine, soft powder called flour or meal, which is made into dough with water or milk, or both, and baked. Salt is usually added to the dough, and frequently a little sugar and lard or butter. If no yeast or other leavening agent is mixed with the dough, unfermented bread results, and to make up for the lack of porous structure, unfermented bread is usually baked in flat, thin cakes. The passover bread of the Jews and hardtack or pilot bread are common forms of unleavened bread. In making fermented bread, sour dough or leaven and yeast are the common leavening agents. Leaven is simply dough, or a mixture of flour which is in a state of fermentation; that is, which contains a large number of active yeast plants, or similar micro-organisms. Ordinarily yeast contains an abundance of the yeast plant growing in a satisfactory culture medium and in a convenient form for mixing with dough. For commercial purposes, the fluid is often thickened with flour or similar ma-

terial and made into small cakes, so that it may be transported and handled more conveniently than the liquid yeast. The proportion of water required to mix with flour and yeast to form the bread sponge depends on the quality of the flour, or more specifically, upon the amount and character of gluten present, but enough should be added to make the sponge as moist as can be moulded readily with the hands. The dough should be thoroughly kneaded so that the yeast will penetrate every part of the mass, and should then be allowed to stand in a warm place, for some warmth is an essential condition to the fermenting process. The most favorable temperature is 70° to 75° F. When the yeast plant grows in the bread sponge, it acts first upon the starch of the flour, changing it into sugar, and then decomposes the sugar into carbon dioxide and alcohol, and it is not until the latter stage is reached and gas begins to form that the action is noticeable. After a time the whole mass of the dough is honey-combed with bubbles of gas, and it is usually kneaded a second time to break up the larger bubbles into many small ones and distribute them evenly through the mass of the dough. The thoroughly kneaded mass is next moulded in loaves and is again allowed to rise. The growth of the yeast plant destroys a small amount of nutritive material, but this loss is of course not of so much importance from a practical standpoint.

Bread which has been kneaded only once has a sweeter flavor than that moulded twice, but the texture is coarse and the appearance less attractive. The best temperature for baking bread is from 450° to 550° F., so that the interior of the loaf will reach the boiling-point of water (212° F.). The lightness of raised bread is due to the presence of gas bubbles and to their expansion by heat. Cereals like corn and rice cannot be used for breadmaking without a mixture of wheat flour or other material, since they do not contain gluten and so cannot form these air bubbles with tenacious walls. Aërated bread, which is popular in London, was invented by an English physician, Daughlish, in 1856, and is made without the use of yeast by incorporating carbon dioxide with the dough by means of a special machine. When baking powder is used in the manufacture of bread, cake, etc., the carbon dioxide needed to lighten the dough is liberated when the baking powder, which should be thoroughly distributed throughout the mass, comes in contact with the water or milk used to wet the dough.

In modern bakeries bread is made entirely by machinery and need not be handled at all by the hands until it is delivered to the customer. White bread made from standard patent flour contains on an average 35.3 per cent. water, 9.2 protein, 1.3 per cent. fat, 53.1 per cent. carbohydrates, and 1.1 per cent. ash, its fuel value being 1,200 calories per pound, and very closely resembles in composition the standard patent flour from which it was made when the two are reduced to the same water content. Whole wheat flour or entire wheat flour and Graham flour are also used for breadmaking. Graham flour retains all of the bran of the wheat, and the entire wheat flour a considerable portion of it. Breads made from these flours contain somewhat more protein and mineral matter than standard patent flour bread, but are not as thoroughly digested, so that as regards the amount of nutritive material which the body actually receives, the three sorts of bread are about equal. The coefficients of digestion of standard patent flour are: Protein 88.6 per cent., and carbohydrates 97.7 per cent. In general it may be said that while the coarser grades are not more nutritious than the finer flours, there are many cases in which they are especially desirable, as, for instance, for persons of sedentary habit and occupation, because their stimulating of the alimentary tract may help to produce a larger secretion of the digestive juices and also to overcome a tendency to constipation.

The estimated consumption of wheat in the United States is 6.23 bushels per head per year. This would be equivalent to about 277 pounds of flour. It seems certain that at least three-fourths of this is used for bread. To sum up, wheat flour of all grades, and breads made from it, are among the cheapest, most digestible, and most nutritious of human foods, and well worthy of the high estimation in which they are generally held. Though furnishing a fair proportion of protein, breads are essentially carbohydrate foods, and so may very properly be combined with meat, milk, eggs, and other nitrogenous materials to form a well balanced ration.

**Breadalbane,** dist., W. Perthshire, Scotland, comprising many lofty peaks of the S. Grampians, the highest being Ben Lawers (3,984 ft.). It is drained by the feeders of Loch Rannoch, Loch Tay, and Loch Lyon, and is rendered accessible by good roads through Glen Dochart, Glen Lyon, and Glen Rannoch.

**Bread-fruit.** The bread-fruit

tree (*Artocarpus incisa*) is a native of the E. Indies and the islands of the Pacific, where its fruit constitutes an important article of food. The tree grows to a height of about 40 ft., and has bold, leathery leaves varying from a foot to half a yard in length. The male flowers are borne in catkins, the female appear as globular heads. The fruit is of the size and shape of a melon with knobbed rind. The young fruit contains a thick, white fluid which is pleasant and nourishing, but it is generally allowed to develop to a more solid condition before being used as food. It is usually cooked in a hole in the ground; it is cut into several pieces, and the core is removed; after which it is placed on heated stones for half an hour, with leaves, in alternate layers. It contains about three per cent. of albumin and fourteen per cent. of carbohydrates.

Bread-fruit.

1, Stamens; 2, pistil; 3, section of fruit.

**Bread Nut**, the fruit of *Brosimum alicastrum*, of the Urticaceæ, common in the W. Indies, etc. The nuts taste like hazel nuts, and, roasted or boiled, are used as bread; the leaves and shoots are greedily eaten by cattle. The wood resembles mahogany.

**Bread-root**. See YAM and PSORALEA.

**Bread-tree**. See KAFFIR BREAD.

**Breakbone Fever**. See DENGUE.

**Breakers**. See WAVES.

**Break Joint**, the overlapping of similar pieces of timber, stone, or iron so that two joints should not occur at the same point, which would produce a weak structure. In masonry and bricklaying this is called 'breaking bond.'

**Breakspær**, NICOLAS. See ADRIAN IV., POPE.

**Breakwaters**. See HARBORS.

**Bream** (*Abramis*), fish belonging to the carp family, distinguished by the compressed and elevated body, the short dorsal fin, and the absence of barbels from the mouth. Of the seven European species, two are British, the common bream (*A. brama*) and the white bream (*A. bicca*). Bream are often exceedingly abundant in slowly-moving waters, and on some parts of the Continent are the object of an important fishery. In the United States the name is indefinitely applied to various small cyprinoid fishes.

**Breast**, popularly used for the thorax or chest, but here restricted to its anatomical sense—*i.e.* the milk gland or mamma of mammalia. Breasts exist in the male as well as in the female—in the former only in a rudimentary state, unless their growth has been excited by peculiar circumstances. In the female they are two hemispherical eminences in the pectoral region, corresponding to the intervals between the third and sixth or seventh ribs, and extending from the sternum to the axillæ. They are of small size before puberty, enlarge during pregnancy, and become atrophied in old age. The outer surface is convex, and has a small conical prominence, the nipple. The mamma consists of glandular lobes, of fibrous tissue connecting the lobes, and of fatty tissue in the intervals between them. The lobes are connected by areolar tissue with blood-vessels and ducts. The ducts unite to form larger ones, which terminate in excretory ducts opening into the nipple. During pregnancy the alveoli or spaces in the glands enlarge, and the cells undergo rapid multiplication. The cells in the centre of the spaces at the commencement of lactation undergo fatty degeneration, and are eliminated as colostrum corpuscles. The peripheral cells of the spaces remain, and form in their interior oil globules, which are ejected into the lumen of the alveolus, and constitute the milk globules.

**Diseases of the Breast**.—Inflammation, or mastitis, is frequent during lactation, morbid or defective states of the nipple being the most common causes. It often passes on to suppuration or abscess. When actual congestion of the gland tissue exists, it should be reduced by mechanical means or bandaging. When inflammation is present, the local application of warmth, the application of belladonna, and a suitable support for the breast are required. Sometimes the milk accumulates, forming a cyst or galactocele, which varies in size from time to time. The treat-

ment consists in opening, removing the contents, and drainage. At other times a portion of the breast becomes the seat of chronic lobular mastitis, which can be reduced by local soothing applications and attention to the general health. The breasts are the seat of tumors—some non-malignant, as cysts, adenoma, and fatty tumor; others malignant, as sarcoma or cancer. Cancer of the breast occurs in two chief forms—scirrhous or hard, and encephaloid or soft. In both of these lymphatic glands are included, and the only hope of cure is early removal. Diseases of the nipple may be due to (1) defective formation, remedied by the use of an exhausting glass; (2) fissures or cracked nipple, which may lead to abscess. Fissure is formed during sucking, is very painful, and should be guarded against by the use of astringent or spirit lotions during the later months of pregnancy; and while nursing, by perfect cleanliness, and by drying the nipples after sucking. Once fissured, the nipple should be protected by a shield, and dusted often with a drying antiseptic powder, such as oxide of zinc.

**Breastplate**. (1.) The Jewish high priest's breastplate was made of embroidered linen, wherein were inserted four rows of jewels, twelve in all, engraved with the names of the tribes of Israel. (See Ex. 28:15 ff.) (2.) A cuirass, formed first of linen or of leather, afterward of metal, bronze, or brass plates, generally without collars, worn by Egyptian, Greek, Roman, and Hebrew soldiers. See J. G. Wilkinson's *Antiquities*, i. (1878).

**Breath**. See RESPIRATION.

**Breccia**, a rock consisting of angular fragments united by a matrix. The shape of the components indicates that they have been produced by fracture, and have not been subjected to rounding by attrition. 'Fault breccia' is often found between the two walls of a geological fault, and is due to the breaking down of the rocky walls when grinding on one another. Mineral veins are often formed in fissures, and are brecciated later by movement of the walls. Volcanic breccias are produced by the consolidation of the coarse ejecta of volcanoes, or by the breaking up of a partly cooled lava stream and the subsequent cementation of the fragments. The intrusion of igneous rocks often lead to the formation of breccias along the contact with the neighboring formations.

**Brechin**, par. (13,922 ac.), tn., parl. and royal bur., Forfarshire, Scotland, on the South Esk, 8½ m. by road W. of Montrose; manufactures paper, linen, and sail-cloth; has bleachfields and distilleries. Its antiquities include

the castle, the round tower, and the cathedral (1150). Pop. (1911) of tn. 8,439; of par. 9,836.

**Breckenridge, JOHN** (1797-1841), American clergyman, was born near Lexington, Ky., and graduated (1818) at Princeton. He became a Presbyterian clergyman, and was chaplain of Congress, 1819-21. After filling several pastorates, he was appointed professor of theology in Princeton Theological Seminary, 1836, and two years later was made secretary and general agent of the Presbyterian Board of Foreign Missions. His controversy with Archbishop Hughes on the respective merits of the Roman Catholic and Presbyterian churches attracted much attention, and the papers were collected and published (1836). Mr. Breckenridge had a considerable reputation as an old-school pulpit orator.

**Breckenridge, ROBERT JEFFERSON** (1800-71), American clergyman and educator, brother of John (1797), was born near Lexington, Ky., and graduated (1819) at Union. He studied and practiced law for several years, but in 1829 joined the Presbyterian Church, freed his slaves, and in 1832 was licensed to preach, becoming pastor of the 2nd Presbyterian Church at Baltimore, where he remained thirteen years. He was made president of Jefferson College, Pa., 1843, but accepted a Presbyterian pastorate in Lexington, Ky., two years later. From 1853 until his death he was professor of theology at Danville, Ky., Theological Seminary. Mr. Breckenridge edited various publications. He was conservative before the Civil War, but a supporter of the Union during that struggle. He had much to do with the establishment of the public school system in Kentucky. Author of several polemical works and volumes of travel.

**Breckinridge, JOHN CABELL** (1821-75), American lawyer, political leader, and soldier, born near Lexington, Ky. He was educated at Centre College, Danville, Ky., and at the Transylvania Institute Lexington, Ky.; served as a major of volunteers in the Mexican War (1846-7), and became a prominent lawyer and political leader in Ky. He was a Democratic representative in Congress (1851-5) and was vice-president of the U. S. (1857-61). In 1860 at Baltimore he was nominated for the presidency by the seceders from the regular Democratic convention, representing only 21 states, and in the ensuing election stood next to Lincoln, receiving 72 electoral votes—those of Ala., Ark., Del., Fla., Ga., La., Md., Miss., N. C., S. C., and Tex. He was immediately elected to the

U. S. Senate, but withdrew and joined the Confederate army with the rank of major-general (commissioned Aug., 1861). He took a conspicuous part in the battles of Murfreesboro, Chickamauga, Chattanooga, and Cold Harbor, and was defeated by Gen. Sheridan in the Shenandoah Valley in 1864. From Jan. to April, 1865, he was Secretary of War in the cabinet of Pres. Davis, and on the collapse of the Confederacy fled to Europe, where he remained until 1868, subsequently living near Lexington, Ky.

**Breckinridge, JOSEPH CABELL** (1842), American soldier, born at Baltimore, Md., the son of the Rev. Robert J. Breckenridge. He was educated at Centre College, Danville, Ky., and at the University of Virginia, and in the Civil War served as a lieutenant in the Federal army, winning the brevets of captain (July, 1864) and major (Mar., 1865). He became a brigadier-general and inspector-general in the U. S. army in Jan., 1889; served in the Spanish-American War as a major-general of volunteers (commissioned in May, 1898), taking part in the Santiago campaign and being in command of the camp at Chickamauga; and in April, 1903, was made a major-general in the regular army and retired from active service.

**Brecknock, or BRECON**, munic. bor. and mrkt. tn., cap. of Brecknockshire, on the Usk, 29 m. s.w. of Hereford; contains Christ College (originally a Dominican friary, and converted by Henry VIII. into a grammar school), and the Congregational Memorial College, founded in 1869. There is a considerable trade in lime, and in the manufacture of flannels and woolsens. Mrs. Siddons, the actress, was born here in 1755. In the vicinity are Roman remains. Pop. (1911) 5,908.

**Brecknockshire, or BRECON**, an inland county of Wales, w. of Herefordshire. Area, 742 sq. m. The surface is very mountainous, and presents much picturesque scenery. The chief mountain ranges are the Black Mts. in the s.e., the Brecknockshire Beacons in the centre (highest point, 2,907 ft.), the Black Mts. in the s.w., and the Epynt Hills in the n. The principal rivers are the Usk, Wye, and Yrfon, and the upper courses of the Towy, Neath, Tawe, and Taf. The county forms part of the great S. Wales coal field. Iron, building-stone, limestone, lead, and copper also occur. The soil is very varied—fertile along the banks of the Wye and the Usk, but the higher mountainous districts are suited only for pasturage. Oats and corn are the chief crops. Coarse woolsens and hosiery represent the textile industries, and there are

iron works at Beaufort and Clydach, lead-mining at Nant-y-garw (8 m. from Rhayader), and slate at Cwm Yrfon (3 m. from Llan-wyrtyd). There are many remains of antiquarian interest, such as Roman stations, stone circles, and cromlechs. See T. Jones's *History of the county* (2 vols. 1805-9; repr. 1898). Pop. (1911) 59,298.

**Breda, tn., prov. N. Brabant**, Netherlands, 19 m. s.e. of Dordrecht. The Reformed Church contains fine burial monuments to the early counts of Nassau-Dillenburg. The old castle (1536-1696) is now used as a military academy. Carpets, cloth, and hosiery are manufactured. Here were signed the compromise of Breda in 1566, a protest of the Dutch nobility against the Spanish rule; the declaration of Breda in 1660 by Charles II. of England, in which he granted a free pardon and promised religious toleration; and the peace of Breda in 1667 between England and Holland. Pop. of comm. (1899) 26,096.

**Bredahl, CHRISTIAN HVIID** (1784-1860), Danish poet, born and died a poor peasant; an opponent both of the romantic poetry of Oehlenschläger and of the realistic novels of Gyllembourg-Ehrensward; wrote *Dramatiske Scener* (1819-33; new ed. 1855).

**Brederoo, GERBRAND ADRI-AENS** (1585-1618), Dutch comic dramatist, was born at Amsterdam, and professed painting; but his reputation rests upon the farces *Kluchten* (1612), *Symen sonder Soeticheyt* (1613), and *Van den Meulenaer* (1613); the comedies *Moorije* (1615), and *Spaansche Brabander Jerolimo* (1618); and a volume of verse, *Groot Liedboek* (1622). His collected works were edited by Jan ten Brink and others in 1885-90 (3 vols.). See a monograph in Dutch by Jan ten Brink (2nd ed. 1888).

**Brederode, HENRY, COUNT OF** (1531-68), Dutch patriot, leader, with Egmont and Horn, in the revolt against the Spanish rule of Cardinal Granvella. In 1566 he presented to Granvella's successor, Margaret, Duchess of Parma, the famous 'Request,' the refusal of which led to the insurrection of the Gueux, or 'Beggars.' He died in Germany.

**Bredow**, a suburb of Stettin, Germany, with factories, iron works, and shipbuilding yards. The Atlantic liners *Deutschland* and *Kaiser Wilhelm der Grosse* were built here. It was absorbed in Stettin in 1900.

**Bredow, GOTTFRIED GABRIEL** (1773-1814), German historian, author of popular historical works, such as *Merkwürdige Begebenheiten aus der Weltgeschichte* (some 40 eds.), *Handbuch der alten Geschichte* (several eds.), *Weltgeschichte in Tabellen* (nearly

a dozen eds.), *Chronik des 19ten Jahrhunderts* (1808), etc. See *Life* by Kunisch (1823).

**Brée**, MATTHIAS IGNATIUS VAN (1773-1839), Flemish painter, was born at Antwerp, and studied art in Paris under Vincent. He won the Prix de Rome in 1797, and in 1827 was appointed director of the Academy at Antwerp. A painter of historical and allegorical subjects, he excelled in coloring. His principal pieces were *Napoleon's Entry into Antwerp*, *Death of Rubens*, and *Van der Werff at the Siege of Leyden*. His brother Philip (1786-1871) was also a painter of some note. The Van Brées painted in the somewhat conventional style of the 18th-century Flemish school.

**Breech, Breechloader.** See GUN and RIFLE.

**Breches Bible.** See BIBLE.

**Breeding**, a term particularly applied to man's control over the pairing of domesticated and semi-domesticated animals. The domestication of all the more important components of what we may call 'stock' was effected in prehistoric times. Modern attempts to extend the list have not been attended with important success; and, in explanation of the relative failure, it may be suggested—(1) that the number of docile forms which can breed in captivity or under artificial conditions may actually be very small; (2) that domestication may require a longer time and a greater care in graduating the imposed restrictions than modern attempts have afforded; and (3) that in primitive times men may have possessed some secret in regard to the treatment of wild animals which has been lost with the growth of civilization. But although civilized man has not been able to add much to the roll of domesticated animals, he has done a great deal in the way of multiplying breeds, and of improving them along lines which he has selected for his advantage or amusement.

*General Theory of Breeding.*—In general theory, by some form of isolation, man secures the inbreeding of similar variants until the characters he desires to foster have become more or less prepotent in inheritance, and a new breed is established. His interference consists in selecting particular variants, and in restricting their reproductive radius—positively, by bringing similar forms together; negatively, by preventing intercrossing with dissimilar forms: and this may imply the elimination of many members of the young breed itself.

*Complications.*—The success of breeding experiments requires attention to a large number of factors which are still imperfectly understood. (1.) Much depends

on the original choice of the character, or group of characters, which the breeder seeks to develop. There are well-known 'incompatibles' in the characters of organisms; and groupings of characters which may occur together in a casual freak may entirely fail to be realized in a stable breed. (2.) So far as we know, the breeder cannot expect success if the observed peculiarity which he starts with turns out to be an 'acquired character,' a 'modification' due to habits and surroundings, and not an inborn or germinal variation. (3.) It is easy to speak of securing the inbreeding of similars, and of preventing mixture with other breeds or sub-breeds; but in practice the difficulties are in some cases great—e.g. with pigeons, dogs, and cats. (4.) A stable breed may be established quickly, as in the case of the ancon sheep; but it may be the work of a lifetime or more, demanding infinite patience and the most sedulous care. (5.) The essential process of inbreeding may be pursued too far, and degeneration may set in, ending perhaps in impotence; or the introduction of 'fresh blood,' intended to save the desired breed, may be followed by results which give a quite new turn to the reproductive events. (6.) In many cases the development of a breed implies artificial conditions of life (surroundings, food, and habits), which complicate the problem by inducing 'modifications' or acquired bodily characters, theoretically, at least, quite distinct from those inborn or germinal peculiarities which form the only secure foundation of a breed. (7.) Moreover, though we cannot here discuss the details, the breeder has to take account of the age of the parents, their bodily vigor, the relative ripeness of the germ-cells, the normal time of pairing, and a dozen other factors of importance in reproduction.

*Some Results of Breeding Experiments.*—It is not possible at present to formulate 'laws of breeding.' There are, however, some valuable results which will eventually be incorporated in a unified theory. We propose to refer to a few of these.

1. Carefully-kept records—e.g. of basset hounds—have formed part of the basis of Galton's law of ancestral inheritance—an average statistical statement of the fact that inheritance is like a mosaic, the two parents contributing one-half, the four grandparents one-fourth, the eight great-grandparents one-eighth, and so on, of the total heritage of the average offspring.

2. There is no doubt that a variation sometimes crops up which is almost certain to be transmitted in its full strength, even although

its possessor is paired with a form that does not possess the peculiarity in question. This prepotency of certain individual variations was probably operative in the origin of some of the more extraordinary breeds, such as ancon sheep, pug-dogs, and short-faced tumbler pigeons.

3. It seems certain that, given healthy stock, breeding in-and-in—i.e. within a small circle of blood relations—may be carried much further than most practical breeders are at present inclined to allow. The history of some breeds—e.g. of polled Angus cattle—shows in the early years a closeness of inbreeding which could hardly be exaggerated.

4. There is ample evidence to show that inbreeding in a healthy stock tends to develop the prepotency of the breed, giving fixity and stability and certainty of transmission to their peculiar characters. Galloway cattle may be cited as a good example of an extremely prepotent breed.

5. The experiments of Ritzemabos and others on the inbreeding of rats and mice, and the less precise experience of breeders of valuable stock, show, on the other hand, that inbreeding may be carried too far, and may lead to degeneration, frequent abnormalities, abortions, and sterility. Sometimes, however, the collapse may be traceable to the artificial preservation of notably weak members who should have been detected and eliminated before they became reproductive. This leads to the question of intercrossing or outbreeding (exogamy) between members of different breeds.

6. While inbreeding induces fixity and prepotency, outbreeding or intercrossing of breeds is certainly provocative of variation. As Professor Ewart puts it: 'It is only necessary to interbreed half-bred animals, the offspring of two varieties that have long lived apart.... in order to obtain an epidemic of variation, to induce a more or less prolonged period of "sporting."' Ewart's experiments with rabbits seem to prove this up to the hilt.

7. But the results of intercrossing different breeds are so diverse that they may be called unpredictable. Following Ewart, we may summarize the more striking results:—(1.) The offspring, down to minute details, may be all but intermediate between the two parents; but this is not very common. (2.) The offspring may resemble one of the parents. (3.) Some of the offspring may resemble one of the parents, and some the other. (4.) The offspring may combine, almost unimpaired, the more striking characters of both breeds; but this is very rare.

In regard to pigeons, for instance, it seems very difficult to combine the distinctive characters of two well-marked breeds. (5.) Sometimes new, or at least unexpected, characters appear in the offspring—e.g. a tailless rabbit, a spinning rabbit like a Japanese dancing mouse, a chestnut crow, and so on. (6.) The offspring of half-breeds are usually extremely variable. (7.) Sometimes the offspring, instead of resembling the parents, resemble former ancestors—a phenomenon which is, in some cases, interpretable as a reversion.

8. In 1865 Gregor J. Mendel published the results of numerous experiments on the hybridization of plants, of varieties of pea in particular, and formulated what is now called Mendel's law—an induction of profound importance in connection with breeding. His mastery work remained all but unknown till 1900, when De Vries, Correns, and Tschümak reached similar conclusions. These have been confirmed by the experiments conducted by Bateson and Saunders, for animals as well as plants; and no one should now theorize or experiment on breeding without first making himself familiar with Bateson's statement and vindication of Mendel's law. Within our space we cannot do justice to Mendel's discovery, but the gist of it, in Bateson's words, is this: 'The germ-cells or gametes produced by crossbred organisms may, in respect of given characters, be of the pure parental types, and consequently incapable of transmitting the opposite character; that when such pure similar gametes of opposite sexes are united together in fertilization, the individuals so formed and their posterity are free from all taint of the cross; that there may be, in short, perfect or almost perfect discontinuity between these germs in respect of one of each pair of opposite characters.' See MENDELISM.

9. A careful scrutiny of the results of breeding does not seem to furnish any secure evidence in favor of the belief in the transmission of acquired characters or 'modifications;' but it is only fair to say that some expert breeders—e.g. Brewer—find the evidence satisfactory. The same remark must be made in regard to telegony—the supposed influence of a previous sire on the subsequent offspring of the same mother by a different father.

See W. Bateson and Miss E. R. Saunders, *Reports to the Evolution Committee, Royal Soc., Lond.*, 1901—a very valuable record of experiments; W. H. Brewer, series of papers in the American journal *Agricultural Science*, 1892 and

1893; E. D. Cope, *The Primary Factors of Organic Evolution* (1896)—deals at some length with breeding, and expounds Brewer's conclusions; Ch. Cornevin, *Traité de Zootechnie Générale* (1891)—an important treatise; Charles Darwin, *Variation of Plants and Animals under Domestication* (1868)—the classic work on the variations of breeds; J. Cossar Ewart, *The Penicuik Experiments* (1899); 'Variation: Germinal and Environmental,' in the *Scientific Transactions, Royal Dublin Soc.*, vii.353-378(1901)—a valuable continuation of the book above cited; P. Geddes and J. Arthur Thomson, *The Evolution of Sex* (4th ed. 1901); V. Hensen, *Physiologie der Zeugung* (1881)—a valuable treatise, necessarily a little out of date; G. J. Mendel, *Versuche über Pflanzenhybriden* (Abh. Nat. Ver., Brünn), reprint in Ostwald's *Klassiker* (1901), also in *Flora* (1901), and trans. in *Jour. Roy. Horticultural Soc.* (1901)—a very valuable record of experiments not as yet duly appreciated; H. von Nathusius, *Vorträge über Viehzucht und Rassenkenntniss* (1872); G. J. Romanes, *Darwin and after Darwin* (3 vols. 1893, 1895, 1897)—giving many illustrations of the evolutionary interest of breeding; A. Sanson, *Traité de Zootechnie* (2nd ed., five small vols., 1874-8; vol. ii. on laws and methods of breeding), and *L'Hérédité Normale et Pathologique* (1893)—paying much attention to breeding; H. Settegast, *Die Thierzucht* (2 vols. 5th ed. 1888)—a valuable treatise by an expert in touch with biological progress; H. de Vries, *Die Mutations-theorie*, vol. i. (1901); Alfred Russel Wallace, *Darwinism* (1889); August Weismann, *The Germ-Plasm* (1893), and *The Evolution Theory* (Eng. trans. 1904).

BREEDERS' ASSOCIATIONS IN AMERICA. There are numerous associations of breeders of domestic animals in America, of which the following are most important: *Cattle*. American Aberdeen-Angus Breeders' Association, Ayrshire Breeders' Association, Brown Swiss Cattle Breeders' Association, American Devon Cattle Club, Dutch Belted Cattle Association, American Galloway Breeders' Association, American Guernsey Cattle Club, American Hereford Cattle Breeders' Association, Holstein-Friesian Association of America, American Jersey Cattle Club, American Polled Durham Breeders' Association, Polled Hereford Club, Red Polled Cattle Breeders' Association, American Shorthorn Breeders' Association, National Improved Saxony Sheep Breeders' Association, American Shropshire Registry Association, American Southdown Breeders'

Association, American Suffolk flock Registry Association.

*Swine*. American Berkshire Association, Cheshire Swine Breeders' Association, American Chester White Record Association, American Duroc-Jersey Swine Breeders' Association, American Essex Association, American Hampshire Swine Record Association, American Poland-China Record Company, American Suffolk Association, American Tamworth Swine Record Association, American Yorkshire Club, Improved Small Yorkshire Club of America.

*Horses*.—American Association of Importers and Breeders of Belgian Draft Horses, American Clydesdale Association, French Coach Horse Society of America, German Hanoverian and Oldenburg Coach Horse Association of America, American Hackney Horse Society, American Morgan Register Association, Oldenburg Coach Horse Association of America, American Percheron Horse Breeders' and Importers' Association, American Saddle Horse Breeders' Association, American Shetland Pony Club, American Shire Horse Breeders' Association, American Suffolk Punch Horse Association, American Trotting Registry Association, American Breeders' Association of Jacks and Jennets.

*Sheep*.—American Cheviot Sheep Society, American Cotswold Registry Association, Dorset Horn Sheep Breeders' Association of America, Hampshire Down Breeders' Association of America, American Leicester Breeders' Association, American Lincoln Sheep Breeders' Association, National DeLaine Merino Sheep Breeders' Association, American Rambouillet Sheep Breeders' Association, Improved Black Top Merino Association, United States Merino Sheep Breeders' Registry Association, American Oxford Down Record Association.

**Breed's Hill**, in Charlestown, Mass. (now Boston), the field of battle to which the name of a neighboring eminence, Bunker Hill, was attached through popular error.

**Breeze**. See WIND.

**Bregenz** (anc. *Brigantium*), tn. and summer resort of Austria, the cap. of Vorarlberg, stands at the E. end of the Lake of Constance, 121 m. N.W. of Innsbruck. It consists of the upper old town and the lower new town down beside the lake. Its chief feature is the National Museum of Antiquities, with many Roman remains. The people are engaged in silk mills, and make fancy ornaments. Pop. (1900) 7,595.

**Brehm**, ALFRED EDMUND (1829-84), German naturalist.

He was born in Reuthendorf, studied at Jena and at Vienna, and travelled extensively in Europe, Asia, and Africa. He was director of the zoological gardens in Hamburg (1863-7), and founder and director of the aquarium in Berlin. (1867-75). His most famous work is his *Illustriertes Tierleben*, or 'Animal Life' (10 vols.; Eng. trans. 1895), whose accurate delineations won immediate recognition.

**Bre'hon Laws**, the name used to denote the jurisprudence of ancient Ireland. The Gaelic MSS. embodying these laws, of which the *Senchus Mór* (Great Book of the Ancient Law) and the *Book of Aicill* are the most noteworthy, have been translated into English and published in a series of five volumes, with a sixth volume as *Glossary*, under the title of *The Ancient Laws of Ireland* (1865-1901). It is the work of half a century, authorized by a royal commission constituted on Nov. 11, 1852, and carried out by various distinguished scholars.

**Breisingau**, bris'gou, in the Middle Ages a *gau*, or district of Alemannia, the country of the Germanic tribe of the Alemanni. It included the valley of Freiburg and the south of the Black Forest, and embraced an area of 600 to 700 square miles.

**Breitenfeld** bri'ten-felt, village, Germany, in the district of Leipzig, Saxony, 4 miles north of Leipzig. It is noted as the place where, in 1631, Gustavus Adolphus of Sweden defeated the forces of the Catholic League of the empire, commanded by Tilly. See also LEIPZIG.

**Breitkopf**, brit'kopf, BERNHARD CHRISTOPH (1695-1777), founder of the Leipzig printing house of Breitkopf, now Breitkopf and Härtel. He established himself at Leipzig in 1718, and after 1726 attracted notice by his admirable printing of Gottsched's works.

**Breitkopf**, JOHANN GOTTLIEB EMMANUEL (1719-94), son of Bernhard Christoph Breitkopf, was born in Leipzig. He followed his father's profession and in 1750 invented movable music type, improved the shape of the German characters, devised a method of printing maps and pictures from movable pieces, and wrote several valuable works on typography.

**Breitmann**, HANS. See LELAND, CHARLES GODFREY.

**Bremen**, brä'men, free state, Germany, between the grand-duchy of Oldenburg and the Prussian province of Hanover; area 99 square miles. It is governed by a constitution adopted in 1920. The duchy of Bremen was assigned in 1648 to Sweden, whence it was sold in 1715 to

Hanover. Pop. (1919) 311,266.

**Bremen**, seaport, Germany, capital of the state of Bremen, on the Weser river, 46 miles from the North Sea and 72 miles southwest of Hamburg. It lies in a sandy plain on both banks of the river and consists of two parts, the old town on the right bank, enclosed by ramparts, and the new town on the left bank, with broad paved streets and handsome buildings. Features of interest are the Rathaus, a handsome Gothic building erected in the fifteenth century, the Exchange, the Cathedral, built in the twelfth century as a basilica, Gewerbehause, the old guild hall of the cloth merchants, the Municipal Museum of natural history, ethnology and commerce, and the Kunsthalle, containing some good modern paintings and sculptures.

Several bridges connect the old and new towns and fine promenades have been laid out on the old ramparts surrounding the old town. Many statues adorn the city, chief among which are those of Bismarck, William I., Frederick III., Moltke; and Bürger Park is an attractive spot laid out in English style.

Bremen is the second largest port in Germany and is commercially important. It imports large quantities of cotton, wool, grain, tobacco, rice and coffee and exports wool, hides, glass and wooden toys. The North German Lloyd steamship company, whose chief port it is, before the Great War had a fleet of 982,952 tons register, most of which it lost by the Treaty of Versailles, but in 1922 regular sailings were resumed between Bremen and New York and by 1925 shipping had reached almost its pre-War level. The chief industries are shipbuilding, manufactures of cigars, paper, cotton and woollen goods, sugar refineries, distilleries, and breweries. Pop. (1919) 269,806. The town owes its origin to a bishopric founded in 788 by Charlemagne. It joined the Hanseatic League in the thirteenth century, and was very prosperous throughout the sixteenth century. Its modern commercial prosperity dates from the founding of Bremerhaven in 1830.

**Bremer**, brä'mer, FREDERIKA (1801-65), Swedish novelist, was born in Tuorla, near Åbo, Finland. Her first book, *Teckningar ur Hvardagslivet* which appeared in 1828, was followed by a series of romances with a common title, of which *Familien H.* . . (1833), *Grannarne* (1837), *Presidentens Döttrar* (1834), *Hermmet* (1839), *I Dalarne* (1845) all translated into English by Mary Howitt, are generally

regarded as the best. She spent two years (1849-50) in America, impressions of which are recorded in *Hemmen inya världen* (1853), and in 1856-61 she travelled in Europe. She received the Swedish Academy gold medal in 1844. Miss Bremer's works faithfully portray Swedish middle-class life but in her later novels she adopts the rôle of the philanthropist and reformer.

**Bremerhaven**, brä'mer-hä'fen; Eng. brem'er-hä'ven, or BREMERHAFEN, seaport (outport of Bremen), Germany, in the state of Bremen, at the mouth of the Weser, on its right bank, 45 miles northwest of Bremen. The town dates from 1827, when Bremen bought land from Prussia, whereon she has since constructed three large harbor basins, besides docks (including the dry dock of the North German Lloyd) and wharves. Pop. (1919) 24,200.

**Bremerton**, city, Washington, in Kitsap County, on Puget Sound and on the Washington Steamship Line; 17 miles west of Seattle. It is a modern well built city and is the seat of the Puget Sound navy yard, which has three large dry docks, one of which is a construction dock in which two large ships can be built at the same time. Industries include saw mills, cigar factories, and machine shops. In 1927 it was consolidated with Charleston. Pop. (1910) 2,993; (1920) 8,918.

**Brendan**, bren'dan, or BRENNANN, St. (484-577), of Clonfert, called 'son of Finnloga' to distinguish him from St. Brendan of Birr, is the hero of the *Navigation of St. Brendan*, a popular tale of the Middle Ages. He is said to have visited certain islands in the Atlantic, which suggest the familiar Greek legend of the Isles of the Blest. Brendan visited St. Columba (563) at Iona. His day is May 16.

**Brendan**, St. (?490-573), of Birr, now Parsonstown, in King's county, Ireland. A disciple of St. Finnian of Clonard, he was the friend of Columba, was present at his excommunication and advised him to settle at Hy. His day is November 29.

**Bren'eman**, ABRAM ADAM (1847- ), American chemist, was born in Lancaster, Pa. He was graduated (1866) from Pennsylvania State College, where he was instructor and professor in chemistry until his appointment (1875) to a similar position at Cornell, where in 1879 he became professor in industrial chemistry. After 1882 Professor Breneman resided in New York City, occupied as a chemical expert, analyst, writer, and lecturer, giving special attention to the subject of water and its contami-

nations and to the chemistry of ceramics and explosives. He is joint author with Dr. Caldwell of a chemical text-book and has published many scientific papers and is the inventor of a process for making iron non-corrodible. In 1884-93 he edited the *Journal of the American Chemical Society*, of which he was a vice-president in 1890.

**Brenham**, city, Texas, county seat of Washington County, on the Southern Pacific and the Gulf, Colorado and Santa Fé Railroads; 75 miles northwest of Houston. The city has a public library and is the seat of the Blinn Memorial Junior College and is an important centre for the trade and manufacture of cotton and by-products. Brooms, mops, ploughs, and iron goods are also manufactured, and the city is one of the chief markets of the grain industry of the district. Pop. (1910) 4,718, (1920) 5,066.

**Bren'ner**, village and summer resort, Austria, in the Tyrol, near the head of the Brenner Pass, 25 miles south of Innsbruck. Thermal springs are a feature of the village.

**Brenner Pass**, a mountain pass which connects the valley of the Inn with that of the Etsch (Adige). It is the lowest (4,485 feet) of the great Alpine passes, and was used by the Romans between Verona and Augsburg. It was made practicable for wheeled vehicles in 1772, and in 1867 a railway, 78 miles long, was opened, which connects the railway systems of Germany and Austria by Italy.

**Brenner**, VICTOR DAVID (1871-1924), American sculptor and medalist, was born in Shavly, Russia. He went to the United States when a young man and after being employed as a die cutter, went to Paris where he studied under Roty. Among the medals he designed are the seal of the New York Public Library, the Lincoln cent, and portrait medals of Whistler, Roosevelt, Carl Schurz and many others. He is the author of *The Art of the Medal* (1910).

**Brennus**, the leader of the Gallic tribe of the Senones, who, in 390 B.C., after besieging Clusium, marched on Rome, defeated the Romans at the battle of the Allia, and took and burnt their city. After a long siege it is probable that by means of ransom the Senones were bribed to retire.

**Brennus**, the leader of the Gauls who invaded Greece in 279 B.C. After being checked at Thermopylae, they devastated Ætolia, and advanced on Delphi, where they were completely defeated, and Brennus committed suicide.

**Brent**, CHARLES HENRY (1862- ), American Protestant Episcopal bishop, was born in Newcastle, Ont. He was educated at Trinity College, Toronto, ordained priest in 1887, and held charges in Buffalo (1887) and Boston (1888-1901). In 1901 he was elected bishop of the Philippine Islands and in 1918 became bishop of Western New York. In 1908 he declined the bishopric of Washington, D.C., and in 1914 that of New Jersey. He has served several times as delegate to the International Opium Conferences and in 1927 played an important part in the Lausanne Conference on Faith and Order. In the Great War he was chief of the Chaplain service of the A. E. F. in France, and is an officer in the Legion of Honor. His publications include *With God in the World* (1889), *The Consolations of the Cross* (1902), *With God in Prayer* (1907), *The Mind of Christ* (1908), *The Sixth Sense* (1911), *Presence* (1914), *Prisoners of Hope* (1915), *The Mount of Vision* (1918).

**Brentano**, bren-tä'nō, CLEMENS (1778-1842), German poet and novelist, a leader of the younger Romantics, was born in Ehrenbreitstein. He studied at Jena and in 1801 recorded his early experiences of life and love in *Godwi*, a frivolous book patterned after Schlegel. He later went to Heidelberg, where, together with his friend Achim von Arnim, he published (1805-8) *Des Knaben Wunderhorn*, or *Boy's Magic Horn*, a collection of popular folk songs which they dedicated to Goethe, and which is Brentano's most important work. After a somewhat wandering and unsettled life he entered the Roman Catholic Church becoming a devout adherent of its doctrines. Among his other works are *Die Geschichte vom braven Kaspar*, *Romanzen vom Rosenkranz*, *Gockel*, *Hinkel und Gockeleia*.

**Brentano**, LUIS JOSEF, 'LUJO' (1844- ), German political economist, was born in Aschaffenburg, Bavaria. He was educated at Heidelberg, Göttingen and other universities and was professor of political economy at Breslau (1872). Strassburg (1882), Vienna (1888), Leipzig (1889), and Munich (1891). He has made a special study of the working classes both from the historical point of view and from the actual present-day conditions. His published works include *Die Arbeitergilden der Genewart* (1871-2), *Die Arbeitsversicherung* (1879), *Der Arbeitsversicherungszwang* (1881), *Die Christlichsoziale Bewegung in England*—2nd ed. 1883, *Agrarpolitik* (1897), *Die Wirtschaftliche Lehren des Christlichen Alterthums*

(1902), *Die deutsche Getreidezölle* (1911), *Clemens Brentano's Liebesleben* (1921), *Die Urheber des Weltkriegs* (1922), *Konkrete Grundbegrunder der Volkswirtschaft* (1924).

**Brentford**, market town, England, county town of Middlesex, on the river Brent; 8½ miles west of St. Paul's, London. There are soap works, distilleries, breweries, and market gardens. It was the scene, in 1016, of Edmund Ironside's defeat of the Danes. Pop. (1921) 17,039.

**Brent Goose**. See BRANT.

**Brenz**, brents, JOHANN (1499-1570), German theologian and Protestant reformer, was born in Weil. He was educated at Heidelberg and being won over to Lutheranism escaped a trial for heresy by accepting a call to the church at Hall, which he reorganized. He took part in the Marburg Disputation (1529), the Augsburg Conference (1530), and the Conferences of Hagenau (1540), Worms (1540), and Ratisbon (1541 and 1546); and was one of the authors of the Wurtemberg Confession. In 1553 he became provost of the cathedral of Stuttgart, whither he betook himself on the issue of Charles v.'s 'Interim,' which he strenuously opposed.

**Brescia**, bresh'ä, province, Italy, between the Tyrol, Lake Garda, and the river Oglio; area 1,823 square miles. The principal products are rice, maize, wine, and fruits. Silk, machinery, and leather are the chief manufactures. Pop. (1921) 652,225.

**Brescia**, city, Italy, in Lombardy, capital of the province of Brescia; 51 miles east of Milan. It is a well built manufacturing city with many Renaissance buildings and monuments. Among the features of interest are the church of Santa Maria dei Miracoli, the cathedral, begun in 1604, the Loggia, architecturally the glory of Brescia, the National Museum of Roman Antiquities, the Mediaeval Museum, and the Pinacoteca Tosio Martinenzo, which contains many examples of the Brescian school of painting. The leading industries are the manufacture of iron and steel, especially small arms for the Italian army, silk, cotton, and woollen mills, paper factories, linen weaving, and wine making. Pop. (1921) 100,168.

Brescia became a Roman town under Caesar but was destroyed by Attila in 452. It was one of the leading Lombard cities to oppose Frederick Barbarossa and in the 15th century became subject to Venice. In 1860 it became a part of the Kingdom of Italy.

**Breslau**, bres'lou, town, capital of the province of

Silesia, Prussia, commercially and educationally the chief city in Eastern Germany, is situated on the Oder; 190 miles southeast of Berlin. It consists of the old and new towns and five suburbs. Educational institutions are numerous, the most notable being the university founded by the Emperor Leopold I. in 1702. Churches include the cathedral (12th century) and the churches of St. Elizabeth (13th century), St. Magdalene (14th century), and St. John. Among other buildings are the town hall, near which are fine statues of Frederick the Great, Frederick William III. of Prussia, and Blücher; the archepiscopal palace; and the palace of the king of Prussia, now used as a government building. The chief industries are the manufacture of machinery, printing, brewing, distilling, bell casting, flour milling, and gardening. The important articles of trade are metals, textiles, lumber, and wool.

Breslau is of Slavonic origin, and was for many centuries occupied alternately by the Poles and Bohemians. It was subject to Austria from 1526 to 1741; at the latter date it was conquered by Frederick the Great of Prussia. Pop. (1910) 470,000.

**Bres'say**, one of the Shetland Islands (q. v.).

**Brest**, fortified seaport, department of Finistère, France, and the principal French naval station, is located on the north-western coast, on the northern side of the Bay of Brest; 289 miles by rail west of Paris. The harbor, one of the finest in Europe, communicates with the sea only by a narrow channel, scarcely a mile in width, called *Le Goulet*. Forts and batteries guard both the approaches to the harbor and the roadstead, and the difficulty and danger of access to hostile ships are increased by the narrowness of the entrance.

Industry is largely confined to the equipment of the navy. There are extensive shipyards, storehouses, and arsenals, and manufactures of candles, paper, cork, hats, ropes, soap, and leather. Exports are chiefly beer, grain, brandy, and dried fish. Coal, timber, and fertilizers are imported in large quantities.

The splendid position of Brest made it an object of contention to the French, English, and Spanish. It was ceded by a count of Léon to the Duke of Brittany in 1240, and in 1342 passed into the hands of the English. In 1499 it fell to the French by the marriage of Louis XII. with Anne of Brittany, and in 1512 an English fleet under Lord Howard made an unsuccessful attempt to reconquer it. In 1631 Richelieu commenced the fortification of the harbor, and his work was

completed under the direction of Vauban (q. v.) in 1680-88. In 1794 a French fleet under Admiral Villaret de Joyeuse was defeated off Brest by an English fleet under Admiral Howe. The town was an important debarkation station for American troops during the Great World War (1914-18). Pop. (1913) 90,540.

**Brest-Litovsk**, lyě-tófsk', town and important fortress, Grodno government, Russian Poland, is situated on the Bug River, and at the junction of the Moscow-Warsaw and Königsberg-Odessa Railroads; 131 miles by rail south of Grodno. It is the see of a Greek Orthodox and an Armenian bishop. It has trade in cloth, grain, leather, and wool.

Brest-Litovsk came into the possession of Russia on the third partition of Poland, in 1795. Vast sums of money were spent upon its fortification, and it was considered an impregnable stronghold up to its capture by the Germans during the Great War (1914-18). It was taken by General von Mackensen on Aug. 25, 1915, having been practically reduced to ruins by the Russian troops before they evacuated it. Pop. 55,000, over half Jewish.

*Treaty of Brest-Litovsk*.—Peace negotiations between Germany, Austria, Bulgaria, and Turkey on one side and Russia on the other were opened at Brest-Litovsk on Dec. 22, 1917, and on March 3, 1918, the peace treaty between the Central Powers and Russia was signed by the plenipotentiaries of the respective nations. By the terms of the treaty Russia surrendered to the Central Powers, for their disposal, Finland, and the Aland Islands, Ukraine, Russian Poland, the Baltic Provinces (Estonia, Livonia, Courland), Lithuania, and Russian Armenia, a total of 455,000 square miles, with a population of 56,000,000.

Ukrainian delegates signed a separate peace with the Central Powers at Brest-Litovsk on Feb. 9, 1918. The Supreme War Council of the Allies refused to recognize the treaties, and their renunciation was a condition of the armistice which ended the war (see ARMISTICE). See EUROPE, GREAT WAR OF.

**Bretagne**. See BRITANNY.

**Brethren, Apostolic**, a North Italian sect of the thirteenth and fourteenth centuries, which urged a return to the primitive communism of the apostolic church. Its founder, Gerhard Segarelli, a Parma weaver, was, after twenty years of successful preaching in the garb of an apostle, burned at the stake (1300), and the brethren suffered persecution. His successor, Dolcino of Novara, a learned man, educated to the priesthood, and an eloquent

preacher of apocalyptic prophecies, maintained himself in arms against Pope Boniface VIII. for two years, but was captured, and was burned at the stake at Vercelli in 1307.

The name was also applied to a sect of the third and fourth centuries, in Asia Minor, which condemned marriage and followed Christian communism, and to a German communist body of the twelfth century.

**Brethren, Bohemian**. See MORAVIANS.

**Brethren in Christ**. See RIVER BRETHREN.

**Brethren of the Common Life**, semi-monastic associations founded by Gerhard Groot (q. v.) at Deventer, in Holland, about the year 1376, for teaching children, copying books, and generally laboring and living in Christian communion. They were likewise known as Brethren of Good Will, Hieronymites, Gregorians, and Collation Brethren.

**Brethren, Plymouth**. See PLYMOUTH BRETHREN.

**Bretigny**, bret-ēn-yé', village, department of Eure-et-Loir, France, near Chartres. By the treaty of Bretigny, May 8, 1360, Edward III. of England gave up his claim to the throne of France. See EDWARD III.

**Bretton, CAPE**. See CAPE BRETON ISLAND.

**Bretton**, brē-tôn', JULES ADOLPHE AIMÉ LOUIS (1827-1906), French painter, a master of the realist school of peasant-painters, was born in Courrières, and studied at Ghent under Devigne, at Antwerp under Wappers, and at Paris under Drolling. He was in touch with the Barbizon school, and one of the first to follow Millet and Courbet in the revolution against academic tradition; but his subjects were less uncompromising and more convincing than theirs, and this tendency towards idealization became still more developed in his later works. His best pieces include *Blessing the Fields* (1857), *Return of the Gleaners* (1859), *Evening and Weeders* (1861), *Potato Harvest* (1868), *The Fountain* (1872), *Song of the Lark* (1885). He was also an author of note. Consult his autobiographical *Vie d'un Artiste*.

**Bret'on**, NICHOLAS (?1545-1626), English poet and pamphleteer, was son of a London merchant, and stepson of the poet George Gascoigne. Some charming pastoral lyrics in the Spenserian vein are to be found in his *Passionate Shepherd* (1604), and in the miscellany *England's Helicon* (1600). His *Collected Works* were edited by A. B. Grosart (1876).

**Bretón de los Herreros**, brā-tōn' dā lōs er-rā'rōs, MANUEL (1796-1873), Spanish scholar and dramatist, was born at Quel. He

held various government positions, and in 1837 was elected secretary to the Royal Spanish Academy. He was an indefatigable writer of poems, articles, sketches, and tales, but is chiefly known as a dramatist, much of his work still holding the stage. Among his most notable pieces are *A Madrid me vuelvo* (1828), *Marcela* (1831), *Muñete; y veras* (1837), and *Escuela del matrimonio* (1852). The best collected edition of his works is that of Orozco.

**Breton Language and Literature.** Breton (Fr. *Bas Breton*), or Armorican, the ancient language of Brittany, is a Celtic dialect, forming, together with Welsh and the extinct Cornish dialect, the Cymric or southern group of the Celtic languages. It was carried to France by the British Celts who fled from England upon the invasion of the Anglo-Saxons in the fifth and sixth century, and is still spoken by more than 1,250,000 persons, mainly in the department of Finistère, western parts of Cotes du Nord, and in Morbihan. Breton has four distinct dialects, the Vannes, Tréguier, Cornouailles, and Léon, the last being the most important and the purest.

An excellent grammar and dictionary of the language was published by Le Gonidec (3rd ed. 1847-50), while Froude issued an authoritative lexicon (new ed. 1876).

The chief monuments of ancient Breton literature (after the 6th century) are two miracle plays of the fourteenth century—*Le Grand Mystère de Jésus* (ed. by La Villemarqué, 1866) and *Le Mystère de Saint Nonne* (ed. by Le Gonidec, 1833) founded on the life of St. Nonna. The nineteenth century has witnessed an important Breton revival, and a large number of popular traditions, stories, poems, and miraculous narratives have been collected and given to the world. Among the most important collections are Emile Souvestre's legends of Brittany, *Foyer Breton* (1844); M. Luzel's *Légendes Chrésiennes de la Basse-Bretagne* (2 vols., 1881), and *Contes Populaires de la Basse-Bretagne* (3 vols., 1887); M. Paul Sebillot's *Contes Populaires de la Haute-Bretagne* (1880), and *Traditions et Superstitions de la Haute-Bretagne* (1882). Consult E. Renan's *La Poesie des Races Celtique*; Quellien's *Chansons et Danses des Bretons*; D'Arbois de Jubainville's *Les Celtes et les Langues Celtiques*; *La Revue Celtique*.

**Bretschneider**, KARL GOTTLIEB (1776-1848), German theologian, was born at Gersdorf, Saxony. He studied theology at Leipzig, became a councillor of the Upper Consistory at Gotha,

and gained a reputation as a sound and judicious thinker of rationalistic tendencies. His numerous works include *Systematische Entwicklung aller in der Dogmatik vorkommenden Begriffe* (1805; 4th ed., 1841); *Probabilia de Evangelii et Epistolarum Joannis Apostoli Indole et Origine* (1820); *Lexicon Manuale Græco-Latinum in Libros Novi Testamenti* (1824; 3d ed., 1840).

**Brett**, WILLIAM BALIOL. See ESHER, WILLIAM BALIOL BRETT, VISCOUNT.

**Bretton**, HENRY DE. See BRACTON, HENRICUS DE.

**Bretts and Scots**, LAWS OF THE, an old code of laws, of which only a fragment remains, evidently a survival of Cymric and Gaelic jurisprudence in Scotland. The 'Bretts' were the remnants of the old Britons, who were formerly the chief inhabitants of the island of Great Britain, and continued to occupy certain regions in the south of Scotland, while the 'Scots' were a people who had migrated from Ireland and had settled in the western parts of the same country. Edward I. of England, in his ordinance made for the government of Scotland (1305), specially cancels these laws, as unsuited to the existing civilization of Scotland. The most noteworthy feature of these laws is the institution of the *cro*, which was the price at which every man's life was valued according to his rank and degree, and which had to be paid to his kindred as compensation in the event of his being murdered.

**Breughel**, brùch'el, BRUEGHEL, or BRUEGEL, a family of Flemish painters. (1.) PIETER (c. 1530-69) was born at Breughel, near Breda, Netherlands, from which he took his name. He painted chiefly the pleasures of peasant life and landscapes. (2.) PIETER THE YOUNGER (1564-1637), his son, was born in Brussels and earned for himself the title 'Infernal,' because of his paintings of hags, witches, devils, and kindred subjects. (3.) JAN (1568-1625), a younger brother of the second Pieter, the best of the three, was called the 'Velvet,' presumably from the smoothness of his style. He was born in Brussels and painted miniatures, flowers, and landscapes—e.g. *Paradise, The Four Seasons*—and collaborated in the great painting *Adam and Eve in Paradise* (in the Louvre), the figures in which were painted by Rubens. Consult Michel's *Les Brueghels*.

**Breve**, brëv, in musical notation a note having the value of two whole notes or semi-breves. See MUSIC.

**Breve**, an old Scots law term signifying a short, compendious writ issued from the crown to a judge, ordering him to try by

jury the points outlined in the writ.

**Breven**, brā-vān', or BREVENT, a mountain of the Pennine Alps, in Savoy (8,284 ft.) on the north side of Mont Blanc, of which it affords a fine view.

**Brevet'**, a military commission in the U. S. Army bestowed by the Senate, upon the nomination of the President, as a reward for gallant and meritorious service in the field. Brevet rank entitles the holder to wear the uniform and bear the title of the grade to which he is brevetted, but not to draw the pay or to take the command or precedence usually belonging to the grade.

**Breviarium of Eutropius**. See EUTROPIUS.

**Breviary**, a book containing the divine office, which every Roman cleric in holy orders and choir, monks, and nuns are bound to recite daily. The Roman office in its complete state dates from the latter part of the seventh century or the beginning of the eighth, and continued unchanged for at least four hundred years. In the thirteenth century it received various additions, chiefly taken from the Franks; and this, which was called by Gregory IX. the 'modern office,' was given by him to the Franciscans in the form of a breviary, properly so called, in 1241. This breviary was introduced into the Roman basilicas under Nicholas III. in 1280, and into the churches of Avignon in 1337 by Benedict XII. The Council of Trent called for a revision of the breviary, and the result was the breviary (1568) of Pius v., with subsequent amendments by Clement VIII. (1602) and Urban VIII. (1631), the breviary of the latter with additions by later popes being that now in use. A decree of Pope Pius x., shortening the offices was issued in 1911, operative in 1913.

The breviary is divided into four parts—a winter, spring, summer, and autumn quarter. Each part contains (1) the *Psalter*—i.e. the psalms arranged for each day of the week; (2) the *Proprium de Tempore* (the proper of the liturgical season)—i.e. hymns, antiphons, chapters, and lessons, with responsories and versicles for each day of the church year, including the movable feasts; (3) the *Proprium Sanctorum* (the proper of the saints)—i.e. prayers, lessons, responsories, etc., for the feasts of the saints; (4) the *Commune Sanctorum* (the common of the saints)—i.e. lessons, Gospels, responsories, versicles, and antiphons that may be employed for whole groups of saints (Apostles, Martyrs, Abbots, etc.)—and, in addition, the offices of the dedication of churches and of the Blessed Virgin; (5) a supplement containing offices which do not bind the whole church, and are recited only in

particular countries. Every day the office begins with matins and lauds, which form together the longest of the seven canonical hours. These are followed by prime, terce, sext, none, vespers, and compline. In religious communities a shorter office is substituted, and in churches the services are usually combined—matins and lauds at 7.30 or 8 A.M.; prime, terce, sext, and none at 9.30 or 10; vespers and compline at 4.

It was on the lines of the breviary that the English order of Morning and Evening Prayer was drawn up. They retain their old features so fully that the English Prayer Book may be regarded as an improved breviary and missal. A strong feature of the modern breviary is the skill and taste which have been brought to bear upon the translation (by Newman, Neale, and others) of the hymns, as shown in the edition of the breviary edited by the third Marquis of Bute (1879). See Grancolas's *Commentarius Historicus in Romanum Breviarium: Batiffol's Histoire du Breviaire Romain* (1893); Bäumer's *Geschichte des Breviers* (1895).

**Brevier.** See TYPES AND TYPEFOUNDING.

**Brewer,** city, Penobscot co., Maine, opposite Bangor, on the Penobscot Railway, and on branch lines of the Maine Central R.R. The chief industries are shipyards, a tannery, and pulp, paper, and saw mills. Pop. (1910) 5,667.

**Brewer,** DAVID JOSIAH (1837-1910), American jurist, was born in Smyrna, Asia Minor. His mother was a sister of Justice Stephen J. Field, David Dudley Field, and Cyrus W. Field. He graduated at Yale University in 1856, and from the Albany Law School in 1858. He began practice at Leavenworth, Kan., in 1859; became successively judge of the Probate, District, and Supreme Courts of Kansas, and in 1884 was made judge of the U. S. Circuit Court for the Eighth District. In 1889 he was appointed Associate Justice of the U. S. Supreme Court. In 1896 he was a member of the Venezuela Boundary Commission; in 1899 of the British-Venezuelan Arbitration Tribunal; and in 1904 was president of the International Congress of Lawyers and Jurists in St. Louis. Six colleges and universities conferred upon him the degree of LL.D. His great learning, ability, and fairness of judgment were widely recognized. He wrote: *The Pew to the Pulpit* (1897); *Twentieth Century from Another Viewpoint* (1899); *American Citizenship* (1902); *The United States a Christian Nation* (1905).

**Brewer,** EBENEZER COBHAM (1810-97), English writer, born in London. He is best known as the compiler of the *Dictionary of*

*Phrase and Fable, Reader's Handbook, Dictionary of Miracles, and The Historic Note Book.*

**Brewer,** JOHN HYATT (1856), American organist and composer, was born in Brooklyn, N. Y. He studied under local masters, including several years with Dudley Buck. He was organist of several Brooklyn churches until 1881, when he became organist and musical director of the Lafayette Avenue Presbyterian Church, a position he still holds (1911). In 1899 he became professor of music in Adelphi College. He was also a co-founder of the Apollo Club of Brooklyn, and was elected conductor to succeed Dudley Buck in 1903. He is conductor of the Flatbush Glee Club. Author of numerous and varied compositions, including several cantatas.

**Brewer,** JOHN SHERREN (1810-79), English historical writer, was professor of classical literature (1839) and of English literature (1855) at King's College, London; and edited the *Standard* for a short time. In 1856 he began a calendar of *State Papers* (4 vols., 1856-76) of Henry VIII. The prefaces to the various volumes have been edited by Gairdner (1884), under the title, *The Reign of Henry VIII.*

**Brewer,** THOMAS MAYO (1814-80), American naturalist, was born in Boston, Mass. He graduated at Harvard (1835) and at the Massachusetts Medical School. He was editor of the Boston *Atlas* from 1840 to 1857. His ornithological publications include an edition of Wilson's *Birds of North America* (1839), edited, with additions, by himself. In 1874 he began the publication of *History of North American Birds*, which contains matter supplementary to Audubon's work, and of which he was editor-in-chief. The work was completed by other hands after his death.

**Brewer,** WILLIAM HENRY (1828-1910), American agricultural educator, was born in Poughkeepsie, N. Y. He was graduated (1852) at the Yale Scientific School, and studied at Heidelberg and Munich. He held chemistry professorships in various colleges; member of the geological survey of California (1860-4); professor of agriculture at the Sheffield Scientific School, Yale, from 1864 till his death. He did considerable exploring in the Sierras and in Arctic regions, and was one of the founders, and for some time president, of the Arctic Club of America. He published numerous scientific papers, principally concerned with the chemistry of agriculture.

**Brewing,** the process by which malted grain is treated with hot water to produce a wort. This is boiled with hops, filtered, and cooled, and is then made to undergo alcoholic fermentation. In the preparation of native

beers, such as *bousa* (Abyssinian beer), *samshoo*, and others, spontaneous fermentation is allowed; but in civilized countries the greatest care is taken to prevent that process. Beer is a beverage of the most remote antiquity. The Egyptian god Osiris is said to have taught mankind to make a drink from barley not much inferior to wine. Isidorus (5th century A.D.) describes the method employed by the ancient Britons: 'The grain is steeped in water and made to germinate; it is then dried and ground, after which it is infused with water, which, being fermented, becomes a pleasant and intoxicating drink.'

Only since the middle of the 19th century has beer been brewed on scientific principles. This change is due to the great advances made in chemistry, bacteriology, and agriculture. Of all the members of the grass family, barley has been found the most convenient for the manufacture of beer; and for this in Europe the two-rowed barley and in America the six-rowed varieties are mostly used. Some of the most important European barleys are: Chevalier, Imperial, Champion and Hanna barleys, and the most important barley varieties of America, the Montana, Canada, California, Wisconsin, Dakota, Michigan and New York state barleys. When fully matured these barleys vary greatly in appearance. They are bright and yellow in color, but while the two-rowed varieties are large, plump, and thin-skinned, the six-rowed barleys are smaller in size and have a thicker husk. In weight they average from 50 to 56 lbs. per bushel, and yield a malt of from 36 to 42 lbs., showing a loss of about 25 per cent. in the process, due mostly to increase in volume during malting. Barley is used in preference to other cereals for the following reasons: it germinates rapidly and readily; the growth of the acrospire (plumule) is within the husk; it yields a starch comparatively free from fatty matter; it contains a relatively high proportion of suitable nitrogenous matter and a large amount of starch.

Light chalky and dry gravelly loams, or medium to light soils, produce the best malting barleys; but much depends on the season and climate, which should be warm and rather dry. Strong lands and soils rich in humus produce heavy crops of coarse barleys; while heavy and clayey soils yield a dull-looking barley, which contains too high a percentage of glutinous matters.

**Malting.**—Two systems are in general use—the old *flooring* and the *pneumatic*. The chief objects to be attained in malting are:

(a) the modification or rendering naked of the starch cells; (b) the development of the diastatic, proteolytic, and other enzymes present in the grain; and (c) alterations of a physical nature by growth of the acrospire and rootlets. These changes are brought about by germination under starvation conditions

*Analysis of Two Samples of Malting Barley.*

Constituents.	Percentage.	
	(1.)	(2.)
Starch .....	57.98	63.51
Nitrogenous matter .....	11.74	11.46
Water .....	12.19	13.06
Cellulose .....	10.51	7.28
Gums, sugars, pectins, coloring matters, etc. ....	2.83	1.34
Fatty bodies .....	2.17	1.03
Ash .....	2.58	2.32
Total .....	100.00	100.00

*Common Floor Malting.*—The barley as it comes from the elevator contains much dust, seeds from other plants, injured kernels, and kernels of other cereals. It is therefore necessary to clean the barley, separate and grade the kernels according to size, and, if desirable, wash it. This is done by machines known as 'barley cleaners' and 'separators.'

*Steeping.*—Steeping is the process of soaking barley with water, and is performed by immersing the grain in the steep-tank for a period of time under certain conditions. It aims to impart to the grain sufficient moisture to start and carry on germination, and also to dissolve from the husk the coloring matter and other extractive substances, which otherwise would give the barley a raw taste. The best water for steeping is a medium hard, pure spring or well water. The temperature of the water should not exceed 55° F.; otherwise, mouldy growth will be encouraged. In winter the water should be warmed to the proper temperature before it is run into the steeping tanks. The period of steeping generally varies from 40 to 60 hours and depends upon the character of the water—whether soft or hard—the temperature of the water and the nature and age of the grain. When the barley has reached the desired degree of steeping it is sent to the germinating department. In the modern malt-house the steep-tank is provided with a conical hopper bottom situated above the malt-floor, so that the grain slides down on the floor in a heap. The first heap is called a 'couch.' The 'couch' is set on one end of the floor and the

malt gradually works over towards the opposite end, at which the dry kiln is situated. The chief points to be observed in carrying on germination are, sufficient moisture, suitable temperatures, and ventilation. Growth should not proceed too rapidly; the saving of time thus effected influences unfavorably the quality of the resulting malt, especially its mellowness. At advanced stages of development sprinkling is resorted to in order to provide the necessary moisture for further growth. After the acrospire has developed to about  $\frac{3}{4}$  of the length of the kernel and the radicles to about  $1\frac{1}{2}$  the length of the kernel and the proper degree of mellowness has been reached the growth is restricted as promptly as possible. The time of germination varies from five to eight days. The further growth of the grain is arrested by expelling a large percentage of the moisture in the green malt. The green malt is conveyed directly into the kiln, the kiln having almost invariably two floors, one above the other. The grain is dumped on the upper floor and there dried slowly to the requisite degree of dryness. Green malt contains about 35 to 40 per cent. of moisture and the air dried malt from 12 to 15 per cent. While the malt is on the upper kiln floor the temperature should be kept comparatively low (75–90° F.) until the moisture has been for the greatest part expelled. After the desired degree of dryness has been obtained the malt is dumped on the lower kiln floor. The regulation of temperatures on the lower kiln floor is governed by the desired quality of the final product. The initial temperature here should be 120–130° F. until the malt is absolutely dry. Then the temperature is raised within two hours to the final temperatures and kept there for two to three hours. The final temperatures for pale malt should be from 165–180° F.; for high dried malt, up to 220° F. The period of kiln drying varies from 36 to 72 hours. The charge on a kiln floor is usually 2,500 bushels in the larger malting establishments, or 5,000 bushels on both floors. The turning on the kilns is mostly done by machinery.

The differentiation between barley and malt may be best illustrated as follows: The loss in cleaning varies from 0.5–2.0 per cent.; loss in skimming from 0.1–4 per cent.; loss in sprouts from 2.8–3.2 per cent.; loss of extract from 4.6–6.8 per cent. and the loss of moisture on kiln from 7.1–7.7 per cent.; so that from 100 lbs. of barley 75 to 84 lbs. fresh kilned, dried malt with

3 per cent. moisture are obtained.

*Pneumatic Malting.*—Of pneumatic malting the two more important systems are those of Galland (drum malting) and Saladin (pneumatic floor malting). There is very little difference in steeping for pneumatic malting and steeping for floor malting. In the drum malting after the desired degree of steeping is reached the grain runs into the drum which is located on the floor below right under the steep tank and calculated to hold just one full charge of the tank. A steep tank generally holds from 250 to 500 bushels. When the drum is filled it is started revolving. The temperatures in the drums are regulated by increasing or reducing the draught of air. The drum is connected with an air-shaft leading from the atomizing room where the air is drawn through coke and water so as to be charged with the necessary moisture and having correct temperatures; the air is drawn through the drum by means of a fan. While in the drum, the grain is sprinkled by means of mechanical self-regulating sprinklers at suitable intervals. The time it remains in the drums varies from five to eight days, the last day being given to air-drying or withering. The malt is then conveyed from the drum into the kiln and the kilning process carried out in the same manner as for floor malting.

*Pneumatic Floor Malting.*—In pneumatic floor malting the steep is discharged into a compartment instead of into a drum. In the compartments the malt lies about 30–36 inches in depth on the perforated floor and draughts and fans are set in operation and the air drawn through the malt. The velocity of the draught and the saturation with moisture must be regulated to suit the condition of the 'piece.' The malt is turned by means of 'turners' and sprinkled when necessary.

*Brewing Process.*—Brewing operations embrace the production of the wort from the raw materials; they include all the operations from the cleaning of the malt up to the point where the yeast is added to the wort in the settling tank or fermenting vat. The selection of the methods to be employed to produce beer depends upon the quality and character of the finished product. The character or properties of a beer necessarily depend upon its composition, that is, the amount and nature of the various substances present in the beer.

*Process of Mashing.*—Mashing is the process of extracting the goods by mashing them with water at suitable temperatures

and in proper relative quantities preparatory to the boiling in the kettle. Chemically, it proceeds in the main by the inversion of the malt into maltose, malto-dextrin, and dextrin, and the modification of the insoluble albuminoids into a soluble form. These changes are brought about by the agency of enzymes contained in the malt, which begin operations when the malt is mixed with water at proper temperatures. These enzymes are called diastase and pepsase. It is the function of the diastase to convert the starch and of the pepsase to modify the albuminoids of the malt. The amounts of dextrin, malto-dextrin and maltose, as well as of modified albuminoids, like albuminoids, peptones and amides, finally present in the wort, are materially affected by the condition under which the enzymes do their work; hence it is in the power of the brewer to control the composition of the wort within certain limits. The method of mashing to be followed is determined by the requirements as regards the character of the beer. If it is desired to obtain a beer with a high degree of palatfulness and foamkeeping capacity, the brewer must understand how to incorporate into the wort the desirable albuminoids and unfermentable extractive substances upon which these properties depend. This can be done by peptonizing at low temperatures—for instance, 100° F.—for one hour and converting the starch at high temperatures—for instance, 154–167° F.—and raising the temperature rapidly between 100° and 154° F., so as to avoid the formation of too much maltose. If we wish to obtain beers with a high percentage of alcohol, we should keep the mash for a sufficient length of time at between 122 and 140° F., at which temperatures maltose is mainly formed. The mash should be so conducted as to secure the desired composition of the wort and to obtain the largest yield possible of extract from the goods employed:

#### Mashing System.—

- (1.) **Infusion or Water Mash:**  
 American Beers—From lower initial temperatures to higher final temperatures;  
 English Beers—High initial temperatures.
- (2.) **Decoction and Thick Mash:**  
 German Beers.

By the infusion method the mash is brought to its final temperature by the addition of water of a suitable high temperature; by the decoction method part of the mash itself is raised by boiling and then returned to the mash-tub. The American raw material

method is a combination of both, as the raw grain is boiled separately and run into the malt mash to produce the final temperature. Malt contains diastase in quantities sufficient to convert more starch than is stored up in the malt itself. Anton Schwartz was the first in this country to advise the employment of rice and corn in conjunction with malt. With but few exceptions in the United States rice and corn are used as malt substitutes. In reference to the quantity of these unmalted cereals, it may be stated that from 25 to 40 per cent. of the malt may be replaced by these raw materials. These unmalted cereals are mashed in special vessels with part of the malt at temperatures ranging up to 167° F. The starch is rendered soluble by boiling. The vessels used for the conversion of the unmalted cereals are made of wood or iron, and are supplied with good stirring apparatus. These converters are furthermore provided with steam coils or steam jackets for indirect steaming, or the temperature is raised by direct steam. Besides these unprepared cereals some products are used which can be added directly into the mash-tub, as they have been previously prepared by steaming and rolling; such products are known as 'frumentum' and 'cerealine.' The use of these raw materials enables the brewer to produce a beer of paler color, better stability, and to work more cheaply. The amount of materials to be used per barrel of beer depends upon the gravity and strength of the wort and the yield of the material. The brewery yield will never be as high as the laboratory yield, but it should approach it within 2 to 3 per cent. A good quality of malt should yield 64–65 per cent. of extract, a good corn from 76–78 per cent., and corn flakes and rice from 78–80 per cent.

Malt beers are brewed from 12–15 per cent. Balling and require from 50 to 65 lbs. of malt; pale Lager beer should be brewed from 12–13 per cent. Balling and require from 48 to 53 lbs.; pale bottle beer should be brewed from 13–15 per cent. and require from 52 to 60 lbs. of material; temperance beers are brewed with from 7–8 per cent. Balling; malt tonics are brewed from 8–15 per cent. Balling.

After the mashing process is completed and a wort of the proper composition is obtained the mash is allowed to rest for the purpose of permitting the grains to settle well, so as to form a good filtering material and allow the wort to run off quickly. As a rule, the mash is kept on rest for about one-half hour.

But it is well to be guided by other conditions when fixing the time of resting; such conditions are: the construction of the mash-tub; the condition of the false bottom; the kind of materials employed.

**Filtration of the Wort and Sparging.**—A good filtration of the wort depends upon the quality of the malt, the conversion, and the grinding of the malt; also upon the arrangement of the drawing pipes. Very fine grinding, incomplete conversion and a too vertical position of the drawing pipes render the filtration of the wort more difficult. With a brewing plant of large size 100 barrels per hour is to be considered good work. The first portions of the wort are returned to the mash-tub until the wort runs perfectly clear, and then brought into the kettle. The first wort is allowed to run off until the surface of the wort is only two to three inches above the grains. Then sparging begins. The objects of sparging are, to wash out the extract from the grains. Two kinds of sparging devices are now in use, the 'rotary' and the 'ring spargers,' of which the latter is most generally employed. It consists of a stationary, bent, copper tub placed near the top of the mash-tub, having holes drilled through its lowest side in such a direction that the water is evenly distributed over the surface of the grains.

**Boiling of the Wort and Addition of Hops.**—The wort obtained by mashing is boiled for the purpose of: (1) coagulation of the albuminoids, that is, break of the wort; (2) evaporation of water, consequently concentration of the wort; (3) extraction of hops. The wort is generally heated by steam, open fire kettles having gone quite out of use. The time of boiling varies from 1½ to 2½ hours.

**Hopping the Wort.**—The hop cones which are used in brewing contain between their leaves a yellowish hop-flour—the so-called lupuline—which contains the active principles of hops; namely, the aromatic oil and the resinous and bitter substances. The leaves of the hop cones contain the tannic acid and some of the effective constituents, but no valuable substances are contained in the seeds of the hop-cones. The latter contain substances which, when extracted, may impart a harsh taste to the beer. Good hops should be of greenish yellow color, and silky to the touch; they should be of a slightly glossy appearance, should contain as few seeds as possible, and should be picked clean, that is, free from leaves and stems

The hops are added in different portions, in order to secure both the bitter and aroma. The quantity of hops depends upon the quality of the hops and the preference of the public for a more or less bitter beer. As a rule, from  $\frac{3}{4}$  to 1 lb. are added per barrel for ordinary draught beer; from 1 to  $1\frac{1}{2}$  lbs. per bbl. for pale beers; and from 2 to  $2\frac{1}{2}$  lbs. per bbl. for special beers. From the kettle the beer runs into the 'hop-jack,' where it is allowed to stand for a period of about 15 minutes, to permit the hops and albuminoids to settle. The wort is then pumped into the surface cooler for the purpose of preliminary cooling. From the surface cooler the wort is sent over the Baudelot Cooler which consists of a series of pipes arranged in vertical tiers over the outside of which pipes the wort is allowed to flow, while through the insides of the pipes the cooling medium is circulated. The wort should not be cooled lower than  $145^{\circ}$  on the surface cooler, as below such temperatures the development of disease ferments is favored, which ordinarily will act unfavorably on the quality, flavor, and stability of the product. Of late, closed coolers have been installed, in which the beer is cooled without coming in contact with the air, except such as has been previously filtered and sterilized. After the wort has been cooled to the proper temperature it is ready for pitching with yeast.

*Fermenting Cellar Operations.*—With reference to the character of the beer to be produced, as far as determined by the process of fermentation, two methods of conducting fermentation are distinguished:

- (1.) Top fermentation, for ale, stout, and porter;
- (2.) Bottom fermentation, for lager beer.
